The 1976 Regents' Resolution also recognized the principle of limiting the average daily population at Parnassus Heights to 13,400 persons, for the purpose of limiting environmental effects associated with occupancy and use of the Parnassus Heights campus site. The 1982 LRDP emphasized the need to limit the use of the Parnassus Heights campus site to purely academic and clinical functions and to move most campus-wide administrative functions to other areas. The 1996 LRDP established a new goal to limit the average daily population to 16,000 persons. Currently, the average daily population at Parnassus Heights is estimated at 17,950 persons.

To support and achieve its missions, UCSF proposes to grow where growth can be reasonably accommodated at its currently owned sites: primarily at Mission Bay, to a limited extent at Mount Zion, and if needed, in a new building at Mission Center. While most of this growth is proposed to be accommodated in new buildings, a portion would be met through better utilization of existing space through implementation of a new UCSF-wide space policy[3], renovation of obsolete labs and repurposing of vacant and underutilized space. It is also envisioned that new space would be developed to accommodate a greater density of occupants than in the past for greater space efficiency and higher utilization.

UCSF has many old buildings that will require an enormous investment to fully comply with seismic and other life safety codes, extend the life of utility systems and make the buildings more energy efficient. Because of the extensive need to upgrade and replace infrastructure at UCSF facilities, another important objective of the LRDP is to prioritize these needs along with the construction of new buildings to provide space for growth.

UCSF also strives to improve overall efficiency and minimize operational costs via a consolidation strategy that involves, where practicable, reducing the number of building leases and campus sites. Consolidation will also help UCSF achieve its instructional, research, clinical, support and financial objectives. In some cases, it is necessary for UCSF to lease space in a particular geographic area of the City, (e.g., to provide a neighborhood clinic). However, opportunities will be sought to relocate and accommodate currently leased space into buildings owned by UCSF, and to co-locate owned space either on or near major sites in the near-term.

Finally, to help improve campus amenities, meet housing demand and reduce commute traffic, UCSF proposes additional campus housing at Parnassus Heights and Mission Bay where demand for housing is greatest. New housing at both sites would make it possible to realign students, postdoctoral scholars and faculty to live where they attend classes or work. Other campus facilities would be developed, including more child care space where it is most needed, indoor and outdoor recreation and fitness facilities, shuttle support facilities, retail and more and enhanced open space areas. As a part of the on-going LRDP planning process, the objectives listed below may be revised, as necessary, in the LRDP EIR.

[3] The Space Governance policy requires each academic and research unit to re-use vacated space within a limited period of time, or else the space may be re-assigned. The Space Governance and Principles can be viewed at http://policies.ucsf.edu/policy/600-24.

Overarching Objectives

- Optimize the use of existing campus sites (land and entitlements) and existing campus space through repurposing, renovation, densification and consolidation where appropriate; locate programs and activities at sites where they are suitable and compatible with UCSF's missions, and best foster collaboration, accommodate interdependent programs and reinforce academic and operational relationships.
- Meet the seismic requirements of SB 1953 and successive legislation by constructing and maintaining modern, seismically safe hospitals and facilities that that will remain operational in the event of a major earthquake.
- Plan new facilities and implement improvements to existing buildings to meet the UC Policy on Seismic Safety, to ensure a seismically safe environment for UCSF patient, visitors, physicians and staff.
- Maintain UCSF's prominent role as an educational, training and research institution for medical professionals providing health care, medical/surgical care, emergency/urgent care to San Francisco and surrounding communities.
- Facilitate growth in an environmentally responsible manner while reducing carbon emissions by implementing UCSF's greenhouse gas reduction plan to meet the goals of Assembly Bill 32 (AB32), the California Global Warming Solutions Act[4].
- Develop adequate facilities and transportation demand reduction policies to emphasize transportation alternatives that will lessen auto traffic in and around campus sites and to meet changing needs consistent with the City's Transit First policy.
- Continue to prioritize parking for patients and essential healthcare providers.
- Reduce the number of UCSF locations by consolidation of owned and leased sites.
- Address the need for campus housing for students, postdoctoral scholars, house staff and junior and incoming faculty at major campus sites by constructing an adequate number of new units while taking into account financial feasibility and physical site constraints.
- Provide amenities such as permanent childcare facilities, additional recreation and fitness facilities and improved outdoor areas to enhance the quality of campus life and the public realm.
- Continue to engage neighbors for feedback on development proposals to address potential community concerns that may arise as a result of UCSF's physical development.

Campus Site Specific Objectives

Parnassus Heights

- Maintain and enhance the Parnassus Heights campus site as the main center for didactic instruction to continue to promote excellence and leadership in health science education.

[4] UCSF is required to develop a long-term strategy for voluntarily meeting the State of California's goal for reducing greenhouse gas (GHG) emissions to 1990 levels by 2020, pursuant to the California Global Warming Solutions Act of 2006 (AB32).

- Ensure that adequate space is provided to foster collaboration and to facilitate the inter-dependence and connectivity for operational efficiency and effectiveness for instruction, clinical, research and support uses in close physical proximity to each other.
- Ensure that the new hospital addition and Long Hospital are adequately supported and aligned with the instruction, research and tertiary care programs that remain at the Parnassus Heights campus site.
- Implement management, maintenance and risk reduction actions planned for the Mount Sutro Open Space Reserve to increase usability of the Reserve, improve safety for the people and property in the environs of the Reserve, minimize wildfire and tree hazards and promote a healthier forest.

Mission Bay

- Continue UCSF's commitment to excellence, innovation and collaboration to grow and expand the research campus at Mission Bay and to support the new Medical Center at Mission Bay.
- Strategically expand the existing research campus at Mission Bay while increasing efficiency by aligning and locating interdependent research and clinical teams and themes at Mission Bay campus site.
- Consolidate specialized services associated with Women's, Children's and Cancer services at the new Medical Center at Mission Bay, scheduled to open in 2015.

Mount Zion

- Convert the Mount Zion campus site into an outpatient ambulatory-care center to meet existing and future projected inpatient and outpatient needs by expanding specialized services.
- Develop a new facility that can accommodate future program space need of up to approximately 257,000 gsf on the main block.

Other Objectives

- Meet UCSF's instructional and clinical missions while continuing to provide economically viable development and programs.
- Design projects that are compatible with neighborhood aesthetics and scale to the extent feasible.

2.5 Projected Growth

As explained in detail below, this LRDP would provide for an additional 2.76 million gsf of space through 2035 if all the planned capacity were to be developed within that time frame.

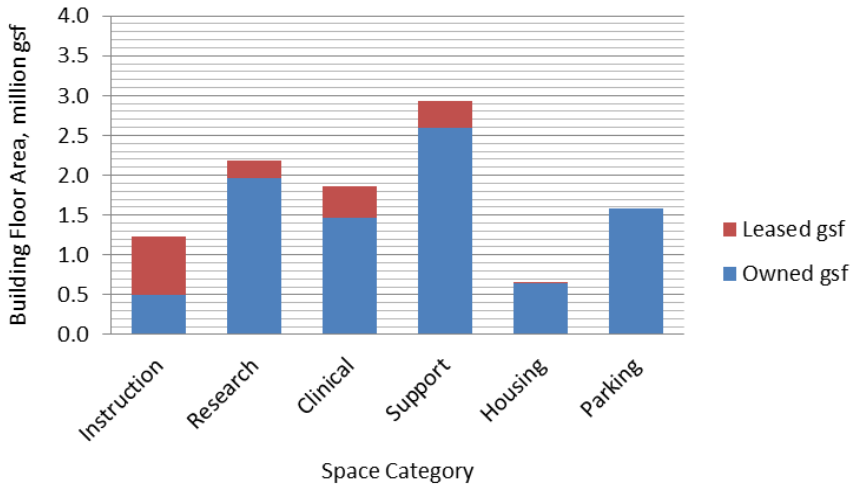
The LRDP is intended to serve as a general guide to the physical development of the campus. Except for the proposed development projects described later in this Project Description, the LRDP does not propose a commitment to any specific project, construction schedule or funding priority.

Existing Space

UCSF currently occupies a total of approximately 8.25 million gsf in owned and leased space at all of its campus sites in San Francisco, excluding approximately 1.58 million gsf in structured parking. The space is used for various institutional uses within the following major categories:

- **Instruction**, including classrooms, teaching laboratories, seminar rooms and academic offices
- **Research**, including research conducted in laboratories, offices and support space
- **Clinical**, including space for services provided to patients in hospitals or clinics and for functions that directly support patient care such as administrative offices and conference rooms
- **Support**, consisting of the following types of uses:
  - *Academic Support*, including support space such as the library and animal care
  - *Academic and Campus Administration*, including all administrative space at the department, school and campus levels: deans' and directors' offices, conference rooms, copying facilities as well as non-academic support space such as police, personnel and accounting offices
  - *Campus Community*, including campus amenities such as recreation, fitness, child care, conference centers, food service and retail
  - *Logistics*, including space devoted to the delivery of materials, and physical plant space such as machine shops, service yards, laundry services, utilities and storage
- **Housing**, including residential facilities for students, postdoctoral scholars, house staff and faculty

Figure 2 shows the allocation of all existing UCSF-owned and leased space at all sites in San Francisco among these major space categories. As can be seen in Figure 2, there are substantial amounts of support, research and clinical space, with the remaining space divided roughly equally between instruction and housing.



SOURCE: UCSF, Jan. 2011

Figure 2
Existing Space Inventory at All Sites (September 2013)

Buildings Under Construction

In addition to UCSF's approximately 8.25 million gsf in owned and leased space at all sites in San Francisco, new construction totaling approximately 1.13 million gsf and consisting of the Phase 1 Medical Center and Mission Hall at the Mission Bay campus site is underway and scheduled for completion in 2015.

Projected Need for Additional Space

UCSF's projected need for additional space through the LRDP horizon of 2035 is 2.43 million gsf in addition to the buildings currently under construction. The amount of instruction, clinical, research and support space that is expected to be needed and can be financially supported through 2035 is described below. The breakdown of the types of space needed across all sites is presented and discussed by major space category.

The 2.76 million gsf of additional capacity under the LRDP exceeds the projected 2.43 million gsf need for additional space in order to allow for some degree of campus growth to meet needs that may not be foreseeable at this time, given the 20+ year horizon of the LRDP. This is explained in greater detail below under "Total Space at LRDP Buildout."

Instruction

The projected need for 109,600 gsf of instruction space is based on expected growth in student enrollment and the University's financial ability to renovate academic space to accommodate the increase in the number of students.

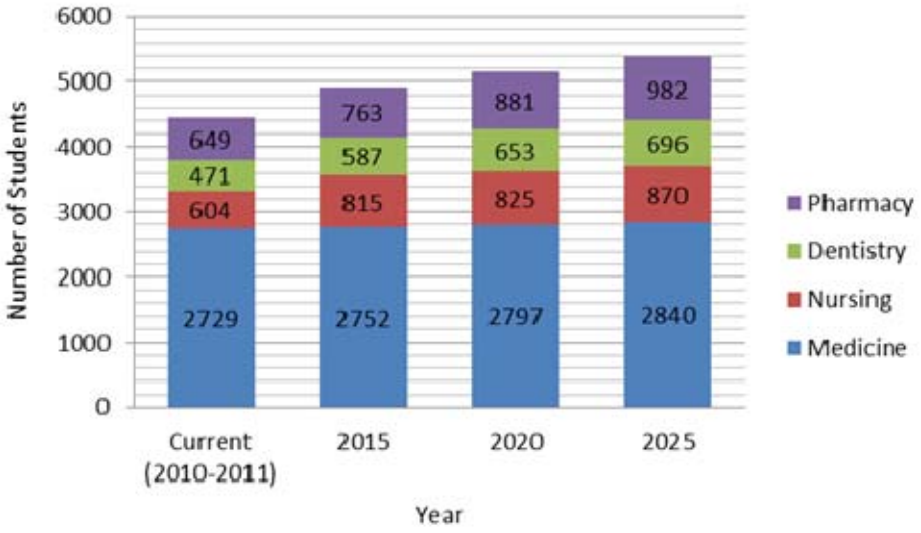
Figure 3 illustrates the number of students enrolled in each of the four UCSF schools[5] between 2011 and 2025, the final year for which projections are currently available. A total increase of 21% in enrollment is expected by 2025, with the smallest increase in enrollment occurring for the School of Medicine at 4% and the largest for the School of Pharmacy with a 53% increase in enrollment. For purposes of the LRDP, it is assumed that enrollment after 2025 will remain relatively constant because enrollment projections beyond 2025 would be highly speculative.

Research

The projected need in 2013 for additional research space[6] is 626,000 gsf. It is assumed that research space need would be met in existing facilities through 2021. Between 2021 and 2030, an annual growth rate of 2.5% in research space need is assumed. Due to the uncertainty in funding, and due to industry trends that could affect research space needs and configurations, it is too speculative to assume additional space or faculty growth beyond 2030.

5 SOURCE: UCSF Budget & Resource Management, January 2011. Graduate Division enrollment projections are included within the schools totals.

6 Research space does not include 18,000 gsf of research support functions and 79,200 gsf for animal care space that are included in the academic support category.



SOURCE: UCSF, Jan. 2011

Figure 3
Existing and Projected Enrollment

Clinical

Driving the need for additional clinical space, the inpatient need is expected to increase by 23% by 2035. This projection is based on the current adult patient average daily census and staff estimates for growth in adult services and cancer programs. It reflects plans to backfill space vacated by moves to Mission Bay in Moffitt Long Hospital at Parnassus Heights and the hospital at Mount Zion after the new Medical Center at Mission Bay opens in early 2015, as well as in the new hospital addition planned at Parnassus Heights by 2030. Clinical space growth is expected to be highest in the near term with the opening of the Medical Center at Mission Bay, followed by less growth thereafter with the construction of the new hospital addition at Parnassus Heights. Between 2030 and 2035, the inpatient average daily census is projected to grow by about 4% and would be accommodated in the new hospital addition at Parnassus Heights and the Medical Center at Mission Bay. Outpatient volume is expected to grow by 72% by 2035.[7] Including both inpatient and outpatient space, the total clinical space[8] need is projected to be 773,000 gsf by 2035.

7 This projection is based on compound annual growth rates of 3% through 2020, 2% from 2021 to 30 and 1% from 2031 to 2035.

8 Clinical space includes 308,000 gsf of new inpatient space at Parnassus Heights, 172,700 gsf of new outpatient space at Parnassus Heights and Mount Zion, and 169,300 gsf of new academic office space at Parnassus Heights (150,100 gsf in UC Hall and CSB) and Mount Zion (19,200 gsf). Not included in Clinical space are office and outpatient space need at Mission Bay that will be accommodated in Mission Hall and in the Medical Center outpatient building to be built by 2015 and 2020, respectively.

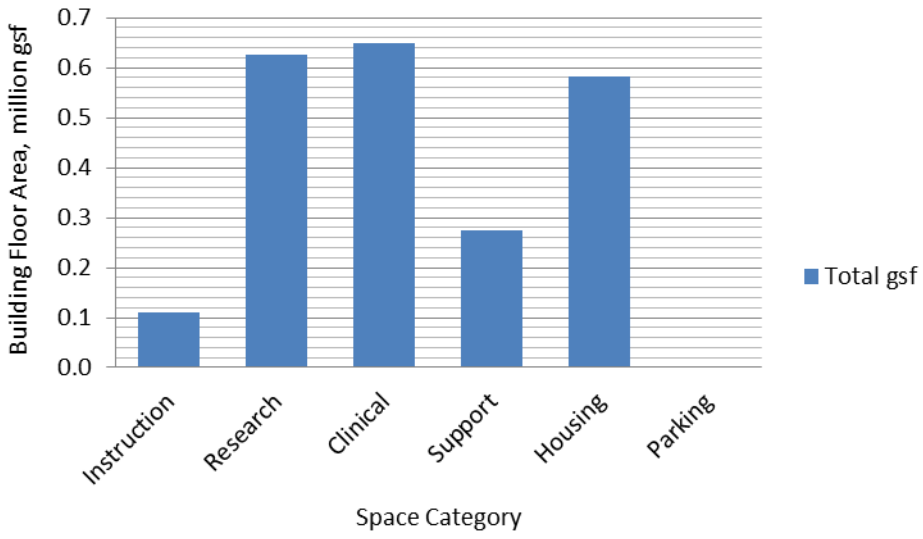
Support

Support space need is projected to be about 284,300 gsf. This growth reflects plans to expand child care, retail, recreation and fitness and conference space.[9]

Housing

The projected growth of 637,200 gsf for housing is based on the potential capacity for new housing at Mission Bay and non-residential uses that could be converted to housing at Parnassus Heights.

Figure 4 summarizes, by space category, the additional 2.43 million gsf projected space need in this LRDP. Although a major portion of the projected space need would be accommodated in new buildings on campus sites or in new off-site leases, some of it would be met through a combination of better utilization of existing vacant or underutilized space, converting existing space to other uses to meet changing priorities (e.g., converting office space at Parnassus Heights to housing and backfilling Moffitt Hospital after 2030 with hospital support and other uses), or consolidating functions or leases.



SOURCE: UCSF, 2013

Figure 4
UCSF Projected Additional Space Need by Major Category in 2035 (GSF)

[9] Some of this space need was determined by applying multipliers to base space needs (e.g., research), or by assuming a constant ratio to the amount of existing space (e.g., logistics).

Total Space at LRDP Buildout

As noted above, UCSF's projected need for additional space through the LRDP horizon is 2.43 million gsf in addition to the 1.13 million gsf of building space currently under construction. The projects identified in the LRDP would provide up to 2.76 million gsf at LRDP buildout. Although a major portion of the projected space need would be accommodated in new buildings on campus sites, some of it would be met through a combination of better utilization of existing vacant or underutilized space, reinvestment in existing sites, converting existing space to other uses to meet changing priorities (e.g., converting office space at the Parnassus Heights campus site to housing and backfilling Moffitt Hospital after 2030 with hospital support and other uses), or consolidating functions or leases.

If all projects in the LRDP are implemented, total UCSF owned and leased space across all UCSF sites would be about 12.14 million gsf by 2035, an increase of about 3.90 million gsf over 2013. Of the 3.90 million gsf, 1.13 million gsf of building space is under construction, therefore growth under the LRDP by 2035 would be 2.76 million gsf. The overall space planned through 2035 exceeds the projected space need because the following assumptions are included in the total space:

- The total owned space includes the Phase 2 Medical Center at Mission Bay, which was addressed in Amendment #3 to the 1996 LRDP. While it is not planned to be built until after 2035, it is included in this EIR for a conservative analysis.

- While UCSF's near-term strategy is to consolidate leases into owned space to improve operational efficiency and to reduce operational costs, for the purposes of the LRDP and the EIR analysis, it is assumed that UCSF's total lease portfolio would remain at about one million gsf over the LRDP planning horizon. This will account for fluctuations that will likely occur depending on a variety of factors, which could include community health care needs, growth and expansion in clinical and research programs and other demands and constraints.

- Maximum development options were studied and developed at the Mission Center and Mount Zion campus sites. It was determined that by maximizing development capacity at these campus sites, a total of 357,300 gsf of new medical office and/or research building(s) could be developed to accommodate future programs that have not yet been identified with needs for geographic proximity to those locations. For purposes of the EIR, these maximum development options will be analyzed at the program-level and are assumed to occur by 2035.

The distribution of total projected space at LRDP buildout is shown in **Figure 5** below. **Figures 6** and **7** compare the existing and future distributions of building space by use category.

Figure 7
Change in UCSF Building Space by Use Category
Existing to LRDP Buildout

The summary of existing and total projected gsf at LRDP buildout by 2035 is shown below in **Table 1**. By 2035, UCSF's total space will be about 12.14 million gsf, an increase of about 47% from existing conditions. The total space across all campus sites would increase by 3.90 million gsf. Of the 3.90 million gsf, 1.13 million gsf is under construction, therefore growth under the LRDP by 2035 would be 2.76 million gsf.

TABLE 1
SUMMARY OF TOTAL UCSF EXISTING, LRDP BUILDOUT 2035 GSF AND NET CHANGE

Type of Space	Existing 2013[1,2] Total gsf	LRDP Buildout 2035 Total gsf	Change in gsf from existing (2013-2035)[3]
Instruction	574,900	645,700	70,800
Research	2,185,400	2,814,400	629,000
Clinical	1,864,600	3,779,300	1,914,700
Support			
Academic Support	415,500	538,700	123,200
Academic/Campus Admin	1,725,800	2,035,500	309,700
Campus Community	391,700	470,600	78,900
Logistics	395,600	546,100	150,500
Support Subtotal	2,928,600	3,590,900	662,300
Housing	657,500	1,268,400	610,900
Vacant/Alteration	38,100	45,900	7,800
Total	**8,249,100**	**12,144,600**	**3,895,500**

1 Existing as of September 2013
2 Excluding 1,584,300 gsf of structured parking (653,700 gsf at Parnassus Heights; 177,400 gsf at Mount Zion; 654,800 gsf at Mission Bay; and 107,400 at Laurel Heights)
3 Zero net change of total leased space assumed from 2013 to 2035

Current and Projected Population

The estimated UCSF population across all sites in 2011-12 and upon full implementation of the LRDP proposals by 2035 are shown below in **Table 2**. The total population across all campus sites would increase by 16,770, of which 14,200 is associated with the 2.76 million gsf growth proposed by the LRDP.

TABLE 2
CURRENT AND PROJECTED UCSF POPULATION

	Current (2011-2012)	Projected Population at LRDP Buildout (2035)
Students[1]	4,450	5,390
Faculty[2]	3,170	4,130
Staff[3]	16,440	26,230
Unpaid Faculty[4]	4,920	5,340
Postdoctoral Scholars[5]	1,550	1,550
Patients[6]	3,010	5,190
Visitors[7]	4,890	7,360
Total	**38,420**	**55,190**

1 Students as of Fall 2011; includes all Residents
2 Does not include volunteer faculty and community health providers
3 Full-time equivalent staff as of Fall 2012
4 Majority of unpaid faculty not physically present on campus daily
5 Includes clinical fellows
6 Average daily inpatient population and outpatient visits to ambulatory care clinics, private practice physicians, dental clinics and other referred visits.
7 Includes visitors to patients, faculty, students and staff; conference center visitors; participants in continuing education and recreation programs; volunteers; children at child care facilities; and vendors.

2.6 Campus-wide Programs

The following campus-wide programs are part of an ongoing planning process conducted by UCSF for the LRDP. Revisions and/or additions to these programs may be made during the LRDP planning process.

Transportation Demand Management Program

To minimize traffic generated by UCSF current and planned facilities, UCSF proposes to implement more robust Transportation Demand Management (TDM) measures. These include enhancing the City CarShare and UCSF's carpool programs, expanding bicycle parking and access to showers and lockers, promoting ridesharing participation, and, with new campus development, enhancing the shuttle system. UCSF would regularly monitor UCSF-generated traffic to ensure that traffic volumes do not increase beyond what is projected in the EIR.

Climate Action Plan and Greenhouse Gas Reduction Strategy

The University of California is committed to responsible stewardship of resources and to demonstrating leadership in sustainable practices. To that end, The Regents have adopted a

detailed policy on Sustainable Practices.[10] As part of implementing the policy, UCSF is required to develop a long-term strategy for voluntarily meeting the State of California's goal for reducing greenhouse gas (GHG) emissions to 1990 levels by 2020, pursuant to the California Global Warming Solutions Act of 2006 (AB32).

As an intermediate target, UCSF also has the goal of reducing GHG emissions to 2000 levels by 2014; and intends to achieve climate neutrality[11] as soon as possible after achieving the 2014 and 2020 reduction targets.[12] UCSF GHG emissions reduction goals pertain to emissions of the six Kyoto greenhouse gasses originating from sources specified in the American College and University Presidents Climate Commitment.[13] The Regents Policy specifies that these goals will be pursued while maintaining the primary research and education mission of the University.

As part of the LRDP, UCSF is updating its portfolio of GHG reduction strategies. These strategies include the following: campus infrastructure improvements, renewable energy facilities construction, renewable energy purchase, equipment retrofits, operational energy efficiencies, and measures that can be applied to individual projects with the goal of incrementally reducing UCSF's overall GHG emissions over the LRDP horizon. UCSF has prepared and previously published comprehensive emissions inventories covering Scope 1 and 2 for the 1990 baseline[14], 2000 interim year, current year (2011) and future projections (2014 and 2020). UCSF reported total emissions of 81,950 metric tons of carbon dioxide equivalents (CO_2e) in 1990; 142,616 metric tons CO_2e in 2000; and 149,215 metric tons CO_2e in 2011. UCSF's emissions make up about 2.8% of the City of San Francisco's estimated total emissions of 5.3 million metric tons of CO_2e/year.

The California Air Resource Board (CARB) has proposed an efficiency threshold of 4.6 metric tons of CO_2e /year per service population (residents plus employees) for the State in order to meet the year 2020 goal of AB 32. UCSF per capita emissions are currently 5.5 metric tons CO_2e/year.

UCSF currently has one facility – the Parnassus Central Utility Plant – that is subject to Cap-and-Trade rules under AB 32. UCSF has pre-purchased Cap-and Trade allowances for this facility for future years. UCSF has also committed to purchasing additional offsets to meet its 2014 interim Sustainable Practices policy goal. Despite the addition of significant space and population over the life of the LRDP, UCSF anticipates meeting its 2020 emissions goals.

10 http://policy.ucop.edu/doc/3100155
11 Climate neutrality is defined as the University having a net zero impact on the Earth's climate, and will be achieved by minimizing GHG emissions as much as possible and using carbon offsets or other measures to mitigate the remaining GHG emissions (UCSF Climate Action Plan, December 2009).
12 CA Executive Order S-3-05 calls for reducing GHG emissions to 80% below 1990 levels by 2050.
13 The six greenhouse gases identified in the Kyoto Protocol/ACUPCC are carbon dioxide, methane, nitrous oxide, sulfur hexafluoride, hydrofluorocarbons and perfluorocarbons.
14 Scope 1 (Direct Emissions), includes stationary combustion such as boilers, hydrofluorocarbon (HFC) refrigerant use, or combustion of fuels in UCSF-owned vehicles; Scope 2 (Indirect Emissions) includes purchased electricity for leased facilities (UCSF Climate Action Plan, December 2009).

2.7 Campus Site Locations and Proposed Physical Development Plans

The following development plans are part of an ongoing planning process conducted by UCSF for the LRDP. Revisions and/or additions to these programs may be made during the LRDP planning process.

Parnassus Heights

The Parnassus Heights campus site is the oldest and largest of the UCSF campus sites, occupying about 107 acres of land at the base of Mount Sutro in the Inner Sunset mixed-use neighborhood. The campus site is bounded by Carl and Irving Streets to the north, Fifth Avenue to the west and Clarendon Avenue, Christopher Drive and Crestmont Drive to the south. The eastern boundary is bordered by the Cole Valley neighborhood and the City's Interior Greenbelt Natural Area. UCSF's facilities are concentrated at the north end of the campus site where Moffitt Long Hospital, the four professional schools, clinics, research, auxiliary services, housing, parking and other support uses are located. The 61-acre Mount Sutro Open Space Reserve (Reserve) occupies the central and southern portion of the campus site, up to 400 feet in elevation above Parnassus Avenue. The Reserve is designated by The Regents as permanent open space and is available for public use. Adjacent to the Reserve are three small office buildings, the Environmental Health and Safety incinerator building, the Aldea San Miguel (Aldea) apartment complex and a community center.

Parnassus Heights is the primary UCSF campus site for providing didactic education, a role that is expected to continue through the 20+ year planning horizon of the LRDP. The population of the campus site consists of students, faculty and staff, patients, visitors and residents of UCSF housing. The total population of Parnassus Heights is not expected to grow substantially over the life of the LRDP. Changes in population, however, will reflect changes in the types and uses of space at the site. Approximately 80% of UCSF's 4,450 total students are educated at Parnassus Heights and the majority of the future projected growth in UCSF enrollment is projected to occur here. An additional 600+ students per year could be educated at Parnassus Heights. There are currently over 8,300 UCSF faculty and staff employed at the Parnassus Heights campus site, which is not expected to increase under the LRDP. UCSF housing at Parnassus Heights is currently home to over 560 residents. This number could grow to 750 residents with the future conversion of buildings at Parnassus Heights into housing. Over 256,000 outpatient visits per year are currently seen at clinics at Parnassus Heights. Depending on the future mix of services, this number could grow to 340,000 outpatient visits per year during the life of the LRDP.

As discussed previously, in the 1976 Regents' Resolution, The Regents designated Mount Sutro as a permanent open space reserve; defined campus boundaries to prohibit further property acquisition (by purchase, condemnation or gift) and leasing of private residential properties outside this area by UCSF; directed that the houses acquired and occupied by UCSF on Third Avenue, Fifth Avenue Parnassus Avenue, Irving Street and Kirkham Street be returned to residential use, and that some be sold; and adopted the "space ceiling" within the newly designated campus site boundaries.

The space ceiling limit of 3.55 million gsf of building space (excluding residential uses in UCSF-owned "Avenue Houses" on Third, Fourth, Fifth and Parnassus Avenues and Kirkham and Irving Streets) was adopted for UCSF development at the Parnassus Heights campus site. Currently, space applicable to the space ceiling at the Parnassus Heights campus site is approximately 8.2% above the space ceiling limit. The LRDP identifies strategies to reduce the space ceiling overage over the life of the LRDP.

With the goal of reducing the space ceiling overage, the strategy proposed by the LRDP involves: 1) converting some existing office space (UC Hall and Millberry Union towers) to residential use, which with the exception of housing at the Aldea housing complex, is excluded from the space ceiling; and 2) demolishing a number of buildings and either moving occupants and programs to other campus sites or absorbing them into other buildings at Parnassus Heights.

UCSF will also implement additional Transportation Demand Management measures beyond those that have already been implemented to further help reduce traffic impacts on neighbors. In addition, high-volume clinics may be relocated to other campus sites. Many of these actions are proposed for implementation before the new hospital addition would be built by 2030. The proposed hospital addition is the only new building proposed at the Parnassus Heights campus site during the LRDP planning period, as it is driven by a State mandate to address seismically vulnerable buildings in compliance with SB 1953 by 2030. UCSF currently plans to comply with this legislation by decommissioning Moffitt Hospital for acute care use and constructing a new addition physically connected to Long Hospital (which does comply with SB 1953) after demolishing the Langley Porter Psychiatric Institute building.

Because UCSF proposes to backfill Moffitt Hospital with outpatient facilities, hospital support and other campus uses after the new hospital addition is constructed, it would increase space at the Parnassus Heights campus site and other actions would be considered to offset the net new space both before and after the hospital addition is built.

In accordance with the 1976 Regents' Resolution, which was intended to limit environmental impacts such as traffic and parking impacts on the neighborhoods surrounding the Parnassus Heights campus, UCSF has no plans to acquire or lease additional residential property within the area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton Street and Clarendon Avenue.

The following LRDP proposals at the Parnassus Heights campus site would be evaluated in this EIR at the project level (as illustrated in **Figure 8**):

> **Renovate and reuse of UC Hall.** Built in 1917, UC Hall is the oldest building on the Parnassus Heights campus site. It has been determined to be potentially eligible for the California Register of Historical Resources (CRHR) and the National Register of Historic Places (NRHP). This seven-story building is located on the west end of the campus site on Parnassus Avenue. It contains approximately 147,000 gsf. UC Hall was slated for demolition in the 1996 LRDP. However, UCSF now proposes to retain, seismically retrofit, renovate and reuse UC Hall by 2019. The top three floors would be used as housing, with

SOURCE: UCSF

UCSF Long Range Development Plan Initial Study

Figure 8
Parnassus Heights

up to 136 beds in 73 units. Initially, the three full floors below the housing would be used as faculty offices; these floors would be converted to housing (up to 75 beds in 69 units) after Moffitt Hospital is decommissioned and renovated and is available for other uses including the offices displaced from these three floors of UC Hall. UCSF retained the firm of Page & Turnbull, an architectural firm specializing in historic preservation, to make preliminary recommendations regarding alterations to the exterior of UC Hall that would be consistent with the Secretary of the Interior's Standards for Rehabilitation. UCSF would follow those recommendations to ensure that, in carrying out the renovation project, the Secretary of the Interior's Standards for Rehabilitation are met.

Implement cushioning actions. As part of the planning effort for renovating and reusing UC Hall, UCSF worked with the community to arrive at a number of actions to help cushion UCSF's impacts on neighbors and to respond to some of their requests. These actions include 1) building a new trail from Koret Way to Medical Center Way that would connect with a new trail that is proposed into the Mount Sutro Reserve (and discussed below), 2) enhancing connectivity to the Reserve's trail system from neighborhoods to the west and north of the campus site, 3) improving the Fifth and Kirkham intersection for traffic calming and pedestrian safety, 4) developing more off-street loading and parking to reduce congestion on Parnassus Avenue and 5) providing more all-day parking behind buildings on the west end of campus in lieu of short-term parking that generates traffic throughout the day.

Demolish five small buildings. In order to reduce the space ceiling overage, the 1996 LRDP proposed to demolish seven small buildings, five of which have not yet been scheduled for demolition: Surge, Woods, Medical Research 4, Laboratory of Radiobiology and the Proctor Foundation building (735 Parnassus Avenue has been demolished; 374 Parnassus will soon be demolished). Together, these five buildings contain about 55,600 gsf. The Medical Research 4 and the Laboratory of Radiobiology buildings would be demolished by 2016; the demolition of the Surge and Woods buildings would follow within the next several years. Because the Proctor Foundation building was constructed with funds donated by the Proctor family for use by the foundation for its clinical, research and teaching functions, UCSF is obligated to provide the Proctor Foundation with comparable replacement space or funds to construct equivalent new space. Such obligations must be met before the building is vacated and demolished; therefore, demolition of the Proctor Foundation building is likely to occur toward the end of the LRDP horizon. None of the small buildings is potentially eligible for the CRHR or the NRHP, with the exception of the Surge building, which was constructed in 1966 and would likely be eligible for the CRHR and NRHP when it reaches 50 years of age in 2016.[15] The Surge and Woods building sites would be restored to open space and incorporated into the Reserve, though their existing parking areas would remain. The Laboratory of Radiobiology and Medical Research 4 sites would be developed to provide additional surface parking and possibly new loading dock space for delivery vehicles. The Medical Research 4 site may also be developed with expanded outdoor play yard space for the nearby Kirkham Child Care Center. The Proctor Foundation site and 735 Parnassus Avenue site, where a small building was recently removed, may be developed with housing if they are not developed as open space.

15 Carey & Company, Inc., *UCSF Historic Resources Survey*, February 8, 2011, p. 49.

Construct retaining wall. Landslides have occurred along the northern slope of the Reserve just south of the Regeneration Medicine Building. UCSF proposes to construct a retaining wall to shore up the hillside to prevent future landslides.

Demolish three older Aldea buildings. The Aldea student housing complex is located in the southern portion of the Parnassus Heights campus site adjacent to the Reserve. Single students and student families live in nine buildings that were rebuilt in 1998 and three original buildings that were renovated in 2009 for interim occupancy. Based on an agreement between UCSF and the UCSF Community Advisory Group (CAG), the three older buildings (165 Johnstone, 175 Johnstone and 105 Behr) are planned for demolition by 2024, which would result in the demolition of 42 units totaling 27, 700 gsf. The sites would be restored to open space; 0.5 acres of that space would be added to the Reserve per prior agreements. While the space ceiling excludes campus housing on Third, Fourth, Fifth and Parnassus Avenues and on Kirkham and Irving Streets, the Aldea housing complex is counted toward the space ceiling. Under this LRDP, this agreement would be implemented to help reduce the space ceiling overage. In 2010, these three structures were determined to be potentially eligible for the CRHR and the NRHP.

Demolish the Environmental Health & Safety building. This two-story 6,200 gsf building is located south and uphill of the Ray and Dagmar Dolby Regeneration Medicine Building across Medical Center Way on the northern edge of the Reserve. The occupants would be moved into other buildings on the campus site and the building demolished before the construction of the hospital addition. The site would be restored as open space and added to the Reserve, though the existing parking area would remain. The building was constructed in 1971. It was determined to be ineligible for inclusion in the CRHR or the NRHP and is not listed on a local register. Hence, it is not considered to be a historic resource. The adjacent Annex building would remain.

Demolish the Koret Vision Research building. Located behind the Dental Clinics building and UC Hall on Koret Way, this four-story building contains approximately 40,000 gsf. The Koret Vision Research building would be demolished toward the end of the LRDP horizon, after the hospital addition is built and Moffitt Hospital is renovated and can accommodate Koret Vision Research occupants and programs. The demolition would help UCSF reduce the space ceiling overage. The site may be developed with parking or open space. Constructed in 1986, this building will be 49 years old by 2035. It has not yet been evaluated for its historic significance.

Demolish the Langley Porter Psychiatric Institute (LPPI) building and two small support buildings. LPPI is located on the east side of the campus site on Parnassus Avenue and Medical Center Way. The seven-story 107,000 gsf LPPI building houses psychiatric inpatient and outpatient uses, as well as instruction, research and administrative space. LPPI and the two small buildings (containing an additional 4,600 gsf) are planned to be demolished in year 2025 to allow for construction of the new hospital addition. The LPPI building, constructed in 1941, and the two small support buildings have been determined to be ineligible for inclusion in the CRHR and the NRHP. They are not identified on any local registers or surveys and are not considered historic resources.

Convert Millberry Union towers from office to residential use. The Millberry Union towers are currently used as office space. UCSF would convert the upper levels to student housing (the original use of the towers) to help reduce the space ceiling overage.

Preliminary studies indicate that up to 83 studio and one-bedroom units could be provided. This conversion would occur toward the end of the LRDP horizon after Moffitt Hospital is decommissioned and renovated, so that current occupants of the Millberry Union towers could be relocated into the vacated Moffitt building. The ground floor uses of Millberry Union and the levels below, which are mostly retail with a small amount of office and outpatient space, would not change.

Implement Parnassus Avenue Streetscape Plan. With the renovation of the Clinical Sciences and UC Hall buildings, and possibly new faculty housing near the Fifth and Parnassus Avenue intersection, there would be opportunities to begin implementing the proposed Parnassus Avenue Streetscape Plan. This plan calls for improvements that: make crossing the street safer and more convenient for pedestrians; reorganize and improve transit and UCSF shuttle operations; create more usable outdoor space; strengthen UCSF's identity; and enhance the public realm. Improvements would include new paving, street furniture, lighting and street trees, as well as sidewalk and crosswalk widening and more defined campus gateways at either end of the street as it passes through the campus site, incorporating the new entrance way to align with the future hospital addition. The improvements would occur in phases starting on the south side of Parnassus Avenue at the west end at Fifth Avenue, through the campus core and along the front of the hospital addition to Medical Center Way.

Renovate Saunders Court. As part of the seismic renovation of Clinical Sciences, Saunders Court would undergo changes to improve its functionality for general use and special events, as well as to make it more attractive and interesting. Improvements would include an expansion of the pavement, seating and tables at the north end to accommodate more people without compromising pedestrian movement between Medical Sciences and School of Nursing buildings, a new diagonal walkway with historic information about UCSF that would cut through the center of the courtyard, conversion of part of the lawn to a different surface material, new plants and features that mitigate windy conditions and provide access for the disabled and for fire trucks. The project would also improve connectivity between Parnassus Avenue and Saunders Court through Clinical Sciences.

Create New Trails in the Mount Sutro Reserve. To enhance and improve access throughout the Reserve for the enjoyment of visitors three new trails are proposed in the Mount Sutro Reserve: 1) a trail on the north side of the Reserve connecting the Historic Trail to the campus, allowing for ease of access to/from the campus; 2) a trail connecting the South Ridge and Quarry Road Trails to Christopher Drive, allowing for easier public access from the south side of the Reserve; and 3) an extension of this new trail to Clarendon Avenue and to trails to the Interior Greenbelt (on City-owned land) and southeast of the Reserve. The proposed trail alignments are approximate and have not yet been designed. Creating these new trails will require minimal vegetation removal, minor amounts of grading and new trail markers.

Relocate and expand utility lines and replacement of gas and fuel storage tanks. UCSF is planning to relocate and expand medical gas storage tanks in the vicinity of Medical Center Way near the hospital. In addition, existing underground diesel fuel storage tanks in Medical Center Way and underground lines connecting the tanks to Long Hospital must be replaced to meet State and local codes. Current plans anticipate replacement of these tanks underground.

For program level components, UCSF would determine the appropriate level of environmental review when more detailed plans become available. The following LRDP proposals at the Parnassus Heights campus site would be evaluated in this EIR at the program level:

Renovate and reuse of Moffitt Hospital with non-acute care uses. The decommissioned Moffitt Hospital would be renovated and reused for outpatient, hospital support and office uses. The existing circular driveway along Parnassus Avenue, which would no longer be needed for patient drop-off and pick-up, would be reused for other purposes such as commercial loading, shuttle loading or open space.

Construct a new hospital addition building on the LPPI site. To comply with the requirements of Senate Bill 1953, an addition to Long Hospital would be constructed on the LPPI site. Construction would take about four years, ending by 2030. The addition would contain up to 140 beds in approximately 308,000 gsf. The hospital addition would be seven stories or about 110 feet in height, excluding rooftop mechanical equipment which could add up to an additional 17 feet. The building has not yet been designed, but it would be set back from Parnassus Avenue with a landscaped strip to provide a passenger drop-off/pick-up, parking and loading loop that would exit directly across from Hillway Avenue. The upper portion of the building would step back from the lower portion to minimize shading on Parnassus Avenue and to create a more attractive appearance and better human scale when viewed from the public street. Additional loading space may be created at the back of the building. The corner of the building would be designed to be architecturally prominent as the eastern gateway to the campus site.

Mission Bay

The 56.4 acre UCSF Mission Bay campus site is generally bounded by Mission Bay Boulevard South to the north, Owens Street to the west, Mariposa Street to the south and Third Street to the east. The campus site is in the Mission Bay neighborhood north of the Potrero Hill and Dogpatch neighborhoods. It is approximately 3.8 miles east of the Parnassus Height campus site and 3.6 miles southeast of the Mount Zion campus site.

The population of the Mission Bay campus site consists of students, faculty and staff, patients, visitors and residents of UCSF housing. Reflecting the growth in space, the total population of Mission Bay is expected to grow substantially over the life of the LRDP. There are currently over 3,500 UCSF faculty and staff employed at the Mission Bay campus site. With the construction of the LRDP proposals, this number could grow to 12,500 in the future. UCSF housing at Mission Bay is currently home to over 900 residents. This number could grow to 1,800 residents in the future through the construction of additional campus housing. A total of 70,000 outpatient visits per year are currently seen at clinics at Mission Bay. This number is projected to grow to 450,000 outpatient visits per year during the life of the LRDP, primarily due to the Medical Center at Mission Bay.

As described below, new construction totaling approximately 1.13 million gsf is underway at the Mission Bay campus site and is scheduled for completion in 2015. Approximately 1.45 million gsf of new space is proposed under the LRDP, all of which would be located north of 16th Street. In addition, the Phase 2 Medical Center and cancer outpatient building are assumed to be constructed prior to 2035. These two projects combined are approximately 918,000 gsf.

Under the 1996 LRDP, the 42.3-acre portion of the campus north of Sixteenth Street was entitled for 2.65 million gsf for instruction, research and support uses. As UCSF's primary location for basic science research, it is home to programs in biological sciences, biochemistry and biophysics, cellular and molecular pharmacology, the Center for Brain Development, the Cardiovascular Research Institute, and the Neurosciences Center, among others. Of the 2.65 million gsf entitlement, 1.93 million gsf has been fully built in six research buildings, a campus community center, and 430 units of housing in four separate buildings, representing 73% of the 1996 LRDP approved entitlement.

Mission Hall, a faculty office building of 264,800 gsf, is currently under construction at the northeast corner of Fourth and 16th Streets. Upon its completion in 2015, the total development on the portion of the campus site north of 16th Street will be 2.20 million gsf, or about 82% of the 1996 LRDP development entitlement. Approximately 463,700 gsf of the existing entitlement remains available for future development. Existing built space at this campus site has been developed at a higher density than originally anticipated so the remaining undeveloped land north of 16th Street has additional development capacity.

Future development at the Mission Bay campus site north of 16th Street would be driven by increasing demand for program space, as well as by the need to provide housing for more of the campus population and to decant space for those who currently work in leased space or space that is otherwise vacated. As the population of the campus grows over time, a third parking structure and campus life improvements would also be necessary, such as a permanent facility for child care, additional retail and outdoor recreation and fitness facilities and other open space.

The *2011 Mission Bay Phase 2 Study* evaluated options for developing the remainder of the campus site north of 16th Street. These options reflected various building capacities and heights, and the amount of parking that each would require. One option illustrated how the site would be developed under the existing amount of entitlement; the other options showed potential development scenarios in excess of the current entitlement limit. These options served as the basis from which the preferred plan emerged in considering the projected need for space at this campus site. It was determined that an additional 752,000 gsf was needed at Mission Bay for instruction and research, plus a small amount for child care, recreation and fitness and police services uses, and that the maximum capacity for housing on Block 15 was another 398,700 gsf. The combination of the remaining amount of existing entitlement of 463,700 gsf under the current LRDP with a proposed increase of 991,800 gsf under the new LRDP, for a total of 1.45 million gsf, would provide more than enough space to meet all of this projected need through 2035.

Under the proposed LRDP, the development entitlement for Mission Bay north of 16th Street would increase from 2.65 million gsf to 3.64 million gsf. Although housing was not included in the original campus master plan or entitlement for the Mission Bay campus site, 808,800 gsf of the total entitlement would be devoted to housing (410,100 gsf of existing housing on Block 20 and 398,700 gsf of proposed new housing on Block 15).

In 2007, UCSF acquired additional land south of 16th Street for a new Medical Center with a maximum capacity of 1.79 million gsf on 14 acres. Phase 1 of the Medical Center at Mission Bay

is currently under construction and will open in 2015 on the east side of the site. Phase 1 includes a 289-bed women's, children and cancer hospital of 625,600 gsf, a 207,400 gsf medical building and a 36,000 gsf energy center, for a total of 869,000 gsf. Over 1,000 parking spaces will be provided in a surface lot and existing garage.

Phase 2 of the Medical Center at Mission Bay is planned as a 261-bed hospital with additional outpatient space, totaling 793,500 gsf. Phase 2 is planned to be built at some point after 2035 on the west side of the site, but it is assumed to be completed by 2035 for a conservative analysis of potential impacts in the EIR. A 124,500 gsf cancer outpatient building is also anticipated to be constructed prior to 2035 as part of the Phase 1 entitlement, which would bring the total for Phase 1 to 993,500 gsf.

The preferred development on each block at Mission Bay campus site is summarized below and shown on **Figure 9**. The following LRDP proposals at the Mission Bay campus site would be evaluated in this EIR at the project level:

> **Block 15.** A housing complex consisting of up to 668 beds in 523 units and totaling 398,700 gsf is proposed to be built on Block 15. The complex would be comprised of four or fewer buildings with an internal courtyard. The buildings would range from 55 feet in height along Mission Bay Boulevard South, 85 feet along Sixth Street and Nelson Rising Lane and up to 120 feet along Fifth Street. The complex could include an 18,000 gsf child care center. If child care is located off-site, approximately 12 additional units could be added to the housing program on Block 15. In addition, approximately 1,500 assignable square feet could be considered on this block (or Block 23) for UCSF police services.

For program level components, UCSF would determine the appropriate level of environmental review when more detailed plans become available. The following LRDP proposals at the Mission Bay campus site would be evaluated in this EIR at the program level:

> **Development of remaining entitlement.** Under the existing entitlement for the Mission Bay campus site north of 16th Street, 463,700 gsf of remaining entitlement may be developed by 2035 for additional instruction, clinical, research, support and residential space. Blocks that may be developed or further developed include 15, 16, 18, 23 and 25. On the campus south of 16th Street, Phase 2 of the Medical Center at Mission Bay, comprised of 793,500 gsf, is planned. As discussed above, Phase 2 is not likely to be completed by 2035, but is assumed to be completed by 2035 for purposes of the EIR analysis. While remaining entitlement north and south of 16th Street has been analyzed previously at a programmatic level and is part of the 1996 LRDP as amended, the remaining entitlement is being carried forward into the 2014 LRDP.
>
> **Development with an increase in entitlement north of 16th Street.** An additional 991,800 gsf may be developed by 2035. Buildings may be developed for additional instruction, clinical, research, support and residential space. Blocks that may be developed or further developed include 15, 16, 18, 23 and 25.

SOURCE: UCSF

UCSF Long Range Development Plan Initial Study

Figure 9
Mission Bay

Block 16. One research and/or office building and a central utility plant totaling approximately 289,000 gsf, or alternatively two research buildings totaling up to 377,400 gsf may be built on Block 16. The current plan is to build a 53,000 gsf central utility plant, but the funding for this facility may not be realized, or may not be available soon enough to be cost effective if too many buildings that it would have served are already built, each with their own utility systems, by the time funding for the central plant becomes available. The height of the buildings would be similar in height to other research buildings on the campus site, but would have a setback of 30 feet at the 55-foot height along Mission Bay Boulevard South in accordance with the Mission Bay Campus Master Plan and Design Guidelines. Building footprint configurations would be flexible, but the building on the east side of the block must preserve and respond to the north gateway area. If the central utility plant is constructed, a centralized Environmental Health & Safety facility could be located within the building, along with a Facilities Management landscape yard between the two buildings. Trucks would enter from Nelson Rising Lane and exit onto Mission Bay Boulevard South if the City agrees to this proposal.

Block 18. An office and/or research building (possibly with clinics) with up to 193,000 gsf in a building up to 160 feet in height could be built on this block. To the east of it, a separate or attached eleven-story (110 feet in height) parking garage with approximately 1,540 spaces could be built. The ground floor of the garage would be sized to accommodate about 60 UCSF shuttles. Garage entrances/exits would be on Nelson Rising Lane and mid-block on Owens Street to avoid conflicts with Gene Friend Way, which is a pedestrian corridor. A full-size, multi-purpose sports field would be developed on the eastern portion of the block, providing outdoor recreation and fitness space between the existing community center and future housing. Pedestrian connectivity through the block and to and from the garage would be facilitated in the layout of the facilities and landscape yard, if feasible.

Block 23. An 85-foot tall 232,200 gsf research building would be constructed on the western side of the block in an "L" shape configuration along Fourth Street and the plaza, across from Koret Quad. This building may also contain clinics, offices and retail uses, as well as police space not provided on the Block 15 site with the housing project. A south-oriented courtyard would also be developed on the block between the existing Third Street Garage and the new building. This building would relate to the public street, plaza and Koret Quad at the ground level with transparent facades, active uses and accessibility features.

Block 25. A research/office building, possibly with clinics and retail uses, would be developed on the eastern side of the block. All or a portion of the building may be constructed up to 160 feet in height and may contain up to 323,300 gsf. With its visually prominent location at the southeast corner of the research campus along Third and 16th Streets, it would be an architecturally important building that would be designed with sensitivity to the public realm.

Mount Zion

The UCSF Mount Zion campus site is approximately 7.6 acres on six contiguous city blocks in the Western Addition neighborhood of San Francisco. The campus site is generally bounded by Pine Street to the north, Scott Street to the east, Post Street to the south and Broderick to the west. It is located approximately 1.5 miles northeast of the Parnassus Heights campus site and one mile east of the Laurel Heights campus site.

The Mount Zion campus site is located in a mixed-use neighborhood commercial district. Most buildings along Divisadero Street consist of residential and office uses above ground floor retail. In the vicinity of the campus site there are several private medical office buildings that are not affiliated with UCSF. Kaiser Medical Center is located on Geary Boulevard, one block to the southwest. Residential uses predominate to the north and west, and directly across Scott Street to the east of the main block containing the hospital.

The Mount Zion campus site has 776,300 gsf of owned space and 45,300 gsf of leased space within ¼ mile, for a total of 821,600 gsf. The hospital is located on the main block, with the entrance on Divisadero Street between Post and Sutter Streets. It provides 90 licensed inpatient beds, of which 50 currently are in use. Mount Zion is also the home of the Helen Diller Comprehensive Cancer Center, Women's Health Center, Center of Excellence in Women's Health in Northern California, the Osher Center for Integrative Medicine, Pain Management Center, Sleep Disorders Center, Dialysis Center and other outpatient programs. 1,800 UCSF faculty and staff are located at the Mount Zion campus site.

To support these programs, UCSF owns and operates three parking garages and one parking lot with a total of 454 parking spaces. Other garages, lots and street parking are available nearby. Because parking in the vicinity is in high demand, patients and essential healthcare providers are given priority access to parking under UCSF's control.

The Mount Zion campus site was identified as an outpatient hub in the *2005 LRDP Amendment #2* (approved by The Regents on March 17, 2005), which discussed a plan for replacing UCSF's inpatient facilities at this site and reconfiguring clinical space among campus sites. Accordingly, development at the Mount Zion campus site would be driven by the demand for outpatient space, in addition to addressing seismically compromised buildings. Inpatient functions at the Mount Zion campus site will move to Mission Bay with the opening of the Medical Center at Mission Bay in 2015. The hospital at the Mount Zion campus site will be repurposed as an ambulatory care center with ambulatory surgery. Vacated space will be backfilled with growth of the cancer program, expansion of outpatient treatments, new clinics and support spaces.

Approximately 75,500 gsf of additional outpatient space would be needed at the Mount Zion campus site through 2035. In addition, it is anticipated that some clinical programs at the Parnassus Heights campus site would eventually be relocated to the Mount Zion campus site and nearby leased space would be consolidated into owned space in one or more new buildings on the main block. If UCSF were to dispose of the Laurel Heights facility, the relocation of the child care center at Laurel Heights would require further study, but could be moved to the Mount Zion campus site or elsewhere. In total, approximately 257,300 gsf of new program space would be required at the Mount Zion campus site through 2035. This space would be developed on the main block as there are no plans to acquire additional property in the vicinity or expand the campus boundary. The LRDP proposes to demolish three buildings totaling approximately 85,000 gsf. The new office/research building would be approximately 257,300 gsf, resulting in a net increase at the Mount Zion campus site of about 172,300 gsf.

Specific LRDP proposals at the Mount Zion campus site that would be evaluated at the project level include (shown on **Figure 10**):

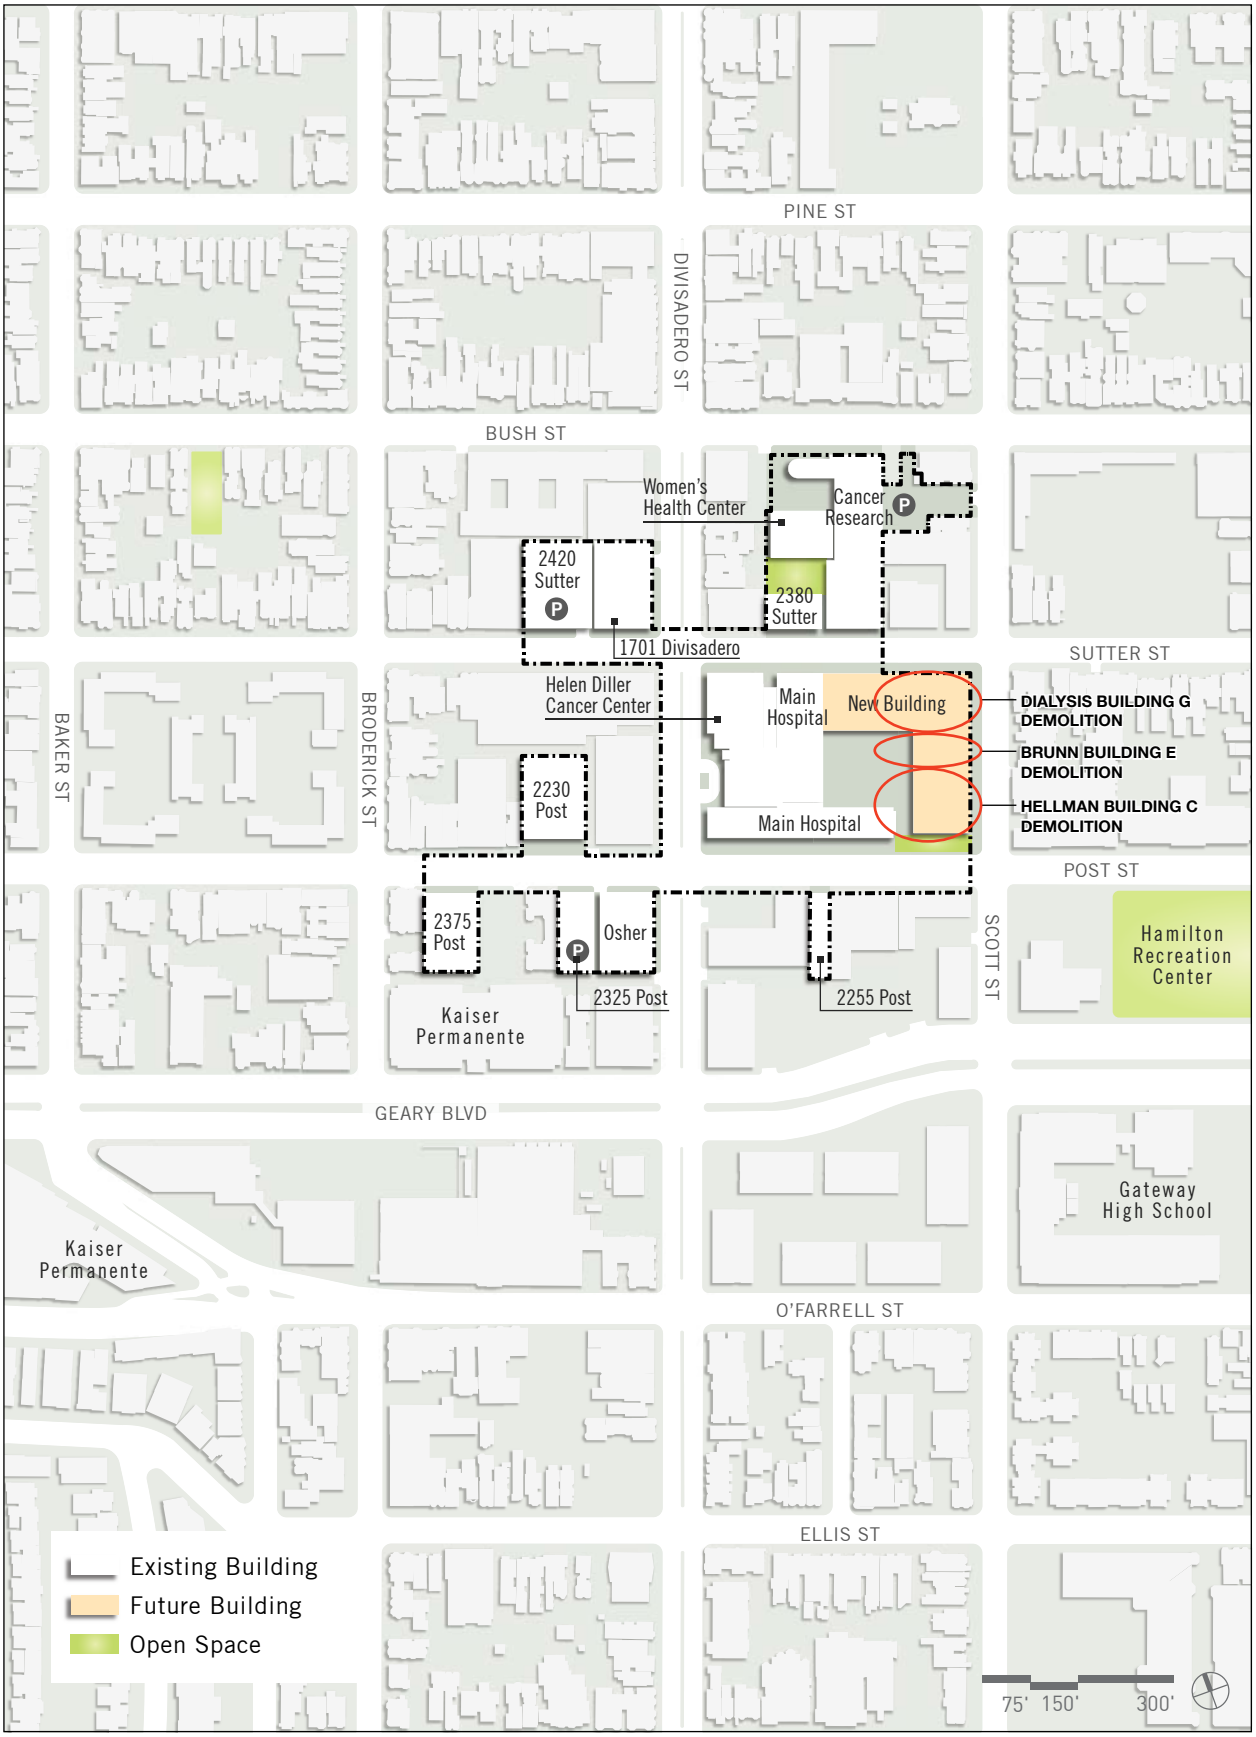
Renovate and reuse the existing hospital. The inpatient facilities at the Mount Zion campus site are provided in two interconnected buildings. Neither building will meet SB 1953 requirements through 2030, so both will require decommissioning as inpatient facilities by this date. With the opening of the Medical Center at Mission Bay in 2015, the inpatient uses at the Mount Zion campus site will be relocated to the Mission Bay campus site and the inpatient buildings will subsequently be repurposed for outpatient use.

Demolish the Hellman, Harold Brunn Institute and the Dialysis Center buildings. These three buildings are located on the east side of the main block along Scott Street between Sutter and Post Streets. The Hellman building is seismically compromised. UCSF would demolish all three buildings, but not necessarily at the same time, and the occupants and programs would be relocated into the repurposed hospital buildings or located elsewhere. Demolition of the Hellman building would likely occur in 2016-2017. In 2003, the Hellman building was determined to be potentially eligible for the CRHR. The Harold Brunn Institute and Dialysis Center buildings are not eligible for the NRHP or CRHR.

The following LRDP proposals at the Mount Zion campus site would be evaluated in this EIR at the program level. For program level components, UCSF would determine the appropriate level of environmental review when more detailed plans become available.

Construct a new medical office and/or research building(s) and additional parking. One or more buildings (or a phased building) would be built on the east side of the main block where the Hellman, Harold Brunn Institute and Dialysis Center buildings are currently located. UCSF conducted a capacity study to evaluate options and to determine how much space could be developed on this portion of the block, given the program target of an additional 257,300 gsf, the need for a central open space area, parking and loading requirements and the City's height and bulk limits that UCSF strives to meet. The study determined that the full program could be met, but only if the City's bulk limits were exceeded and parking was located underground or off the block. A new building along Scott Street could be built up to 65 feet with a 20-foot step back at 40 feet in height to lower the building scale at the street level. It could be set back from Post Street to align with the existing hospital building for a grander landscaped entrance. Building space on Sutter Street could be up to 105 feet in height with a 20-foot setback along Sutter and Scott Streets. This building would comply with the City's height limit, but not the bulk limit. Up to 185 parking spaces could be constructed in two levels underground, if not developed off-site. Streetscape improvements would be made along the affected street frontages.

While it is uncertain when the new building would be developed during the LRDP horizon, if all 257,300 gsf were to be built, it would represent a 21% increase over the total existing UCSF owned and leased buildings at the Mount Zion campus site.



SOURCE: UCSF

UCSF Long Range Development Plan Initial Study

Figure 10
Mount Zion

Mission Center

The three-acre Mission Center campus site is in the northeast portion of San Francisco's mixed use Mission District, located on the southern half of the block bounded by 14th, Harrison, 15th and Folsom Streets. It has only one building that is six stories tall and contains 291,000 gsf. The building fronts on Folsom Street, but the main entrance is adjacent to the 207-space parking lot, which can be accessed from Harrison and 15th Streets. Mission Center is approximately three miles east of the Parnassus Heights campus site, 1.25 miles west of the Mission Bay campus site and one mile northeast of San Francisco General Hospital.

Approximately 800 employees work in the building in various departments including campus police, documents, media and mail, information technology services, the finance services center and the controller's office. The building contains a small amount of research and other administrative functions.

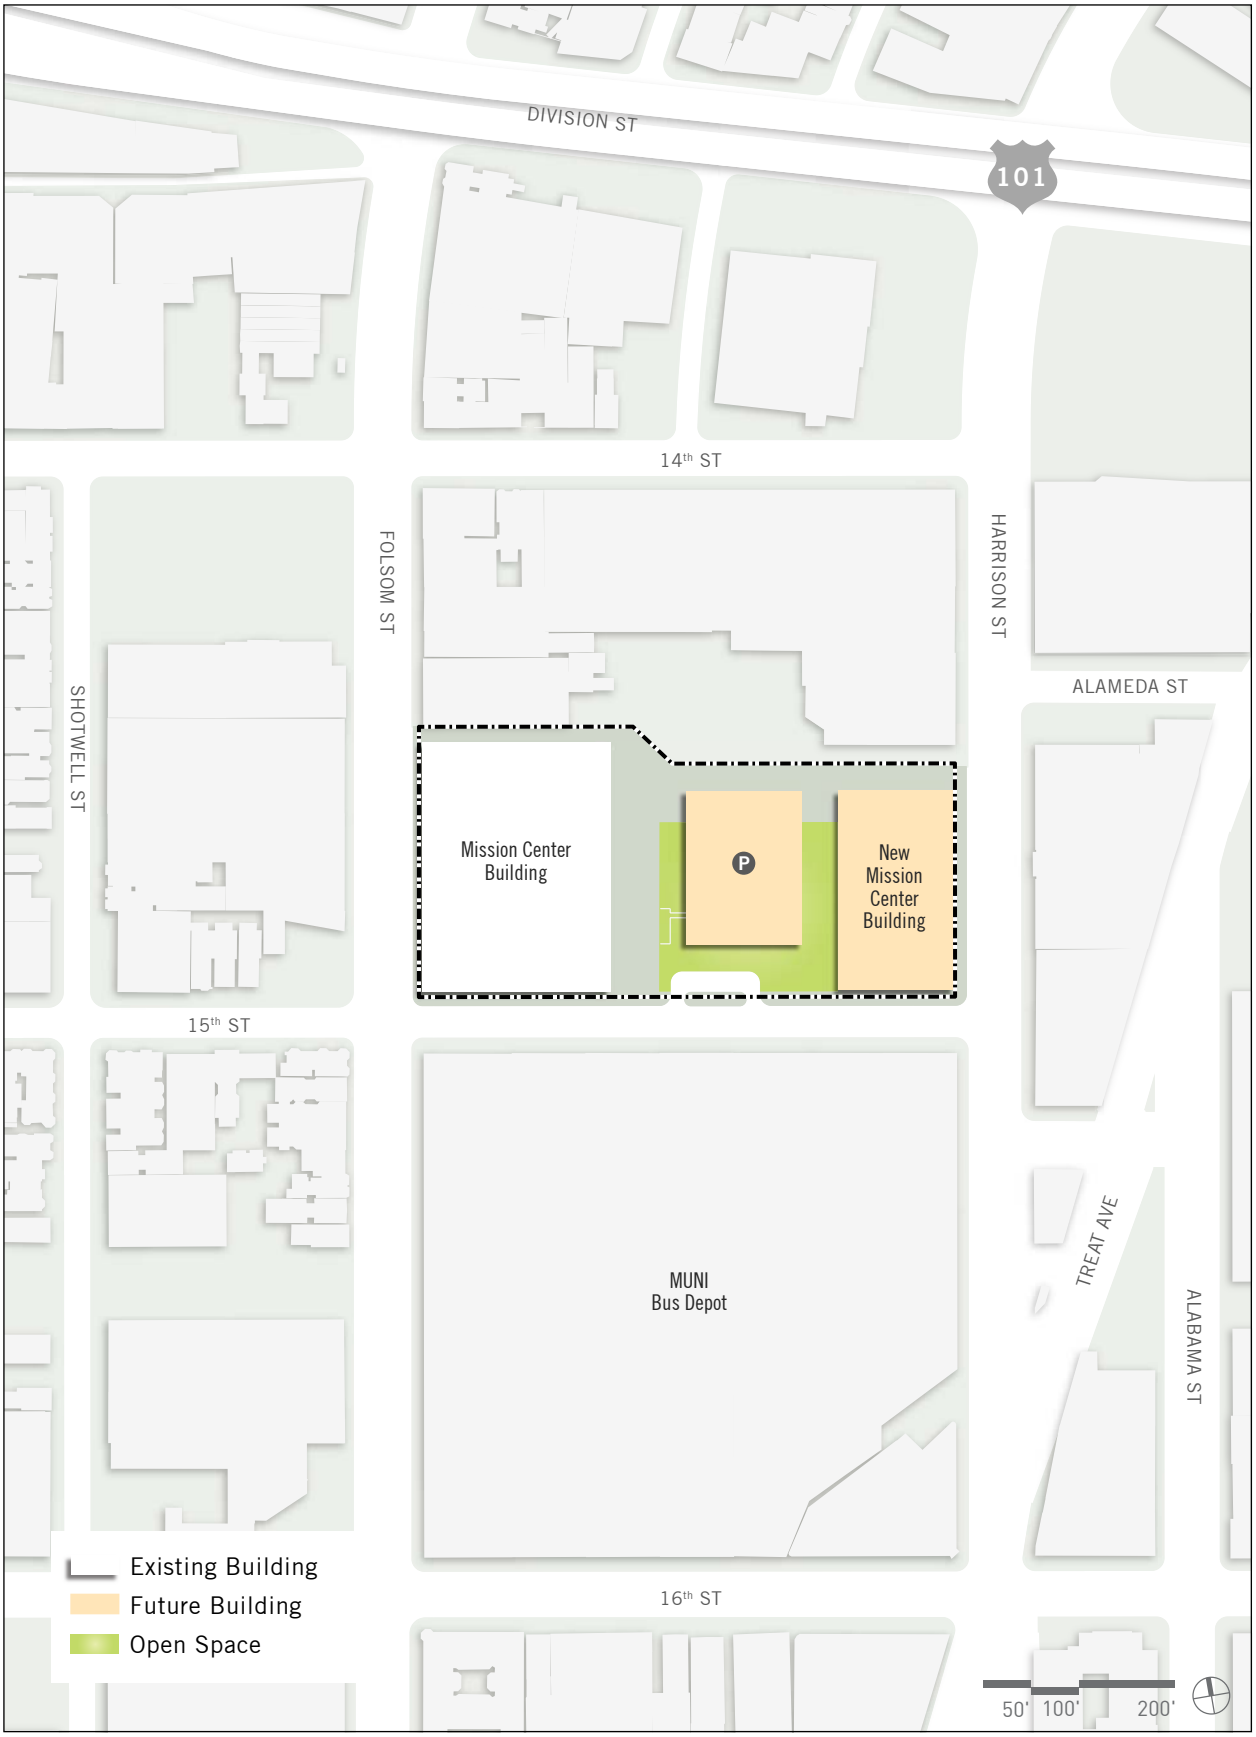
The existing building will remain, and no changes in use are planned. UCSF performed a study to evaluate options for further developing the site should UCSF determine that more program space is needed at this campus site, although no such need is currently anticipated. The capacity study analyzed the potential size and location of a new building and parking structure, and took into consideration urban design elements that would preserve the existing outdoor plaza, create additional open space, enhance the public realm and improve shuttle circulation, while also respecting the City's height and bulk limits.

The study determined that it would be preferable to build a parking structure first, followed by a building with program space, rather than an integrated structure so that some parking on the site would always be available. Because UCSF has no current need for additional space at this campus site, for planning purposes a new building would be no greater than the City's height limit of 55 feet, which would allow for a four-story building up to 100,000 gsf. To support this space, a five-story, 95,600 gsf garage with up to 294 parking spaces would be built between the existing and new buildings. Additional open space with a southern exposure would be developed between the buildings. The shuttle stop would be relocated next to this open space, just off 15th Street where up to two street parking spaces would be removed. Vehicular access into the garage would be limited to Harrison Street. Development of this new building would occur only if needed in the future when funding becomes available. This LRDP proposal will be evaluated in the EIR at a program level. **Figure 11** shows the proposed development at Mission Center.

Other Campus Sites and Affiliations

Laurel Heights

The 10.3 acre Laurel Heights campus site is located at 3333 California Street. The campus site is located on the block bounded by California, Presidio, Euclid and Laurel Streets. The main building is approximately 350,000 gsf with three below-grade floors of offices and parking, and four above-grade floors of office space. A one-story annex building with 13,000 gsf is located at the corner of California and Laurel Streets. There are 210 parking spaces in the underground garage and 333 at ground level, for a total of 543 parking spaces.



SOURCE: UCSF

UCSF Long Range Development Plan Initial Study

Figure 11
Mission Center

The campus site is in the Laurel Heights neighborhood adjacent to the Presidio Heights neighborhood. The Jewish Community Center of San Francisco is located directly across California Street to the north. The California campus of the California Pacific Medical Center is a half mile to the west. The Laurel Heights campus site is approximately two miles northeast of the Parnassus Heights campus site and about one mile west of the Mount Zion campus site.

The Laurel Heights buildings were constructed in several phases between 1955 and 1966 but were not acquired by UCSF until 1985. There are approximately 1,200 employees at this campus site, which is the primary location of UCSF's social, behavioral and policy science research. A number of academic and campus administrative departments are located there along with food services, a conference center and a child care center.

In order to improve programmatic adjacencies and operational efficiencies, UCSF is reviewing its use of the Laurel Heights campus site. While no near-term changes are currently contemplated, a substantial investment of capital to maintain and extend its useful life is required. The cost-benefit of committing financial resources to this site for this purpose is being studied. As part of the study, UCSF is exploring opportunities for relocating occupants from the Laurel Heights campus to other major campus sites.

In December 2012, UCSF issued a Request for Qualifications to solicit and evaluate potential interest for developing the campus site. If selected, the developer will be responsible for developing a plan for the site, working with the community, complying with CEQA (with the City as the lead agency under CEQA), and securing all necessary City entitlements. It should be noted that no change in use is currently proposed at the Laurel Heights campus site and therefore is not analyzed in the EIR for the LRDP.

Buchanan Dental Center

The Buchanan Dental Center is operated by UCSF's School of Dentistry. It is located at 100 Buchanan Street, approximately two miles east of the Parnassus Heights campus site. The facility is located on a 0.6-acre parcel within the boundaries of a 5.4-acre parcel that was formerly owned by UC Berkley and used as UC Berkeley Extension's San Francisco campus. The Buchanan Dental Center is served by on-site parking at this site. UC Berkeley vacated the site in 2003. A private developer has proposed a redevelopment project, 55 Laguna, on the remainder of the parcel, which will include 330 units of market-rate housing and 110 units for low-income seniors, retail uses and a community center. Construction for this project is anticipated to begin in fall of 2014.

The two-story, 18,200 gsf clinic building was constructed in 1979. The building contains dental laboratories, treatment and exam rooms, offices and a classroom. There are approximately 25 UCSF personnel employed at the clinic. These academic and clinical care programs will continue under the new LRDP as they exist today. Fifty-one parking spaces in the new development would be deeded to the University for use in connection with the Dental Center.

654 Minnesota Street

Located just south of the Mission Bay campus site, the three-story 654 Minnesota Street building contains 65,000 gsf. The building and its associated parking lot are located on the south end of the block bounded by Indiana, 19th and Minnesota Streets in the Dogpatch neighborhood, two blocks south of the Medical Center at Mission Bay. UCSF purchased the building in 2005. The building is home to Capital Programs, Campus Planning, Facilities Management, Real Estate Services, Financial and Administrative Services (FAS), Financial Service Center, School of Medical Information Services Unit and Campus Police. There are approximately 200 UCSF personnel employed in the building. Programs and uses at 654 Minnesota Street will continue at existing levels under the new LRDP.

Hunters Point

The 3.8-acre Hunters Point site is located at 900 Palou Avenue, adjacent to the former Hunters Point Naval Shipyard in the Bayview/Hunters Point neighborhood. It is approximately 3.2 miles south of the Mission Bay campus site. The Hunters Point site contains two single-story buildings that total approximately 17,700 gsf. The property is used exclusively as an animal care facility, with approximately 14 UCSF personnel. The surrounding land use is primarily industrial with a pocket of residential north and above the low-lying site. The City of San Francisco approved the Candlestick-Hunters Point Shipyard Development Plan, an extensive mixed-use redevelopment plan for the surrounding area that would include housing, retail, office, commercial, industrial and open space uses. Relocation and disposition of Hunters Point functions is being considered as part of the strategy to consolidate remote sites.

Oyster Point

The 5.7-acre Oyster Point site is located at 616 Forbes Boulevard in the City of South San Francisco. This property houses UCSF's Materials Management warehouse, which provides distribution, storage and mail services and has an adjacent parking lot. The building contains approximately 138,000 gsf. There are approximately 42 UCSF personnel employed at the Oyster Point facility. Surrounding land uses include industrial, research, office and distribution. Several biotech companies, such as Genentech, are located in close proximity to the site. UCSF continues to evaluate sites for centralized receiving to potentially reduce the number of deliveries to each campus site. Relocation and disposition of Oyster Point is being considered as part of the strategy to consolidate remote sites.

San Francisco General Hospital

San Francisco General Hospital (SFGH) is an acute-care medical center owned and operated by the City and County of San Francisco. UCSF does not own facilities at SFGH, but through an affiliation agreement with the City, UCSF faculty and physicians provide all of the medical care at SFGH in City-owned buildings. In addition, UCSF faculty conduct research at SFGH. UCSF leases or otherwise occupies space in exchange for services. There are approximately 2,000 UCSF faculty and staff at SFGH.

SFGH is located in the Mission district, bordering the western portion of the Potrero Hill neighborhood. The site is bounded by U.S. Highway 101 to the north and east, 23rd Street to the south and Potrero Avenue to the west. The area immediately surrounding SFGH is residential with some neighborhood-serving commercial activity on the ground floor, especially along 24th Street.

UCSF occupies approximately 262,000 gsf of research labs, office and clinic space on the SFGH campus in ten buildings (Buildings 1, 3, 5, 9, 10, 20, 30, 40, 80/90 and 100). Because the University of California Office of the President considers SFGH to be an adjunct campus to UCSF, it is subject to UC's Policy on Seismic Safety (Policy), which requires that UCSF occupants be located in seismically safe buildings. To comply with the Policy, UCSF intends to relocate its occupants to a new, UCSF-constructed and seismically robust research building of about 175,000 gsf. The building would be constructed on the existing SFGH surface parking lot along 23rd Street, which is located between the existing hospital (SFGH Building 5) and 23rd Street. The building may also accommodate off-site leases. UCSF intends to continue to occupy Building 3, which is seismically safe.

This new research building is in the early stages of conceptual design, and potentially could be five-stories and would be less than 90 feet in height. Parking spaces that would be displaced by the new research building, possibly along with new demand from off-site leases, could be replaced on the SFGH campus. One option being explored is the expansion of the City's parking structure on 23rd Street. The potential expansion would extend the garage footprint toward 24th Street on the surface parking lot of the garage site. The expansion project would be undertaken by the City, as it is located on City property.

Due to the timing of the proposed project, the proposed SFGH Research Building will undergo its own environmental review process, separate from the LRDP EIR. Under the LRDP, UCSF expects to maintain its activities and affiliation at SFGH and no changes in UCSF uses are anticipated at SFGH.

San Francisco Veterans Affairs Medical Center

The San Francisco Veterans Affairs Medical Center (SFVAMC) is owned by the US Department of Veterans Affairs and has been affiliated with UCSF as a teaching hospital for over 50 years. All physicians are jointly recruited by the SFVAMC and UCSF School of Medicine. SFVAMC has 189 residency and fellow positions and 40 allied health professionals. Annually, more than 700 UCSF trainees from 36 programs rotate through the SFVAMC. SFVAMC space is not considered in the LRDP because although UCSF faculty are physically located at the SFVAMC site and practice at the SFVAMC, UCSF does not lease or otherwise control any of the space at the SFVAMC. There is close cooperation between UCSF and SFVAMC regarding facilities needs and uses.

The 29-acre SFVAMC Fort Miley campus is located in the northwest area of the City adjacent to the Outer Richmond District neighborhood. It is bounded by Clement Street and Seal Rock Drive and the outer Richmond District neighborhood to the south, and otherwise by the National Park Service's Golden Gate National Recreation Area (GGNRA).

The SFVAMC completed its LRDP in June 2012 and the Draft LRDP EIR in August 2012. The SFVAMC identified a need for retrofitting existing buildings to meet the most recent seismic safety requirements and two alternatives, which include the buildout at Fort Miley and an unidentified location in the Mission Bay area, which would provide an additional 589,000 gsf of medical space in two phases to meet projected needs over the next 20 years.

The SFVAMC's LRDP was developed to meet its particular requirements and is thus separate from the UCSF LRDP, and the two planning documents are unrelated. The US Veterans Affairs Department and its local medical center administration will be implementing SFVAMC's LRDP. UCSF expects to maintain its activities as an affiliated institution at the SFVAMC, and UCSF uses at the SFVAMC are not anticipated to change under the LRDP.

UCSF Fresno Medical Education and Research Program

UCSF established a regional medical education program in Fresno in 1975 to provide training for doctors and other health care professionals in the Central San Joaquin Valley. The program was created with support from the California Legislature and the Veterans Administration to address the shortage of physicians practicing in California's San Joaquin Valley and to increase access to continuing medical education in the region. UCSF Fresno provides medical education and physician training programs through community and university partnership. Training for residents and in some programs, fellows, is available in: emergency medicine, family practice, general surgery, internal medicine, obstetrics/gynecology, pediatrics, psychiatry and surgical critical care. As a regional medical campus, UCSF Fresno carries out its training and patient care through a network of affiliation agreements with a number of hospitals in the area, including the Community Healthcare Network (Clovis Community Medical Center, Fresno Heart & Surgical Hospital and University Medical Center), Veterans Affairs Medical Center, Children's Hospital Central California, Saint Agnes Medical Center and Kaiser Permanente, as well as several community hospitals and other specialized facilities.

Located on 3.02 acres, the three-story, 82,000 gsf UCSF Fresno Center for Medical Education and Research Building opened in 2004. The building serves as the hub of medical education and research and includes clinical skills lab, standardized patient center, digital medical library, virtual classrooms and research facilities. UCSF expects to continue its current academic, research and clinical activities at Fresno and UCSF uses are not anticipated to change under the LRDP.

Leased Sites

UCSF leases approximately 1.03 million gsf in San Francisco. By 2014, approximately 200,000 gsf of lease space is expected to be consolidated into UCSF owned space. Beyond 2015, UCSF hopes to continue to reduce its lease portfolio by an additional 470,000 gsf. There is approximately 350,000 gsf of space in community-based leases that will need to remain at their current locations to serve local clinical populations. While UCSF's near-term strategy is to consolidate leases to improve operational efficiency, and when possible, consolidate leases into owned space, for the purposes of the LRDP, it is assumed that UCSF's total lease portfolio will remain at about one million gsf over the LRDP planning horizon. This will account for fluctuations that will

likely occur due to community health care needs, growth and expansion in clinical and research programs and other demands.

Leases are proposed as the need arises, and typically are not foreseeable far enough in advance to include in the LRDP. UCSF evaluates proposed leases of space on a case-by-case basis to determine the appropriate level of environmental review. In general, such activities have been exempt from environmental review in the vast majority of cases. The following is a summary of UCSF's major leased sites that are greater than 10,000 gsf and lay beyond a quarter of a mile from UCSF's three major campus sites. Other leased sites are not addressed in the LRDP.

China Basin

UCSF leases approximately 187,000 gsf at 185 Berry Street between Third and Fourth Streets in the China Basin building. It is located one block west of the Giant's ballpark and one block south of the Fourth and King Street Caltrain Station. The UCSF Imaging Center, Department of Epidemiology and Biostatistics and several other research, academic and campus administration units are located in this building. UCSF plans to remain at China Basin in the near-term, but may eventually move occupants into owned space at Mission Bay as part of its lease consolidation strategy.

2300 Harrison Street

UCSF leases approximately 65,500 gsf at 2300 Harrison Street in a building at the southwest corner of 19th and Harrison Streets in the Mission District. The building is occupied by Medical Center administrative support units. UCSF would likely vacate this property when the lease expires at the end of 2013 and relocate occupants into owned space at various campus sites as part of UCSF's lease consolidation strategy.

250 Executive Park Boulevard

UCSF leases approximately 42,400 gsf at 250 Executive Park Boulevard. This building is located in the Bayview Candlestick Park area off U.S. Highway 101 near the San Francisco County line. Executive Park is part of a privately-owned mixed-use development. The space leased by UCSF is used by the Medical Center's information technology center. UCSF plans to remain at 250 Executive Park in the near-term, but will determine if the uses should be consolidated into owned space as part of its long-term lease consolidation strategy.

3330 and 3360 Geary Boulevard

UCSF leases approximately 6,400 gsf and 19,300 gsf at 3330 and 3360 Geary Boulevard, respectively, totaling 25,700 gsf. These buildings are located on Geary Boulevard between Parker and Commonwealth Streets. The space is occupied by Medical Center administrative support units. For now, UCSF will remain at these locations, but will assess if the occupants should be moved into owned space as part of UCSF's lease consolidation strategy.

220 Montgomery Street

UCSF leases approximately 8,300 gsf at 220 Montgomery Street in downtown San Francisco where the Office of Development and Alumni Relationships is located. UCSF will continue to lease space at this location until 2017, but then will determine if the lease should be renewed or if occupants should be consolidated into owned space at Mission Bay as part of UCSF's lease consolidation strategy.

50 Beale Street

UCSF leases approximately 57,400 gsf at 50 Beale Street in downtown San Francisco for Global Health Sciences and the Center for AIDS Prevention Study. UCSF will continue to lease space at this location in the near-term. It is anticipated that some of the occupants will relocate to Mission Hall on the Mission Bay campus site when it opens in 2015 and that others will move to other owned space at Mission Bay or to leased space in the China Basin building.

1930 Market Street

UCSF Alliance Health Project Center is located at 1930 Market Street on the north side of the street between Guerrero Street and Duboce Avenue in the Upper Market neighborhood. UCSF leases approximately 14,800 gsf in this one-story building. It is a community based clinic and counseling center, also known as the AIDS Health Center, affiliated with the Department of Psychiatry at UCSF, San Francisco General Hospital and the UCSF AIDS Research Institute. UCSF plans to remain at this location.

982 Mission Street

UCSF leases approximately 24,800 gsf at 982 Mission Street in the South of Market district for the Citywide and Community Focus Center, which is affiliated with UCSF and SFGH Department of Psychiatry programs. The center provides outpatient psychiatric care, crisis intervention, therapy and clinical case management services. No changes are planned at this location.

2727 Mariposa Street

Affiliated with SFGH, the UCSF Trauma Recovery and Treatment Center is located at 2727 Mariposa Street at Bryant Street in the Mission District. UCSF leases approximately 12,000 gsf in this mixed-use building and has no plans to relocate.

2.8 Projects and Activities Not Included in the LRDP EIR

The following is a list of projects and activities that are not included in the LRDP EIR.

Parnassus Heights

Mount Sutro Management Project

The Draft EIR for the Mount Sutro Management Project was issued on January 18, 2013. The proposal would implement a number of management activities in the Mount Sutro Open Space Reserve. These management activities include thinning the forest, native plant restoration and enhancement, conversion planting (removal of non-native trees and plants and conversion to native species) in select areas, and construction of new trails. Because this project is currently underway with its own environmental review, it is not included as part of the LRDP EIR.

New Housing at 735 Parnassus Avenue and 1414 Fifth Avenue

UCSF is currently conducting a feasibility analysis for constructing five units of housing on the 1414 Fifth Avenue site and up to 40 units on the former site of 735 Parnassus for a total of up to 45 units and about 48,400 gsf in an L-shape configuration around the Faculty Alumni House. Any development proposal on this site would require a separate project-level environmental review and community participation process, separate from this LRDP EIR process. However, development capacity for this possible project is included in the overall LRDP growth at the Parnassus Heights campus site.

Mission Bay

UCSF issued a second Request for Qualifications to identify opportunities for acquisition of a site for office use near UCSF's Mission Bay campus. The site would serve as a consolidation location for both owned and leased properties, as many of the leases will expire in coming years and UCSF hopes to reduce its overall lease portfolio. UCSF plans to engage the community in acquisition of any space in accordance with the UCSF Mission Bay Planning Principles. Given that the campus does not currently have a specific proposal for a new Mission Bay site, this potential lease consolidation and site is being considered separately from the LRDP EIR.

Block 14 of the Mission Bay campus site is currently reserved for use by the San Francisco Unified School District (SFUSD) as a public school site. Per the agreements through which the Mission Bay campus site was acquired by The Regents, the SFUSD has until 2027 to request conveyance of the 2.4-acre Block 14 for use as a school site. If the SFUSD does not request Block 14 during that timeframe, UCSF may then develop Block 14 for its own use after the necessary planning, environmental review and amendment of the LRDP.

Laurel Heights

As described previously, UCSF is reviewing its use of the Laurel Heights campus site. No near-term changes are currently proposed at the Laurel Heights campus site as a part of the LRDP.

UCSF is exploring opportunities for relocating occupants from the Laurel Heights campus to other major campus sites. No change in use is currently proposed at the Laurel Heights campus site thus it will not be studied in the EIR.

SFGH

As described previously, UCSF intends to vacate seismically compromised buildings at SFGH and construct a new research building of about 175,000 gsf on the existing parking lot along 23rd Street. Due to the timing of this proposed project, the proposed SFGH Research Building will undergo its own UCSF environmental review process, separate from the LRDP EIR.

Under the LRDP, UCSF expects to maintain its activities and affiliation at SFGH and no changes in UCSF uses are anticipated at SFGH.

2.9 Discretionary Approvals

Action by The Regents (including any Regents-delegated committee or official):

Upon certification of the EIR, The Regents or its designee will consider whether to approve the proposed Long Range Development Plan, as well as any individual projects that are brought forth for approval.

Action by Other Agencies:

There are no responsible agencies that have approval authority over the proposed Long Range Development Plan.

There are no responsible agencies that have approval authority over the proposed projects, with the exception of certain activities that are proposed to occur within the public right-of-way. The Parnassus Avenue Streetscape Plan contains various proposals that would occur within the public right-of-way and that would require approval by the San Francisco Municipal Transportation Agency (MTA) and encroachment permits from the Department of Public Works (DPW). In addition, a cushioning action related to the renovation and reuse of UC Hall would involve traffic-calming measures at the intersection of Fifth Avenue and Kirkham Street. Such activities would also require review and approval by DPW and MTA.

3. Purpose of the Initial Study

Section 21080.09(b) of the Public Resources Code requires that approval of a campus LRDP be supported by an EIR. UCSF will prepare an EIR for the 2014 UCSF Long Range Development Plan in compliance with this requirement. As identified in Section 15063(c) of the CEQA Guidelines, the purpose of this Initial Study is to: (1) inform responsible agencies and the public of the nature of the proposed project and its location, (2) identify impacts that will clearly not result or will clearly be less than significant and therefore will not be discussed in the EIR, and (3) provide a general description of the topics intended to be addressed in the EIR.

The environmental factors checked below could be potentially affected by implementation of the 2014 LRDP and/or by cumulative impacts resulting from implementation of the 2014 LRDP in conjunction with other expected developments. These factors will be evaluated in the 2014 LRDP EIR.

☒ Aesthetics	☐ Agriculture and Forestry Resources	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☒ Geology and Soils
☒ Greenhouse Gas Emissions	☒ Hazards and Hazardous Materials	☒ Hydrology and Water Quality
☒ Land Use/Planning	☐ Mineral Resources	☒ Noise
☒ Population and Housing	☒ Public Services	☒ Recreation
☒ Transportation and Traffic	☒ Utilities and Service Systems	☒ Mandatory Findings of Significance

4. Determination

On the basis of the initial evaluation that follows:

☐ I find that proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made that will avoid or reduce any potential significant effects to a less than significant level. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find that the proposed project MAY have a significant effect on the environment. An ENVIRONMENTAL IMPACT REPORT will be prepared.

Signature — Date: 9/23/13

Diane C. Wong
Printed Name — For

5. Evaluation of Environmental Effects

Appendix G of the CEQA Guidelines provides a suggested format to use when preparing an Initial Study. The Environmental Checklist used in this document adopts a different format while still addressing the Appendix G checklist questions for each environmental issue area.

The attached Environmental Checklist identifies potential environmental effects that will be analyzed in the 2014 LRDP EIR. The effect may be a less-than-significant impact that will be addressed to provide a more comprehensive analysis; an impact for which further analysis is necessary or desirable before a determination about significance can be made; an impact that is potentially significant but may be reduced to a less-than-significant level with the adoption of mitigation measures; or an impact that may be significant and unavoidable.

The EIR will address effects in a program-level analysis for the 2014 LRDP and in a cumulative-level analysis for potential effects associated with growth under the 2014 LRDP and other known and reasonably foreseeable growth in the region. The 2014 LRDP EIR will also include project-specific analyses of effects, or in some cases will not be required to address effects, for proposed projects at Parnassus Heights, Mission Bay and Mount Zion campus sites.

If implementation of the 2014 LRDP, or any of the individual projects or programs proposed under the LRDP, would clearly result in no impact or result in a less-than-significant impact under CEQA criteria, no analysis beyond that provided in this Initial Study is necessary.

c)	Substantially degrade the existing visual character or quality of the site and its surroundings?	--	--	--	☒	☒	--	☒	☒	--	--	☒	☒	--
d)	Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	--	☒	--	☒	☒	--	☒	☒	☒	--	☒	☒	--
e)	Exceed the LRDP EIR significance standard by substantially reducing sunlight or significantly increasing shadows in public open space areas, or by increasing pedestrian-level wind speeds above the hazard level set forth in the San Francisco Planning Code?	--	☒	--	--	☒	--	☒	☒	--	--	☒	☒	--

Topics to be analyzed in the 2014 LRDP EIR are indicated: ☒

Topics that do not require additional analysis beyond that provided in the Initial Study are indicated: --

Aesthetics

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic. A scenic vista is defined as a public view from existing parks, plazas, roadways, or other public areas. Impacts on views from private property are not considered significant. UCSF typically imposes mitigation to minimize light and glare from new buildings through building orientation, use of landscaping and choice of primary façade materials; as well as requiring exterior lighting to be directed downward.

San Francisco Planning Code Section 295 generally prohibits development above a height of 40 feet that would cause significant new shadow on open space under the jurisdiction of the San Francisco Recreation and Park Commission between 1 hour after sunrise and 1 hour before sunset, at any time of the year. A project proposed under the LRDP would have a significant effect if it would result in substantial new shadow on public open space in a manner that would substantially affect use of that area.

Generally, structures less than 100 feet tall are not of sufficient height to alter wind speeds at the ground level. Therefore, detailed wind analysis is typically not required for structures below this height. For projects that warrant detailed analysis, San Francisco Planning Code Section 148 establishes in certain districts of San Francisco wind speed criteria for the comfort and safety of pedestrians. Wind speeds in excess of 26 miles per hour (equivalent wind speed for a single hour of the year) are considered hazardous. Therefore, a project would have a significant effect if it would result in pedestrian-level wind speeds that exceed this hazard level. It is UCSF policy to review proposed construction designs and modify, as needed, proposed new structures such that pedestrian-level wind speeds would not reach hazardous levels.

Discussion of Potential Impacts

a) Have a substantial adverse effect on a scenic vista?

For purposes of this analysis, a scenic vista is defined as a public view from existing parks, plazas, roadways or other public areas, and gateway or panoramic views from areas generally available to the general public. Views from private residences and non-public areas are not considered to be scenic views because they are not available to the general public. Impacts on views from private property are not considered significant.

2014 LRDP

All potential aesthetic effects would occur only as a result of activities at specific campus sites, and only as a result of proposed LRDP programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

The Parnassus Heights campus site buildings proposed to be demolished are low-rise structures, including the Langley Porter Psychiatric Institute (LPPI) building, and are generally obscured from public views by surrounding buildings and/or trees. UC Hall, Moffitt Hospital and Millberry Tower, the three major buildings proposed to be renovated, are prominent structures whose existing facades will not be materially changed by renovation. Thus, the demolitions and the renovations would have no effect on a scenic vista.

The LPPI building is a four-story low-rise structure near the corner of Parnassus and Medical Center Way. Although the demolition of the existing LPPI would alter the view of that prominent site on the north slope of Mount Sutro, its loss would not adversely affect the scenic vista of the Parnassus Heights campus site. The demolition of the LPPI building would be followed by the construction of the high-rise replacement hospital on that site. The high-rise replacement hospital will be adjacent to and visible from Parnassus Avenue, and due to the combination of the elevation of the hillside site and the height of the proposed high-rise hospital, will also be visible from a number of distant public view locations. The 2014 LRDP EIR will consider the potential effects of the proposed high-rise Parnassus Heights replacement hospital on scenic vistas.

The proposed utilities and the retaining wall would be visible from Medical Center Way, a campus street. The Parnassus Avenue streetscape improvements are intended to improve the appearance and function of Parnassus Avenue. None of these projects has the potential to have a substantial adverse impact on views or scenic vistas.

Mission Bay

The Mission Bay campus site is located in a developing portion of San Francisco surrounded by a mix of biomedical, institutional, office and residential uses.

The impacts on views of development under the 2014 LRDP would be less than significant with the applied measures, such as protecting view corridors, creating open space and developing the UCSF site in a manner that is compatible with the surrounding area and consistent with local plans and policies. The 2014 LRDP's proposed program and project at Mission Bay would adhere to all policies addressing visual resources contained in the 1996 LRDP as amended, including the protection of scenic view corridors.

Views of the Bay from the Mission Bay campus site would continue to be available along east-west roadway corridors after development anticipated under the LRDP is complete. The impact and its mitigations will be discussed in the 2014 LRDP EIR.

Mount Zion

The Mount Zion campus site is located in a mixed-use neighborhood commercial district. Most buildings along Divisadero Street have residential and office uses above ground floor retail. In the vicinity are several private medical office buildings not affiliated with UCSF. Kaiser Medical Center is located on Geary Boulevard, one block southwest. Residential uses predominate to the north and west, and directly across Scott Street, east of the main block. The hospital is located on

the main block of the Mount Zion campus site, which is also the home of a number of outpatient programs.

Demolition of the seismically poor buildings, together with the construction of a new office/research building on the main block at Mount Zion will be the visible parts of the changes proposed in the 2014 LRDP; renovation and reuse of the hospital will have no visual effect.

The project site and surrounding area are on land that is relatively flat, and offer no scenic vistas. The program to renovate Mount Zion hospital and projects to demolish the Hellman, Brunn and Dialysis buildings at Mount Zion will have no effect on a scenic vista and will not be considered further in the EIR. Likewise, the office/research building project, while potentially taller than the existing structures on the site, would not affect a scenic vista as none exists on the site or when viewed from other public areas nearby.

Mission Center

The three-acre Mission Center campus site is in the northeast portion of San Francisco's Mission District, located on the southern half of the block bounded by 14th, Harrison, 15th and Folsom Streets. It has only one six-story building, which fronts Folsom Street but may be entered as well from the 207-space parking lot. The existing building would remain, and no changes in use are planned.

The LRDP considers options for further developing the site should UCSF decide more program space is needed at this campus site, although no such need is currently anticipated. The capacity study analyzed the potential size and location of a new building and parking structure, and took into consideration urban design elements that would preserve the existing outdoor plaza, create additional open space, enhance the public realm and improve shuttle circulation, while also considering the city's height and bulk limits.

The project site and surrounding area are on land that is relatively flat and offer no scenic vistas. As such, proposed development on this site would have no effect on a scenic vista.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

There are no state-designated scenic highways in the vicinity of the UCSF campus sites at Parnassus Heights, Mount Zion, Mission Bay, or Mission Center. There could be no impact on such scenic resources at these sites.

The LRDP proposes no programs or projects for other UCSF campus sites, although some sites are being considered for closure and consolidation in the long-term. There would be no effect on scenic resources at other UCSF campus sites.

No further analysis is required.

---

c) Substantially degrade the existing visual character or quality of the site and its surroundings?

2014 LRDP

All of the potential effects on visual character or quality occur only as a result of development and activities that would occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects at the appropriate campus sites.

Parnassus Heights

Impacts on visual character or quality due to the replacement hospital program and the streetscape project will be analyzed in the 2014 LRDP EIR. Other projects at Parnassus Heights will have no effect on visual character/quality and will not be considered further in the EIR.

Mission Bay

Impacts on visual character or quality due to the remaining and increased entitlement program and the new housing project at Mission Bay campus site will be analyzed in the 2014 LRDP EIR.

Mount Zion

Effects of the office/research building project at Mount Zion on visual character or quality will be analyzed in the 2014 LRDP EIR. The program to renovate Mount Zion hospital and the projects to demolish the Hellman, Brunn and Dialysis buildings at Mount Zion will not substantially degrade the existing visual character or quality of the site or their surroundings and will not be considered further in the EIR.

Mission Center

The visual effect of the program to construct an office building and garage at Mission Center will be analyzed in the 2014 LRDP EIR.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

2014 LRDP

All of the potential effects on light and glare occur only as a result of development and activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

Light and glare impacts associated with the replacement hospital program and the streetscape project will be analyzed in the 2014 LRDP EIR, as will the effects of light or glare for construction and demolition activities. The analysis will consider whether night work or night lighting of worksites would be required for any reason. If so, then the analysis will consider the potential to create light and glare. Other projects at Parnassus Heights will have no effect and will not be considered further in the EIR.

Mission Bay

Light and glare impacts associated with the remaining and increased entitlement program and the new housing project at Mission Bay campus site will be analyzed in the 2014 LRDP EIR.

Mount Zion

Light and glare impacts associated with the office/research building project at Mount Zion will be analyzed in the 2014 LRDP EIR, as will the effects of light or glare for demolition activities. The program to renovate the main hospital at Mount Zion will have no effect on light and glare and will not be considered further in the EIR.

Mission Center

Light and glare impacts associated with the program to construct an office building and garage at Mission Center will be analyzed in the EIR.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under

current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

e) Exceed the LRDP EIR significance standard by substantially reducing sunlight or significantly increasing shadows in public open space areas, or by increasing pedestrian-level wind speeds above the hazard level set forth in the San Francisco Planning Code?

2014 LRDP

All of the potential effects occur only as a result of development and activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

The project to renovate UC Hall and the program to renovate Moffitt Hospital and Millberry Tower at Parnassus Heights will have no effect on sunlight, shadow, or wind and will not be considered further in the 2014 LRDP EIR.

The potential to adversely affect winds and shadowing will be analyzed in the 2014 LRDP EIR for the project to demolish 13 existing buildings and the program for the construction of the replacement hospital, because the removal of buildings could open new paths for winds to reach pedestrian areas, while placement of a large new building could intercept and redirect local winds into pedestrian areas. The infrastructure projects at Parnassus Heights will have less than significant effects on wind and shadow and will not be considered further in the EIR.

Mission Bay

The potential to adversely affect winds and shadowing will be analyzed in the 2014 LRDP EIR for the remaining and increased entitlement program and the new housing project at Mission Bay campus site.

Mount Zion

Hamilton Recreation Center playground and athletic courts are located across Post and Scott Streets from the main block of the Mount Zion campus site and could be affected by shadow from the office/research building project. The potential for shadow and wind effects at Mount Zion will be analyzed in the 2014 LRDP EIR. The program to renovate Mount Zion Hospital will have no effect on shadow or wind and will not be considered further in the EIR.

Mission Center

The program to construct an office building and garage at the Mission Center campus site will be analyzed in the EIR.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

Agriculture and Forest Resources

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic.

Discussion of Potential Impacts

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

e) Involve other changes in the existing environment, which, due to their location or nature, could result in conversion of Farmland to non-agricultural use?

No UCSF campus site contains agricultural uses. No significant impacts to agriculture could occur. Therefore, no further study of agriculture is necessary and this topic will not be analyzed in the EIR.

---

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)) or timberland (as defined in Public Resources Code section 4526)?

d) Result in the loss of forest land or conversion of forest land to non-forest use?

The 2014 LRDP does not propose rezoning, loss of forest land, or conversion of forest land to non-forest use. No significant impacts on forest land would occur. Therefore, no further study of forest resources is necessary and this topic will not be analyzed in the EIR.

Air Quality

Standards of Significance

The impact questions above constitute the significance standards for air quality. The proposed project is located in the City and County of San Francisco, which is within the San Francisco Bay Area Air Basin. The Bay Area Air Quality Management District (BAAQMD) is the agency with jurisdiction over air quality within the Air Basin. In June 2010, the BAAQMD published significance thresholds in the *BAAQMD CEQA Air Quality Guidelines*[16] (updated in 2011 and hereinafter BAAQMD CEQA Guidelines) to assist lead agencies in evaluating the significance of a project's individual and cumulative impacts on local air quality. Projects that do not result in emissions of air pollutants that exceed the BAAQMD CEQA Guidelines thresholds would not be considered as having a significant impact on the attainment of air quality goals and would therefore be consistent with the current air quality plan.

The significance thresholds contained in the BAAQMD CEQA Guidelines were challenged by the California Building Industry Association. On March 5, 2012, the Alameda County Superior Court issued a judgment finding that the Air District had failed to comply with CEQA when it adopted the thresholds contained in the BAAQMD CEQA Guidelines. The court found that the adoption of the thresholds was a project under CEQA. The court issued a writ of mandate ordering the District to set aside the thresholds and cease disseminating them until the District had complied with CEQA. However, on August 13, 2013 the California Court of Appeals issued a full reversal of the judgment. In a published ruling, the Court directed that the Superior Court to vacate the writ of mandate issued in March 2012. BAAQMD has not formally re-instated the thresholds or otherwise responded to this Appellate Court reversal at this time.

In the interim, BAAQMD had chosen not to make a recommendation on the use of the 2010 significance thresholds to determine the significance of air quality impacts; instead, the BAAQMD recommends that the lead agency should "determine appropriate air quality thresholds of significance based on substantial evidence in the record."[17] The Alameda County Superior Court did not rule on or question the adequacy of the evidentiary basis supporting the significance thresholds that were contained in the BAAQMD CEQA Guidelines and the BAAQMD-recommended impact assessment methodologies. Therefore, each lead agency has the discretion to use the significance thresholds and methodology for analyzing air quality impacts under CEQA based on the evidence and technical studies supporting the BAAQMD CEQA Guidelines or other evidence.

The University has examined the information in the BAAQMD CEQA Guidelines and other information and determined that it will use the significance thresholds provided in the BAAQMD CEQA Guidelines to evaluate the air quality impacts that could potentially result from a project's criteria pollutant and toxic air contaminants (TAC) emissions. **Table 3**, BAAQMD CEQA Significance Thresholds, below, presents the significance thresholds for criteria pollutants as contained in the 2011 BAAQMD CEQA Guidelines.

16 Bay Area Air Quality Management District, *BAAQMD CEQA Air Quality Guidelines*, Updated May 2011.
17 Bay Area Air Quality Management District, http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES.aspx, Accessed July 9, 2013.

TABLE 3
BAAQMD CEQA SIGNIFICANCE THRESHOLDS

	2011 Construction-Related Thresholds of Significance	2011 Operational Thresholds of Significance	
	Maximum Daily Emissions (pounds/day)	Maximum Daily Emissions (pounds/day)	Annual Emissions (tons/year)
Criteria Pollutants and Precursors (Regional)			
ROG	54	54	10
NO_x	54	54	10
PM_{10} (Particulate Matter Exhaust)	82	82	15
$PM_{2.5}$ (Particulate Matter Exhaust)	54	54	10
$PM_{10}/PM_{2.5}$ (Fugitive Dust)	Best Management Practices	None	None
Criteria Air Pollutants and Precursors (Local)			
CO	–	9.0 ppm (8-hour average) concentration 20.0 ppm (1-hour average) concentration	
Risks and Hazards			
Siting a New Source or Receptor (Individual Project)	Cancer Risk: >10 in a million Non-Cancer Hazard Index: >1.0 $PM_{2.5}$ Level: >0.3 µg/m^3 annual average		
Siting a New Receptor (cumulative)	Cancer Risk: >100 in a million Non-Cancer Hazard Index: >10.0 $PM_{2.5}$ Level: >0.8 µg/m^3 annual average		

SOURCE: BAAQMD, 2011.

The average daily emissions thresholds for particulate matter and ozone precursors in Table 3 are based on emission rates of 10 tons per year for ROG, NO_X and $PM_{2.5}$ and 15 tons per year for PM_{10}. These values are derived from the federal New Source Review Significant Emission Rate and BAAQMD Offset Requirement limits and apply the federal BAAQMD Offset Requirements to ozone precursors for which the San Francisco Bay Area Air Basin is designated as a non-attainment area. This is judged to be an appropriate approach to prevent further deterioration of ambient air quality and thus has nexus and proportionality to prevent regionally cumulative significant impacts. Consequently, these values are applicable to all facilities emitting criteria pollutants in California, and similar thresholds are in use in many other air districts in California. Based on the above substantial evidence, the threshold emission rates in Table 3 will be used to evaluate the air quality impacts of the proposed projects and programs.

In addition to the thresholds above, the project-level cancer (10 in 1 million chance) and non-cancer (hazard index of 1) risk thresholds from the BAAQMD CEQA Guidelines have also been retained by the University to evaluate the proposed project's TAC impacts. These values were established in the Emission Inventory Criteria and Guidelines for the Air Toxics "Hot Spots" Program as thresholds for determining the priority of a facility emitting TACs. A facility with a cancer risk of at least 10 in 1 million or a non-cancer risk index greater than 1.0 would be considered a "high-level" facility and subject to reporting requirements under the Air Toxics "Hot Spots" Program.

These threshold values are commonly used by air districts throughout the state, including the South Coast Air Quality Management District, the Sacramento Metropolitan Air Quality Management District, the San Joaquin Valley Air Pollution Control District, as well as many others. Based on the above substantial evidence, the project-level cancer and non-cancer risk thresholds will be used to evaluate the project's TAC impacts.

BAAQMD also identified a concentration-based threshold for fine particulate matter ($PM_{2.5}$) in its 2011 CEQA Guidelines. This threshold is an increase in annual average $PM_{2.5}$ concentration of 0.3 micrograms per cubic meter ($\mu g/m^3$) and is based on the U.S. EPA staff-proposed Significant Impact level (SIL) for $PM_{2.5}$.

Finally, compliance with the *Clean Air Plan* will provide evidence that Long Range Development Projects (LRDP) projects do not contribute to cumulative ozone impacts. The most recently adopted air quality plan in the San Francisco Bay Area Air Basin is the *2010 Clean Air Plan*. The *2010 Clean Air Plan* is a roadmap showing how the San Francisco Bay Area will achieve compliance with the state 1-hour ozone standard as expeditiously as practicable, and how the region will reduce transport of ozone and ozone precursors to neighboring air basins. The control strategy includes stationary-source control measures to be implemented through BAAQMD regulations; mobile-source control measures to be implemented through incentive programs and other activities; and transportation control measures to be implemented through transportation programs in cooperation with the MTC, local governments, transit agencies and others. The *2010 Clean Air Plan* also represents the Bay Area's most recent triennial assessment of the region's strategy to attain the state 1-hour ozone standard. In this, the *2010 Clean Air Plan* replaces the *2005 Ozone Strategy*. Under the BAAQMD updated 2012 methodology, a determination of consistency with the most recently adopted Clean Air Plan, currently the 2010 Clean Air Plan, must demonstrate that a plan or project supports the primary goals of the Clean Air Plan, includes applicable control measures of the Clean Air Plan, and would not disrupt or hinder implementation of any control measures of the Clean Air Plan.

CEQA Checklist Discussion Items

In the following discussions of the CEQA Checklist items, the LRDP programs and projects are grouped into categories with similar air quality effects, in order to focus on characterizing the effect and determining the most suitable measure to mitigate potential impacts. These categories are used in Section 5.3 discussions, rather than discussing the programs and projects only by campus site, as is done for most other Checklist item discussions.

The proposed LRDP programs and projects include certain types of activities that would affect air quality in different ways. These general types of activities include:

- Building Demolitions, including the project to demolish 13 existing buildings at various locations at the Parnassus Heights campus site, and the project to demolish the Hellman, Brunn and Dialysis buildings at the Mount Zion campus site.
- Building Renovations, including the project to renovate UC Hall and the program to renovate Moffitt Hospital and Millberry Tower at the Parnassus Heights campus site, and the program to renovate the Main Hospital at the Mount Zion campus site.

- Building and Infrastructure Construction, including the program to construct the Replacement Hospital and the project to install utilities and retaining walls, and make open space improvements to Saunders Court and streetscape improvements to Parnassus Avenue at the Parnassus Heights campus site, the program to construct the buildings that comprise the remaining and increased entitlement and new housing at the Mission Bay campus site, the program to construct an Office / Research Building at the Mount Zion campus site, and the program to construct an Office Building and garage at the Mission Center campus site.
- Operation of the new and renovated buildings and facilities.
- The development and implementation of policies and programs, such as the greenhouse gas (GHG) reduction strategy, that affect design, construction and use of UCSF's facilities, the resultant use of energy and resources, and the air emissions that result.

Discussion of Potential Impacts

a) Conflict with or obstruct implementation of the applicable air quality plan?

2014 LRDP

BAAQMD guidance indicates that any project (i.e., project or plan) that does not support the three primary goals of the Clean Air Plan would not be considered consistent with the Clean Air Plan. Specifically, if approval of a project would not result in significant and unavoidable air quality impacts after application of all feasible mitigation, the project may be considered consistent with the Clean Air Plan.

Consequently, it will be necessary to determine whether all the elements of the 2014 LRDP would cumulatively result in emissions that would be significant and unavoidable after application of mitigation measures. Quantitative analysis of all project elements will be conducted as part of the analysis for the LRDP EIR.

Parnassus Heights, Mission Bay, Mount Zion and Mission Center

The demolition of buildings at the Parnassus Heights and Mount Zion campus sites would result in emissions of particulate matter and ozone precursors that could result in a potential conflict with the primary goals of the BAAQMD 2010 Clean Air Plan. Emissions associated with operation and construction of the replacement hospital at Parnassus Heights; 1.45 million gsf of development and the Phase 2 hospital at Mission Bay; and proposed buildings at Mount Zion and Mission Center would be assessed. Other renovations and improvements would also contribute to emissions. Quantitative analysis of all emissions will be conducted as part of the analysis for the LRDP EIR and will be used to determine if these elements would result in a potential conflict with the primary goals of the 2010 Clean Air Plan.

Other UCSF Campus Sites

The LRDP proposes no programs or projects for other UCSF campus sites, although some sites are being considered for closure and consolidation in the long-term. Potential actions at other campus sites are not anticipated to result in emissions or conflicts with the 2010 Clean Air Plan.

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation (e.g., induce mobile source carbon monoxide (CO) emissions that would cause a violation of the CO ambient air quality standard)?

2014 LRDP

The UCSF campus sites are primarily located in the San Francisco Bay Area Air Basin, a non-attainment zone for ozone and airborne particulate matter. The 2014 LRDP EIR will examine the potential for vehicle and stationary source emissions under the 2014 LRDP (including emissions associated with all project elements at each of the campus sites within the Air Basin) to violate state and federal air quality standards or to contribute to existing air quality violations.

Parnassus Heights, Mission Bay, Mount Zion and Mission Center

The demolition of existing buildings at the Parnassus Heights and Mount Zion campus sites will result in emissions of particulate matter and ozone precursors that could result in particulate matter and ozone precursor emissions above the stated thresholds. Emissions associated with operation and construction of the replacement hospital at Parnassus Heights; 1.45 million gsf of development and the Phase 2 hospital at Mission Bay; and proposed buildings at Mount Zion and Mission Center would be assessed. Other renovations and improvements would also contribute to emissions. Quantitative analysis of all emissions will be conducted as part of the analysis for the LRDP EIR and will be used to determine if these elements would result in a violation of air quality standards or contribute to existing violations.

Other UCSF Campus Sites

The LRDP proposes no programs or projects for other UCSF campus sites. Possible actions at other campus sites are not anticipated to result in a violation of air quality standards or contribute to existing violations.

---

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

2014 LRDP

The UCSF campus is located in the San Francisco Bay Area Air Basin, a non-attainment zone for ozone and airborne particulate matter. The 2014 LRDP EIR will examine the potential for vehicle and stationary source emissions under the 2014 LRDP (including emissions associated with the all project elements at each of the campuses) to result in a cumulatively considerable contribution of particulate matter or ozone precursors.

Parnassus Heights, Mission Bay, Mount Zion and Mission Center

The demolition of existing buildings at the Parnassus Heights and Mount Zion campus sites will result in emissions of particulate matter and ozone precursors that could result in particulate

matter and ozone precursor emissions above thresholds established to attain air quality standards. Emissions associated with operation and construction of the replacement hospital at Parnassus Heights and the Phase 2 hospital at Mission Bay could also exceed BAAQMD thresholds as the size (square footage) of the proposed building exceeds the size-based screening criteria for hospital uses contained in the BAAQMD's 2011 CEQA Guidelines for both operational and construction-related emissions. Emissions associated with operation and construction of 1.45 million gsf of development and the Phase 2 hospital at Mission Bay, and proposed buildings at Mount Zion and Mission Center would be assessed. Other renovations and improvements would also contribute to emissions. Quantitative analysis of all emissions will be conducted as part of the analysis for the LRDP EIR and will be used to determine if these elements would result in a cumulatively considerable contribution of particulate matter or ozone precursors.

Other UCSF Campus Sites

The LRDP proposes no programs or projects for other UCSF campus sites. Possible actions at other campus sites are not anticipated to result in a cumulatively considerable contribution of particulate matter or ozone precursors.

---

d) Expose sensitive receptors to substantial pollutant concentrations?

2014 LRDP

The BAAQMD CEQA Guidelines identify sensitive receptors as facilities or land uses that include members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses. Examples include schools, hospitals and residential areas. Sensitive receptors on UCSF campuses include student and faculty/staff housing, child care centers, and hospitals. The 2014 LRDP would result in increased construction, traffic, and operations, which would increase emissions of localized pollutants including carbon monoxide and particulate matter. The EIR will include an analysis of increased carbon monoxide concentrations under the 2014 LRDP (including emissions associated with the all project elements at each of the campuses) at locations near sensitive receptors. If the program-level evaluation in the EIR identifies potential conflicts between the specific projects and sensitive receptors, the project-specific analyses would include additional analysis. Localized fine particulate matter ($PM_{2.5}$) concentration contributions will be estimated for the maximally exposed receptor.

Parnassus Heights, Mission Bay, Mount Zion and Mission Center

The demolition of existing buildings at the Parnassus Heights and Mount Zion campus sites will result in emissions of fine particulate matter ($PM_{2.5}$) that would be mitigated through the implementation of *Basic Construction Mitigation Measures* and applicable air toxic control measures (ATCM) for all construction. The University implements these measures on all applicable projects. Construction of the replacement hospital at Parnassus Heights as well as other proposed development at Mission Bay, Mount Zion and Mission Center also would result in

emissions of $PM_{2.5}$ that would be addressed through these measures. Localized $PM_{2.5}$ concentration contributions will be estimated in the LRDP EIR for the maximally exposed receptor at Parnassus Heights, Mission Bay, Mount Zion and Mission Center. In addition, proposed housing at Parnassus Heights and Mission Bay would be considered new sensitive receptors.

Other UCSF Campus Sites

Other UCSF sites are being considered for closure and consolidation in the long-term and are not anticipated to result in localized exposure risks to sensitive receptors.

---

e) Create objectionable odors affecting a substantial number of people?

The proposed LRDP would not include development of the types of land uses identified by BAAQMD as typically associated with odor issues, such as wastewater treatment plants, landfills, composting facilities, refineries, or chemical plants (BAAQMD, 2012). As the 2014 LRDP would not result in development at any campus site that would be a potential source of odors, this topic will not be evaluated further in the EIR.

---

f) Exceed the LRDP EIR standard of significance by exposing receptors to toxic air contaminant emissions that (1) result in a cancer risk greater than 10 cancer cases per 1 million people exposed in a lifetime; or (2) for acute or chronic effects, result in concentrations of toxic air contaminant emissions with a Hazard Index of 1.0 or greater.

2014 LRDP

Sensitive receptors on UCSF campuses include student and faculty/staff housing, child care centers and hospitals. The 2014 LRDP would result in increased construction, traffic and operations, which would increase emissions of localized pollutants, including carbon monoxide, toxic air contaminants and particulate matter. The EIR will include a detailed analysis of increased pollutant concentrations under the 2014 LRDP (including emissions associated with the project elements at each campus site) and potential effects on sensitive receptors. If the program-level evaluation in the 2014 LRDP EIR identifies potential conflicts between the specific projects and sensitive receptors, the project-specific analyses would include additional analysis.

Parnassus Heights, Mission Bay, Mount Zion and Mission Center

The demolition of existing building at the Parnassus Heights and Mount Zion campus sites will result in emissions of diesel particulate matter (DPM), a known carcinogen. Resulting concentrations of DPM could increase cancer risks at both on-site and off-site sensitive receptors. Construction of the replacement hospital at Parnassus Heights as well as other proposed development at Mission Bay, Mount Zion and Mission Center also could expose sensitive receptors to DPM emissions. A quantitative health risk analysis of all emissions, including

emergency generators and the Central Utility Plant at Mission Bay will be conducted as part of the analysis for the LRDP EIR and will be used to determine if these elements would result in significant health risks or hazards. Additionally, potential exposure impacts to proposed new residential housing at Parnassus Heights and Mission Bay from existing sources will also be addressed in the health risk assessment conducted for the 2014 LRDP EIR.

Other UCSF Campus Sites

Other UCSF sites are being considered for closure and consolidation in the long-term and are not anticipated to result in emissions that would result in significant health risks or hazards.

5.4 Biological Resources

		2014 LRDP	Parnassus Heights					Mission Bay		Mount Zion			Mission Center	Other UCSF Campus Sites
Issues (and Supporting Information Sources):		*Land Use, Population, Space Needs,& CAP (Program)*	*Demolish 13 Existing Buildings (Project)*	*Renovate UC Hall (Project)*	*Utilities, Retaining Walls, Saunders Court & Streetscape (Project)*	*Construct Replacement Hospital (Program)*	*Renovate Moffitt & Millberry Tower (Program)*	*Remaining & Increased Entitlement (Program)*	*New Housing (Project)*	*Demolish Hellman, Brunn & Dialysis (Project)*	*Renovate Main Hospital (Program)*	*Construct Office / Research Building (Program)*	*Construct Office Building (Program)*	*No Proposed Projects or Programs*
Would the project:														
a)	Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	--	☒	--	☒	--	--	--	--	--	--	--	--	--

Biological Resources

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic.

Discussion of Potential Impacts

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

2014 LRDP

The majority of projects described under the 2014 LRDP will occur at already developed sites within an urban setting and without the presence of sensitive species or desirable habitat. The California Natural Diversity Database (CNDDB) documents 76 special status plant and wildlife species within the San Francisco North and San Francisco South U.S. Geological Survey (USGS) quadrangles, which include all UCSF campus sites for which the 2014 LRDP proposes programs or projects. Most of the species identified within these quadrangles are associated with specific habitat types, such as dunes, valley foothill grasslands, chaparral, coastal prairie, coastal bluff scrub, marshes and swamps. None of these habitats is present at the 2014 LRDP campus sites. Site-specific effects of the 2014 LRDP are considered under individual campus sites.

Parnassus Heights

Development at Parnassus Heights would not have a substantial adverse effect either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife[18] (CDFW) or U.S. Fish and Wildlife Service (USFWS). The CNDDB database documents five special status species within one mile of the project sites, however none is expected to occur within the project footprint due to lack of suitable habitat and lack of historic presence. These species include San Francisco gum plant (*Grindelia hirsutula* var. *maritima*), blue coast gilia (*Gilia capitata* ssp. *congesta*), coastal triquetrella (*Triquetrella californica*), California red-legged frog (*Rana draytonii*) and western red bat (*Lasiurus blossevillii*).

Demolition of 13 buildings as well as construction of retaining walls adjacent the Regeneration Medicine building have the potential to adversely affect nesting birds in the adjacent Mount Sutro Open Space Reserve, approximately 82% of which is comprised of mature eucalyptus (*Eucalyptus* sp.) forest as well as oak (*Quescus* sp.) woodlands and a dense understory of English ivy (*Hedra helix*) and Himalayan Blackberry (*Rubus armeniacus*). Trees and buildings in and around the project area provide suitable habitats for breeding birds. Most native, breeding birds

[18] The California Department of Fish and Game (CDFG) changed its name on January 1, 2013 to The California Department of Fish and Wildlife (CDFW). In this document, references to literature published by CDFW prior to Jan. 1, 2013 are cited as 'CDFG, [year]'. The agency is otherwise referred to by its new name, CDFW. CDFG Code remains as such and is referred to as "Code".

are protected under Section 3503 of the CDFG Code (Code), and raptors are protected under Section 3503.5 of the Code. In addition, both Section 3513 of the Code and the Federal Migratory Bird Treaty Act (16 U.S. Code, Sec. 703 Supp. I, 1989) prohibit the killing, possession, or trading of migratory birds. Finally, Section 3800 of the Code prohibits the taking of non-game birds, which are defined as birds occurring naturally in California that are neither game birds nor fully protected species. This potential impact will be analyzed and discussed further in the EIR.

Mission Bay

Development at Mission Bay campus site would not have a substantial adverse effect either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. The CNDDB database documents no sensitive species within one mile of the campus site and sensitive species habitat in the vicinity of the campus is associated with the San Francisco Bay and/or the Mission Bay China channel. Development at Mission Bay campus site would not be located on or near aquatic habitat or directly affect aquatic habitat and water-dependent, special-status species that may be present in the Mission Bay China Basin channel; thus no significant impacts on biological resources would occur. Mission Bay development will not be analyzed further under this significance criterion in the EIR.

Mount Zion

Development at Mount Zion would not have a substantial adverse effect either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. The project sites are contained within an already developed, urban setting, which lacks desirable habitat for special status species. The CNDDB database documents three special status species within one mile of the Mount Zion project sites: Franciscan manzanita (*Arctostaphylos franciscana*), Presidio Manzanita (*Arctostaphaylos Montana* ssp. *ravenii*) and Marin western flax (*Hesperolinon congestum*). None of these species are expected to occur at Mount Zion due to lack of suitable habitat and lack of historic presence; thus no significant impacts on biological resources would occur. The programs and project at Mount Zion will not be analyzed further under this significance criterion in the EIR.

Mission Center

Potential development at Mission Center includes construction of a new additional building and parking garage. This potential development would not have a substantial adverse effect either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. The site is contained within an already developed, urban setting, which lacks desirable habitat for special status species; thus no significant impacts on biological resources. Mission Center development will not be analyzed further under this significance criterion in the EIR.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?

2014 LRDP

The majority of projects described under the 2014 LRDP would occur at already developed sites within an urban setting. Small areas of oak woodland, eucalyptus forest, montane hardwood, non-native annul grassland, lacustine, riparian and freshwater emergent wetland habitat, are present within the City of San Francisco but not at or in the vicinity of the LRDP campus sites for which the 2014 LRDP proposes programs or projects. Site-specific effects of the 2014 LRDP are considered under individual campus sites.

Parnassus Heights

Development at Parnassus Heights would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the CDFW or USFWS because no riparian habitat or other sensitive natural community is mapped or identified within the campus site. Portions of the Parnassus Heights development would be adjacent to the Mount Sutro Open Space Reserve; however, the reserve is largely comprised of non-native eucalyptus forest with a non-native understory. No development is planned within the reserve or in undeveloped areas that would affect sensitive habitat; thus, there are no significant impacts on riparian or sensitive habitats. Development at Parnassus Heights will not be analyzed further under this significance criterion in the EIR.

Mission Bay

The Mission Bay campus site is contained within an urban setting and development on the existing campus site would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the CDFW or USFWS because no riparian habitat or other sensitive natural community is mapped or identified within the campus site. The program and the project would not affect the adjacent China Basin Water Channel or the San Francisco Bay; thus, there are no significant impacts on riparian or sensitive habitats. Development at Mission Bay campus site will not be analyzed further under this significance criterion in the EIR.

Mount Zion and Mission Center

The Mount Zion and Mission Center campus sites are contained within an urban setting and will not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the CDFW or USFWS because no riparian habitat or other sensitive natural community is mapped or identified within these campus sites. Development at these campus sites will not be analyzed further under this significance criterion in the EIR.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

2014 LRDP

The majority of projects described under the 2014 LRDP would occur at already developed sites within an urban setting. Some federally protected wetlands are present within the City of San Francisco but not at or in the vicinity of the LRDP campus sites for which the 2014 LRDP proposes programs or projects. Site-specific effects of the 2014 LRDP are considered under individual campus sites.

Parnassus Heights

Development at Parnassus Heights would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means because there are no jurisdictional or non-jurisdictional wetlands mapped or identified at Parnassus Heights. While some development would occur adjacent the Mount Sutro Open Space Reserve, no federally protected wetlands exist within the Reserve. No impact would occur and proposed development at Parnassus Heights will not be analyzed further under this significance criterion in the EIR.

Mission Bay

Development on the Mission Bay campus site would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means because there are no jurisdictional or non-jurisdictional wetlands

mapped or identified in the project footprint. Proposed development will not affect the adjacent China Basin Water Channel, an estuarine, deep water wetland, or the San Francisco Bay; thus there are no significant impacts on riparian or sensitive habitats. The Mission Bay campus site will not be analyzed further under this significance criterion in the EIR.

Mount Zion and Mission Center

Development at the Mount Zion and Mission Center campus sites would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means because there are no jurisdictional or non-jurisdictional wetlands mapped or identified at these campus sites. The Mount Zion and Mission Center campus sites will not be analyzed further under this significance criterion in the EIR.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

2014 LRDP

The City of San Francisco and the San Francisco Bay exists along the Pacific Flyway, a main north-south travel corridor for migrating birds extending from Alaska to Patagonia. Birds frequently stopover in desirable habitat within the City or on the Bay waters throughout migration. Development at the UCSF campus sites for which the 2014 LRDP proposes programs or projects is not expected to disrupt migrating birds or interfere with the movement of any native resident or migratory fish or other wildlife species or with established native resident or migratory corridors or nursery sites as the majority of projects described under the 2014 LRDP would occur at already developed sites within an urban setting and not in desirable habitat. Site-specific effects of the 2014 LRDP are considered under individual campus sites.

Parnassus Heights

Parnassus Heights is located adjacent to the Mount Sutro Open Space Reserve, which is desirable habitat for resident and migrating birds moving along the Pacific Flyway due to its expanse of mature trees and dense understory isolated within an urban setting. Development at the Parnassus Heights campus site is not expected to impact migrating birds as projects that could affect habitat will likely occur outside of bird-nesting season. No additional migratory corridors or wildlife

nursery sites exist within the project area. However, because effects of LRDP programs and projects on habitat cannot be ruled out, this topic will be studied in the EIR.

Mission Bay

The Mission Bay campus site is located adjacent to the San Francisco Bay, which is considered desirable habitat for resident and migratory birds moving along the Pacific Flyway. Development on the Mission Bay campus site is not expected to impact migrating birds as projects would occur on previously developed land with no desirable habitat. No impact would occur and this criterion will not be analyzed further under this significance criterion in the EIR.

Mount Zion and Mission Center

Development at the Mount Zion and Mission Center campus sites is not expected to interfere with the movement of any native resident or migratory fish or other wildlife species or with established native resident or migratory corridors or nursery sites as the sites are already developed, within an urban setting, and are not located in desirable habitat. Development at the Mount Zion and Mission Center campus sites will not be analyzed further under this significance criterion in the EIR.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

e) Conflict with any applicable policies protecting biological resources?

Pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation, including City of San Francisco General Plan policies regarding the protection of urban biological resources. City of San Francisco Planning Code Section 139, Standards for Bird-Safe Buildings, was adopted by the City in 2011. Section 139 focuses on buildings that create location-specific hazards and building feature-related hazards to birds. Location-specific hazards apply to buildings in, or within 300 feet of and having a direct line of sight to, an Urban Bird Refuge, such as "open spaces two acres and larger dominated by vegetation, including vegetated landscaping, forest, meadows, grassland, or wetlands, or open water." Section 139 requires that 90% of glazing in the "Bird Collision Zone" (60 feet above grade, plus 60 feet above an adjacent vegetated roof 2 acres or larger) be treated (fritted, stenciled, frosted, or covered with netting, screens, grids, or bird-visible UV patterns). Lighting must also be minimized, and any wind generators must comply with Planning Department requirements. Although UCSF is not subject to the standards described under this section, UCSF will strive to be consistent with the standards, where feasible.

Conflicts with biological resource policies will not be analyzed in the EIR.

---

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other applicable habitat conservation plan?

There are no adopted habitat conservation plans, natural community conservation plans, or other applicable habitat conservation plan that would be applicable to the 2014 LRDP or any of the individual projects or programs proposed under the LRDP. No impact would occur and this criterion will not be analyzed in the EIR.

---

g) Exceed the LRDP EIR standard of significance by damaging or removing heritage or landmark trees or native oak trees of a diameter specified in a local ordinance?

The San Francisco Urban Forestry Ordinance (Article 16 of the San Francisco Public Works Code) was enacted to ensure the protection of trees on private land within and adjacent to public areas. The City of San Francisco currently considers street trees, significant trees, and landmark trees as protected. Significant trees are trees within 10 feet of the public right-of-way and are either 20 feet or greater in height, 15 feet or greater in canopy width, or 12 inches or greater in trunk diameter at 4.5 feet above grade. Landmark trees are trees that have received special designation by the San Francisco Board of Supervisors due to species rareness, size, age, structure, ecological contribution, or historical and cultural importance.

2014 LRDP

The majority of projects described under the 2014 LRDP will occur at already developed sites within an urban setting and without impact to street trees, significant trees, or landmark trees. Site-specific effects of the 2014 LRDP are considered under individual campus sites.

Parnassus Heights

The LRDP programs and projects at the Parnassus Heights campus site are not expected to affect protected trees. The Parnassus Heights campus site will not be analyzed further under this significance criterion in the EIR.

Mission Bay

Development at the Mission Bay campus site would not impact protected trees as none are present. The Mission Bay campus site will not be analyzed further under this significance criterion in the EIR.

Mount Zion and Mission Center

Development at the Mount Zion and Mission Center campus sites is not expected to impact protected trees as the sites are already developed, with few street trees, and no landmark or

significant trees are present. While the removal of protected trees on private land is not prohibited under the ordinance described above, a permit would be required from the Department of Public Works. Development at these campus sites will not be analyzed further under this significance criterion in the EIR.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

Cultural Resources

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic. The significance criteria standards for impacts are further explained and defined below.

Public Resources Code (PRC), Section 5020.1 and *CEQA Guidelines* Section 15064.5(b)(1) define a significant impact to historical resources as one that would materially impair the significance of an historical resource. According to *CEQA Guidelines* Section 15064.5(b)(2), material impairment of a resource's historic significance could result if the project would:

- Demolish or materially alter in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the California Register of Historic Resources; or
- Demolish or materially alter in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to local ordinance or resolution (PRC Section 5020.1[k]), or its identification in an historical resources survey meeting the requirements of PRC Section 5024.1(g) unless a preponderance of evidence establishes that the resource is not historically or culturally significant; or
- Demolish or materially alter in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility

Generally, a project that follows the Secretary of the Interior's guidelines will be considered mitigated to a less than significant level, according to *CEQA Guidelines* Section 15064.5(b)(3).

CEQA Guidelines Section 15064.5(c) applies to effects on archaeological sites. Effects on non-unique archaeological resources are not considered significant. Regarding unique archaeological resources, lead agencies may require that reasonable efforts be made to permit such resources to be preserved in place or left in an undisturbed state. To the extent that unique archaeological resources are not preserved in place or not left undisturbed, mitigation measures to protect such resources are required (PRC Section 21083.2[c]). In addition, mitigation measures may be imposed to make provisions for archaeological sites accidentally discovered during construction. With the imposition of mitigation measures, effects on archaeological resources generally would be reduced to a level of non-significance.

Several sections of the Public Resources Code protect paleontological resources. Public Resources Code Section 5097.5 prohibits "knowing and willful" excavation, removal, destruction, injury and defacement of any paleontological feature on public lands (lands under state, county, city, district, or public authority jurisdiction, or the jurisdiction of a public corporation), except where the agency with jurisdiction has granted permission.

Under State law, human remains and associated burial items may be significant resources in two ways: they may be significant to descendent communities for patrimonial, cultural, lineage and religious reasons and human remains may also be important to the scientific community, such as

archaeologists, epidemiologists and physical anthropologists. The specific stake of some descendent groups in ancestral burials is a matter of law for some groups, such as Native Americans (*CEQA Guidelines* Section 15064.5 [d], PRC Section 5097.98). In other cases, the concerns of the associated descendent group regarding appropriate treatment and disposition of discovered human burials may become known only through outreach. Beliefs concerning appropriate treatment, study and disposition of human remains and associated burial items may be inconsistent and even conflictual between descendent and scientific communities. CEQA and other State regulations concerning Native American human remains provide the following procedural requirements to assist in avoiding potential adverse effects to human remains within the contexts of their value to both descendents communities and the scientific community:

- When an initial study identifies the existence or probable likelihood that a project would impact Native American human remains, the lead agency is to contact and work with the appropriate Native American representatives identified through the Native American Heritage Commission (NAHC) to develop an agreement for the treatment and disposal of the human remains and any associated burial items (*CEQA Guidelines* Section 15064.5 (d), PRC Section 5097.98).
- If human remains are accidentally discovered, the county coroner must be contacted. If the county coroner determines that the human remains are Native American, the coroner must contact the NAHC within 24 hours. The NAHC must identify the most likely descendant (MLD) to provide for the opportunity to make recommendations for the treatment and disposal of the human remains and associated burial items. If the MLD fails to make recommendations within 48 hours of notification or the project applicant rejects the recommendations of the MLD, the Native American human remains and associated burial items must be reburied in a location not subject to future disturbance within the project site (PRC Section 5097.98).
- If potentially affected human remains/burial may have scientific significance, whether or not having significance to Native Americans or other descendent communities, then under CEQA, the appropriate mitigation of effect may require the recovery of the scientific information of the remains/burial through identification, evaluation, data recovery, analysis and interpretation (*CEQA Guidelines* Section 15064.5[c][2]).

Discussion of Potential Impacts

a) Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5?

2014 LRDP

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed LRDP programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

The Parnassus Heights campus site is the oldest of the UCSF campus sites, having begun in 1896 as the Affiliated Colleges, and contains numerous buildings and structures that are listed in, or are eligible for listing in, the California Register of Historical Resources (CRHR). The proposed

project at Parnassus Heights would demolish 13 buildings and structures in furtherance of the space ceiling program, would include various open space projects, as well as utilities and infrastructure projects. Other buildings on the campus would be altered and renovated for new uses. All of these actions have the potential to demolish or materially alter in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the CRHR. Some of the buildings and structures proposed for demolition at the Parnassus Heights campus site have been previously evaluated and determined ineligible for listing in the CRHR,[19] and will not be further addressed in the EIR, while others are currently unevaluated (i.e., their historic status is unknown), or were evaluated over 10 years ago, and would require further analysis in the EIR. **Table 4**, below, provides breakdown of those LRDP actions at Parnassus Heights which will be addressed in the EIR, and those which will have no further discussion.

Mission Bay

Mission Bay is a recently-developed campus which contains no buildings or structures listed in or eligible for listing in the CRHR. Blocks 15, 16, 18, 23 and 25B at Mission Bay campus site are undeveloped lots, and proposed construction of buildings under the remaining and increased entitlements or for new housing at this location would have no potential to impact historic resources. As such, construction at Mission Bay will not be addressed in EIR.

Mount Zion

There are three projects at Mount Zion which have the potential to impact historic resources. This includes demolition of three buildings; Hellman, the Harold Brunn Institute and the Dialysis Center Buildings. Built in 1913, Hellman is the oldest building at the Mount Zion campus site. This building was evaluated in 2003 and determined eligible for listing in the CRHR, and as such, it is considered a historic resource for CEQA purposes.[20] Proposed demolition of this structure will be addressed in EIR. Historic American Building Survey (HABS) documentation of the Hellman Building was previously completed by Page & Turnbull in 2006.[21]

The Harold Brunn Institute and the Dialysis Center buildings, built in 1914 and 1962, respectively, were evaluated in 2003 and were determined ineligible for listing in the CRHR.[22] Although this evaluation was completed 10 years ago, a reconnaissance-level pedestrian survey by an ESA architectural historian in July, 2013, found no physical changes to the buildings or other information which would indicate a change in their original significance determination. As these buildings are not considered historic resources, their demolition would have no significant impact to historic resources, and these actions will not be addressed further in the EIR.

TABLE 4
PARNASSUS HEIGHTS CAMPUS PROJECTS TO BE ADDRESSED IN THE EIR

Project Component	Historic Status	To Be Addressed in EIR? (Y/N)
Renovation and Conversion Projects:		
Renovate and reuse UC Hall for residential use	Built in 1917. Determined eligible in 2003 and again in 2011. Identified as a historic resource. Plans for adaptive reuse, including compliance with the Secretary of the Interior's Standards, will be evaluated in EIR.	Y
Conversion of Millberry Union towers to residential use	Built in 1955. Determined eligible in 2011. A potential historic resource. Conversion project will be addressed in EIR.	Y
Renovate Moffitt Hospital	Built in 1955. Determined ineligible in 2003. Not considered a historic resource. Backfilling Moffitt Hospital after 2030 with hospital support and other uses would have no impact on historic resources. This project will not be addressed further in the EIR.	N
Demolition of 13 structures in furtherance of the space ceiling policy:		
Surge	Built in 1966. Determined eligible in 2011. Considered a historic resource. Demolition will be addressed in EIR	Y
Woods	Built in 1962. Determined ineligible in 2011. Not considered a historic Resource. Demolition will not be addressed further in EIR	N
Medical Research 4	Built in 1944, remodeled 1960. Determined ineligible in 2003. Building will be reevaluated, and demolition will be addressed in EIR	Y
Laboratory of Radiobiology	Built in 1949-78. Evaluated in 2003 and determined ineligible, but will be reevaluated and addressed in EIR	Y
Three buildings at the Aldea Housing complex	Built in 1960. Determined eligible in 2011. Considered historic resources. Demolition will be addressed in EIR	Y
Koret Vision Research building	Built in 1986. Will not reach 50 yr age threshold old by 2035, and is not be considered a historic resource. Demolition will not be addressed further in EIR.	N
Environmental Health and Safety (EH&S) office building	Built in 1971. Determined ineligible in 2011. Not considered a historic resource. Demolition will not be addressed further in EIR.	N
Proctor Foundation building	Built in 1956. Determined ineligible in 2003, but will be reevaluated and addressed in EIR	Y
Langley Porter Psychiatric Institute (LPPI) building	Built in 1941. Determined ineligible in 2003, but will be reevaluated and addressed in EIR.	Y
Two LPPI support structures	Built in 1964 and 1979. Determined ineligible in 2011. Not considered historic resources. Demolition of these buildings will not be addressed further in the EIR	N

Construction of the office/research building, or renovation and reuse of the existing hospital, built in the mid-1960s and expanded and renovated numerous times in the last 30 years, would have no impacts to historic resources. As such, the new construction and the renovation and reuse will not be addressed further in the EIR.

Mission Center

The Mission Center Building was constructed in 1928, and was determined eligible for listing in the CRHR.[23] Under the LRDP, the Mission Center Building would remain, however, potential new construction would occur in the adjacent parking lot. Potential impacts of the adjacent new construction on this building, as well as the historic district as a whole, will be addressed in the EIR.

Other UCSF Campus Sites

None of the buildings at the other UCSF Campus sites have been identified as historic resources in previous studies, with the exception of the Laurel Heights Building at 3333 California Street. Built between 1955 and 1966, this building was determined eligible for listing in CRHR an excellent example of mid-century Modernism and the International Style (Carey & Co, 2011). No near-term changes are currently proposed at Laurel Heights. UCSF is exploring long-term opportunities for relocating Laurel Heights functions and disposing of the site as part of its site consolidation strategy. As described in the Project Description of this Initial Study, any private developer of the Laurel Heights campus site will comply separately with CEQA with the City as the lead agency at the time that this future project is proposed. Therefore, this potential action is not included as part of the LRDP, and will not be addressed in the EIR.

---

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed LRDP programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites. Preliminary research suggests that the Parnassus Heights and Mount Zion campus sites have a low archaeological sensitivity and/or there is substantial modern ground disturbance that would have destroyed any possible remains, however the potential for uncovering archaeological resources cannot be entirely discounted. Preliminary research suggests that the Mission Bay and Mission Center campus sites have a high sensitivity to contain significant archaeological deposits and/or features from both prehistoric and historic-period use and occupation. The 2014 LRDP EIR will analyze effects resulting from these programs and projects at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

[23] City of San Francisco, *Showplace Square/Northeast Mission Historic Resource Survey*, www.sf-planning.org/index.aspx?page=2666.

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

2014 LRDP

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites. Preliminary research suggests there may be the potential for the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites to contain paleontological resources. The EIR will analyze effects resulting from programs and projects at these campus sites.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

d) Disturb any human remains, including those interred outside of formal cemeteries?

2014 LRDP

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites. Preliminary research suggests that the Parnassus Heights and Mount Zion campus sites have a low sensitivity for the discovery of human remains and/or there is substantial modern ground disturbance that would have destroyed any possible remains, however the potential for uncovering human remains cannot be entirely discounted. Preliminary research suggests that the Mission Bay and Mission Center campus sites have a high sensitivity for the discovery of both prehistoric and historic-period human remains. The 2014 LRDP EIR will analyze effects resulting from these programs and projects at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

Geology, Soils and Seismicity

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic.

Discussion of Potential Impacts

a.i) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

2014 LRDP

The San Francisco Bay Area contains both active and potentially active faults and is considered a region of high seismic activity. The nearest known active fault is the San Andreas fault, which near San Francisco trends offshore north of Colma, and continues northwest through the Pacific Ocean approximately six miles due west of the Golden Gate Bridge. Multiple other active faults are located within 50 miles of the city, including the Calaveras, Hayward and San Gregorio faults. The San Andreas Fault system has been the source of numerous moderate to large magnitude historical earthquakes that caused strong ground shaking in the project area, including the 1906 San Francisco and 1989 Loma Prieta earthquakes. Future strong ground shaking from nearby large-magnitude earthquakes is a virtual certainty and should be a consideration in the design of the new project facilities and components. The current version of the California Building Code (CBC) is the 2007 edition, which is based on the 2006 International Building Code, with the incorporation of additional requirements for seismic design of structures. The guiding principle (Basic Policy) of the UC Seismic Safety Policy is "to acquire, build, maintain, and rehabilitate buildings and other facilities which provide an acceptable level of earthquake safety." With adherence to the UC Seismic Safety Policy, any new or renovated structures would be designed and constructed to current seismic standards.

All of the potential effects from fault rupture occur only as a result of activities that occur at specific campus sites, as a result of proposed LRDP programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

The Parnassus Heights campus site is located on a bedrock outcrop of the Franciscan Complex, a mix of chert, greenstone, meta-sandstone and shale. The campus is not within an Alquist-Priolo Special Studies zone, but it is subject to ground shaking in the event of an earthquake. The proposed demolition, construction, utilities/retaining walls/streetscaping work and renovation activities at the Parnassus Heights campus site could expose persons or structures to loss, injury, or death due to rupture of a known earthquake fault. The 2014 LRDP EIR will assess the potential for substantial adverse effects resulting from fault rupture.

Mission Bay

The Mission Bay campus site is underlain by a mélange of native alluvium, dune sands and weathered rocks of the Franciscan Complex as well as artificial fill that was placed at the site around the turn of the 20th century. The campus site is not within an Alquist-Priolo Special Studies zone, but it is subject to ground shaking in the event of an earthquake. Proposed entitlement and housing development activities at the Mission Bay campus site could expose persons or structures to loss, injury, or death due to rupture of a known earthquake fault. The 2014 LRDP EIR will assess the potential for substantial adverse effects resulting from fault rupture.

Mount Zion

The Mount Zion campus site is underlain by sands and sandstones of the Franciscan Complex. The campus site is not within an Alquist-Priolo Special Studies zone, but it is subject to ground shaking in the event of an earthquake. Proposed demolition, renovation and construction activities at the Mount Zion campus site could expose persons or structures to loss, injury, or death due to rupture of a known earthquake fault. The 2014 LRDP EIR will assess the potential for substantial adverse effects resulting from fault rupture.

Mission Center

The Mission Center campus site is underlain by sands and sandstones of the Franciscan Complex. The campus site is not within an Alquist-Priolo Special Studies zone, but it is subject to ground shaking in the event of an earthquake. Proposed construction activities at the Mission Center campus site could expose persons or structures to loss, injury, or death due to rupture of a known earthquake fault. The 2014 LRDP EIR will assess the potential for substantial adverse effects resulting from fault rupture.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

a.ii) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?

See a.i), above. The entire City of San Francisco, including Parnassus Heights, Mission Bay, Mount Zion and Mission Center are located in an area with a high probability of exceeding peak horizontal ground motion, as mapped by the CGS Probabilistic Seismic Hazard Assessment (CGS 2008). Proposed activities at the campus sites could put people or structures at risk of loss, injury,

or death involving strong seismic ground shaking. The 2014 LRDP EIR will assess the potential for substantial adverse effects resulting from strong seismic ground shaking.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

a.iii) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction?

2014 LRDP

Liquefaction is the process by which saturated, generally unconsolidated soils behave in a semi-solid or liquid manner due to seismic activity. All of the potential effects due to liquefaction occur only as a result of activities that occur at specific campus sites, as a result of LRDP proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

The CGS has mapped the Parnassus Heights campus site as having a low risk of liquefaction from seismic ground shaking. Nevertheless, the campus site is located within the City's Special Geologic Area for potential ground failure hazards. Proposed entitlement and housing development activities at the Parnassus Heights campus site could affect exposure of persons or structures to loss, injury, or death due to seismic-related ground failure, including liquefaction. The 2014 LRDP EIR will assess the potential for substantial adverse effects resulting from seismic-related ground failure.

Mission Bay

The CGS has mapped the Mission Bay campus site as having a moderate to high risk of liquefaction from seismic ground shaking, and the campus is located within the City's Special Geologic Area for potential ground failure hazards. Proposed entitlement and housing development activities at the Mission Bay campus site could affect exposure of persons or structures to loss, injury, or death due to seismic-related ground failure, including liquefaction. As the Mission Bay campus site has developed, UCSF has been implementing a long-term program of surcharging to reduce the potential for any land subsidence or potential for liquefaction. Proposed development at Mission Bay, and the surrounding area adjacent to these areas, would likely be surcharged before any future construction. The 2014 LRDP EIR will assess the potential for substantial adverse effects resulting from seismic-related ground failure and liquefaction.

Mount Zion

The CGS has mapped the Mount Zion campus site as having a moderate risk of liquefaction from seismic ground shaking. Proposed demolition, renovation and construction activities at the Mount Zion campus site could affect exposure of persons or structures to loss, injury, or death due to seismic-related ground failure, including liquefaction. The 2014 LRDP EIR will assess the potential for substantial adverse effects resulting from seismic-related ground failure and liquefaction.

Mission Center

The CGS has mapped the Mission Center campus site as having a moderate to high risk of liquefaction from seismic ground shaking, and the building is located within the City's Special Geologic Area for potential ground failure hazards. Proposed construction activities at the Mission Center campus site could affect exposure of persons or structures to loss, injury, or death due to seismic-related ground failure, including liquefaction. The 2014 LRDP EIR will assess the potential for substantial adverse effects resulting from seismic-related ground failure and liquefaction.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

a.iv) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?

2014 LRDP

Landslides occur when slopes suddenly move from a stable to unstable condition, and can be triggered by a broad range of conditions including seismic activity, surface water runoff, groundwater conditions, and more. All of the potential effects due to landslides occur only as a result of activities that occur at specific campus sites, as a result of proposed LRDP programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

The Parnassus Heights campus site is located within the City's Special Geologic Area for potential ground failure hazards and the CGS Seismic Hazard Zone for landslides. The proposed demolition, construction, utilities/retaining walls/streetscaping work, and renovation activities at the Parnassus Heights campus site could affect exposure of persons or structures to loss, injury, or death due to landslides. The 2014 LRDP EIR will assess the potential for substantial adverse effects resulting from landslides.

Mission Bay, Mount Zion and Mission Center

The remaining UCSF campuses are not mapped in hazard zones for landslides. There are no proposed projects or programs at these sites that could affect the potential for substantial adverse effects resulting from landslides. No impact would occur and this criterion will not be analyzed in the EIR for these campus sites.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

b) Result in substantial soil erosion or the loss of topsoil?

See Section 5.9, Hydrology and Water Quality, below. The proposed demolition, construction and utilities/retaining walls/streetscaping work at the Parnassus Heights campus site as well as development activities at the Mission Bay, Mount Zion, and Mission Center campus sites could potentially generate surface water runoff that could lead to substantial soil erosion or the loss of topsoil. Section 5.9 discusses the Stormwater Pollution Prevention Programs (SWPPPs) and Best Management Practices (BMPs) aimed at minimizing or preventing erosion and loss of topsoil. The 2014 LRDP EIR will assess the potential for substantial soil erosion and loss of topsoil from proposed activities.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

See a), above. The UCSF campus sites, particularly Parnassus Heights and Mission Bay, are located on geologic units and soils that could become unstable as a result of proposed activities. The 2014 LRDP EIR will assess the potential for substantial harm resulting from geologic and soil instability, including on- or off-site landslides, lateral spreading, subsidence, liquefaction, or collapse.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994) (California Building Code), creating substantial risks to life or property?

Expansive soils are defined as those that shrink when dry and swell when moist; they typically contain a high proportion of clay particles. In general, soils in San Francisco are not expansive, and past geotechnical investigations at the UCSF campus sites have not revealed the presence of expansive soils. As described above, the University requires all new facilities to adhere to the current CBC, which includes detailed provisions to ensure that the design of new facilities is appropriate to site soil conditions, including requirements to address expansive and otherwise problematic soils. With adherence to the CBC, impacts related to site soil conditions due to proposed 2014 LRDP activities – including but not limited to expansive soils, if any are present – would be less than significant.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

The 2014 LRDP does not propose any activities that would require the utilization of septic systems or alternative wastewater disposal systems. Therefore, there are no anticipated adverse effects from wastewater disposal associated with any of the programs or projects proposed by the 2014 LRDP and this criterion will not be analyzed in the EIR.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated

buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

f) Exceed the LRDP EIR standard of significance by exposing people to structural hazards in an existing building rated Level V (Poor), or Level VI (Very Poor), under the University's seismic performance rating system, or substantial nonstructural hazards?

2014 LRDP

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights and Mount Zion

Proposed renovations of UC Hall, Moffitt Hospital and Millberry Union towers at Parnassus Heights, and the main hospital at Mount Zion, would be analyzed in the EIR for this criterion.

Other UCSF Campus Sites

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

Greenhouse Gas Emissions

Standards of Significance

The BAAQMD has published significance thresholds in the *BAAQMD CEQA Air Quality Guidelines*[24] in order to identify projects that would individually and cumulatively have significant impact on local air quality. Proposed projects that do not exceed the thresholds would not be considered as having a significant impact on the attainment of air quality goals and would therefore be consistent with the current air quality plan. The guidelines also provide guidance and significance thresholds for evaluating the impact of a project's greenhouse gas (GHG) emissions.

Significance thresholds established by the BAAQMD for GHG emissions are listed below in **Table 5**, Summary of BAAQMD GHG CEQA Significance Thresholds.

TABLE 5
SUMMARY OF BAAQMD GHG CEQA SIGNIFICANCE THRESHOLDS

	2011 Construction-Related Thresholds of Significance	2011 Operational Thresholds of Significance
		Annual Emissions (Metric tons CO_2e/year)
Greenhouse Gases		
Project Level Bright line Threshold	N.A.	1,100
Project Level Efficiency Threshold	N.A.	4.6 per service population
Plan Level Efficiency Threshold	N.A.	6.6 per service population
Stationary Source Threshold	N.A.	10,000

SOURCE: BAAQMD, 2011.

The guidelines recommend only quantifying and reporting GHG emissions from construction activities, and do not provide significance thresholds. Operational emissions may be compared to an absolute threshold of 1,100 metric tons of carbon dioxide equivalents per year (CO_2e/yr) or an efficiency standard of 4.6 metric tons CO_2e/yr for each Service Person (residents plus employees) associated with the proposed project. A third option is compliance with a qualified GHG reduction strategy. A qualified GHG reduction strategy is an element of the proposed 2014 LRDP. For stationary-source projects, the threshold is 10,000 metric tons CO_2e/yr. Stationary-source projects include land uses that accommodate processes and equipment, such as a back-up diesel generator, that would emit GHG emissions and require a BAAQMD permit to operate.

As discussed above in Section 5.2, *Air Quality*, these BAAQMD thresholds are in dispute and are not being recommended for use by the BAAQMD. However, the University has examined the information in the District's guidelines and other evidence and has determined that it will use the District's efficiency threshold to evaluate the impacts of the proposed project. The overall

[24] Bay Area Air Quality Management District, *BAAQMD CEQA Air Quality Guidelines*, Updated May 2011.

regulatory basis for greenhouse gas emission control in California is Assembly Bill 32 (AB 32), which was signed into law in 2006. AB 32 requires overall greenhouse gas emissions rates in California to be reduced to match 1990 emission rates by the year 2020. The responsibility for meeting these goals lies with the local air districts, including the BAAQMD. Accordingly, the BAAQMD developed the thresholds presented in Table 5 to meet the requirements of AB 32 using the emissions sources and growth projections for the Bay Area. Based on land use GHG emissions targets and population and employment projections, the GHG threshold of 4.6 metric tons CO_2e/yr for each Service Person represents an emission rate at which the Bay Area would meet its AB 32 goals. As the technical work supporting the thresholds has not been challenged in the court decision on the validity of the thresholds, it is assumed that the thresholds are still relevant for demonstrating compliance with AB 32 and thus a suitable measure of significance for the proposed 2014 LRDP.

Further, other air districts in California have proposed similar efficiency thresholds, specifically the South Coast Air Quality Management District and the Monterey Bay Unified Air Pollution Control District. The South Coast Air Quality Management District has draft CEQA guidelines for greenhouse gases that include an efficiency threshold of 4.8 metric tons CO_2e/yr per Service Person. The Monterey Bay Unified Air Pollution Control District has proposed and is currently considering an efficiency threshold of 6.6 metric tons CO_2e/yr per Service Person for long-range development plans and 4.6 metric tons CO_2e/yr per Service Person for land use development projects. Therefore, there is substantial evidence to support the use of the efficiency threshold of 6.6 metric tons CO_2e/yr per Service Person for the LRDP at the Plan level and 4.6 metric tons CO_2e/yr per Service Person at the project level for individual elements; these thresholds will be applied to evaluate the GHG emission impacts of the LRDP.

Discussion of Potential Impacts

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

2014 LRDP

The 2014 LRDP EIR will examine the overall Plan-wide incremental increase in vehicle and stationary source GHG emissions with respect to the Plan-level GHG threshold of 6.6 metric tons of CO_2e per year per Service Person.

Parnassus Heights

The demolition of 13 existing buildings at the Parnassus Heights campus site will result in short-term construction-related GHG emissions, which will be quantified in the LRDP EIR. Some of the buildings to be demolished have older air conditioning units with high leakage rates for refrigerants and replacement of these structures would result in a decrease in refrigerant GHG emissions. Emissions associated with operation of the replacement hospital would be assessed. The 2014 LRDP EIR will examine the increase in operational emissions associated with proposed changes at the Parnassus Heights campus site with respect to the project-level GHG threshold of 4.6 metric tons of CO_2e per year for each Service Person potential.

Mission Bay

1.45 million gsf of development may be developed at the Mission Bay campus site by 2035. GHG emissions associated with construction and operation of the Phase 2 hospital could also exceed BAAQMD thresholds based on the size (square footage) of the proposed building that exceeds the size-based screening criteria for hospital uses contained in BAAQMD's 2011 CEQA Guidelines for both operational GHG emissions. The 2014 LRDP EIR will examine the increase in operational emissions associated with proposed changes at the Mission Bay campus site with respect to the project-level GHG threshold of 4.6 metric tons of CO_2e per year for each Service Person potential.

Mount Zion

The demolition of three existing buildings at the Mount Zion campus site will result in temporary construction-related GHG emissions which will be quantified in the 2014 LRDP EIR. Potential development of the Mount Zion campus site would include building(s) of up to approximately 257,300 gsf and up to 185 parking stalls. Quantitative analysis of all emissions will be conducted as part of the analysis for the LRDP EIR and will be used to determine if these elements would result in significant GHG emissions.

Mission Center

Potential development of the Mission Center campus site would include a medical office structure of approximately 100,000 gsf and a 294-stall parking garage. Quantitative analysis of all emissions will be conducted as part of the analysis for the LRDP EIR and will be used to determine if these elements would result in significant GHG emissions.

Other UCSF Campus Sites

No projects or programs are proposed at other UCSF campus sites. There would be no change in GHG emissions.

---

b) Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?

2014 LRDP

The 2014 LRDP will include a GHG reduction strategy. The GHG reduction strategy will include measures that can be applied to individual projects, as appropriate, with the goal of limiting and/or incrementally reducing or offsetting the University's GHG emissions over time. The University intends to use the GHG reduction strategy (and the LRDP EIR analysis of the GHG reduction strategy) to provide coverage for the LRDP as a whole and for individual projects that may arise over the course of the LRDP, to the horizon year 2035 and its GHG threshold of 6.6 metric tons of CO_2e per year potential. The LRDP EIR will qualitatively discuss this strategy as a means of demonstrating that individual LRDP projects and programs would not conflict with plans, policies, or regulations adopted for the purpose of reducing GHGs.

Parnassus Heights

The 2014 LRDP EIR will qualitatively discuss how the demolition of 13 existing buildings at Parnassus Heights would be consistent with the UCSF GHG reduction strategy and therefore, would not conflict with plans, policies, or regulations adopted for the purpose of reducing GHGs.

Mission Bay

The 2014 LRDP EIR will qualitatively consider whether the additional Mission Bay development not entitled under the existing LRDP, as well as construction of the new residential project, would be consistent with the UCSF GHG reduction strategy and therefore, would not conflict with plans, policies, or regulations adopted for the purpose of reducing GHGs.

Mount Zion

The 2014 LRDP EIR will qualitatively discuss whether the demolition of three existing buildings at the Mount Zion campus site would be consistent with the UCSF GHG reduction strategy and therefore, would not conflict with plans, policies, or regulations adopted for the purpose of reducing GHGs.

Mission Center

Potential development at Mission Center would include an office building and parking garage. The 2014 LRDP EIR will qualitatively discuss whether this development at Mission Center would be consistent with the UCSF GHG reduction strategy and therefore, would not conflict with plans, policies, or regulations adopted for the purpose of reducing GHGs

Other UCSF Campus Sites

No projects or programs are proposed at other UCSF campus sites. There would be no change in GHG emissions.

5.8 Hazards and Hazardous Materials

		2014 LRDP	Parnassus Heights					Mission Bay		Mount Zion			Mission Center	Other UCSF Campus Sites
Issues (and Supporting Information Sources):		Land Use, Population, Space Needs,& CAP (Program)	Demolish 13 Existing Buildings (Project)	Renovate UC Hall (Project)	Utilities, Retaining Walls, Saunders Court & Streetscape (Project)	Construct Replacement Hospital (Program)	Renovate Moffitt & Millberry Tower (Program)	Remaining & Increased Entitlement (Program)	New Housing (Project)	Demolish Hellman, Brunn & Dialysis (Project)	Renovate Main Hospital (Program)	Construct Office / Research Building (Program)	Construct Office Building (Program)	No Proposed Projects or Programs

Topics to be analyzed in the 2014 LRDP EIR are indicated: ☒

Topics that do not require additional analysis beyond that provided in the Initial Study are indicated: --

This page intentionally left blank

Hazards and Hazardous Materials

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic.

Discussion of Potential Impacts

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

All of the potential effects regarding hazardous materials would occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. The 2014 LRDP EIR will analyze effects resulting from these programs and projects at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

There are no public use airports within two miles of the City of San Francisco. Both San Francisco International Airport and Oakland International Airport are over five miles from the City limit. No impact would occur and this criterion will not be discussed in the EIR.

---

f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

The only UCSF campus site within two miles of a private airstrip is Mission Bay. On completion of the current construction, UCSF will operate an active helipad at the UCSF Medical Center at Mission Bay. The proposed facilities that would be closest to this helipad will be the proposed buildings constructed under the remaining and increased entitlement, including the new housing at the Mission Bay campus site. The 2014 LRDP EIR will address operational heliport effects only at the Mission Bay campus site. No impact would occur at other campus sites.

---

g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Development under the 2014 LRDP could potentially exceed the UCSF emergency response capabilities, which could impair implementation of its emergency response plan or emergency evacuation plan. The 2014 LRDP EIR will characterize the UCSF emergency response plans and capabilities, and will assess the effects of growth under the LRDP on UCSF's ability to manage emergencies in a campus-wide context as well as specifically related to proposed development at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

The Mount Sutro Open Space Reserve Management Plan at Parnassus Heights indicates that, as with any monocultural (i.e. single species) forest, the trees of the reserve are particularly prone to widespread disease and wildfire. The use of heavy construction equipment during demolition and construction activities adjacent to the reserve could increase the risk of fire. This criterion will be evaluated only for the Parnassus Heights campus site in the 2014 LRDP EIR.

Hydrology and Water Quality

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic. Standard mitigation includes preparation of a Storm Water Pollution Prevention Plan (SWPP) when required, including Best Management Practices to avoid erosion and minimize sedimentation.

Discussion of Potential Impacts

a) Violate any water quality standards or waste discharge requirements?

2014 LRDP

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed LRDP programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

Surface water runoff from the Parnassus Heights campus site drains into a combined storm drain system that flows to the City's Oceanside Water Pollution Control Plant (OWPCP) at Ocean Beach on the City's western shoreline. OWPCP has a permit from the National Pollutant Discharge Elimination System (NPDES) program administered by the Regional Water Quality Control Board (RWQCB) that regulates discharge from the plant to the Pacific Ocean. The OWPCP meets all the dry- and wet-weather effluent discharge standards described in NPDES Permit No. CA0037681 and State Water Resources Control Board (SWRCB) Water Quality Order No. R2-2009-0062.

The proposed demolitions, construction, utilities/retaining walls/streetscaping work and renovation activities at the Parnassus Heights campus site could potentially generate surface water runoff with elevated levels of sediment and urban contaminants such as oil, grease, metals, pesticides, herbicides and entrained dust. This runoff could violate water quality standards and/or waste discharge requirements established in the NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities, Permit No. CAS000002 and SWRCB Water Quality Order No. 2009-0009-DWQ. Under this permit, the proposed activities at the Parnassus Heights campus site would necessitate development of a Stormwater Pollution Prevention Plan (SWPPP) that establishes Best Management Practices (BMPs) to protect storm water quality. Subsequent amendments to this permit (SWRCB Water Quality Orders No. 2010-0014-DWQ and 2012-0006-DWQ) specify post-construction runoff reduction requirements. The San Francisco Public Utilities Commission (SFPUC), which operates the combined sewer system, has developed a suite of design solutions for construction projects (the *San Francisco Stormwater Design Guidelines*, published in 2009) aimed at achieving compliance with stormwater management requirements; it is expected that work initiated under the LRDP will satisfy these guidelines.

The 2014 LRDP EIR will characterize Parnassus Heights campus site stormwater runoff and wastewater discharge, identify applicable water quality standards and waste discharge requirements, and evaluate the compliance of the 2014 LRDP with applicable standards and/or requirements. The 2014 LRDP EIR will also address the project-specific water quality effects associated with the proposed activities at the Parnassus Heights campus site.

Mission Bay

Unlike the other areas covered in the 2014 LRDP, the Mission Bay campus site has its own storm drain system separate from the combined sewer system in most of the rest of the City. This system is classified as a Municipal Separate Storm Sewer System, more commonly known as an "MS4," and is regulated under a different NPDES General Permit, No. CAS000004, and SWRCB Water Quality Order No. 2003-0005-DWQ.

The proposed remaining and increased entitlement and the housing development activities at the Mission Bay campus site could potentially generate surface water runoff with elevated levels of sediment and urban contaminants such as oil, grease, metals, pesticides, herbicides and entrained dust. This runoff could violate water quality standards and/or waste discharge requirements established in the MS4 Permit as well as the NPDES General Permit for Construction described above. Development at Mission Bay will also necessitate development of an SWPPP with appropriate BMPs; it is also anticipated that the SFPUC *Stormwater Design Guidelines* will be integrated in this location as well.

The 2014 LRDP EIR will characterize Mission Bay stormwater runoff and wastewater discharge, identify applicable water quality standards and waste discharge requirements, and evaluate if the 2014 LRDP would result in violation of applicable standards and/or requirements. The 2014 LRDP EIR will also address the project-specific water quality effects associated with the proposed activities at the Mission Bay campus site.

Mount Zion

Surface water runoff from the Mount Zion campus site drains into a combined storm drain system that flows to the City's Southeast Water Pollution Control Plant.

The 2014 LRDP EIR will characterize Mount Zion campus site stormwater runoff and wastewater discharge, identify applicable water quality standards and waste discharge requirements, and evaluate the compliance of the 2014 LRDP with applicable standards and/or requirements. The 2014 LRDP EIR will also address the project-specific water quality effects associated with the proposed activities at the Mount Zion campus site.

Mission Center

Surface water runoff from the Mission Center campus site drains into a combined storm drain system that flows to the City's Southeast Water Pollution Control Plant.

The 2014 LRDP EIR will characterize Mission Center campus site stormwater runoff and wastewater discharge, identify applicable water quality standards and waste discharge

requirements, and evaluate the compliance of the 2014 LRDP with applicable standards and/or requirements. The 2014 LRDP EIR will also address the project-specific water quality effects associated with the proposed activities at the Mission Center campus site.

Other UCSF Campus Sites

There are no proposed projects or programs at other UCSF campus sites that could violate water quality standards or waste discharge requirements.

---

b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

None of the proposed projects under the 2014 LRDP will result in groundwater extraction or otherwise affect groundwater resources. No impact would occur and this criterion will not be discussed in the EIR.

---

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off site?

2014 LRDP

Implementation of the 2014 LRDP would not alter the course of a stream or river. However, development under the 2014 LRDP would alter drainage patterns of campus sites (during and/or after ground-disturbing activities), which could result in increased potential for erosion or siltation. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

The proposed demolition of 13 buildings, utilities/retaining walls/streetscaping work, and replacement hospital construction at Parnassus Heights would change drainage patterns and could potentially result in erosion and siltation off-site. The 2014 LRDP EIR will evaluate potential impacts related to increased erosion and siltation, and address the project-specific effects on drainage patterns and erosion associated with these projects.

The proposed renovation of UC Hall, Moffitt Hospital and the Millberry Union towers would not result in any changes to drainage patterns, and as such will have no impact on erosion or siltation off-site

Mission Bay

The proposed entitlement/housing development at Mission Bay would change drainage patterns and could potentially result in erosion and siltation on- or off-site. The 2014 LRDP EIR will evaluate potential impacts related to increased erosion and siltation, and address the project-specific effects on drainage patterns and erosion associated with these projects.

Mount Zion

The proposed demolition of the Hellman, Brunn and Dialysis buildings as well as the proposed construction of an office/research building would change drainage patterns and could potentially result in erosion and siltation on- or off-site. The 2014 LRDP EIR will evaluate potential impacts related to increased erosion and siltation, and address the project-specific effects on drainage patterns and erosion associated with these projects.

The proposed renovation of the main hospital at Mount Zion would not result in any changes to drainage patterns, and as such will have no impact on erosion or siltation off-site.

Mission Center

The proposed construction of an office building and parking structure at Mission Center would change drainage patterns and could potentially result in erosion and siltation on- or off-site. The 2014 LRDP EIR will evaluate potential impacts related to increased erosion and siltation, and address the project-specific effects on drainage patterns and erosion associated with this project.

Other UCSF Campus Sites

There are no proposed projects or programs at other UCSF campus sites that could change drainage patterns or result in siltation or erosion on- or off-site.

---

d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?

2014 LRDP

Implementation of the 2014 LRDP would not alter the course of a stream or river. However, development under the 2014 LRDP would alter drainage patterns on campus sites (during and/or after ground disturbing activities), which could increase the potential for flooding on- or off-site. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

The 2014 LRDP EIR will evaluate potential impacts of the proposed demolition of 13 buildings, utilities/retaining walls/streetscaping work, and replacement hospital construction at Parnassus Heights related to changed drainage patterns and potential for flooding.

The proposed renovation of UC Hall and Moffitt and Millberry Tower would not result in any changes to drainage patterns, and as such will have no impact on flooding.

Mission Bay

The 2014 LRDP EIR will evaluate potential impacts of the proposed entitlement/housing development at Mission Bay related to changed drainage patterns and flooding.

Mount Zion

The 2014 LRDP EIR will evaluate potential impacts of the proposed demolition of the Hellman, Brunn and Dialysis buildings as well as the proposed construction of an office/research building related to changed drainage patterns and flooding.

The proposed renovation of the main hospital at Mount Zion would not result in any changes to drainage patterns, and as such will have no impact on flooding.

Mission Center

The 2014 LRDP EIR will evaluate potential impacts of the proposed construction of an office building and parking structure at Mission Center related to changed drainage patterns and flooding.

Other UCSF Campus Sites

There are no proposed projects or programs at other UCSF campus sites that could change drainage patterns or result in flooding on- or off-site.

---

e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

2014 LRDP

As discussed in Items (a) and (d) above, development under the 2014 LRDP would increase impervious surfaces, which could increase the volume of surface water runoff and increase levels of urban contaminants in stormwater. The 2014 LRDP EIR will evaluate whether the existing/planned drainage system could accommodate increased runoff generated as a result of development under the 2014 LRDP, and it will evaluate potential impacts associated with stormwater pollution. All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

The proposed demolition of 13 buildings, utilities/retaining walls/streetscaping work, and replacement hospital construction at Parnassus Heights would could potentially result in

additional sources of polluted runoff during demolition or construction. As discussed in (a) above, the 2014 LRDP EIR will evaluate potential impacts related to water quality and stormwater runoff.

The proposed work at the Parnassus Heights campus site will not result in a net increase of impervious surface area over existing conditions, so there will be no impact to the stormwater drainage system.

Mission Bay

The proposed entitlement and housing development, and the parking structure at the Mission Bay campus site could potentially result in additional sources of polluted runoff during and after construction. In addition, the proposed development would result in a net increase of impervious surface that could increase the volume of surface water runoff. The 2014 LRDP EIR will evaluate whether the existing/planned drainage system could accommodate increased runoff generated as a result of development under the 2014 LRDP, and it will evaluate potential impacts associated with stormwater pollution.

Mount Zion

The proposed demolition, renovation and construction at the Mount Zion campus site could potentially result in additional sources of polluted runoff during and after construction. As discussed in (a) above, the 2014 LRDP EIR will evaluate potential impacts related to water quality and stormwater runoff.

The proposed work at the Mount Zion campus site will not result in a net increase of impervious surface area over existing conditions, so there will be no impact to the stormwater drainage system.

Mission Center

The proposed office building development activities at the Mission Center campus could potentially result in additional sources of polluted runoff during and after construction. In addition, the proposed development would result in a net increase of impervious surface that could increase the volume of surface water runoff. The 2014 LRDP EIR will evaluate whether the existing/planned drainage system could accommodate increased runoff generated as a result of development under the 2014 LRDP, and it will evaluate potential impacts associated with stormwater pollution.

Other UCSF Campus Sites

There are no proposed projects or programs at other UCSF campus sites that could generate additional polluted runoff or change drainage patterns that could affect storm water drainage systems.

f) Otherwise substantially degrade water quality?

2014 LRDP

Potential sources of water quality degradation under the 2014 LRDP are discussed in items (a), (c), and (e) above.

---

g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

None of the proposed activities in the 2014 LRDP will place housing with a 100-year flood hazard area as mapped on a current federal Flood Hazard Boundary or Flood Insurance Rate Map**.** The federal Flood Hazard Boundaries and Flood Insurance Rate Maps for San Francisco are currently being revised. The revisions will inform whether proposed development at Mission Bay will place housing within an area that is potentially subject to inundation by sea level rise (SLR). The most recent guidance from the Bay Conservation and Development Commission (BCDC) places discrete portions of the Mission Bay campus site at risk of inundation by 2050 (anticipated sea level rise of 16 inches) and most of the campus at risk by 2100 (55 inches of sea level rise) (BCDC 2009). However, the BCDC estimates are based on older elevation data for the site, prior to 2000 when redevelopment and re-grading of the Mission Bay site was by initiated by UCSF and the overall elevation of the site was raised by several feet. The 2014 LRDP EIR will assess the potential effects of sea level rise and attendant flood hazards on the proposed programs and projects at the Mission Bay campus site.

h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?

See item (g); proposed development of the Mission Bay campus site could put structures in an area subject to inundation by future sea level rise. The 2014 LRDP EIR will assess the potential effects of sea level rise and attendant flood flows on the proposed programs and projects at the Mission Bay campus site.

---

i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

See item (g); proposed development of the Mission Bay campus site could expose people or structures to a risk of loss, injury, or death from flooding due to sea level rise and compounding factors such as storms, tsunamis and other events. The 2014 LRDP EIR will assess the potential effects of sea level rise and attendant flood flows on the proposed programs and projects at the Mission Bay campus site.

---

j) Inundate by seiche, tsunami, or mudflow?

2014 LRDP

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

Parnassus Heights

The Parnassus Heights campus site is located at the foot of Mount Sutro, a steep-sided hill with shallow soils prone to slope failures and landslides. The proposed demolition of 13 buildings, utilities/retaining walls/streetscaping work, and hospital replacement activities at the Parnassus Heights campus site could potentially put people and structures at risk of inundation by mudflow. The 2014 LRDP EIR will assess the potential impacts of proposed activities on mudflows as well as ground stability and geotechnical conditions (see Section 5.6, above).

Mission Bay

As discussed in item (g), proposed entitlement/housing development at the Mission Bay campus site could put people and structures in the path of seiches and tsunamis within 100 years due to sea level rise. The 2014 LRDP EIR will assess the potential effects of sea level rise and attendant flood hazards on the proposed programs and projects at the Mission Bay campus site.

Mount Zion, Mission Center and Other UCSF Campus Sites

No proposed activities at the Mount Zion, Mission Center, or other UCSF campuses will place people or structures at risk of inundation by seiche, tsunami, or mudflow.

5.10 Land Use and Planning

		2014 LRDP	*Parnassus Heights*					*Mission Bay*		*Mount Zion*			*Mission Center*	*Other UCSF Campus Sites*
Issues (and Supporting Information Sources):		*Land Use, Population, Space Needs,& CAP (Program)*	*Demolish 13 Existing Buildings (Project)*	*Renovate UC Hall (Project)*	*Utilities, Retaining Walls, Saunders Court & Streetscape (Project)*	*Construct Replacement Hospital (Program)*	*Renovate Moffitt & Millberry Tower (Program)*	*Remaining & Increased Entitlement (Program)*	*New Housing (Project)*	*Demolish Hellman, Brunn & Dialysis (Project)*	*Renovate Main Hospital (Program)*	*Construct Office / Research Building (Program)*	*Construct Office Building (Program)*	*No Proposed Projects or Programs*
Would the project:

b)	Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	--
c)	Conflict with any applicable habitat conservation plan or natural community conservation plan?	--	--	--	--	--	--	--	--	--	--	--	--	--
d)	Exceed an LRDP EIR standard of significance by being substantially incompatible with existing land uses, or by substantially conflicting use, density, height and bulk restrictions of local zoning, although UCSF is exempt from such restrictions?	☒	--	☒	--	☒	☒	☒	☒	--	☒	☒	☒	--

Topics to be analyzed in the 2014 LRDP EIR are indicated: ☒

Topics that do not require additional analysis beyond that provided in the Initial Study are indicated: --

This page intentionally left blank

Land Use and Planning

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic. For impact questions b and d, please see below for more explanation of the significance standard. In addition, local land use policies are taken into consideration in UCSF planning efforts.

Pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation. However, UCSF reviews local land use policies as planning guidelines and as the basis for determining land use and planning impacts under CEQA. Further, UCSF cooperates with local planning agencies in matters of mutual concern. Based on these policies, the LRDP would have a significant adverse land use or planning impact if the proposed LRDP development and uses would:

- substantially conflict with the adopted environmental goals, plans and policies of the local planning jurisdiction;
- substantially conflict with the use designations, height and bulk, and density restrictions of local zoning; or
- be substantially incompatible with existing land uses.

Discussion of Potential Impacts

a) Physically divide an established community?

Implementation of the 2014 LRDP, or any of the individual projects or programs proposed under the LRDP, would have no potential to physically divide an established community. No development outside of established campus properties is proposed, and no incursion into, or division of, surrounding residential communities would occur. The campus sites would remain as distinct educational and medical land uses that are woven into the fabric of the surrounding neighborhoods. Campus boundaries for each campus site would not change as a result of the LRDP. No physical barriers such as roads or other infrastructure that would divide an established community are proposed. No impact would occur and no additional analysis is required.

---

b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

The 2014 LRDP would be the applicable land use plan for the campus through 2035. The EIR will evaluate any proposed land use changes for consistency with the LRDP. Land within the City of San Francisco's jurisdiction is subject to plans, policies and zoning controls that regulate future

development proposals and mitigate certain environmental effects. Although UCSF is not under the jurisdiction of the City of San Francisco, the 2014 LRDP EIR will evaluate the potential for growth under the LRDP to directly or indirectly conflict with these policies.

---

c) Conflict with any applicable habitat conservation plan or natural community conservation plan?

No habitat conservation plan or natural community conservation plan has been adopted that is applicable to the UCSF campus sites. No impact would occur and this topic will not be analyzed in the EIR.

---

d) Exceed an LRDP EIR standard of significance by being substantially incompatible with existing land uses, or by substantially conflicting use, density, height and bulk restrictions of local zoning, although UCSF is exempt from such restrictions?

Land within the City of San Francisco's jurisdiction is subject to plans, policies and zoning controls that regulate the timing and location of future development proposals and mitigate certain environmental effects. Although UCSF is not under the City's jurisdiction, the 2014 LRDP EIR will evaluate the potential for growth under the LRDP to directly or indirectly conflict with these plans, policies and zoning controls. Demolition of buildings as well as other infrastructure improvements proposed at Parnassus Heights and Mount Zion would not be incompatible with existing land uses or conflict with building regulations; therefore, no impact would occur and these activities will not be analyzed in the EIR.

5.11 Mineral Resources

Issues (and Supporting Information Sources):	2014 LRDP	Parnassus Heights					Mission Bay		Mount Zion			Mission Center	Other UCSF Campus Sites
	Land Use, Population, Space Needs,& CAP (Program)	Demolish 13 Existing Buildings (Project)	Renovate UC Hall (Project)	Utilities, Retaining Walls, Saunders Court & Streetscape (Project)	Construct Replacement Hospital (Program)	Renovate Moffitt & Millberry Tower (Program)	Remaining & Increased Entitlement (Program)	New Housing (Project)	Demolish Hellman, Brunn & Dialysis (Project)	Renovate Main Hospital (Program)	Construct Office / Research Building (Program)	Construct Office Building (Program)	No Proposed Projects or Programs
Would the project:													
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	--	--	--	--	--	--	--	--	--	--	--	--	--
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	--	--	--	--	--	--	--	--	--	--	--	--	--

Topics to be analyzed in the 2014 LRDP EIR are indicated: ☒

Topics that do not require additional analysis beyond that provided in the Initial Study are indicated: --

This page intentionally left blank

Mineral Resources

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic.

Discussion of Potential Impacts

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

None of the UCSF campus sites is located in areas of known mineral resources or would otherwise conflict with mineral resources recovery. No impacts on mineral resources would occur. Therefore, no further study of mineral resources is necessary and this topic will not be analyzed in the EIR.

This page intentionally left blank

5.12 Noise

Issues (and Supporting Information Sources):	2014 LRDP	Parnassus Heights					Mission Bay		Mount Zion			Mission Center	Other UCSF Campus Sites

Noise

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic. UCSF voluntarily complies with the City of San Francisco Noise Ordinance and uses the Noise Ordinance as a standard of significance. In addition, UCSF typically imposes as mitigation limits on construction hours that are more restrictive than the City's Noise Ordinance.

Discussion of Potential Impacts

a) Exposure of persons to or generation of noise levels in excess of standards established in any applicable plan or noise ordinance, or applicable standards of other agencies?

2014 LRDP

All potential noise effects would occur only as a result of activities that occur at specific campus sites as a result of proposed LRDP programs and projects. These effects will be considered under the individual programs and projects that are listed under the appropriate campus sites.

As a program-level document the LRDP would address land use changes and development. While these changes may result in new noise sources or receptors, the potential noise impacts of these changes would be addressed individually for each project element in the 2014 LRDP EIR.

Parnassus Heights

The demolition of 13 existing buildings, renovation of buildings, and construction of the replacement hospital at the Parnassus Heights campus site will result in temporary construction-related noise. The LRDP will assess the construction-related noise exposure relative to standards of the City of San Francisco Noise Ordinance.

Construction of the replacement hospital would result in replacing some existing mechanical equipment that now serves the existing hospital, which could reduce operating noise levels compared to existing noise levels. The 2014 LRRDP EIR will examine the resultant noise levels from proposed modifications relative to noise ordinance standards.

Mission Bay

1.45 million gsf may be developed by 2035, including a Block 15 housing complex consisting of up to 668 beds in 523 units and totaling 398,700 gsf. The 2014 LRDP EIR will examine the potential for construction noise to exceed standards of the San Francisco Noise Ordinance. The 2014 LRDP EIR will also assess the land use compatibility of proposed new residential uses to State of California suggested noise standards.

Mount Zion

The demolition of the Hellman, Brunn, and Dialysis buildings and the construction of a new office / research building at the Mount Zion campus site will result in temporary construction

noise that will be addressed in the 2014 LRDP EIR with respect to City of San Francisco noise ordinance standards.

Mission Center

Potential development of the Mission Center site would include an office building of approximately 100,000 gsf and a 294-stall parking garage. Construction would result in temporary construction noise, as well as operating noise, that will be addressed in the 2014 LRDP EIR with respect to City of San Francisco noise ordinance standards.

Other UCSF Campus Sites

No projects or programs are proposed. No noise impacts would result.

---

b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

2014 LRDP

As a program-level document the LRDP would address land use changes. Although the Parnassus Heights and Mission Bay campus sites are served by SF Muni light rail vehicles, there are no substantial vibration sources (i.e., "heavy-rail" railways) within 200 feet of planned land use changes. Beyond 200 feet, vibration from rail sources is considered to be unlikely to have a vibration impact on residential and hospital uses.[25] Consequently, vibration impacts of or to the LRDP are considered less than significant and will not be assessed in the 2014 LRDP EIR.

Parnassus Heights

The demolition of 13 existing buildings and construction of the replacement hospital at the Parnassus campus will result in temporary construction-related vibration. The LRDP EIR will assess the construction-related vibration impacts relative to Caltrans standards for building damage and human annoyance.

Construction of the replacement hospital would likely require pile driving. The 2014 LRDP EIR will examine the resultant vibration levels from pile driving proposed modifications relative to Caltrans standards for building damage and human annoyance.

Mission Bay

1.45 million gsf of development may occur by 2035, include a housing complex on Block 15. The 2014 LRDP EIR will examine the potential for construction activities to exceed Caltrans standards for building damage and human annoyance.

[25] Federal Transit Administration, *Transit Noise and Vibration Impact Assessment*, May 2006.

Mount Zion

The demolition of three existing buildings and construction of one new building at the Mount Zion campus site will result in temporary construction noise that will be addressed in the 2014 LRDP EIR relative to Caltrans standards for building damage and human annoyance.

Mission Center

Potential development of the Mission Center site would include an office structure and parking garage. Construction would likely require pile driving. The 2014 LRRDP EIR will examine the resultant vibration levels from pile driving proposed modifications relative to Caltrans standards for building damage and human annoyance.

Other UCSF Campus Sites

No projects or programs are proposed. No impacts would result.

---

c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

2014 LRDP

As a program-level document the LRDP would address land use changes. While these changes may result in new noise sources, the potential noise impacts of these changes would be addressed individually for project elements in the 2014 LRDP EIR.

Parnassus Heights

Operation of the replacement hospital would result in changes to existing rooftop mechanical equipment in the area which could reduce noise from that source relative to existing noise conditions. Localized traffic redistribution may result in increased noise levels along some roadways. The 2014 LRDP EIR will examine the resultant noise levels from proposed modifications relative to noise ordinance standards and overall increase in ambient noise from traffic.

Mission Bay

The proposed additional development may include a housing complex on Block 15. Localized traffic redistribution may result in increased noise levels along some roadways. The 2014 LRDP EIR will examine the resultant noise levels from proposed modifications relative to noise ordinance standards and overall increase in ambient noise from traffic.

Mount Zion

The demolition of three existing buildings at the Mount Zion campus site would not result in permanent noise increases. Consequently, permanent noise increases impacts resulting from demolition activities at Mount Zion are considered less than significant and will not be assessed in the 2014 LRDP EIR. Construction of a new building may result in increased noise levels along

some roadways. The 2014 LRRDP EIR will examine the resultant noise levels from proposed modifications relative to noise ordinance standards and overall increase in ambient noise from traffic.

Mission Center

Potential development of the Mission Center campus site would include an office structure and parking garage. Localized traffic redistribution may result in increased noise levels along some roadways. The 2014 LRRDP EIR will examine the resultant noise levels from proposed modifications relative to noise ordinance standards and overall increase in ambient noise from traffic.

Other UCSF Campus Sites

No projects or programs are proposed. No impacts would result.

---

d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project (including construction)?

2014 LRDP

As a program-level document, the LRDP would address land use changes and development. While these changes may result in temporary construction noise, the potential noise impacts of these changes will be addressed individually for project elements in the 2014 LRDP EIR.

Parnassus Heights

The demolition of 13 existing buildings, renovation of UC Hall, Moffitt Hospital, and the Millberry Union towers, and construction of the replacement hospital will result in temporary construction-related noise at Parnassus Heights. The LRDP will assess the construction-related noise exposure relative to standards of the City of San Francisco Noise Ordinance.

Mission Bay

1.45 million gsf of development would include a housing complex on Block 15. The 2014 LRDP EIR will examine the potential for construction activities to exceed standards of the San Francisco Noise Ordinance.

Mount Zion

The demolition of three existing buildings and construction of one new building at the Mount Zion campus site will result in temporary construction noise that will be addressed in the 2014 LRDP EIR with respect to City of San Francisco noise ordinance standards.

Mission Center

Potential development of the Mission Center site would include an office building and parking garage. Construction would result in temporary construction noise that will be addressed in the 2014 LRDP EIR with respect to City of San Francisco noise ordinance standards.

Other UCSF Campus Sites

No projects or programs are proposed. No impacts would result.

---

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

There are no public use airports within two miles of the City of San Francisco. Both San Francisco International Airport and Oakland International Airport are over five miles from the City limit. Consequently there would be a less than significant impact with regard to exposure to excessive noise levels from public use airports and the issue will not be assessed in the 2014 LRDP EIR.

---

f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

The only UCSF campus within two miles of a private airstrip (helipad) is Mission Bay. UCSF will operate an active helipad at the medical center. The 2014 LRDP EIR will address the operational helicopter noise effects at LRDP-proposed sensitive land uses at the Mission Bay campus site. All other campus sites would have a less than significant impacts due to noise from private air strips.

---

g) Exceed an LRDP EIR standard of significance by contributing to an increase in average daily noise levels (Ldn) of 3 dB(A) or more at property lines, if ambient noise levels in areas adjacent to proposed development already exceed local noise levels set forth in local general plans or ordinances for such areas based on their use?

2014 LRDP

As a program-level document the LRDP would address land use changes and development. These changes may result in new noise sources, and the potential noise impacts of these changes will be addressed individually for project elements in the 2014 LRDP EIR.

Parnassus Heights

Operation of the replacement hospital would result in changes to existing mechanical equipment in the area which could reduce noise levels at adjacent land uses. The 2014 LRDP EIR will examine the resultant noise levels from proposed modifications relative to noise ordinance standards and general plan land use compatibility standards.

Mission Bay

Additional development, some not entitled under the existing LRDP, may be developed by 2035. This would include a housing complex on Block 15. Localized traffic redistribution may result in increased noise levels along some roadways. The 2014 LRDP EIR will examine the resultant noise levels from proposed modifications relative to noise ordinance standards and general plan land use compatibility standards.

Mount Zion

The demolition of buildings and construction of one new building at Mount Zion would not result in permanent noise increases. Consequently, permanent noise increases at adjacent properties resulting from the LRDP at Mount Zion are considered less than significant and will not be assessed in the 2014 LRDP EIR.

Mission Center

Potential development at the Mission Center campus site includes a medical office structure and parking garage. Localized traffic redistribution may result in increased noise levels along some roadways. The 2014 LRRDP EIR will examine the resultant noise levels from proposed modifications relative to noise ordinance standards and general plan land use compatibility standards.

Other UCSF Campus Sites

No projects or programs are proposed. No impacts would result.

5.13 Population and Housing

Issues (and Supporting Information Sources):	2014 LRDP	Parnassus Heights					Mission Bay		Mount Zion			Mission Center	Other UCSF Campus Sites
	Land Use, Population, Space Needs,& CAP (Program)	Demolish 13 Existing Buildings (Project)	Renovate UC Hall (Project)	Utilities, Retaining Walls, Saunders Court & Streetscape (Project)	Construct Replacement Hospital (Program)	Renovate Moffitt & Millberry Tower (Program)	Remaining & Increased Entitlement (Program)	New Housing (Project)	Demolish Hellman, Brunn & Dialysis (Project)	Renovate Main Hospital (Program)	Construct Office / Research Building (Program)	Construct Office Building (Program)	No Proposed Projects or Programs

c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	--	--	--	--	--	--	--	--	--	--	--	--	--
d) Exceed the LRDP EIR standard of significance by creating a demand for housing outside the market area where the facilities or site are located?	☒	--	--	--	--	--	--	--	--	--	--	--	--

Topics to be analyzed in the 2014 LRDP EIR are indicated: ☒

Topics that do not require additional analysis beyond that provided in the Initial Study are indicated: --

This page intentionally left blank

Population and Housing

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic. Population and housing changes, in and of themselves, are not normally considered to be significant impacts (substantial, adverse impacts on the physical environment) under CEQA, but CEQA does allow inclusion of these effects as indicators of other impacts. Therefore, this section quantifies and describes the magnitude of such potential changes. The potentially significant physical environmental impacts associated with changes in population and housing are analyzed in other sections of this Initial Study (e.g., traffic, public services, air quality).

Discussion of Potential Impacts

a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

The 2014 LRDP would result in population growth in the San Francisco area through increased employment and student enrollment. The 2014 LRDP would accommodate an increase in population from the current approximately 38,420 to approximately 55,190 by the year 2035. The increase in population will be evaluated in the EIR in a campus-wide context as well as specifically related to proposed residential development at Mission Bay. Population growth at Parnassus Heights would result from partial conversion of UC Hall and Millberry Union towers to residential space. Currently, there are 238 housing units located on the Parnassus Heights campus site. The proposed demolition of three Aldea residential buildings would reduce the total units to 196. Proposed residential conversion at UC Hall and Millberry Union towers would add approximately 227 units at buildout of the LRDP in 2035, resulting in a net increase of 185 units over existing conditions. No housing is proposed at either the Mount Zion or Mission Center campus sites. Therefore, the population growth at Parnassus Heights, Mount Zion and Mission Center would not be substantial and the impact would be less than significant; effects at these campus sites will not be analyzed in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

The proposed projects and programs at Mission Bay, Mount Zion and Mission Center would not displace existing housing or people. No impacts would occur at these campus sites. Three existing short-term residential structures at Parnassus Heights in the Aldea student housing complex are proposed for demolition by 2024. The number of short-term residents displaced at these buildings would not be substantial in comparison to the total population on the Parnassus Heights campus. In addition, the LRDP is proposing to partially convert both UC Hall and the Millberry Union towers to residential use, which would serve as replacement housing for some of the population previously housed in the Aldea buildings. The impact would be less than significant and will not be analyzed in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

d) Exceed the LRDP EIR standard of significance by creating a demand for housing outside the market area where the facilities or site are located?

The 2014 LRDP would result in population growth in the San Francisco area through increased employment and student enrollment. The 2014 LRDP would accommodate an increase in population from the current approximately 38,420 to approximately 55,190 by the year 2035. This anticipated population increase could result in an increased demand for housing in the Bay Area. This criterion will be evaluated in the EIR in a campus-wide context only.

5.14 Public Services

Issues (and Supporting Information Sources):	2014 LRDP	Parnassus Heights					Mission Bay		Mount Zion			Mission Center	Other UCSF Campus Sites
	Land Use, Population, Space Needs,& CAP (Program)	Demolish 13 Existing Buildings (Project)	Renovate UC Hall (Project)	Utilities, Retaining Walls, Saunders Court & Streetscape (Project)	Construct Replacement Hospital (Program)	Renovate Moffitt & Millberry Tower (Program)	Remaining & Increased Entitlement (Program)	New Housing (Project)	Demolish Hellman, Brunn & Dialysis (Project)	Renovate Main Hospital (Program)	Construct Office / Research Building (Program)	Construct Office Building (Program)	No Proposed Projects or Programs
Would the project:													
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

Topics that do not require additional analysis beyond that provided in the Initial Study are indicated: --

This page intentionally left blank

Public Services

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic.

Discussion of Potential Impacts

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

i) Fire protection?
ii) Police protection?
iii) Schools?
iv) Parks?
v) Other public facilities?

Fire Protection and Emergency Medical Services

The San Francisco Fire Department (SFFD), headquartered at 698 Second Street, provides fire protection and emergency services to the City of San Francisco, as well as to all UCSF facilities within the City. Fire suppression companies are organized into two divisions, which are further divided into nine battalions, located throughout the City (SFFD, 2013). As of 2013, the SFFD consists of 1,500 firefighting and emergency medical field personnel and resources include 44 Engine companies, 19 Truck companies, a dynamically deployed fleet of Ambulances, two Heavy Rescue Squad units, two Fireboats and multiple special purpose units. The Airport Division is comprised of three firefighting stations and seven companies located at the San Francisco International Airport (Talmadge, 2013).

Emergency calls for fire and medical services at UCSF campus sites are routed to the SFFD for dispatching. Response times generally reflect the seriousness of the call. As of 2013, the SFFD has a response time goal for the first arriving unit of 5:00 minutes, while actual response times average 4:52 minutes (Talmadge, 2013).

Police Protection

The UC Police Department (UCPD) provides police protection services for University of California properties and facilities that comprise UCSF. The UCPD is responsible for approximately 60,000 patients, visitors, students, faculty, staff and affiliates. Headquartered at 654 Minnesota Street, the UCPD employs approximately 120.5 authorized staff. UCPD headquarters is approximately 4 miles from Parnassus Heights, 1.2 miles from Mission Bay, and 4.1 miles from Mount Zion. The UCPD also operates a patrol station at both the Parnassus Heights and Mission Bay campus sites.

As of 2012, the service ratio of police personnel to UCSF population is 2.2 sworn police officers per 1,000 persons (UCPD 2012 Crime Reporting). Police officers patrol by car, bicycle and on foot to maintain high-profile, proactive and preventive public safety services (UCPD website, 2013). In 2012, UCSF police responded to 49,883 calls for service and processed 313 arrests (UCPD 2012 Crime Reporting).

The UCPD has a mutual-aid agreement with the San Francisco Police Department (SFPD) to provide cooperative assistance within a 1-mile radius of each UCSF campus site. A memorandum of understanding between the UCPD and the SFPD establishes that UCPD has exclusive jurisdiction over police service on UCSF properties. Depending on the nature of the emergency, the UCPD may request assistance from the SFPD (UCSF, 2005).

Projects implemented under the 2014 LRDP would be required to comply with applicable provisions of the Uniform Building Code with respect to the incorporation of security features in standard building design plans.

Public Schools

The City's public schools are operated by the San Francisco Unified School District (SFUSD). The SFUSD administers 75 elementary schools (grades k-5), 13 middle schools (grade 6-8), 15 high schools (grades 9-12) and 11 charter schools (SFUSD, 2013). Over 55,000 students are educated through the SFUSD, the seventh largest in California.

Parks

Effects on local and regional parks are discussed in Section 5.15, *Recreation*, below.

2014 LRDP

As a program-level document the LRDP would address the overarching topics of land use changes, population increase and space needs. While these changes may result in increased demand on public services, the potential impacts would occur individually for project elements of at each campus site in the 2014 LRDP EIR.

Parnassus Heights

Construction of the replacement hospital may alter demand for public services and therefore will be analyzed in the 2014 LRDP EIR.

The proposed demolition of 13 buildings, renovation of UC Hall, renovation of Moffitt Hospital and the Millberry Union towers, and infrastructure/open space projects would not substantially increase the campus population, and therefore would not contribute to an increased demand for public services. No impact would occur and no further analysis is required.

Mission Bay

Potential effects of the entitlement program and the proposed housing construction project may result in significant impacts on public services near this campus site. Both the program and the project require further analysis with regard to public services in the 2014 LRDP EIR.

Mount Zion

Demolition of the Hellman, Brunn and Dialysis buildings, and the renovation of the main hospital would not contribute to campus population and therefore would have no effect on public services near this campus site. No further analysis is required.

Construction of the proposed office and research building at Mount Zion may result in increased population and resultant demand for public services, particularly fire and police services, at this campus site. The potential impacts of this project on public services will be analyzed in the 2035 LRDP EIR.

Mission Center

Construction of the proposed office and research building at Mission Center may result in an increased demand for public services due to an increased facility size at this campus site. This project's potential impacts to fire and police protection services will be analyzed in the 2014 LRDP EIR

Other UCSF Campus Sites

Implementation of development under the 2014 LRDP would have no effect on public services with regard to other UCSF campus sites, and therefore, will not be analyzed in the 2014 LRDP EIR.

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic.

Discussion of Potential Impacts

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

The potential effects regarding the increased use of parks and other recreational facilities would occur only as a result of LRDP development and activities that occur at specific campus sites, as a result of proposed programs and projects. Population growth at the Parnassus Heights, Mount Zion and Mission Center campus sites would not be substantial; therefore, the demand on existing recreational facilities resulting from an increased population at these campus sites would not result in substantial physical deterioration of such facilities. The impact would be less than significant at these campus sites. The proposed residential development at Mission Bay campus site could result in an increased demand for recreational facilities. This impact will be evaluated in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?

The 2014 LRDP proposes new recreational facilities at two campus sites: Parnassus Heights and Mission Bay. No recreational facilities are proposed at Mount Zion or Mission Center. New trails are proposed at Parnassus Heights that would provide access into the Mount Sutro Open Space Reserve in order to increase the connectivity to the Reserve's trail system from neighborhoods to the west and north. At Mission Bay, a multi-sports field is proposed on the eastern portion of Block 18. Construction effects of these facilities at Parnassus Heights and Mission Bay will be evaluated in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

Topics to be analyzed in the 2014 LRDP EIR are indicated: ☒

Topics that do not require additional analysis beyond that provided in the Initial Study are indicated: --

This page intentionally left blank

Transportation and Traffic

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic. Additionally, the following guidelines are used to determine if a significant impact would occur:

Traffic

Signalized Intersections – a significant impact would occur if:

- project traffic causes intersection LOS D or better to deteriorate to LOS E or F
- project traffic causes intersection LOS E to deteriorate to LOS F
- project adds traffic to an intersection that operates at LOS E or F under existing conditions and contributes to the worsening of the average delay per vehicle (an increase in traffic volumes due to the project that is greater than 5% would be considered significant)

Unsignalized Intersections – a significant impact would occur if:

- project traffic causes the LOS at the worst approach to deteriorate from LOS D or better to LOS E or F and Caltrans signal warrants would be met
- project traffic causes Caltrans signal warrants to be met when the worst approach is already operating at LOS E or F
- project adds traffic to an intersection that operates at LOS E or F under existing conditions and contributes to the worsening of the average delay per vehicle (an increase in traffic volumes due to the project that is greater than 5% would be considered significant)

Cumulative – a significant impact would occur if:

- the project would make a considerable contribution to the deterioration of intersection conditions (LOS E or F) under cumulative conditions. A project's contribution would be considerable if the project contribution to cumulative growth would be 5% or greater, and if the project contribution to total traffic volumes on critical movements operating at LOS E or F would be 5% or greater.

Public Transit – a significant impact would occur if:

- project demand for public transit causes the need for development or expansion of mass transit facilities, the development of which would cause significant environmental impacts

Parking

- project-generated parking demand that is not met by the project is not considered significant

Pedestrians/Bikes – a significant impact would occur if:

- the project would cause a substantial conflict among autos, bicyclists, pedestrians and transit vehicles (see g), below)

Discussion of Potential Impacts

a) Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Implementation of the 2014 LRDP would increase both the amount of on-campus building space and the daily population, which would result in increased vehicular traffic on local streets. The EIR will analyze the impact of additional project-related and cumulative traffic on the local street network, including intersection capacity, and effects on pedestrian and bicycle paths, as well as mass transit. Conflicts with an applicable congestion management program will also be analyzed in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

e) Result in inadequate emergency access?

Although the 2014 LRDP does not propose hazardous roadway design features, incompatible uses, or changes to emergency access at any of the campus sites, these criteria will be evaluated in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

g) Exceed the applicable LRDP EIR standard of significance by causing substantial conflict among autos, bicyclists, pedestrians, and transit vehicles?

Implementation of the 2014 LRDP is not anticipated to conflict with policies, plans, or programs supporting alternative transportation on any campus site or within the City of San Francisco.

Similarly, conflicts between various transportation modes are not anticipated under the LRDP. Nonetheless, these topics will be analyzed in the EIR.

---

c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

The 2014 LRDP will not change existing air traffic volumes or affect existing air traffic patterns that would result in substantial safety risks. Therefore, no further study of air traffic patterns is necessary and this topic will not be analyzed in the EIR.

Utilities and Service Systems

Standards of Significance

The impact questions above constitute the significance standards for this environmental topic.

Discussion of Potential Impacts

a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed LRDP programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

The 2014 LRDP EIR will analyze the potential for growth at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites to exceed the wastewater treatment requirements of the San Francisco Bay Regional Water Quality Control Board.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

The 2014 LRDP EIR will analyze the potential for changes at the Parnassus Heights campus site or growth at the Mission Bay, Mount Zion and Mission Center campus sites to require or result in the construction of new water or wastewater treatment facilities, or expansion of existing facilities, the construction of which could cause significant environmental effects.

Demolition activities as well as other infrastructure improvements proposed at Parnassus Heights and Mount Zion would not require new water or wastewater treatment facilities; therefore, no impact would occur and these topics will not be analyzed in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under

current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

The 2014 LRDP EIR will analyze the potential for changes or growth at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites to require or result in the construction of new storm water drainage facilities, or expansion of existing facilities, the construction of which could cause significant environmental effects.

Demolition or renovation activities proposed at Parnassus Heights and Mount Zion would not require new storm water drainage facilities; therefore, no impact would occur and these topics will not be analyzed in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

The 2014 LRDP EIR will analyze the potential for changes or growth at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites to result in the need for new or expanded water entitlements.

Demolition activities as well as other infrastructure improvements proposed at Parnassus Heights and Mount Zion would not require new water supplies; therefore, no impact would occur and these topics will not be analyzed in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

e) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

The 2014 LRDP EIR will analyze the potential for changes or growth at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites to result in the need for additional wastewater treatment capacity.

Building demolition as well as other infrastructure improvements proposed at Parnassus Heights and Mount Zion would not require new wastewater treatment capacity; therefore, no impact would occur and these topics will not be analyzed in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

g) Comply with applicable federal, state, and local statutes and regulations related to solid waste?

All of the potential effects occur only as a result of activities that occur at specific campus sites, as a result of proposed programs and projects. These specific effects are considered under the individual programs and projects, listed under the appropriate campus sites.

The 2014 LRDP EIR will analyze the potential for growth, in addition to demolition and renovation activities, at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites to result in the generation of solid waste that would exceed landfill capacity. In

addition, the EIR will evaluate compliance with applicable federal, state and local statutes and regulations related to solid waste disposal.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

h) Result in the wasteful, inefficient and unnecessary consumption of energy (see CEQA Statutes Section 21100(b)(3))?

The 2014 LRDP EIR will analyze the potential for growth under the LRDP to result in the wasteful, inefficient, and unnecessary consumption of energy. The effects will be evaluated in a campus-wide context as well as specifically related to proposed development at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites.

Demolition activities as well as other infrastructure improvements proposed at Parnassus Heights and Mount Zion would result only in a temporary demand for energy, which would be considered a less than significant effect. No further discussion of these activities regarding energy consumption would be included in the EIR.

No projects or programs are currently proposed at other UCSF campus sites. Under the UCSF long-term consolidation strategy, activity will either be maintained at these locations under current conditions or sites will be vacated and activities absorbed into other university-affiliated buildings. As no development or changes in use are planned for these sites, no impact would occur and this topic will not be analyzed in the EIR.

---

i) Exceed the LRDP EIR standard of significance by requiring or resulting in the construction of new electrical or natural gas facilities, which would cause significant environmental effects?

Mission Bay is the only campus site in which a new electrical or natural gas facility is proposed. The potential effects of the proposed central utility plant at Block 16 will be analyzed in the EIR.

5.18 Mandatory Findings of Significance

Issues (and Supporting Information Sources):	2014 LRDP	Parnassus Heights					Mission Bay		Mount Zion			Mission Center	Other UCSF Campus Sites
	Land Use, Population, Space Needs,& CAP (Program)	Demolish 13 Existing Buildings (Project)	Renovate UC Hall (Project)	Utilities, Retaining Walls, Saunders Court & Streetscape (Project)	Construct Replacement Hospital (Program)	Renovate Moffitt & Millberry Tower (Program)	Remaining & Increased Entitlement (Program)	New Housing (Project)	Demolish Hellman, Brunn & Dialysis (Project)	Renovate Main Hospital (Program)	Construct Office / Research Building (Program)	Construct Office Building (Program)	No Proposed Projects or Programs
Would the project:													
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	--
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of past, present and probable future projects)?	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	--
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	☒	--

Topics to be analyzed in the 2014 LRDP EIR are indicated: ☒

Topics that do not require additional analysis beyond that provided in the Initial Study are indicated: --

This page intentionally left blank

Mandatory Findings of Significance

a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

As indicated in the discussions above, implementation of the 2014 LRDP has the potential to result in significant biological and cultural resource impacts, which could degrade the quality of the environment. The EIR will evaluate whether LRDP implementation will substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory.

---

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of past, present and probable future projects)?

The 2014 LRDP estimates that 12.14 million gsf of academic buildings, support facilities, and student housing are required to support a total future enrollment of 5,390 students and an increase in campus-wide daily population to approximately 55,190 by 2035. The EIR will evaluate whether the potential impacts of increased enrollment and additional building square footage associated with implementation of the 2014 LRDP, combined with other current projects and probable future projects and projected regional growth in the surrounding area, would be cumulatively considerable.

---

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

As indicated in the above discussions, implementation of the proposed 2014 LRDP has the potential to result in significant impacts. The EIR will evaluate whether any of those impacts have the potential to result in substantial adverse effects on human beings either directly or indirectly.

STATE OF CALIFORNIA
EDMUND G. BROWN JR., *Governor*

PUBLIC UTILITIES COMMISSION
505 Van Ness Avenue
SAN FRANCISCO, CA 94102
(415) 703-1815

October 22, 2013

Diane Wong
UCSF Campus Planning
654 Minnesota Street
San Francisco, CA 94143

Dear Ms. Wong:

Re: SCH 2013092047 UC Regents UCSF Long Range Development Plan - NOP

The California Public Utilities Commission (Commission) has jurisdiction over the safety of highway-rail crossings (crossings) in California. The California Public Utilities Code requires Commission approval for the construction or alteration of crossings and grants the Commission exclusive power on the design, alteration, and closure of crossings in California. The Commission Rail Crossings Engineering Section (RCES) is in receipt of the Notice of Preparation (NOP) from the State Clearinghouse for the proposed Regents of the University of California (UC) UCSF Long Range Development Plan project.

The project area is within the proximity of active railroad tracks. RCES recommends that the UC add language to the UCSF Long Range Development Plan, so that any future development adjacent to or near the railroad/light rail right-of-way (ROW) is planned with the safety of the rail corridor in mind. New developments may increase traffic volumes not only on streets and at intersections, but also at at-grade crossings. This includes considering pedestrian circulation patterns or destinations with respect to railroad ROW and compliance with the Americans with Disabilities Act. Mitigation measures to consider include, but are not limited to, the planning for grade separations for major thoroughfares, improvements to existing at-grade crossings due to increase in traffic volumes and continuous vandal resistant fencing or other appropriate barriers to limit the access of trespassers onto the railroad ROW.

If you have any questions in this matter, please contact me at (415) 703-1815, sm4@cpuc.ca.gov.

Sincerely,

Sia Mozaffari
Utilities Engineer
Rail Crossings Engineering Section
Safety and Enforcement Division

Introduction

Please find enclosed selected comments on the EIR study. At a high level, this is a summary of the detail commentary below:

- We strongly object to the way you characterize the 5th Ave and Kirkham St. traffic calming measures. You are portraying them as something done to address the neighbors concerns about UC Hall traffic. This is patently untrue.
- We are concerned that a lack of transparency in the calculation of gross square foot space and population at Parnassus means that you are computing it incorrectly and may be far over the space and population ceiling.
- You have omitted specifying the environmental impact for a number of projects that, when outlined in more detail, may have a significant impact.

If you have any followup questions to these comments, please feel to contact our community through me. Additionally, we would like to see you publish this study for comment one more time before beginning work on the LRDP EIR.

Sincerely,

/s/

Shabbir Imber Safdar

Selected comments

2.7 Campus Site Location and Proposed Physical Development Plans

P. 19: Statement made without basis of fact: "The total population of Parnassus Heights is not expected to grow substantially over the life of the LRDP."

Explanation:

> This claim is not borne out by the facts presented or the history of the management of campus. Historically UCSF has failed to accurately estimate and manage Parnassus population, exceeding the population cap set by the UC Regents Resolution of 1976 every year since implementation. Additionally there are more housing units being built at Parnassus. Given the fact that every year they have remained under limitations that they have failed to meet, UCSF may not claim credibly that the population of the Parnassus campus will increase.

For more information contact us at help@ucsfneighbors.com or Shabbir Imber Safdar (415 683 7526) or Eugene Salazar at santana1732@sbcglobal.net.

Suggested fixes:

1. Break out overall Parnassus population figures per day similar to page 17 Table2
2. Give a figure to show what population is right now versus 2035 on each campus site as well.
3. Provide detailed explanation that explains why population control to date has been in direct violation of the UC Regents guidelines, and how population management will be different going forward.

P.10: **Statement made that structural parking of 1.58 million gsf is going to be excluded from campus-wide calculations. This suggests Parnassus parking is being excluded from space ceilings counts in violation of the 1976 Regents resolution.**

Because no clear breakdown of Parnassus campus space is provided, the use of parking square footage exclusions suggests a violation of the 1976 resolution.

> **1976 Regents Resolution established a limit of 3.55 million gsf at the Parnassus Heights campus -The space ceiling includes all building space, including parking structures….."**

Suggested fixes:

> A clear breakout and count of how the total space at Parnassus is calculated would address these concerns. Such a calculation would assure the neighbors that the space ceiling compliance is not being incorrectly calculated to exclude parking.

p.22: cushioning actions for 5th and Kirkham St were promised previously

This section clearly misstates why traffic calming was undertaken at 5th Ave and Kirkham St. When the childcare center was built at 5th Ave and Kirkham St, UCSF promised traffic calming to the neighbors to mollify them. This traffic calming was never built until UCSF saw an opportunity to claim that it addressed neighbors concerns for new traffic from the UC Hall renovation.

Traffic calming at 5th Ave and Kirkham St does not address neighborhood concerns for the 2013 LRDP. Do not publish these claims on behalf of the neighbors.

p.24 -- Implement Parnassus Avenue Streetscape Plan
Since Parnassus Avenue is a surface street maintained by City and County of San Francisco (CCSF) and used for two buslines, when will the CCSF managed (MUNI and SF Planning Commission) public comment and approval process start? Have the appropriate CCSF agencies been notified of changes to City streets? If so, which ones?

For more information contact us at help@ucsfneighbors.com or Shabbir Imber Safdar (415 683 7526) or Eugene Salazar at santana1732@sbcglobal.net.

Environmental impact checklists

5.1 Aesthetics

Would the project have a substantial effect on a scenic vista?

For Parnassus project "Demolish 13 Existing Buildings", it should be analyzed in the EIR.

Whether or not Mount Sutro is a scenic vista is not in doubt. However for 4 of the 5 Parnassus Heights projects, buildings will be demolished, possible parking facilities will be built requiring night time safety lighting. Additionally truck delivery bays are possible for some of these which can require structures as well.

Unless UCSF is prepared to go into sufficient detail to describe what will happen on each of these sites, the replacements must all be analyzed for their impact on the scenic vista in the EIR.

For Parnassus project "Renovate UC Hall", it should be analyzed in the EIR.

It is impossible to tell whether or not the UC Hall renovation will impact the scenic vista. Choices of exterior materials can impact the appearance of Mt. Sutro. In addition UCSF has admitted that they don't know all the details of the renovation. Factors discovered after the project has been taken to blueprints could reveal a need to change the view profile of the top or sides of the building, impact the scenic vista.

Unless UCSF is prepared to go into sufficient detail to describe what will happen in the UC Hall renovation now, it must be analyzed for impact on the scenic vista in the EIR.

Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area

For Parnassus project "Renovate UC Hall", it should be analyzed in the EIR.

Because the specifics of the UC Hall renovation are not known, both the aesthetic requirements, as well as the safety needs of the building are not known. Changing legal and aesthetic standards could dictate lighting changes that impact the overall brightness of the surrounding area.

Exceed the LRDP EIR significance…or by increasing pedestrian level wind speeds above the hazard level set forth…

For Parnassus projects "Renovate UC Hall" and "Utilities, Retaining Wall", it should be analyzed in the EIR.

The "wind tunnel" effect on Parnassus is a well known problem, admitted to by both neighborhood residents and UCSF staff in public meetings. UCSF's inability to mitigate it has removed any credibility it might have in being able to claim that wind would not increase to the point of safety concerns.

For more information contact us at help@ucsfneighbors.com or Shabbir Imber Safdar (415 683 7526) or Eugene Salazar at santana1732@sbcglobal.net.

To make the claim that wind impacts won't be a factor, UCSF should conduct proper wind studies. **It is worth noting that UCSF Parnassus CAG member Kevin Hart specifically requested this in a recent community meeting regarding the demolition of 374 Parnassus. If UCSF won't take the suggestion of its own captive Community Advisory Group, then one wonders what use they serve besides checking the box for "community input".**

5.12 Noise

Would the project [impact] a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

For Parnassus projects "Demolish 13 existing buildings", it should be analyzed in the EIR.

The demolition of these buildings is only part of the story. Many of these buildings are slated to be replaced with parking lots and truck bays. The ambient noise created by additional car and truck traffic will create additional noise as this demand hits the residential neighborhood around 5th Ave and Kirkham Street.

5.13 Population and Housing

Would the project induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example through extension of roads or other infrastructure)?

For Parnassus projects "Renovate UC Hall" and "Renovate Moffitt & Milberry Tower", it should be analyzed in the EIR.

Perhaps this is simply a drafting error, but the UC Hall and Milberry tower project both create new housing. Each of these projects require a specific assessment of people impact attached to them. This is especially true because UCSF has never successfully been compliant with the space ceiling as set by the UC Regents Resolution of 1976, and adding new housing should not be allowed until they are.

5.16 Transportation and Traffic

This is not a recommended edits of the EIR study, but a requirements of the EIR itself.

EIR should contain detailed analysis about how UCSF will accommodate population growth at Parnassus, and manage neighborhood impact of additional cars. The EIR should address the following issues:

- No parking issues are mentioned in all these different approaches, there will be a resident increase of 560, there will be an increase of patient population at Parnassus of 84,000. Where will they park?

For more information contact us at help@ucsfneighbors.com or Shabbir Imber Safdar (415 683 7526) or Eugene Salazar at santana1732@sbcglobal.net.

- Which new residential units will be eligible for neighborhood parking stickers? Or will they be prevented from getting them?

Public Comment: UCSF LRDP Document:

To: Diane Wong

From: Michael Daly October 29th, 2013

Reference: Clarification Language added to define the intentions of the CEQA/EIR and LRDP process

An always present myth prevails during public participation in the LRDP phase, that myth was repeatedly pronounced at the October 28th public meeting on the Parnassus Campus. One speaker mentioned several times that a ***Plan*** cannot be accomplished without '***Plans"*** developed during an architectural phase, which address design intentions of individual parcels.

In fact, the CEQA/EIR and LRDP milestones are always accomplished in master schedules well in advance of beginning architectural process, *to enable it, not accomplish it*. In order to improve this understanding of the process among all parties, I suggest three minor edits to your draft, as noted below. These would show up on page 3, page 11 and page 14. This comment is submitted as a good faith suggestion which would hopefully allow to you a generous level of efficient communication to the community participants attending your events. Specifically, it would allow event chairs such as Lori Yamauchi actual bullet points in the document text to point to if these questions come up from the floor.

Page 3:

prepare an EIR as required by Public Resources Code Section 21080.09 that will evaluate the environmental effects of growth under the proposed LRDP. The LRDP EIR will be a program EIR that will be used by the Board of Regents of the University of California (The Regents) to evaluate the environmental implications of adopting the proposed LRDP. Once certified, the EIR will also be used to tier subsequent environmental analyses for future UCSF development projects (CEQA Guidelines Section 15152). Proposed UCSF development projects would then be reviewed in light of the LRDP EIR to determine the appropriate level of additional environmental review before implementation.

The CEQA/EIR and LRDP processes are not intended to accomplish actual design of structures or their eventual occupancy, rather these intend to meet statutory requirements of all projects of this scale in ensuring due diligence in all project planning front ends. This is a policy process, not an architectural document.

page 11

Projected Need for Additional Space

UCSF's projected need for additional space through the LRDP horizon of 2035 is 2.43 million gsf in addition to the buildings currently under construction. The amount of instruction, clinical, research and support space that is expected to be needed and can be financially supported through 2035 is described below. The breakdown of the types of space needed across all sites is presented and discussed by major space category**.** ***Actual design of this space will be accomplished in the future as specific needs emerge and can be clarified.***

The 2.76 million gsf of additional capacity under the LRDP exceeds the projected 2.43 million gsf need for additional space in order to allow for some degree of campus growth to meet needs that may not be foreseeable at this time, given the 20+ year horizon of the LRDP. This is explained in greater detail below under "Total Space at LRDP Buildout."

page 14

Total Space at LRDP Buildout

As noted above, UCSF's projected need for additional space through the LRDP horizon is 2.43 million gsf in addition to the 1.13 million gsf of building space currently under construction. The projects identified in the LRDP would provide up to 2.76 million gsf at LRDP buildout.

The purpose of this LRDP is to budget and ensure sufficient space to accomplish goals stated here; actual designs are pending future information to be gathered in real time.

Although a major portion of the projected space need would be accommodated in new buildings

on campus sites, some of it would be met through a combination of better utilization of existing vacant or underutilized space, reinvestment in existing sites, converting existing space to other uses to meet changing priorities (e.g., converting office space at the Parnassus Heights campus site to housing and backfilling Moffitt Hospital after 2030 with hospital support and other uses), or consolidating functions or leases.

Respectfully submitted,

Michael Daly

San Francisco, CA 94131

“Michael Daly” <mdaly138@gmail.com>

Greetings,

I thank UCSF for the opportunity to comment on scoping for the EIR for UCSF's LRDP.

An EIR should study all reasonable project alternatives so that the decision-making bodies and the public have sufficient information to make the best choices for UCSF and the environment. Oftentimes a project selected includes parts from more than one alternative.

In addition to the current proposal the EIR should study an alternative where each campus is a complete entity, with its separate mission, along with its own support facilities such as housing. This alternative will greatly lessen the need for shuttling staff/students/faculty from one campus to another, thereby reducing the burden of traffic between these campuses on the citizens of San Francisco. The environmental burden of semi-independent foci should be compared to the present pattern, where UCSF vans and buses more people around San Francisco all day long.

There are three basic issues--noise, lights, and traffic.

NOISE

The EIR for the previous LRDP made a commitment to reduce noise coming from the Parnassus campus into the surrounding neighborhood. I request that existing noise be analyzed professionally and completely and that future noise from each campus be reduced. Noise reduction is an important mitigation that will make living next to a large campus more livable. Noise reduction is never easy, but can be accomplished.

LIGHTS

Lights are another source of pollution that reaches out into the community. With any changes proposed for each of the campuses, reduction in existing lights is an important mitigation for other changes. Exterior lights should be changed to comply with dark sky principles. Interior lights that bleed out through unshielded windows should be changed to remove this light trespass.

On the Parnassus campus, night light pollution is especially noticeable because of the prevalence of low clouds that spread the light far beyond its source. Three examples; 1) lights from the anatomy floor in the clinic building are frequently on all night, and with non-shaded windows, these lights spread far into the neighborhood; 2) Lights near the glass walls of HSW mostly but also HSE likewise spread out into the neighborhood; 3) light from the Parnassus campus flagpole that flies, 24-7, rain or shine, spreads far into the neighborhood, being as it is on top of the building. As far as the flag is concerned, I would suggest a flagpole in the front circle by Moffitt Hospital, which, being lower down, could be spot illuminated without the broad

spread of light.

While I am suggestion solutions or mitigations, light pollution should be studied in the EIR, with an emphasis on *reducing existing light pollution*.

TRAFFIC

Living in the Inner Sunset, I can state unequivocally that the Parnassus neighborhood is clearly impacted by the comings and goings of the up to 18,000 visitors daily to the campus. Something has to give. The congestion gets worse every year. Traffic must be studied in the EIR and reasonable, achievable goals identified to reduce this impact.

1) Traffic in the citywide and Bay Area or regional network must be studied. It is not enough to study merely one campus and its bordering streets. For the Parnassus campus, it is not sufficient to study Parnassus and Irving, and a few of the avenues. Rather the citywide and regional Bay Area network for trips to the Parnassus campus must be studied, with a commitment to reduce this traffic.

Traffic generated to and from the other campuses should likewise be studied on a citywide and a regional basis.

2) Vans and high capacity vehicles are often proposed to help traffic issues. These vehicles bring their own problems.

2a) No vans or high capacity vehicles on residential streets--these should only be on major thoroughfares. The EIR should study alternative routes that use arterial roadways and avoid neighborhood streets completely.

2b) UCSF has included large, high capacity bus-like vans that move back and forth on residential streets. These particular vans appear to be similar to huge trucks, bringing unreasonable noise and pollution into the neighborhood. The EIR should study replacements for these huge vans that are more environmentally sensitive.

2c) Vans and high capacity vehicles that move people, campus to campus, may themselves induce traffic trips. This possibility should be studied in the EIR and whether a reduction in daily shuttling can be accomplished. With modern computers providing face-to-face dialogue, there should be no need to move people from one campus to another, throughout the day. Riding around on a bus should be seen as a waste of staff time and money, an abuse of student time and that of the professional teaching staff. The means to reduce shuttling should be studied.

3) As traffic mitigation, housing should be built on each campus for those persons who work at that campus and specifically not be allowed to be used for workers at other UCSF campuses.

4) Higher parking fees should be studied as an ideal way to reduce driving and congestion, as shown in the rest of San Francisco. Parnassus and the Mission campus seem to have set the *hourly* rate appropriately. The "early bird" rate, an all day rate, is unreasonably low. The EIR should study the impact of higher daily and monthly parking fees on single car occupancy. The study should include a fee schedule such that the more times per week and per month that a driver parks at a UCSF garage, the higher the fee. Once a week or 4 times a month should be more expensive than the present all day fee, for instance, up to twice higher, but the daily use of a UCSF parking garage should be quite a bit higher than the 'few times' a week fee. Higher parking fees should be used to help pay for the cost of Muni passes described below.

5) The EIR should study better markings for pedestrians, including lighting embedded in the street pavement at critical pedestrian crossings at all UCSF campuses. UCSF pay to put embedded pavement lighting in because UCSF brings in the traffic and UCSF staff and student pedestrians are heavily impacted, along with city neighbors. All campuses should be studied. For the Inner Sunset, obvious locations for pavement-embedded surface lighting are 7th and Irving and 7th and Judah, 7th and Kirkham. The EIR should propose a pedestrian friendly design for the parking garage entrance/exit on Irving Street at Arguello.

6) A critical citywide mitigation for the insult of traffic concerns MUNI use. MUNI passes for everyone working or studying at UCSF should be studied in the EIR.

The issuance of MUNI passes to all UCSF daily workers, students, staff, teachers, perhaps with a small, required fee, for example $20/month may be the most effective mitigation for UCSF's traffic impacts. The EIR should study the beneficial effects, city and regionally wide, of MUNI passes for all, with data from the MTA, the police, and the daily workers. The EIR should study the benefit to MUNI of having passes for all UCSF persons.

Higher fees for campus parking can help offset the cost of MUNI passes. This increase in parking revenue should, however, NOT be expected to *pay* for the passes, merely to *help* pay for them. The cost to UCSF for these passes should be part of the mitigation to the city's neighborhoods for UCSF's continuing presence within the dense urban fabric of San Francisco. The University of San Francisco is an example where all students are issued MUNI passes, automatically upon enrollment. The example of how it is done at USF should be studied in the EIR and how a MUNI pass issuance for all can be applied to UCSF.

7) Parking spaces and garages serve as magnets to cause more cars to come. This phenomenon at UCSF should be studied in the EIR. In the Initial Study there are instances where it is stated that building teardowns or building modifications will be used to create more parking. In order to reduce traffic, no further parking should be provided by UCSF, at any of its campuses. The parking that exists on Mount

Sutro, near the Surge and the Woods buildings, should be eliminated and the space added to the Mt. Sutro Open Space Reserve, as mitigation to the near neighbors on Edgeware.

In coordinating both the EIR and the planning for the LRDP, the EIR should assess UCSF regionally, not locally. The plan and its EIR must consider citywide and Bay Area regional impacts. Especially with regards to traffic, but also with regard the impacts of noise and lights.

One final point, the Initial Study is very vague about what will happen to Moffitt Hospital. Will it change? What will it change to? Will a specific change mean an increase in traffic to the Parnassus site? While other projects on the Parnassus campus are described in a few or several sentences, there is very little indication as to what is proposed for Moffitt Hospital. This seems to be a hole in the IS.

Thank you again for this opportunity.

Subject: Comment on Scope of Initial Study For UCSF Long Range Development Plan EIR

Dear Ms. Wong:

The written comments presented below confirm and make more complete my oral comments presented at the Scoping Meeting held on September 28, 2013 in the Millberry Union of the Parnassus Heights campus regarding the scope of the Initial Study prepared by UCSF.

Public comment on the Initial Study was invited by UCSF regarding the scope and content of the environmental issues that UCSF intends to address in the forthcoming Environmental Impact Report (EIR) being prepared by UCSF for the proposed UCSF 2014 Long Range Development Plan (LRDP). UCSF is preparing the EIR in order comply with state law, the California Environmental Quality Act (CEQA).

In summary, as described more specifically below, the most glaring deficiency in the scope of this Initial Study for the EIR of the proposed UCSF 2014 LRDP is the complete omission of a very significant issue --the numerous past failures of UCSF to comply with the state law, California Environmental Quality Act (CEQA). Since UCSF must comply with CEQA in preparing this Initial Study and in preparing the EIR for the 2014 LRDP, the omission of its past failures to comply with CEQA certainly is a most significant omission.

My comments regarding the scope and content of the environmental issues as described in the Initial Study that UCSF intends to address in the EIR being prepared for the 2014 LRDP are as follows:

1. Omission of UCSF past failures to comply with CEQA. In addressing UCSF's preparation of the EIR for the proposed 2014 LRDP, the scope of the Initial Study includes on page 6 the action taken by UC Regents to adopt a resolution addressing the environmental effects of daily population, floor area of buildings, open space on Mount Sutro, etc. Likewise certainly the scope of the Initial Study also should include complete information in the EIR regarding the potential significant adverse environmental effects of the past failures of UCSF to comply with state environmental law, i.e. CEQA, which were corrected by community organizations initiating legal action and the courts and the UC Regents taking action for UCSF to comply with environmental laws and guidelines. An EIR would be incomplete if it omitted the significant potential adverse environmental impacts which the UC Regents and Courts required UCSF to address and comply with CEQA as described more specifically in the following legal actions initiated by San Francisco community organizations regarding UCSF CEQA violations.
    a. The violation of CEQA in connection with the EIR prepared for the expansion of Moffitt Hospital building.
    b. The violation of CEQA in connection with the EIR prepared for a new building for the Dental School.
    c. The violation of CEQA in connection with the EIR for the master plan for the Laurel Heights campus.
2. The Initial Study fails to present complete and accurate information regarding the 1976 Regents Resolution.
    a. Incorrect description of resolution. Footnote 2 on page 6 notes, "... Mount Sutro was designated as open space for a 25-year period by The Regents in 1975." Incorrect. The Regent's Resolution established 50 acres of open space on Mt. Sutro "*in perpetuity*" - not for 25 years.
    b. Omits significant information. Omitted the facts that the Regents enacted the resolution to:

i. Resolve a law suit regarding the violation of CEQA and lower court decision and injunction. Omission of any reference to the violation of the California Environmental Quality Act by UCSF in connection with the construction of the new building for the Dental School and the expansion of Moffitt Hospital and that the Regents enacted the Resolution to lift the injunction.

ii. To settle law suit Regents adopted policies. Significant information was omitted in the Initial Study to correctly inform the public that the policies - regarding Mt. Sutro open space, daily campus population, gross square foot space ceiling, Parnassus Heights campus boundaries, selling homes (previously seized by eminent domain) to private individuals, etc. - were adopted by the Regents in order to resolve the environmental law suit filed by the community organizations.

iii. The plaintiffs of law suit were community and environmental organizations. The Initial Study omits that UCSF was the defendant of a law suit filed by community and organizations which included as plaintiffs the Mount Sutro Defense Committee, Inner Sunset Action Committee, Sierra Club, and others.

3. The scope of the Initial Study should include the community actions taken to ameliorate potential significant adverse environmental impacts of UCSF actions to:
   a. Seize via eminent domain and demolish single family houses around the Parnassus Heights campus.
   b. Construct a massive new building for the Dental School at the Parnassus Heights campus.
   c. Establish biological warfare research facilities at the Laurel Heights campus and eliminated biological warfare research at this campus.
4. The scope of the Initial Study should include a description in specific terms of each of the past LRDP's of UCSF describing also in specific terms each amendment made to each one of the past LRDP's.
5. The scope of the Initial Study should include a review of the possible future sale of UCSF facilities especially the facilities at the Laurel Heights Campus.

In conclusion, the above information pertaining to the scope of the Initial Study and the preparation of the EIR for the proposed UCSF 2014 LRDP is required to more fully fulfill UCSF's responsibility to prepare a full and complete EIR.

Yours truly,

John D. Bardis

Former Member of the San Francisco Board of Supervisors
Former President of the Inner Sunset Action Committee and Coalition for San Francisco Neighborhoods

APPENDIX C

Regents' Resolution Regarding the Parnassus Heights Campus Site

1. The 61-acre reserve on Mount Sutro is reaffirmed as permanent open space.

2. The Parnassus Heights campus site boundary is reaffirmed as shown on **Figure C-1**.

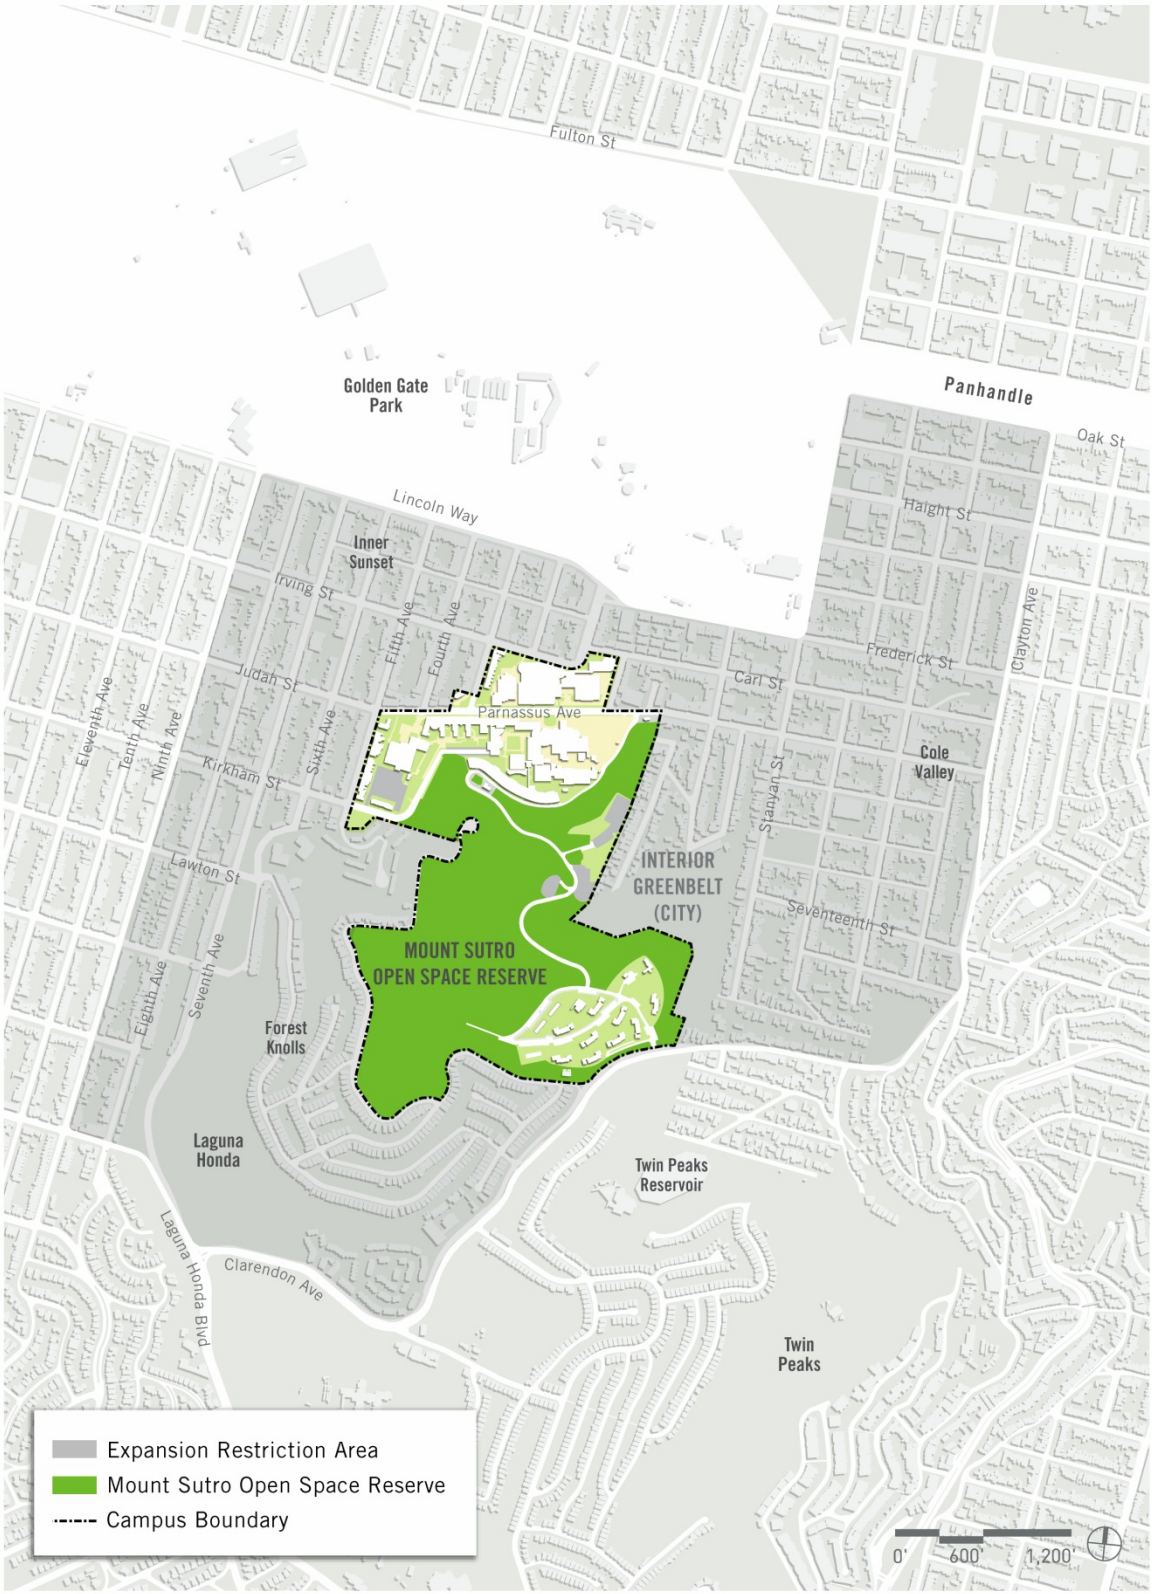
3. The space ceiling for the Parnassus Heights campus site is 3.55 million gross square feet. The space ceiling includes space in non-residential buildings within the boundary of the Parnassus Heights campus site.

4. The Third and Fifth avenue edges of the Parnassus Heights campus site will be consistent with the Housing functional zone designated for that area, to serve as a transition to the adjacent residential neighborhood in terms of use, character and scale.

5. UCSF is prohibited from expanding the Parnassus Heights campus site by purchase or condemnation or gift of any property or lease of private residential property not only contiguous with the campus site boundaries, but anywhere within the surrounding area bounded by Golden Gate Park, Oak Street, Ninth Avenue, Clayton Street, and Clarendon Avenue. This does not prohibit the use of commercial properties or the affiliation with other public agencies within the area described.

6. The Regents recognize the principle that the Parnassus Heights campus site will be administered so that the annual average of the daily campus population at the site will remain substantially in accordance with the projections set forth in the then-current Environmental Impact Report related to the Long Range Development Plan for the campus, as updated from time to time and approved by the Regents.

Figure C-1: Parnassus Heights Planning Agreements



APPENDIX D

UCSF Greenhouse Gas Reduction Strategy

This page intentionally left blank

UCSF GREENHOUSE GAS REDUCTION STRATEGY

1.0 BACKGROUND AND OBJECTIVES

UC San Francisco (UCSF) prepared this greenhouse gas (GHG) reduction strategy (the UCSF GHGRS) in conjunction with the 2014 Long Range Development Plan (LRDP) to ensure that the LRDP is implemented in alignment with the UC *Sustainable Practices Policy,*[1] particularly the directives on greenhouse gases (GHGs), and to fulfill the GHG reduction requirements of the State of California *Assembly Bill 32 (AB): The California Global Warming Solutions Act of 2006*.[2] *AB 32* requires the State of California as a whole to reduce GHG emissions to 1990 levels by the year 2020.

The UCSF GHGRS:

- Consolidates GHG reduction efforts already underway and planned by UCSF over the life of the LRDP (through 2035);
- Reflects and reinforces the policy direction regarding GHG reduction provided in the UCSF *Climate Action Plan* (2009);[3]
- Quantifies the impact on GHG emissions of projected land use as represented by the LRDP;
- Creates a framework for the ongoing monitoring and revision of the UCSF GHGRS; and
- Helps streamline *California Environmental Quality Act* (CEQA)[4] review of future campus development projects as consistent with the LRDP growth projections and the GHG reduction policies and programs contained in this document.

The UCSF GHGRS was prepared in accordance with *CEQA Guidelines Section 15183.5*, which specifically addresses how lead agencies can analyze and mitigate GHGs at a programmatic level and streamline environmental review of future projects that are consistent with the policies and programs contained in the UCSF GHGRS. Development of this strategy was also informed by the Governor's Office of Policy and Research (OPR) *CEQA Guidelines*[5] and its technical advisory *CEQA and Climate Change*,[6] and by the Bay Area Air Quality Management District (BAAQMD) *California Environmental Quality Act Air Quality Guidelines*.[7]

For UCSF, with land use authority over a significant urban area, adoption of campus-wide plans, policies, and programs for reducing GHG emissions is an effective way to reduce the cumulative impact of UCSF operations on climate change, and to streamline later project-specific CEQA reviews. The UCSF GHGRS is intended to minimize the effects of GHGs at a programmatic level across the UCSF campuses through the year 2035. It is designed to be a "qualified" strategy under the streamlining provisions of *CEQA Guidelines Section 15183.5*, to provide CEQA coverage of GHG emissions for future development projects that are consistent with LRDP growth projections and the policies and strategies that are contained in the UCSF GHGRS. As future individual projects are proposed, project-specific environmental review documents can tier from or incorporate by reference the programmatic environmental review of the LRDP and GHGRS to determine if the project's GHG impact is cumulatively considerable. Future environmental documents that rely on the GHGRS for cumulative impact analysis of GHGs must identify the requirements specified herein that apply to the project, and, if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to the project. The procedure for determining if a future project is consistent with UCSF's LRDP and GHGRS is in Section 7.0: CEQA Project Review.

The essential requirements of a qualified GHG reduction strategy, under *CEQA Guidelines Section 15183.5,* and as interpreted by OPR and BAAQMD,[8] are as follows:

See also BAAQMD's *GHG Plan Level Guidance*, May 2012. www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/GHG%20Quantification%20Guidance%20May%202012.ashx?la=en

- Establish a baseline GHG inventory for 2008 or earlier using accepted accounting protocols;
- Establish a business-as-usual GHG forecast for 2020 based on reasonable assumptions;
- Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the strategy would not be cumulatively considerable;
- Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographical area;
- Specify GHG reduction measures and performance standards, that, substantial evidence demonstrates, if implemented on a project-by-project basis, will collectively achieve the specified emissions target;
- Establish a mechanism by which to monitor the plan's progress toward achieving its targets and one which will trigger required amendment if the plan is not achieving specified levels; and
- Be adopted in a public process following environmental review.

UCSF's existing *Climate Action Plan*, dated December 2009, meets many but not all of these requirements. It establishes a 1990 baseline, which in turn informs a 2020 campus-wide target (consistent with *AB 32* and the UC *Sustainable Practices Policy*), forecasts emissions through 2020, and includes a comprehensive set of prescriptive GHG reduction measures. However, the *Climate Action Plan* did not undergo CEQA review and it was not adopted in a public process; in addition, it does not include a clear monitoring plan for tracking GHG emissions reductions and adjusting the plan over time to meet the 2020 target. As a result, the *Climate Action Plan* cannot be considered a "qualified" GHG reduction strategy. This document, however, will meet the criteria to be a qualified GHG reduction strategy.

As of 2014, qualified GHG reduction strategies are constructed around target year 2020, since that is the *AB 32* planning horizon. However, as the 2014 LRDP has a planning horizon of 2035, and as future legislation is anticipated that will mandate a new (post-2020) statewide GHG emissions level, the UCSF GHGRS provides a framework for meeting requirements and maintaining qualification through the year 2035.[9]

With respect to environmental review of a given project under the LRDP (the "project"), the GHGRS is intended to ensure that UCSF can answer "no" to the following questions regarding "Greenhouse Gas Emissions" in the Environmental Checklist Form (Appendix G) of the *CEQA Guidelines*:

- VII.a. Will the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?
- VII.b. Will the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?[10]

The UCSF GHGRS may require revision over time in response to changes in GHG regulations; changes to existing or planned state, UC, or UCSF GHG reduction programs and policies; or development patterns that diverge from the assumptions made when the LRDP was adopted. Circumstances that may lead to revision of this document are outlined in Section 6.0: Implementation and Monitoring.

2.0 POLICY AND REGULATORY SETTING

The UCSF GHGRS addresses applicable federal, state, regional, local, UC system-wide, and UCSF-specific policies and regulations in effect as of April 2014. These are outlined in the following sections.

2.1 POLICIES AND PLANS OF THE BOARD OF REGENTS OF THE UNIVERSITY OF CALIFORNIA AND UNIVERSITY OF CALIFORNIA OFFICE OF THE PRESIDENT

In 2007, the Chancellor of UCSF signed the *American College and University President's Climate Commitment* (ACUPCC)[11] to complete an emissions inventory, set target dates and interim milestones for becoming climate-neutral,[12] take steps to reduce GHG emissions, and prepare public progress reports. As an intermediate target, the University of California Office of the President (UCOP) established the goals of reducing GHG emissions to 2000 levels by 2014; 1990 levels by 2020; and achieving climate neutrality as soon as possible after reaching the 2014 and 2020 reduction targets. More recently, UCSF committed to achieving climate neutrality by

9 www.arb.ca.gov/cc/scopingplan/document/updatedscopingplan2013.htm

10 Applicable plans include *AB 32* and the *AB 32 Scoping Plan*, adopted UC policy, and the UCSF *Climate Action Plan*.

11 www.presidentsclimatecommitment.org/about/commitment

12 Climate neutrality is defined as the University having a net-zero impact on the Earth's climate; it will be achieved by minimizing GHG emissions as much as possible and by using other measures to mitigate the remaining GHG emissions (UCSF *Climate Action Plan*, December 2009).

the year 2047.[13] These goals pertain to Scope 1 and Scope 2 emissions[14] of the six Kyoto greenhouse gases originating from sources specified in the ACUPCC,[15] as well as Scope 3 emissions from business airline travel and commuting by UCSF staff and students. The *Sustainable Practices Policy* of the Board of Regents of the University of California (Regents) and the UCOP specifies that these goals will be pursued while maintaining the primary research and education mission of the University.

As outlined in UCSF's *Climate Action Plan* of 2009, the Regents approved and the UC President issued the *Sustainable Practices Policy* in 2007, which committed UC to implementing actions intended to minimize the University's impact on the environment and reduce the University's dependence on non-renewable energy. The policy was most recently revised in November 2013, and now covers the areas of green building, clean energy, transportation, climate protection, sustainable operations, waste reduction and recycling, environmentally preferable purchasing, sustainable foodservice, and sustainable water systems. The UC *Sustainable Practices Policy* will continue to be updated over time.[16]

The *Sustainable Practices Policy* sets the following requirements and goals relevant to GHG emissions reduction:

- Each UC campus must develop a long-term strategy for voluntarily meeting the requirements of California's *Global Warming Solutions Act of 2006 (AB 32)*;
- All campuses are instructed to attempt to achieve climate neutrality as soon as possible after meeting 2014 and 2020 reduction targets;
- New construction and renovations are required to achieve energy performance 20 percent better than that mandated by *Title 24* (policy maintained as *Title 24* is revised), and to strive to achieve 30 percent;
- New laboratory buildings must meet Labs21 Environmental Performance Criteria (EPC);[17]
- All new construction and major renovation projects must meet a minimum standard of LEED-NC Silver, and are to strive for LEED-NC Gold designation when possible;[18]
- The University is to use energy efficiency retrofits to reduce system-wide energy consumption by 10 percent or more, from the 2000 baseline, by 2014;
- Renovation projects greater than $5 million that do not quality for LEED-NC must be certified under LEED-CI;
- Renovation projects that require 100 percent equipment replacement, and 50 percent non-shell areas, must achieve LEED Silver certification at a minimum, and strive for Gold;
- Each campus is to submit one pilot LEED-EBOM building for certification by July 1, 2014;
- The University of California system is to have the capacity to provide up to 10 megawatts (MW) of renewable energy on-site by 2014 (approximately one MW per UC campus);
- Campuses are to develop goals for reducing transportation-related GHGs and report on progress annually;
- Transportation Demand Management (TDM) programs and projects are to be expanded and enhanced as appropriate to each campus;
- Campuses are to divert 50 percent of solid waste by 2008 and 75 percent by 2012, and are to achieve zero waste by 2020 (defined as diverting 95 percent or more of municipal solid waste);
- Each campus is to develop a *Water Action Plan* and reduce water consumption by 20 percent by 2020;
- All new buildings are to achieve at least two points in the LEED NC Water Efficiency category;
- Campuses are instructed to maximize procurement of environmentally preferable products and services; and
- By 2020, 20 percent of food products purchased by the University must be sustainable food products.

The UC President has set a goal for UC to become carbon

13 This is the current commitment made to ACUPCC and the goal that is referenced in UCSF's Annual Progress Report to the Board of Regents of the University of California (Regents). Carbon neutrality refers to achieving net zero cabon emissions by balancing a measured amount of carbon released with an equivalent amount sequestered. At UC this means scopes 1 and 2 emissions by the year 2025. The carbon neutrality concept may be extended to include other greenhouse gases measured in terms of their carbon dioxide equivalence—the impact a GHG has on the atmosphere expressed in the equivalent amount of CO_2.

14 For a definition of Scope 1, Scope 2 and Scope 3 GHG emissions, see Section 3.0: UCSF GHG Emissions Inventory and Forecasts.

15 The six greenhouse gases identified in the Kyoto Protocol/ACUPCC are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs / CXFY). These are the same six greenhouse gases identified in CEQA *Section 15364.5*.

18 Leadership in Energy and Environmental Design (LEED) definitions, details, and standards are available on the website of the US Green Building Council (USGBC, the organization that sets the standards). www.usgbc.org/leed

neutral by 2025 and purchase only clean energy.[19] This goal has not been formally adopted by the Regents as a policy, but UC is actively working on the President's initiative to be the first major research university to achieve carbon neutrality, with efforts planned or underway to:

- Create a shared service center, which both owns electricity-generation resources and purchases long-term forward contracts, and which will manage the supply of wholesale electricity to campuses eligible for direct access;
- Continue energy-efficient projects and expand them to include small- to medium-scale renewable energy sources[20] at all campus sites, and seek additional funding sources for these projects;
- Effectively manage the purchase of natural gas to mitigate risk tolerance to price changes, develop renewable natural gas (biogas), and purchase biogas contracts through outside producers; and
- Manage emissions allowances and offsets, comply with California's cap-and-trade program and other environmental attribute programs, and generate new funds to support projects resulting in GHG emission reductions.

2.2 UCSF POLICY AND PLANS

UCSF has a robust sustainability program covering sustainability activities across the entire campus. Through its Office of Sustainability, UCSF has created work groups addressing sustainability in the following areas, most of which have direct implications for GHG emissions: Carbon Neutrality, Zero Waste, Water Conservation, Sustainable Food, Toxics Reduction, Green Procurement, Green Buildings, and Sustainable Operations.

UCSF's Sustainability Governance consists of the Academic Senate Sustainability Committee and the Chancellor's Advisory Committee on Sustainability (CACS). The Academic Senate Sustainability Committee identifies faculty recommendations for improving sustainability at UCSF. The charge of the CACS is to:

- Annually examine UCSF's effect on the environment from a comprehensive perspective;
- Evaluate existing UCSF policies, procedures, and programs that affect the environment;
- Serve as a coordinating body for groups or individuals concerned with sustainability issues;
- Advise selected work groups in the development and implementation of UCSF's sustainability initiatives and goals; and
- Support reduction of greenhouse gas emissions to 1990 levels by 2020.

UCSF includes a Sustainability Dashboard on its Living Green website that includes performance metrics for multiple issue areas including GHG emissions. UCSF also publishes an annual sustainability report on its web-site.[21]

UCSF Climate Action Plan (2009)

As part of implementing the UC *Sustainable Practices Policy*, UCSF developed a *Climate Action Plan* in 2009, as mentioned in Section 1. The USCF *Climate Action Plan* is a long-term strategy for voluntarily meeting the State of California's goal for reducing GHG emissions to 1990 levels by 2020, pursuant to *AB 32*. The *Climate Action Plan* also addresses the UCOP goals for 2014 and 2020 target-year GHG emissions, and attaining climate neutrality[22] as soon as possible after achieving the 2014 and 2020 reduction targets. GHG emissions inventories are included for the years 1990, 2000, and 2008. The *Climate Action Plan* forecasts future emissions, and it assesses the impact of UCSF sustainability policies and programs on future GHG emissions and the prospects for achieving GHG reduction goals. The *Climate Action Plan* concluded that UCSF is expected to meet the goal of reducing GHG emissions to 2000 levels by 2014, but that the goal of reaching 1990 levels by 2020[23] likely would not be met without the use of additional reduction measures or carbon offsets.

UC Strategic Energy Plan

The UC *Strategic Energy Plan* (*SEP*)[24] was prepared in 2008 for all UC campuses, to fulfill a goal of UC's *Sustainable Practices Policy* to implement energy efficiency projects in

19 University of California, Office of the President Business Operations, November 2013. *President's Initiative: The First Research University to Achieve Carbon Neutrality*. sustainability.universityofcalifornia.edu/documents/carbon-neutrality2025.pdf

20 Renewable energy is power generated from inexhaustible sources, such as the sun or wind, or from sources that can quickly be replenished, such as biomass. For the purposes of this document, an energy source is renewable if it has been designated as such by the California Energy Commission. For details, see www.cpuc.ca.gov/PUC/energy/Renewables/FAQs/01REandRPSeligibility.htm .

21 Annual Sustainability Reports are available on the UCSF LivingGreen website: sustainability.ucsf.edu/

22 The *Climate Action Plan* defines climate neutrality as having a net zero impact on the Earth's climate, to be achieved by minimizing GHG emissions as much as possible and using carbon offsets or other measures to address the remaining GHG emissions.

23 During development of the UCSF GHGRS it was discovered that the 1990 emissions estimate in the 2009 *Climate Action Plan* is inaccurate, due to an error in energy accounting. The actual emissions were significantly higher, which means the 2020 target in the *Climate Action Plan* should have been higher as well. (See Section 3.4.1 for further detail).

24 System-wide *SEP*: sustainability.universityofcalifornia.edu/documents/ucsep_sw.pdf

existing buildings. The UCSF portion of the *SEP*[25] analyzes energy use and GHG trends, and identifies potential energy efficiency retrofit projects (primarily lighting, HVAC, commissioning, and central plant measures) at all buildings at UCSF having areas of 50,000 gross square feet (gsf) or larger. Energy savings, GHG emissions savings, and financial returns are estimated in the *SEP* for hundreds of projects, which are grouped into Tier 1 (high priority) and Tier 2 (longer-term planning) projects based on their energy savings and financial payback. The *SEP* project list is intended to be regularly updated by each campus to evaluate the feasibility of additional energy-saving measures.

Annual GHG Inventory Reporting

The UC *Sustainable Practices Policy* requires each campus to report a GHG emissions inventory to an independent reporting organization.

UCSF reported Scope 1 and Scope 2 emissions[26] for calendar-year 2008 to the California Climate Action Registry (CCAR). UCSF currently reports its annual Scope 1 and Scope 2 GHG emissions inventory to The Climate Registry (TCR). The most recent inventory reported to TCR was for calendar year 2012.[27] UCSF emissions inventories reported to outside agencies are verified by accredited independent auditors.

Since 2008, UCSF has also been required to report its annual Scope 1 emissions from the Parnassus Central Utility Plant (CUP) to the California Air Resources Board (CARB) under the *AB 32* Reporting Rule. (The CUP is the only UCSF facility that reaches the threshold for required reporting of emissions to the CARB under *AB 32* and federal regulations.)

UCSF tracks and reports its progress towards meeting its GHG emissions goals in its *Annual Sustainability Report*.[28] USCF also reports to the UC Regents annually on its progress in meeting the goals in the UC *Sustainable Practices Policy*. (See Section 3 for more on UCSF's inventories and reporting.)

25 UCSF *SEP*: sustainability.universityofcalifornia.edu/documents/ucsep_ucsf_mc.pdf

26 For more information on UCSF's Scope 1, Scope 2, and Scope 3 GHG emissions, see Section 3.0: UCSF GHG Emissions Inventory and Forecasts.

27 As of April 2014, UCSF was completing 2013 calendar year TCR reporting documents.

28 UCSF Office of Sustainability, *Annual Sustainability Report*, FY12-13: sustainability.ucsf.edu/what_ucsf_is_doing_2/annual_report_fy12_13

2.3 FEDERAL REGULATIONS

Under the *Mandatory Reporting of Greenhouse Gases Rule (74 FR 56260)*[29] of the United States Environmental Protection Agency (USEPA or EPA), large emitters of GHGs are required to report their emissions annually to a public database. Under this rule, GHG emissions from the CUP have been reported annually to the EPA since 2010.

2.4 STATE OF CALIFORNIA AND PROGRAMS AND POLICIES

California is a leader in developing climate change mitigation and adaptation strategies. Since 2005, California has been developing policy and passing legislation that seeks to control emissions of GHGs. These have included regulatory approaches, such as mandatory reporting for significant sources of GHG emissions and caps on emission levels, as well as market-based mechanisms, such as the market-based cap-and-trade exchange. Some regulations apply at the state level, but others are state-imposed mandates that are applicable at the municipal level and required of local agencies and jurisdictions.

Governor's Office of Planning and Research

The California Governor's Office of Planning and Research (OPR) provides guidance for agency compliance with CEQA, which requires that public agencies analyze and document the environmental impacts of proposed projects. OPR has developed guidance on the analysis and mitigation of GHG emissions in CEQA documents. This guidance states that lead agencies should develop their own approach to performing climate change analysis for projects that generate GHG emissions, and that compliance with CEQA can be achieved by identification and quantification of GHG emissions, assessment of significance of the impact on climate change, and identification of mitigation measures and/or alternatives if the impact is found to be significant.

OPR developed, and the California Resources Agency has adopted, amendments to the *CEQA Guidelines* to incorporate this guidance. *CEQA Guidelines Section 15183.5(b)* states that a lead agency may choose to analyze and mitigate significant greenhouse gas emissions in a plan for the reduction of greenhouse gases or similar document, and that such a plan may be used in a cumulative impacts analysis of a project. A lead agency may determine that an individual project's incremental contribution to a cumulative effect on climate change is not cumulatively considerable if the project

29 epa.gov/climate/ghgreporting/basic-info/index.html

complies with the requirement of the previously adopted plan to reduce greenhouse gas.

State of California Executive Order S-3-05: Greenhouse Gas Emission Reduction Targets

In June 2005, the Governor of California signed *Executive Order S-3-05*,[30] which identified the California Environmental Protection Agency (Cal/EPA) as the lead coordinating state agency for establishing climate change emission reduction targets in California. A "Climate Action Team," a multi-agency group of state agencies, was established and tasked with implementing *Executive Order S-3-05*. The Governor's order established aggressive emissions reductions goals: by 2010, GHG emissions must be reduced to 2000 levels; by 2020, GHG emissions must be reduced to 1990 levels; and by 2050, GHG emissions must be reduced to 80 percent below 1990 levels. GHG emission reduction strategies and measures to reduce global warming were identified by the California Climate Action Team in 2006.

State Assembly Bill 32 (AB 32): The California Global Warming Solutions Act of 2006

In 2006, the California legislature adopted *AB 32*, requiring that California cap GHG emissions state-wide at 1990 levels by 2020, as already discussed. *AB 32* requires CARB to establish a program for statewide GHG emissions reporting, and monitoring/enforcement of that program.

The *Climate Change Scoping Plan*,[31] adopted in 2008 and being updated in 2013-2014, outlines the State's plan to achieve the GHG reductions required in *AB 32*. The actions vary by type, which include direct regulations, alternative compliance mechanisms, incentives, voluntary actions, and other mechanisms. The scoping plan identifies local governments as "essential partners" in achieving California's goals to reduce GHG emissions, and encourages the adoption of reduction targets for community and municipal operations emissions that are consistent with the State's commitment (identified as equivalent to 15 percent below "current" levels). *AB 32* spawned many high-impact State measures that target emissions from transportation and power generation, including the Pavley vehicle emissions standards (*Assembly Bill 1493*), the *Renewables Portfolio Standard*, and the *Low Carbon Fuel Standard*, each of which is described below.

Assembly Bill 1493 (Pavley): Clean Car Standards

Assembly Bill 1493 (*AB 1493*, also known as the Pavley bill),[32] directed CARB to adopt regulations to reduce emissions from new passenger vehicles. *AB 1493* required GHG emission reductions from passenger trucks and light cars beginning in 2011. CARB's *AB 32 Early Action Plan*, released in 2007, included a strengthening of the Pavley regulation for 2017. The USEPA granted California the authority to implement GHG emission reduction standards for new passenger cars, pickup trucks, and sport utility vehicles in June, 2009. In September of that year, CARB adopted amendments to Pavley that mandated ever-greater reductions to GHG emissions from new passenger vehicles from 2009 through 2016. It is expected that the Pavley regulations will reduce GHG emissions from California passenger vehicles by about 22 percent in 2012 and about 30 percent in 2016, while improving fuel efficiency and reducing motorists' costs.

Senate Bill 1078 (SB 1078): Renewables Portfolio Standard

California's *Renewables Portfolio Standard* (*RPS*) was established in 2002 under *SB 1078*;[33] it was accelerated in 2006 under *SB 107*[34] and further expanded in 2011 under *SB 2*.[35] Under *AB 32*, the *Renewables Portfolio Standard* requires increased production of energy from renewable sources, like solar, wind, geothermal, and biomass generation. Investor-owned utilities, electric service providers, and community choice aggregators must increase their renewable portfolio to reach 33 percent of total procurement by 2020. UCSF's primary electricity provider, Pacific Gas and Electric (PG&E), expects to meet in excess of 33 percent of its retail energy demand with eligible renewable resources prior to 2020.

Low Carbon Fuel Standard (LCFS) Regulations

The *LCFS* (also known as *EO-S-1-07*)[36] regulations require fuel providers in California to decrease lifecycle fuel carbon intensity[37] by 2020. The *LCFS* applies, either on a compulsory or opt-in basis, to all fuels used for transportation in California. It is expected that the *LCFS* will reduce tailpipe carbon

emissions from passenger vehicles and heavy-duty trucks by approximately 10 percent by 2020. CARB identified specific eligibility criteria in 2009, and the regulation came into effect in January, 2010. In December, 2011, the U.S. District Court for the Eastern District of California issued rulings that struck down the *LCFS* for violation of the Commerce Clause of the U.S. Constitution, and enjoined its further enforcement. CARB appealed the ruling the following month. In 2013, the State of California Court of Appeal, Fifth Appellate District, held that *LCFS* would remain in effect, allowing CARB to continue to implement and enforce the 2013 regulatory standards while making additional amendments. CARB staff will present the revised *LCFS* regulation in the fall of 2014, including 2013 amendments as well as new concepts to improve flexibility, efficiency, and enforcement of the regulation.

2013 Building Energy Efficiency Standards (Title 24 Update)

In 2013, the California Energy Commission (CEC) updated the *California Code of Regulations (CCR), Title 24* of the California Energy Code,[38] so as to enhance the energy efficiency requirements of newly constructed buildings. The 2013 standards were adopted in 2012, and are effective as of July 1, 2014. The update to the code supports the goals described in *AB 32* by enhancing energy efficiency of all new residential and non-residential development, and streamlines the compliance process. The 2008 update reduced GHG emissions levels from electricity use by approximately 21 percent, and from natural gas use by 9 percent for California residential buildings, and by approximately 5 percent for electricity and 9 percent for natural gas for non-residential buildings. The 2013 update to the standards (effective 2014) is expected to further reduce the energy use of new buildings by approximately 20 percent (compared with the 2008 standards); the update also has provisions that are designed to save an estimated 200 million gallons of water per year statewide.

Senate Bill 97 (SB 97): CEQA Guidelines Amendments

The legislature enacted *SB 97*[39] to augment *AB 32*, which did not discuss how GHGs should be addressed in documents prepared under CEQA. *SB 97* required the OPR to develop and adopt amendments to the *CEQA Guidelines* regarding the mitigation of emissions; these were formalized on March 18, 2010. All CEQA documents prepared subsequently have been required to comply with the OPR-approved amendments to the *CEQA Guidelines*.

Senate Bill 375 (SB 375): The Sustainable Communities Act

In 2008, *SB 375*[40] was enacted to address indirect GHG emissions caused by urban sprawl. *SB 375* develops emissions-reduction goals that regions can apply to planning activities. *SB 375* provides incentives for local governments and developers to create new walkable and sustainable communities, revitalize existing communities, and implement conscientiously planned growth patterns that concentrate new development around public transportation nodes. CARB has been working with the state's metropolitan planning organizations to align their regional transportation, housing, and land use plans so as to reduce vehicle miles traveled and attain regional GHG reduction targets. The legislation also allows developers to bypass environmental review of the project's GHG impact under CEQA if they build projects consistent with the Sustainable Community Strategy of a given planning organization.

SB 375 enhances CARB's ability to reach the goals of *AB 32* by directing the agency to develop regional GHG emission reduction targets for 2020 and 2035 that are to be achieved through these the land use and transportation sector. For example, in September, 2010, CARB adopted placeholder per capita emissions reduction targets for the San Joaquin Valley (including eight planning organizations) of five percent and 10 percent, respectively, to be revised in 2012. On December 14, 2012, the Policy Council adopted a progress report that maintained these target recommendations.

Senate Bill 226 (SB 226): Streamlining for Infill Projects

This 2011 California law streamlines environmental review of eligible infill projects under CEQA. Under *SB 226*,[41] qualifying infill projects can avoid environmental review of impacts that were addressed in prior, program-level analysis, or where local development standards already mitigate them. *SB 226* defines infill projects as residential, retail, commercial or mixed-use development, transit stations, schools and public office buildings, on previously developed urban sites or vacant land at least 75 percent surrounded by urban uses. The project must be consistent with *AB 32* and the regional sustainable community strategy developed pursuant to *SB 375*, and be consistent with state planning priorities, water conservation and energy efficiency standards, transit-oriented development policies, and public health policies.

2.5 REGIONAL PLANS AND POLICIES

The BAAQMD is the primary agency responsible for regional air quality regulation in the nine-county San Francisco Bay Area Air Basin (SFBAAB). The BAAQMD established a climate protection program to reduce pollutants that contribute to global climate change and affect air quality in the SFBAAB. The climate protection program includes measures that promote energy efficiency, reduce vehicle miles traveled, and develop alternative sources of energy, all of which assist in reducing emissions of GHGs and in reducing air pollutants that affect the health of residents. The BAAQMD also seeks to support current climate protection programs in the region and to stimulate additional efforts through public education and outreach, technical assistance to local governments and other interested parties, and promotion of collaborative efforts among stakeholders.

In June 2010, the BAAQMD issued revised guidelines (*BAAQMD CEQA Air Quality Guidelines*) for determining CEQA significance thresholds for air pollutants including GHG emissions. Updated in May 2012, these guidelines include recommendations for analytical methodologies to determine air quality impacts and identify mitigation measures that can be used to avoid or reduce GHG emissions. The guidelines also define the essential requirements of a qualified GHG reduction strategy under *CEQA Guidelines Section 15183.5*, consistent with the OPR directives.

On March 5, 2012, the Alameda County Superior Court issued a judgment finding that BAAQMD had failed to comply with CEQA when it adopted its 2010 thresholds of significance. However, in August 2013 the State Court of Appeal issued a full reversal of the Superior Court ruling, although at the time of this analysis, BAAQMD has not formally readopted these thresholds. Notwithstanding formal adoption, the 2011 thresholds are based on substantial evidence provided by BAAQMD (BAAQMD, 2009), and have been accepted by the University of California for use in the LRDP EIR.

The threshold for stationary sources is 10,000 metric tons (mt) of CO_2e[42] per year (i.e., emissions above this level may be considered significant). For non-stationary sources, three separate thresholds have been established:

- Compliance with a qualified GHG reduction strategy (i.e., if a project is found to be out of compliance with a qualified greenhouse gas reduction strategy, its GHG emissions may be considered significant); or
- 1,100 mt of CO_2e per year (i.e., emissions above this level may be considered significant); or
- 4.6 mt of CO_2e per service population (SP) per year (i.e., emissions above this level may be considered significant). "Service population" is the sum of residents plus employees[43] expected for a development project.

For quantifying a project's GHG emissions, BAAQMD recommends that all GHG emissions from a project be estimated, including a project's direct and indirect GHG emissions from operations. Direct emissions refer to emissions produced from on-site combustion of energy, such as natural gas used in furnaces and boilers, emissions from industrial processes, and fuel combustion from mobile sources. Indirect emissions are emissions produced off site from energy production and water conveyance due to a project's energy use and water consumption. BAAQMD has provided guidance on detailed methods for modeling GHG emissions from proposed projects (BAAQMD, 2012). The above-stated thresholds apply only to operational emissions. To date, the BAAQMD has not adopted numeric thresholds for the assessment of construction-related emissions.

2.6 CITY AND COUNTY OF SAN FRANCISCO PLANS AND POLICIES

As outlined in LRDP Appendix C, the 1987 *Memorandum of Understanding* (MOU) between UCSF and the City and County of San Francisco, UCSF maintains constitutional autonomy (per Article 9, Section 9 of the California State Constitution) over the land and facilities it owns or operates within the city of San Francisco. This authority includes University master planning and oversight of land uses and the development, maintenance and use of physical facilities owned or operated by UCSF. Thus, the following City plans and policies apply only to facilities located within the City that UCSF leases from a third party.

City and County of San Francisco Greenhouse Gas Reduction Strategy

San Francisco has a history of environmental protection policies and programs aimed at improving the quality of life for residents and reducing detrimental impacts on the environment. A comprehensive assessment of these policies,

42 **Equivalent carbon dioxide (CO_2e)** is a measure for describing how much global warming a given type and amount of greenhouse gas may cause, using the functionally equivalent amount or concentration of carbon dioxide (CO_2) as the reference. Carbon dioxide equivalency is a quantity that describes, for a given mixture and amount of greenhouse gas, the amount of CO_2 that would have the same global warming potential, when measured over a specified timescale (generally, 100 years). Carbon dioxide equivalency thus reflects the time-integrated radiative forcing of a quantity of *emissions* or rate of greenhouse gas emission—a *flow* into the atmosphere—rather than the instantaneous value of the radiative forcing of the stock (concentration) of greenhouse gases *in the atmosphere* described by CO_2e. en.wikipedia.org/wiki/Carbon_dioxide_equivalent

43 For UCSF, "employees" includes staff and faculty.

programs and ordinances was compiled into the City's *Strategies to Address Greenhouse Gas Emissions in San Francisco* in 2010.[44] The BAAQMD concurs that the strategy meets the criteria for a qualified GHG reduction strategy as outlined in BAAQMD's 2010 *CEQA Air Quality Guidelines*.

The following plans, policies, and legislation demonstrate San Francisco's continued commitment to environmental protection. They include measures applicable to this project that would decrease the amount of GHG emissions emitted into the atmosphere and thus decrease San Francisco's overall contribution to climate change. These programs are collectively referred to as *San Francisco's GHG Reduction Strategy*.

Climate Action Plan for San Francisco

In February 2002, the San Francisco Board of Supervisors passed the *Greenhouse Gas Emissions Reduction Resolution (Resolution Number 158-02)*[45] that set a goal for the City to reduce GHG emissions to 20 percent below 1990 levels by the year 2012. In September 2004, the San Francisco Department of the Environment and San Francisco Public Utilities Commission (SFPUC) published the *Climate Action Plan for San Francisco: Local Actions to Reduce Greenhouse Gas Emissions*.[46] This climate action plan provides the context of climate change in San Francisco and examines strategies to meet the 20-percent GHG emissions reduction target. Although the Board of Supervisors has not formally committed the City to perform the actions addressed in the plan, and many of the actions require further development and commitment of resources, the plan serves as a blueprint for GHG emissions reductions, and several actions have been implemented or are now in progress. Through 2010, the City of San Francisco's GHG emissions were 14.5 percent below the 1990 emission levels.[47] While this reduction has not quite met the goals of the resolution, it does surpass international and statewide emissions targets established as part of the Kyoto Protocol, which called for emission reductions of seven percent by 2012, and *AB 32*, which called for statewide emissions to return to 1990 levels by 2020.

The City updated its *Climate Action Plan* In October 2013, changing its title to the *San Francisco Climate Action Strategy*.[48] The update is organized around three main goals:

- Send zero waste to landfills by 2020;
- Source 100 percent of residential and 80 percent of commercial electricity from renewable sources by 2030, an effort tied to energy-efficiency improvements that will reduce usage; and
- Attain a level of 50 percent of all transportation trips in the city being completed without the use of personal vehicles by 2017.

Electricity Resource Plan (Revised December 2011)

The 2013 *San Francisco Climate Action Strategy* concludes that moving to 100-percent-renewable electricity is the single biggest step the City can take to reduce GHG emissions. The purpose of the 2011 update to San Francisco's 2002 *Electricity Resource Plan*[49] was to identify strategies for San Francisco to achieve a GHG-free electric system by 2030, meeting all of its energy needs from renewable and zero-GHG electric energy sources. The plan affects not only the SFPUC in its role of providing electric power to serve municipal facilities (17 percent of San Francisco's total energy usage), but also the 83 percent of electric energy currently being supplied to San Francisco by PG&E and various energy service providers.

Green Building Ordinance

In August, 2008, the City enacted the *San Francisco Green Building Ordinance* for newly constructed residential and commercial buildings and major renovations to existing buildings. The ordinance (Chapter 13C of the San Francisco Building Code[50]) goes beyond the State's CALGreen mandatory green building measures, and specifically requires newly constructed commercial buildings larger than 5,000 gsf, residential buildings over 75 feet in height, and renovations on buildings over 25,000 gsf to achieve a Leadership in Energy and Environmental Design (LEED) rating of Gold or higher starting in 2012. As a result, San Francisco has achieved the highest per-capita density of LEED-certified square footage of any U.S. city.

Existing Commercial Buildings Energy Performance Ordinance (San Francisco Environment Code, Chapter 20)

Under this ordinance, passed in 2011, nonresidential buildings of 10,000 square feet and larger must benchmark and publically report energy use every year, and undergo a professional energy audit every five years. This ensures that property owners, managers, and tenants know how their buildings are performing and can make informed decisions about effective energy-efficiency strategies for their buildings.

Transit First Policy

In 1973, the City instituted the *Transit First* policy,[51] which added *Article 8A, Section 8A.115* to the City Charter with the goal of reducing San Francisco's reliance on freeways and meeting transportation needs by emphasizing mass transportation. The *Transit First* policy gives priority to public transit investments, adopts street capacity and parking policies to discourage increased automobile traffic, and encourages the use of transit, bicycling, and walking instead of single-occupant vehicles. The University is committed to supporting the City's *Transit First* policy.

San Francisco Municipal Transportation Agency's Zero Emissions 2020 Plan

The *Zero Emissions 2020 Plan* focuses on the purchase of cleaner emission transit buses, including hybrid diesel-electric buses. Under this plan, hybrid buses will replace the oldest diesel buses, some dating back to 1988. The hybrid buses emit 95 percent less particulate matter (soot) than the buses they replace; they produce 40 percent less nitrogen oxides and reduce GHGs by 30 percent.

Zero Waste

In 2004, the City committed to a goal of diverting 75 percent of its waste away from landfills by 2010, with the ultimate goal of zero waste by 2020. San Francisco recovered 80 percent of discarded material in 2012, the most recent year for which the San Francisco Department of the Environment has published data.[52]

Mandatory Recycling and Composting Ordinance

In 2009, the City adopted an ordinance that requires all businesses and residences to compost food scraps and biodegradable products.[53] Businesses and residents are provided with green, blue, and black bins to sort their food and other biodegradable waste, recycling, and trash, respectively. Businesses and residents that do not comply with the ordinance are subject to fines, depending on the level and duration of noncompliance.

Waste Reduction Ordinances

The City has in place ordinances to reduce waste from retail and commercial operations. *Ordinance No. 295-06*,[54] the *Food Waste Reduction Ordinance*, prohibits the use of polystyrene foam disposable food serviceware and requires use of biodegradable/compostable or recyclable food serviceware by restaurants, retail food vendors, city departments, and city contractors. *Ordinance No. 81-07*,[55] the *Plastic Bag Reduction Ordinance*, requires stores located within the city to use compostable plastic, recyclable paper, and/or reusable checkout bags.

Construction and Demolition Debris Recovery Ordinance

City *Ordinance No. 27-06* (2006)[56] requires that all construction and demolition debris be transported to a registered facility that can divert a minimum of 65 percent of the material from landfills. This ordinance applies to all construction, demolition, and remodeling projects within the city.

3.0 UCSF GHG EMISSIONS INVENTORY AND FORECASTS

UCSF has inventoried its campus-wide GHG emissions for several calendar years, including 1990, 2000, and every year since 2007, using standard accounting protocols from the California Climate Action Registry (CCAR), The Climate Registry (TCR), the California Air Resources Board (CARB), and the United States Environmental Protection Agency (USEPA), as discussed in Section 2.2. Reporting rules, protocols, and registries have evolved over this time, with the CCAR no longer active and TCR taking over as the leading

national registry for voluntary reporting. As a major stationary source (greater than 25,000 mt CO_2e per year) and electric power producer, the Parnassus Central Utility Plant (CUP) falls under state and federal reporting requirements. Since 2008, CUP emissions have been reported to CARB under California's *GHG Mandatory Reporting Regulation* (part of *AB32*); and since 2010 CUP emissions have been reported to the USEPA under the *Greenhouse Gas Reporting Rule (74 FR 56260)*.

3.1 ORGANIZATIONAL BOUNDARY

All of the standardized GHG reporting protocols and methodologies require a clear delineation of the organizational and operational boundaries used to account for emissions in an inventory. The organizational boundary includes all facilities and GHG sources over which the reporting entity has management control. Management control can be defined in either financial or operational terms, but the boundary definition must be applied consistently across the organization. Through calendar year 2011, the UCSF inventory based its organizational boundary on the operational control criterion, which requires inclusion of all wholly-owned facilities, and all facilities for which UCSF has operational control through an operational lease or other means. Facilities with which UCSF has an affiliation agreement but not operational control, such as San Francisco General Hospital and Trauma Center (SFGH) or the San Francisco Veterans Affairs Medical Center (SFVAMC), have reported their emissions separately through their own documents.

Starting with the 2012 GHG inventory reported to TCR, UCSF now delineates its organizational boundary using the financial control criterion. Under this criterion, UCSF reports emissions from facilities and sources that are wholly owned, and from facilities and sources that are partially owned but where UCSF retains financial control (e.g., through a capital or financial lease, or where majority ownership establishes management control). Due to this organizational boundary change, pre-2012 inventories in the UCSF GHGRS are presented with boundary adjustments to enable direct comparison with current and future inventories. (Essentially, emissions associated with leased facilities are removed from the pre-2012 inventories.)

3.2 OPERATIONAL BOUNDARY

The operational boundary describes the direct and indirect sources of GHG emissions included in the inventory. GHG reporting protocols generally break emissions down into three source categories related to the level of operational control exercised by the organization over the emission source. For UCSF, the following sources are included:

- **Scope 1 Emissions** – Direct emissions, including stationary combustion such as boilers, hydrofluorocarbon (HFC) refrigerant use, and some medical gases (anesthesia), as well as non-stationary combustion of fuels in University-owned vehicles.
- **Scope 2 Emissions** – Indirect stationary sources, including emissions from purchased electricity and purchased steam for leased facilities.
- **Scope 3 Emissions** – Other indirect emissions from business air travel and from commuting by students, faculty, and staff. Scope 3 is defined as emissions that are a consequence of the activities of the institution, but occur from sources not owned or controlled by the institution.

UC's *Sustainable Practices Policy* stipulates that each UC campus will annually inventory its GHG emissions in accordance with ACUPCC and TCR requirements, to include Scope 1 and Scope 2 emissions as well as Scope 3 emissions from business air travel and from commuting by students, faculty and staff.[57] Inclusion of Scope 3 emissions is optional for TCR reporting, and when reported they are generally not third-party verified.

The standardized reporting methodology also incorporates protocols for carbon sequestration accounting – e.g., 'credits' for items such as institution-owned large tracts of forest land held as 'permanent' (100-year) open space. Although UCSF owns the Mount Sutro Open Space Reserve located at the Parnassus Heights campus site, UCSF GHG inventories do not account for carbon sequestration in the Reserve. UCSF has no plans to develop buildings in the Reserve and intends to leave it in a forested state. Forest land policy is currently being discussed by UC at the system level. Future updates of UCSF's *Climate Action Plan* may include offsets attributable to forest management. If a change in land use or forest coverage were to occur, the net change in sequestered carbon associated with that change would be evaluated and may be included in the inventory.

3.3 ESTABLISHING A BASELINE

There are different requirements for and varying guidance regarding the various reporting rules for establishing a GHG emissions baseline. BAAQMD's guidance for a qualified GHG reduction strategy is to set the baseline inventory as calendar-year 2008 or earlier. Important considerations in setting the baseline include the accuracy and completeness of underlying data, and the role of the baseline in forecasting future

57 Although UCSF has in the past (e.g., 2009 *Climate Action Plan*) included estimates of Scope 3 emissions from wastewater treatment and off-site disposal of solid waste, UC policy does not require their inclusion in annual inventory reporting to the UC Regents or to TCR. Together, these sources accounted for approximately two percent of total emissions in UCSF's 1990 and 2008 inventories.

emissions and setting reduction targets.

AB 32 requires the state to reduce GHG emission to 1990 levels by 2020. Since most communities and facilities covered under *AB 32* do not have access to high quality data for estimating 1990 GHG emissions, CARB and the California Attorney General recommend that plan-level GHG reduction strategies target 2020 emissions at 15 percent below a 2008 (or earlier) baseline. From a statewide perspective, CARB has determined that 15 percent below 2008 is approximately equivalent to 1990 levels.[58] This approach to setting a 2020 target is supported by BAAQMD[59] and OPR,[60] and represents current best practice for climate action plans and general plans adopted by cities and public agencies throughout California. (More on the UCSF GHGRS approach to setting future emission targets and establishing a CEQA threshold is provided in Section 4.0.)

3.4 INVENTORY RESULTS

Table 1 provides a summary of campus-wide GHG inventories for 1990, 2008, and 2012 (the most recently reported year). The inventories contain all sources within the operational boundary prescribed by UCOP's *Sustainable Practices Policy*, which includes all Scope 1 and Scope 2 emissions as well as Scope 3 emissions from business air travel and commuting by students, faculty and staff. A subtotal is provided for Scope 1 and Scope 2 emissions, reflecting the operational boundary associated with the UC President's carbon neutral initiative. The results show that total Scope 1, 2, and 3 GHG emissions increased from 109,817 mt CO_2e in 1990 to 156,339 mt CO_2e in 2008 (a 42 percent increase), and subsequently dropped to 150,258 mt CO_2e in 2012.

The following sections provide more detail on each inventory, highlighting similarities, differences, and data quality.

3.4.1 1990 Inventory

UCSF's earliest GHG inventory (calendar year 1990) is largely based on 1990 activity data, but there are several sources for which accurate or complete data is not available, leaving a certain amount of uncertainty in the GHG emissions estimates for those sources. As mentioned in Section 2.2 / footnote 21 and explained further below, this data reflects an adjustment made to the 1990 inventory as it appeared in the 2009 *Climate Action Plan* to correct for an accounting error discovered during development of the UCSF GHGRS; when the 1990 inventory was first developed, only half of the utility data was aggregated, so the initial 1990 emissions estimates for energy included in the 2009 *Climate Action Plan* were erroneously low. In **Table 1**, the adjusted values for natural gas and electricity emissions have been corrected to account for a full year of energy data. In addition, also as previously discussed, emissions from electricity used by leased buildings were removed from the calculations shown in **Table 1** to maintain consistency with the organizational boundary change that was made starting with the 2012 inventory (from operational to financial control). The 1990 inventory has not been independently audited, nor has it been submitted to a GHG emissions registry.

The largest of the 1990 inventory contributing sectors, Buildings and Facilities - Natural Gas (40.9 percent of total) and Buildings and Facilities - Electricity (22.3 percent), are based on actual utility consumption data tracked in the billing system. However, the utility data represents fiscal year 1989-1990, which is an approximation of calendar-year 1990.

The third-largest contributor to 1990 GHG emissions, the commute to work (15.6 percent of total), was estimated based on a comprehensive transportation survey that UCSF prepared in 1991, which accounts for both mode-split and trip lengths, as explained in the 2009 UCSF *Climate Action Plan*. Other sectors of this inventory, such as UCSF Fleet fuel consumption, did not have centralized record keeping in place in 1990, and were estimated based on an algorithm combining 2008 data scaled to the facility size and population at that time (i.e., fleet emissions are based on 2008 actual fuel consumption data scaled to the 1990 facility size and population). Similarly, Refrigerants and Medical Gases emissions data are an estimate based on 2008 known usage scaled to the conditions that existed in 1990. (Medical gas use is largely dependent on hospital stays; UCSF did not experience a significant change in the size or use of inpatient clinical facilities between 1990 and 2008.)

Following standard GHG accounting protocol, the CCAR acquisition adjustment accounts for the transfer of historical emissions associated with land and buildings purchased by UCSF after 1990. This adjustment methodology is in place so that an institution that has goals related to meeting 1990 emissions levels can accurately account for enterprise-wide emissions source changes through time. In a series of acquisitions, starting in 1998, UCSF acquired a new 57-acre campus site in the formerly industrial Mission Bay South Redevelopment Area of San Francisco. The 1990 historical emissions from this acquired site are represented by the CCAR acquisition adjustment, and are now included in all UCSF inventories since 2008.

---

58 In its *Climate Change Scoping Plan* of September 2008, CARB recommends that local governments adopt a GHG reduction target consistent with the State's commitment to reach 1990 levels by 2020. This is identified as equivalent to 15 percent below "current" levels at the time of writing (2008).

59 BAAQMD's *CEQA Guidelines* (updated May, 2012).

60 Based on conversations with OPR, and expected to be articulated in OPR's forthcoming *Climate Action Plan* Technical Advisory, (publication expected in 2014).

Table 1: UCSF GHG Emissions Inventories (values in mt CO_2e)

Scope	Emissions Category	1990	1990%	2008	2008%	2012	2012%

3	Business Air Travel	7,549	6.9%	12,582	8.0%	13,385	8.9%
3	Commute	17,080	15.6%	22,069	14.1%	24,698	16.4%
	Scopes 1, 2, and 3 TOTAL	109,817	100.0%	156,339	100.0%	150,258	100.0%

3.4.2 2008 Inventory

The 2008 GHG inventory was the first of the UCSF inventories to be audited by an accredited third-party verifier, providing a high degree of confidence in the accuracy and completeness of the underlying data and emissions calculations. The 2008 inventory (Scope 1 and Scope 2 emissions) was reported to the CCAR, while the 2008 emissions from the CUP were reported to CARB under California's *GHG Mandatory Reporting Regulation*. The 2008 figures provided in **Table 1** do not include emissions from electricity used by leased buildings; this is in order to maintain consistency with the organizational boundary change that was made starting with the 2012 inventory (from operational to financial control).

As described in the 2009 *Climate Action Plan*, emissions estimates for all sectors included in the adjusted 2008 inventory are based on actual activity data (utility natural gas and electricity usage, fleet fuel consumption, etc.). As with the 1990 inventory, the Commute emissions estimate is based on a comprehensive transportation survey for 2008.

3.4.3 2012 Inventory

UCSF's latest GHG inventory (calendar year 2012) was third-party verified and reported to TCR. The TCR reporting protocol requires quantification of all Scope 1 and Scope 2 emissions, while reporting of Scope 3 is optional. As mentioned previously, the organizational boundary change made in 2012 means that leased facilities are not included. The 2012 figures in **Table 1** include the emissions reported to TCR, plus the Scope 3 emissions for business air travel and commuting by students, faculty, and staff, so as to match the operational boundaries used for the 1990 and 2008 inventories. In 2012, 96.6 percent of total emissions were associated with three sectors: Buildings and Facilities - Natural Gas (56.3 percent of total), Buildings and Facilities - Electricity (15.8 percent), and Commute (16.4 percent).

3.5 GHG INVENTORY FORECASTS

Consistent with the requirements for a qualified GHG reduction strategy, 2020 and 2035 forecasts of GHG emissions are based on campus energy-use trends, the anticipated impact of LRDP developments, the anticipated impact of existing energy efficiency and GHG reduction programs, and campus growth assumptions consistent with the LRDP. **Table 2** provides a summary of campus-wide GHG emissions for 1990, 2008, and 2012, along with the forecasts for 2020 and 2035. These forecasts are adjusted to incorporate the impact of state-wide measures for reducing transportation-related emissions, namely the Pavley bill (*AB 1493*), which addresses vehicle fuel efficiency, and *LCFS*. Notes on the assumptions and methodologies used to forecast emissions for each sector are provided below.

Table 3 provides a summary of the LRDP building growth assumptions used in the GHG emissions forecasting, broken down by the five main campus sites covered by the LRDP.

The projected impacts of the state's *Renewables Portfolio Standard (RPS)* and the UCSF *Strategic Energy Plan (SEP)* are incorporated into the 2020 and 2035 forecasts for energy-related emissions. Energy data for the past four years were analyzed by the UCSF Energy and Facilities teams to quantify energy use intensities for buildings on each of the main campus sites and larger properties, as well as the impact of *SEP* projects on energy use intensity over the same time period. **Table 4** provides a summary of the future energy use

Table 2: GHG Emissions History and Forecasts (values in mt CO_2e)

Scope	Emissions Category	1990 Inventory	2008 Inventory	2012 Inventory	2020 Forecast	2035 Forecast
1	Buildings & Facilities - Natural Gas	44,923	90,026	84,605	85,589	87,668
1	Buildings & Facilities - Other Fuels	114	NA	NA	NA	NA
1	UCSF Fleet	1,944	3,200	2,710	2,432	2,718
1	Refrigerants and Medical Gases	3,500	3,500	1,079	1,254	1,550
1	CCAR Acquisition Adjustment	10,178	NA	NA	NA	NA
1	LRDP Construction Emissions	NA	NA	NA	27	129
2	Buildings & Facilities - Electricity	24,529	24,962	23,781	20,302	29,205
	Scopes 1 and 2 SUBTOTAL	**85,188**	**121,688**	**112,175**	**109,604**	**121,270**

3	Commute	17,080	22,069	24,698	22,167	24,771
	Scopes 1, 2, and 3 TOTAL	**109,817**	**156,339**	**150,258**	**145,780**	**163,299**

Table 3: UCSF Building Space Forecasts

Campus Site	2012 GSF	2020 GSF	2035 GSF
Mission Bay	1,926,700	3,878,200	5,933,900
Parnassus Heights	3,301,800	3,271,300	3,475,500
Mount Zion	776,200	948,700	948,700
Mission Center Building	290,700	290,700	390,800
Laurel Heights	362,800	362,800	362,800
Other UCSF buildings	332,700	507,800	508,700
TOTAL SPACE	**6,990,900**	**9,259,500**	**11,620,400**

Table 4: UCSF Building Energy Use Intensities

Campus Site	Average energy use intensity in kbtu/sf			Est % reduction per year through 2035
	2012	2020 Forecast	2035 Forecast	
Mission Bay	240.4	213.0	169.8	1.50%
Parnassus Heights	304.6	269.9	215.1	1.25%
Mount Zion	314.6	278.8	222.2	1.50%
Mission Center Building	135.3	119.9	95.6	1.50%
Laurel Heights	53.2	47.1	37.6	1.50%

intensities forecasted for buildings at each of the campus sites, based on the analysis.

Average annual energy efficiency gains were calculated for each campus area and carried forward in future energy use intensity forecasts for each campus area. Next, the square footage projections in the LRDP were combined with existing square footage and the results were used as the basis for estimating total energy use in 2020 and 2035.[61] This formed the basis for quantifying net energy consumption and GHG impacts of LRDP construction, demolition, and space-use changes, combined with *SEP* energy-efficiency projects and the anticipated carbon-reducing impact of the RPS on grid-supplied electricity over time (with future emission factor estimates provided by PG&E). Note that the analysis does not account for *Title 24* and UCOP green building policy impacts (20 percent beyond *Title 24*).

Additional notes on forecasting methodology:

- **UCSF Fleet Emissions:** Forecasts are based on the LRDP's anticipated growth of student and staff populations by 2020 and 2035.
- **Commute Emissions:** Forecasts are based on the LRDP's anticipated growth of student and staff populations by 2020 and 2035.
- **Refrigerants and Medical Gases:** Forecasts are based on the LRDP's anticipated growth of students, staff, patients, and visitors by 2020 and 2035.
- **Solid Waste Emissions:** Forecasts are based on the LRDP's anticipated growth of students, staff, patients, and visitors by 2020 and 2035.
- **LRDP Construction Emissions**: Forecasts are calculated using the California Emissions Estimator Model (CalEEMod), developed by the State of California to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions associated with both construction and operations from land use projects.
- **Adjustments for Statewide Transportation Measures:** Combined, *AB 1493* (Pavley vehicle efficiency standards) and the *LCFS* are expected to reduce overall emissions from cars and light-duty trucks by approximately 21 percent from 2012 levels by 2020, and 25 percent by 2025. The adjusted forecasts assume that the entire UCSF fleet will be impacted by Pavley and the *LCFS*.
- **Air Travel Emissions:** Forecasts are based on the LRDP's anticipated growth of student and staff populations by 2020 and 2035, and then adjusted to account for the expected continuation of fuel efficiency improvements over time. A study by the Federal Aviation Administration (FAA) reports that "Aircraft fuel efficiency has historically improved by about one percent per year. This trend is expected to continue for the foreseeable future."[62]

4.0 GHG TARGETS AND CEQA THRESHOLDS OF SIGNIFICANCE

The UCSF GHGRS utilizes two approaches to establishing campus-wide GHG emissions targets for 2020 that are consistent with UC policy and *AB 32*, as well as other California policy on GHG emissions. One approach is based on UCSF's 1990 emissions inventory, while other is based on UCSF's verified 2008 inventory, using the 15-percent-downward adjustment recommended by CARB to account for emissions growth since 1990. The GHG emissions targets for 2035 were established by determining the midpoint between the state's 2020 target (1990 levels) and 2050 target (80 percent below 1990 levels); this resulted in a target of 40 percent below 1990 levels by 2035. **Table 5** summarizes the 2020 and 2035 targets as determined by these two methods.

The 2035 target may require revision over time, with new developments in UC policy, changes to state policy, or new statewide GHG emissions targets established by the California legislature. As of 2014, CARB's *Draft AB 32 Scoping Plan* recommends setting the 2030 statewide target at 40 percent below 1990 levels; if this target is adopted by law, a straight-line interpolation between CARB's recommended 2030 target and the state's 2050 emissions commitment produces a 2035 target of 50 percent below 1990 levels.

Table 6 compares the two UCSF campus-wide GHG targets against the forecasts for 2020 and 2035, showing the annual GHG reductions needed to meet them. **Table 6** also includes the annual reductions by 2020 and 2035 expected from implementation of the UCSF GHGRS. At minimum, a reduction of 35,963 mt CO_2e per year will be needed to meet the 2020 target, while an annual reduction of 97,408 mt CO_2e will be needed to meet the 2035 target.

The UCSF GHGRS includes two categories of GHG reduction measures: those to which UCSF is already committed in terms of funding and/or implementation (called "Tier 1" measures); and those that are in the planning stages (called "Tier 2" measures). As summarized in **Table 6**, Tier 1 measures are expected to provide annual reductions estimated at 12,878 mt CO_2e by 2020, and 26,830 mt CO_2e by 2035. These measures are described in detail in the following section. Tier 2 measures will provide the additional reductions needed to meet the 2020 and 2035 targets. Tier 2 measures are described in Section 5.3 and in **Table 8**.

61 The 2035 gsf estimate includes Phase 2 of the Medical Center at Mission Bay.

62 Federal Aviation Administration (FAA) Office of Environment and Energy, *Aviation & Emissions: A Primer,* 2005. www.faa.gov/regulations_policies/policy_guidance/envir_policy/media/AEPRIMER.pdf

Table 5: UCSF Campus-wide GHG Emissions Targets (values in mt CO_2e)

Based on 1990 Inventory			Based on 2008 Inventory		
1990	2020 Target	2035 Target	2008	2020 Target	2035 Target
109,817	109,817	65,890	156,339	132,888	79,733

Table 6: UCSF GHG Reduction Targets and Annual Reductions Needed (values in mt CO_2e)

	2020	2035
Emissions Forecast	145,780	163,299
1990-based Target	109,817	65,890
Annual Reductions Needed	35,963	97,408
2008-based Target	132,888	79,733
Annual Reductions Needed	12,892	83,566
Annual Reductions from Tier 1 GHG Measures (from Table 7)	12,878	26,830
Minimum Annual Reductions from Tier 2 GHG Measures	23,085	70,578
Total Annual Reductions Expected from UCSF GHGRS	35,963	97,408

Figure 1 shows the changes in UCSF GHG emissions over time, beginning with the 1990, 2008, and 2012 inventories, and continuing with the emissions forecasts for 2020 and 2035. The solid line indicates historical emissions between 1990 and 2012 based on inventory results. The orange dashed line represents the emissions forecasts provided in **Table 2**, while the green dashed line represents the annual emissions that result with implementation of the Tier 1 measures in the UCSF GHGRS, as presented in the following section. The blue dotted line accounts for the additional impact of Tier 2 measures, representing the path to carbon neutral that passes through the 2020 and 2035 targets and achieves carbon neutrality by 2047, reflecting the UCSF commitment to ACUPCC and the goal that is referenced in UCSF's Annual Progress Report to the UC Regents. The horizontal dotted lines represent the 2020 and 2035 GHG emissions targets based on the 1990 inventory.

5.0 GHG REDUCTION MEASURES

This section describes the GHG reduction measures currently underway at UCSF, as well as those measures that are funded or to which UCSF is currently committed. Tier 1 GHG reduction measures are organized into two major categories: Energy and Transportation.

Table 7 summarizes the significant Tier 1 strategies (comprised of programs, policies, and actions) that are expected to reduce GHG emissions between now and the planning horizon for the LRDP (2035). Most of the programs and policies associated with these strategies are outlined in the 2009 *Climate Action Plan* and on the UCSF Office of Sustainability's website. GHG reduction estimates associated with these measures, if not already incorporated into future emissions forecasts (e.g., EN1: SEP Implementation), are provided for 2020 and 2035. The following sections provide more detail about the key programs, policies and actions comprising each of the measures. Detailed worksheets showing assumptions, methodologies and emissions calculations are provided.

The following sections describe in more detail the implementing actions associated with each Tier 1 measure, and the GHG reductions expected to result from those actions.

Figure 1: UCSF GHG Emissions Timeline

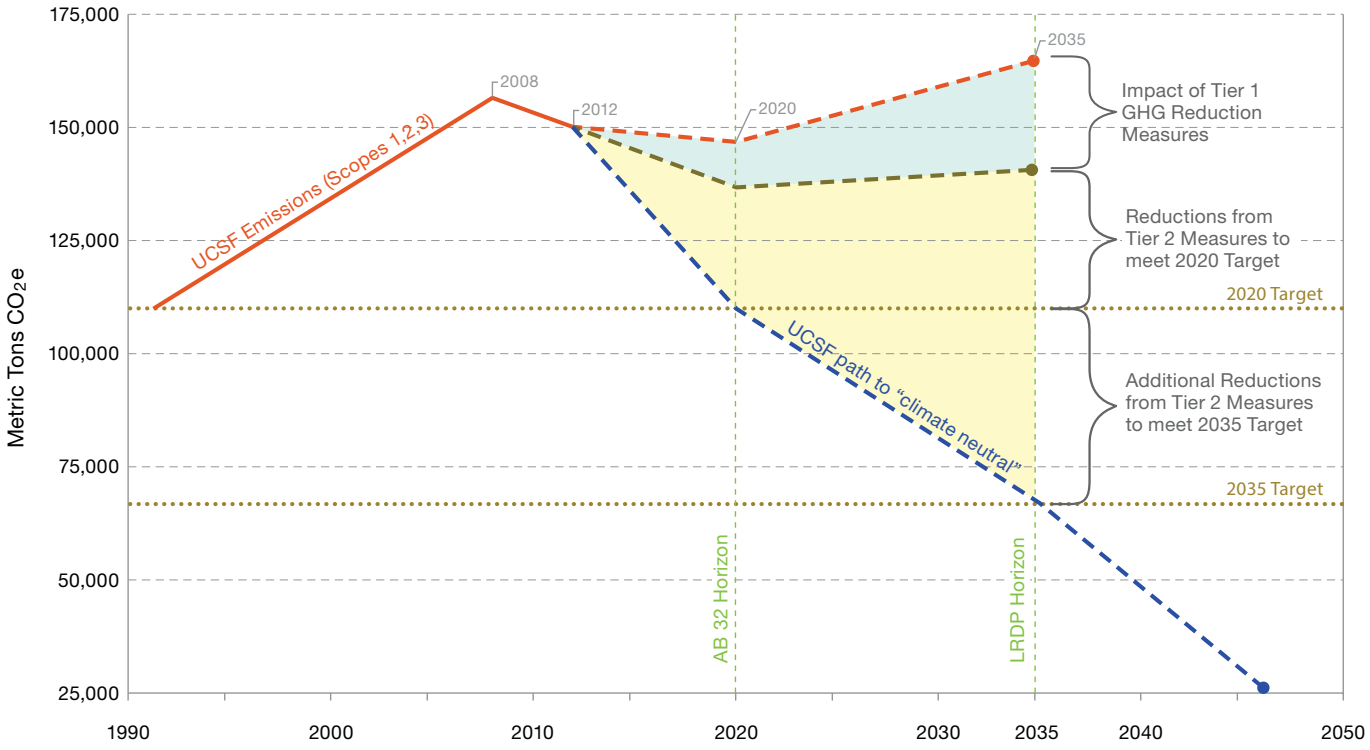

Table 7: UCSF Tier 1 GHG Reduction Measures

Strategy ID	Strategy Name	Annual GHG Reduction by 2020 (mt CO_2e)	Annual GHG Reduction by 2035 (mt CO_2e)
Energy			
EN1	Improve Energy Efficiency of Existing Buildings and Operations (SEP Implementation)	NA	NA
EN2	Green Building Standards	5,235	10,792
EN3.1	Renewable Energy: On-Site Solar PV	128	377
EN3.2	Renewable Energy: Purchasing Green Electricity	-	6,721
EN3.3	Renewable Energy: Purchasing Biogas	6,379	6,379
Transportation			
TR1	Reduce Vehicle Trips	1,137	2,561
TR2	Clean Vehicle Strategies	-	-
	TOTAL	12,878	26,830

5.1 TIER 1 ENERGY MEASURES

Strategy EN1: Improve Energy Efficiency of Existing Buildings and Operations (SEP Implementation)

Key Implementing Actions:

- Continue to revise and implement the *SEP* to achieve energy efficiency improvements consistent with the results of the past four years.
- Continue to participate in the system-wide UC/CSU Investor Owned Utility Energy Partnership.

Annual GHG reduction by 2020: 12,786 mt CO_2e (incorporated into forecast)

Annual GHG reduction by 2035: 22,292 mt CO_2e (incorporated into forecast)

Implementation Timeframe/Status: In progress; to continue through 2035.

Discussion: UCSF owns or leases space in 189 buildings throughout San Francisco, and energy consumption varies considerably by building use (among other variables, such as building age). For example, research and clinical, or complex space, comprises about 25 percent of UCSF assignable square footage but uses about 70 percent of the total energy consumed. The typical laboratory uses far more energy and water per square foot than the typical office building, due to intensive process and ventilation requirements.

Since the early 1990s, UCSF has periodically written *Strategic Energy Plans (SEPs)* to identify and prioritize implementation of campus investments in energy efficiency projects for existing buildings and infrastructure. The most recent UCSF *SEP* was completed in September 2008.[63] These plans, with three-year to seven-year timelines, examine UCSF facilities of 50,000 gsf or larger for application of new efficiency technologies, implementation of best practices, and available financial incentive programs. Focused primarily on electrical infrastructure, the projects are expected to produce savings equal in value to investment costs within 10 years.

Over the past five years (2009 through 2013), implementation of *SEP* projects has saved more than 12,000 megawatt hours (MWh) of electricity and more than 1,700,000 therms of natural gas, according to estimates provided by the UCSF energy engineer. These energy efficiency gains translate directly into GHG emissions reductions. The *SEP* projects undertaken by UCSF over the past 20 years have contributed to a 35-percent reduction of GHGs compared to a business-as-usual scenario.

SEP projects cover a wide variety of improvements, from changing lighting fixtures to building new power plants. Lighting and HVAC (heating, ventilation, and air conditioning) projects are particularly effective tools for achieving reductions. UCSF will continue to convert existing T12 and 32-watt T8 fluorescent light fixtures to 28 watt T8 lamps. Other projects include broader use of occupancy sensor controls, daylight harvesting (using daylight to offset the amount of electric lighting needed to properly light a space), and more energy-efficient stairwell fixtures. The replacement of lighting in parking structures and interior high intensity discharge (HID) fixtures with fluorescent is also being evaluated. As new technologies such as LED lighting, bi-level fixtures (which allow dimming to lower intensity during unoccupied periods), and induction lamps (long-lasting fluorescent lamps without electrodes or filaments) become readily available (anticipated in the near future), these technologies will be incorporated into energy efficiency retrofit projects as appropriate. HVAC improvements in the 2008 *SEP* include meeting basic efficiency standards for air handlers with a horsepower of 10 and greater by: controlling variable air volume with economizers, operating only the hours necessary, providing demand control ventilation where warranted, and controlling static pressure reset to optimize HVAC systems to actual operating conditions.

The *SEP* includes projects for upgrading laboratory fume hoods with more energy-efficient high-performance models. As explained in the 2009 *Climate Action Plan*, fume hoods use large amounts of energy, and if all of the fume hoods campus-wide[64] were retrofitted and operated to maximize energy efficiency, as much as 4,600 mt CO_2e per year could be avoided.

UCSF is a participant in the system-wide UC/CSU Investor Owned Utility Energy Partnership (Partnership). The Partnership is designed to help campuses implement energy efficiency programs that decrease their energy use. The Partnership encourages energy-efficient operations and maintenance practices by offering incentives for equipment improvements, and offering training and providing tools to reduce energy consumption and peak demand. The total incentive funds received to date (2014) exceed $3.5 million. Over the past four years, energy efficiency strategies have reduced energy use across UCSF buildings by approximately

63 This five-tiered *SEP*, sponsored by the University of California Office of the President (UCOP), serves to identify, quantify, prioritize and assist UC campuses in realizing energy-saving opportunities in new construction, retro-commissioning, deferred maintenance, and facility renewal and retrofit projects.

64 Due to an increased awareness of risks associated with exposure to chemicals, and an expanding research program, the number of fume hoods at UCSF has increased from ~400 in 1990 to more than 750 in 2009. The operational energy cost of UCSF's 750 fume hoods is about $4.9 million per year.

17 percent on a per-square-foot basis.

The largest single *SEP*-type project undertaken by UCSF since 1990 has been the Parnassus Central Utility Plant (CUP). The CUP is a 12-MW cogeneration facility constructed between 1995 and 1997; it replaced a far less efficient 50-year-old facility that had significantly higher emissions per MWh.

The CUP cogeneration system is a highly efficient generator of energy that uses a single source of clean fuel (natural gas) to produce two energy products, electricity and heat. The heat is used locally for buildings, instead of being discarded as in a conventional electrical generation facility; the captured heat can be used for either heating or cooling buildings. Further efficiencies are gained by the proximity of the cogeneration plant to the end user, both because transmission losses due to resistance are reduced and because supply can be more quickly matched to demand. Conventional energy production transmits electricity from remote generation sites with low efficiency rates (35 percent); when this is combined with the high efficiency rates (80 percent) of natural gas burned on-site in boilers, UCSF reaches an overall institutional efficiency rate of about 54 percent. In contrast, on-site cogeneration directly employs the thermal energy by-products associated with electricity production, and accompanied with much lower transmission losses, provides an overall institutional efficiency rate of about 76 percent.

As noted in the preceding section, the GHG-reducing impact of EN1 is already incorporated into the future GHG emissions forecasts for 2020 and 2035.

Strategy EN2: Green Building Standards

Key Implementing Actions:

- Exceed *Title 24* energy requirements by at least 20 percent (for all new buildings and major renovations except acute care facilities); strive to achieve 30 percent improvement over *Title 24*. This requirement is maintained over time as *Title 24* is revised.
- Pursuant to the UC *Sustainable Practices Policy*, design and build all new buildings (except for laboratory and acute care facilities) to a minimum standard that is equivalent to a LEED Silver rating. Strive to achieve a standard equivalent to a LEED-NC Gold rating or higher for all such projects whenever possible, within the constraints of program needs and standard budget parameters.
- Design the UCSF Medical Center at Mission Bay to LEED Gold standards. (Facilities that are already constructed or are planned or under construction were designed to meet a LEED Gold standard; future building projects are also expected to meet or exceed this standard.)
- Per the UC *Sustainable Practices Policy*, design all new UCSF laboratory buildings so as to meet Labs21 Environmental Performance Criteria (EPC).

Annual GHG reduction by 2020: 5,235 mt CO_2e

Annual GHG reduction by 2035: 10,792 mt CO_2e

Implementation Timeframe/Status: In progress; to continue through 2035.

Discussion: To improve energy efficiency of new buildings, UCSF relies on several available tools, programs and building codes. *Title 24* of the California Energy Code enhances the energy efficiency requirements of all newly constructed buildings and major renovations. The 2013 *Title 24* update, effective July 1, 2014, improves energy performance of new buildings by as much as 23 percent over the 2008 standard, depending on the type of building and its intended use. Major renovations also benefit with respect to energy savings, though to a lesser degree.

The UC *Sustainable Practices Policy* states that the University of California shall incorporate the principles of energy efficiency and sustainability in all capital and renovation projects within budgetary constraints and programmatic requirements. Given the importance of energy efficiency to green building design, the University has set a goal for all new building projects, other than acute care facilities, to outperform the requirements of *Title 24* energy-efficiency standards by at least 20 percent.[65]

UCSF is committed already to designing and building all new buildings (except for laboratory and acute care facilities, addressed separately below) so as to meet a minimum standard of sustainability that is equivalent to a LEED-NC Silver rating. In addition, and at the same time, UCSF will continue to strive to achieve a standard equivalent to a LEED-NC Gold rating or higher for such new buildings, whenever possible within the constraints of program needs and standard budget parameters. Over time, this will help achieve the energy savings and GHG emissions reductions associated with EN2, as well as providing the myriad long-term economic, social, and health benefits that accrue to the communities occupying green building spaces, compared with those in conventional buildings.

Central to its academic mission, research laboratories make up a large percentage of the new space developed by UCSF. These types of facilities, filled with specialized equipment, consume significantly more energy per square foot than the average building. Given the importance of specifically

65 Although the *Title 24* building code does not apply to hospitals, new UCSF medical facilities must be designed to a LEED Silver standard or higher, which achieves energy savings similar to *Title 24*. The Medical Center at Mission Bay is being designed to a LEED Gold standard.

addressing sustainability in laboratory facilities, UCSF has also committed to designing all new laboratory buildings to a minimum standard equivalent to a LEED-NC Silver rating and the Laboratories for the 21st Century (Labs21) Environmental Performance Criteria (EPC), as appropriate. The UCSF design process includes attention to energy efficiency for UCSF buildings that meet LEED standards for New Construction (listed by standard achieved and year completed):

- Aldea Center on Mount Sutro, 2013 – Gold
- Cardiovascular Research Institute (CVRI), 2012 – Gold
- Dolby Regeneration Medicine, 2011 – Gold
- The Osher Building, 2010 – Silver

UCSF buildings that meet LEED standards for Existing Buildings Operations and Maintenance:

- Arthur and Toni Rembe Rock Hall (Rock Hall), 2009 – Silver

UCSF buildings that meet LEED standards for Commercial Interiors:

- 1500 Owens Street (leased), third floor clinics, 2012 – Gold
- HSE5 Center for Bioengineering and Tissue Regeneration, 2012 – Gold
- Pharmaceutical Packaging Facility, 2011 – Gold
- HSE 15 S/D Craniofacial & Mesenchymal Biology Program Lab Renovation, 2010 – Gold
- MSB S1372 Anatomy Department Renovation, 2013 – Silver
- Campus Data Center, 2009 – Silver
- 654 Minnesota Street, 2009 – Certified
- HSW Dentistry Lab, 2005 - Certified

UCSF must ensure that all regulatory obligations are met when the University considers design or operational strategies for reducing GHG emission. Agencies such as the Joint Commission on the Accreditation of Healthcare Organizations (JCAHO), the Occupational Safety and Health Administration (OSHA), and the Institutional Animal Care and Use Committee (IACUC) often have safety protocols in place that constrain UCSF's ability to satisfy GHG reduction goals and simultaneously maintain an acceptable safety margin.

Strategy EN3.1: Renewable Energy: On-Site Solar PV

Key Implementing Actions:

- Build solar photovoltaic (PV) energy installation (750 kW) at Mission Bay Hospital; to be operational by 2020.
- Implement Priority 1 solar PV projects (as determined by UCSF engineer) over the next 20 years.

Annual GHG reduction by 2020: 128 mt CO_2e

Annual GHG reduction by 2035: 377 mt CO_2e

Implementation Timeframe/Status: In progress; to continue through 2035.

Discussion: Planned and financed solar PV installations expected to be operational by 2020 represent approximately 750 kW capacity, capable of displacing 128 mt CO_2e per year using conservative assumptions about PV panel efficiency and electrical productivity in San Francisco. Longer-term, additional solar PV projects deemed Priority 1 because of their financial payback potential are expected to add 1,465 kW for a total capacity of 2,215 kW, displacing approximately 377 mt CO_2e per year by 2035.

Strategy EN3.2: Renewable Energy: Purchasing Green Electricity

Key Implementing Actions:

- Implement UC's Wholesale Electricity Program to increase the supply of low-carbon electricity sources through direct access suppliers;
- Continue, on an on-going basis, to pursue the possibility of increasing purchases of low carbon electrical power from the grid.

Annual GHG reduction by 2020: TBD

Annual GHG reduction by 2035: TBD

Implementation Timeframe/Status: In progress; to continue through 2035.

Discussion: The UC President's goal for UC to become carbon-neutral by 2025 means that UCSF is serious about purchasing green power. In support of this goal, the UC Wholesale Electricity Program is actively seeking to increase the supply of low-carbon electricity sources through direct access suppliers. Under the Wholesale Electricity Program, UC will become its own registered Energy Service Provider and procure wholesale power for participating campuses (including UCSF), with a target commencement date of January 1, 2015. The Wholesale Electricity Program will serve to stabilize UC's energy costs and provide an opportunity to procure larger proportions of carbon-free energy than would be otherwise available through traditional channels.

As of 2014, almost all of UCSF's outside electrical power is purchased from PG&E, one of the cleanest investor-owned large utilities in the country. PG&E is currently forecasting even lower average carbon content for its grid-supplied electricity through the year 2020. This analysis assumes that PG&E

electricity represents the lowest-carbon electricity alternative for UCSF through 2020. Thus, there are no GHG reductions associated with this measure by 2020.

This GHGRS uses PG&E's 2020 emission factor to forecast 2035 electricity-related GHG emissions (PG&E does not currently provide emission factor forecasts beyond 2020). After 2020, however, it is reasonable to assume that UCSF will continue to lower the average carbon content of its electricity supply due to cleaner electricity from PG&E, or by increasing its allocation of clean Western Area Power Authority (WAPA) hydropower, or purchasing renewable power through its direct access supplier. The annual GHG reduction estimate for 2035 therefore conservatively assumes a 25 percent reduction in the carbon content of grid-supplied electricity from 2020 to 2035.

Strategy EN3.3: Renewable Energy: Purchasing Biogas

Key Implementing Actions:

- Purchase biogas for use at CUP to reduce anthropogenic GHG emissions from the facility, if appropriate sources are available and approved by CARB.

Annual GHG reduction by 2020: 6,379 mt CO2e (incorporated into forecast)

Annual GHG reduction by 2035: 6,379 mt CO2e (incorporated into forecast)

Implementation Timeframe/Status: The University is currently examining its options in the marketplace.

Discussion: CO_2 emissions from combustion of biogas are considered biogenic and represent a net-zero addition of GHG emissions to the atmosphere. UCSF is currently committed to purchasing 120,000 MMBTU[66] per year of biogas for use in the CUP, which would avoid the production of approximately 6,379 mt CO_2e per year from combustion of natural gas.

5.2 TIER 1 TRANSPORTATION MEASURES

Strategy TR1: Reduce Vehicle Trips

Key Implementing Actions:[67]

- As development occurs under the LRDP, increase on-site amenities (such as child care, food services, banking, retail shops, laundry, and fitness facilities), and limit parking for on-campus housing and staff.
- Add on-site housing for faculty and students.
- Enhance and expand existing car-share, vanpool, and carpool programs and incentives.
- Modify existing shuttle routes and implement NextBus Technology Application, which displays schedule, stop locations, and estimated time of arrival for UCSF shuttles.
- Encourage departments to allow flexible work schedules and telecommuting.
- Implement LRDP plans to realign supply chain, warehousing, and deliveries so as to streamline all parts of the process and minimize truck trips.

Annual GHG reduction by 2020: 1,137 mt CO2e (incorporated into forecast)

Annual GHG reduction by 2035: 2,561 mt CO_2e (incorporated into forecast)

Implementation Timeframe/Status: In progress; to continue through 2035.

Discussion: Reductions in UCSF GHG emissions attributable to transportation come from both local institutional actions and from technological and regulatory changes driven by the state and federal government. State and federal government actions to-date have focused on cleaner vehicle technologies, transportation system efficiency improvements, and land use policy. Actions taken by UCSF to address transportation-related GHG emissions have been aimed at reducing vehicle miles traveled (VMT), and include: implementation of various transportation demand management measures, improvements to the campus transportation system, and improving the jobs-to-housing balance. Emissions from transportation are greatly dependent on the length of trips, and the mode of travel used. Generally, bicycle and walking trips produce almost zero carbon emissions, and a trip on public transit produces about half the quantity of GHG emissions as would a comparable trip by private automobile.

As stated in the 2014 LRDP, key features of UCSF's existing TDM program include the following:

- 60 shuttles serving 17 locations, with over 2.3 million passengers per year
- 33 vanpools that travel as far as Sacramento and operate using the Green Road Safety System, which improves fuel consumption and safety
- 62 reserved carpool stalls at various sites
- Marin Commute Club buses with about 55 daily riders who live in Marin and Sonoma Counties to the north of the city
- 18 City CarShare vehicles with dedicated parking spaces,

66 MMBTU signifies [one] million British Thermal Units; the BTU is a traditional unit of energy equal to about 1055 joules. In reference to natural gas, 1 MMBTU (1 million BTU) = 1.054615 GJ. One therm equals 100,000 BTUs.

67 Measure assumes implementation of Transportation Demand Management programs, as described in the *Transportation Demand Management Program Improvement Measures Evaluation* report by Fehr & Peers, August 30, 2012.

along with 1,500 UCSF members who can use these vehicles by scheduling their use online

- Over 1,900 UCSF users of the ZimRide online carpool matching program
- 972 bicycle parking spaces with another 100 planned at Mission Bay, as well as bike racks on shuttles, a cyclist shower program that allows bicyclists to use UCSF showers at a discount, and other bicycle-related benefits
- Bay Area Bike Share station at Mission Bay (due to begin construction in July 2014), where members will have access to bicycles (and a regional network of stations) provided by the Bay Area Air Quality Management District
- More than 400 off-street motorcycle parking stalls in garages and surface parking lots
- An "emergency ride home" program to encourage use of alternative modes of transportation
- Clipper Card (public transit pass) sales at easily accessible locations, including through UCSF's website
- Close to 1,800 UCSF employees participate in a pretax transit program, which saved UCSF employees over $700,000 on public transit commute costs in 2013

UCSF's shuttle system services all primary UCSF campuses, as well as select secondary campus locations, and is free to UCSF faculty, staff, students, patients, and visitors. On average, a total of 7,435 people ride the system daily, with demand for additional service growing by around five percent per year. The 2014 UCSF *Shuttle Operations Study* estimates a demand for 401 additional trips by 2020, and an additional 3,611 trips by 2035. The study also contains recommendations for expanding service lines to meet increasing demand as development occurs under the 2014 LRDP.

UCSF faces considerable constraints outside of its control in developing affordable housing. Housing is an auxiliary enterprise of the University, serving as a support service to its primary educational mission; and therefore, by UC policy, it must be financially self-supporting. Land in San Francisco is extremely expensive to acquire, and UCSF has limitations on new development on land it already owns (such as Aldea Housing at Parnassus Heights). UCSF will continue to implement the goals of the 2005 *Housing Master Plan* to provide more reasonably priced housing for up to 1,400 individuals in targeted groups of the campus community. The 2014 LRDP includes plans for over 1,600 new housing units to be built at Parnassus Heights and Mission Bay by 2035.

Emission reduction estimates for this measure are based on data provided in the report *Transportation Demand Management Program Improvement Measures Evaluation* by Fehr & Peers (2012).

Strategy TR2: Expand Fleet of Clean Vehicles

Key Implementing Actions:

- Continue to incentivize UCSF departments to purchase fuel efficient vehicles (hybrid, electric, CNG) by waiving the annual permit fee of $1,932.00 per vehicle. This has been an effective strategy in encouraging departments to purchase fuel-efficient and alternative-fuel vehicles.
- Continue and expand use of low-emitting fuels and vehicles for shuttle system and across UCSF fleet of vehicles.

Annual GHG reduction by 2020: 1 mt CO_2e
(Incorporated into forecast)

Annual GHG reduction by 2035: 1 mt CO_2e
(Incorporated into forecast)

Implementation Timeframe/Status: In progress; to continue through 2035.

Discussion: In addition to vehicle miles traveled, transportation emissions are dependent on the type of fuel used to power vehicles. UCSF is gradually transitioning its vehicle fleet to alternative fuel vehicles and more fuel efficient vehicles. UCSF currently has 43 low-emitting alternative-fuel and hybrid vehicles, including cars, shuttles, golf carts, and trucks. The UCSF shuttle fleet is currently run entirely on diesel; however, the University is monitoring alternative fuel options, including battery electric options, for future vehicle replacements.

UCSF has also instituted programs and developed infrastructure to encourage commuters to use a mix of more fuel-efficient and alternative-fuel vehicles. The University offers an employee benefit program to encourage the purchase of EVs (electric vehicles); in 2012, five EVs were purchased as part of the program.

The 2012 UCSF *Commute Survey*[68] indicated that the commuter vehicle fleet is composed of 12.6 percent fuel-efficient and alternative fuel vehicles, including hybrid, electric, CNG, and biodiesel-fueled vehicles. The University has installed 18 electric-vehicle charging stations at Parnassus Heights, Mount Zion, and Mission Bay, and plans to install another 20 at Mission Bay in the Owens Street Garage plus 10 at other locations in the near future. UCSF also has 35 priority parking spaces reserved for fuel-efficient and low-carbon emitting vehicles.

Due to the concerted state effort to improve vehicle fuel efficiency (Pavley bill) and the lack of a formal "green" or

68 *UCSF Transportation Services Annual Commute Survey*, UCSF Commute Survey Results 2009-2012.

"clean fuel" vehicle replacement program at UCSF, no additional GHG reductions are associated with this measure.

5.3 CLOSING THE GAP WITH TIER 2 MEASURES

As discussed previously and summarized in **Figure 1**, additional reductions beyond Tier 1 measures (summarized in **Table 7**) are needed over the planning horizon of the LRDP to meet the 2020 and 2035 GHG emission targets. **Table 8** lists the Tier 2 measures that UCSF has identified to accomplish the additional reductions needed. The maximum potential reductions for each Tier 2 measure reflect the inventory forecasts for 2020 and 2035, and do not include the reductions expected from Tier 1 measures.

Tier 2 measures are at various stages in the planning process. Some combination of them will be sufficient to meet the 2020 goals identified in **Table 5**. UCSF is committed to meeting the 2020 and 2035 targets described in this document, as well as the goals of the UC President's *2025 Carbon Neutrality Initiative*. However, the exact mix of future actions to be taken by UCSF is dependent on both the results of the next CARB Scoping Plan Update (due in late 2014), and the recommendations identified in the future implementation plan due from UCOP in 2014 reagrding the Presidents *2025 Carbon Neutrality Initiative* and the *Sustainable Practices Policy*.

6.0 IMPLEMENTATION AND MONITORING

Successful implementation of the Tier 1 measures described in the previous section will nearly enable UCSF to achieve the 2020 GHG target based on a 2008 emissions baseline. Deeper reductions provided by the Tier 2 measures enable UCSF to achieve the 1990-based 2020 target and the 2035 targets. Robust monitoring of campus-wide GHG emissions and the effectiveness of individual programs and policies will be needed to ensure that UCSF is on track to meeting its 2020 and 2035 targets, and to enable UCSF to tier CEQA analyisis of future projects from this GHGRS, as described in Section 7.0.

UCSF annually quantifies its GHG emissions and reports them to TCR and CARB. The annual verified emissions report for TCR, augmented by estimates of Scope 3 emissions from commuting and air travel, will serve as the metric for comparison with the 2020 and 2035 targets.

Staff from the UCSF Office of Sustainability will present annual reports to the UCOP Office of Physical and Environmental Planning summarizing progress of the implementation of the UCSF GHGRS. The report will evaluate the successes and challenges in implementing the GHGRS and evaluate progress toward GHG reduction targets. Staff will provide the status of program implementation (e.g., initiated, ongoing, completed), assess the effectiveness of the strategies and programs included in the plan against the established objectives, and recommend adjustments to programs or tactics as needed. The annual report will also assess whether UCSF's actual growth and development is consistent with the forecasts made in the LRDP. If necessary, UCSF shall modify the geographic scope of the inventory and emissions targets accordingly.

Table 8: UCSF Tier 2 GHG Reduction Measures

Tier 2 Measure	Scope	GHG Inventory Category	Maximum potential reductions by 2020	Maximum potential reductions by 2035
Expand or intensify existing and planned programs for reducing direct emissions associated with stationary sources owned and controlled by UCSF.	1	Buildings & Facilities - Natural Gas	85,589	87,668
Purchase more low-carbon biogas as a replacement for natural gas used by the CUP.	1	Buildings & Facilities - Natural Gas	85,589	87,668
Expand or intensify existing and planned programs for reducing direct emissions associated with mobile sources owned and controlled by UCSF.	1	UCSF Fleet	2,432	2,718
Intensify energy conservation efforts to exceed the reductions of electricity-related emissions currently expected from implementation of the SEP.	2	Buildings & Facilities - Electricity	20,302	29,205
Purchase a greater percentage of grid-supplied electricity from renewable, low-carbon sources.	2	Buildings & Facilities - Electricity	20,302	29,205
Invest in renewable energy projects at UCSF or other UC campuses (where available land exists).	2	Buildings & Facilities - Electricity	20,302	29,205
Invest in offsite projects that reduce GHG emissions, preferably within the UC system where the full range of benefits will be retained, to offset emissions in the UCSF emissions inventory.	all	LRDP Construction Emissions	unlimited	unlimited
Purchase accredited carbon offsets that can be used to offset emissions in the UCSF emissions inventory.	all	Buildings & Facilities - Electricity	unlimited	unlimited

An update of the GHGRS should occur at least once every five years to ensure that the strategies remain effective in reducing GHG emissions to the extent needed for achieving the 2020 and 2035 targets. In addition, the following situations, should they occur over the LRDP planning horizon, would likely necessitate a revision to the GHGRS:

- A change in regulations affecting GHG targets or thresholds. The state is likely to legislate a new GHG reduction goal for post-2020; the GHGRS can only estimate what that goal will be based on the *Draft AB 32 Scoping Plan* revision and other documents. The BAAQMD may also develop new guidelines for CEQA as the state regulations are developed.
- A proposed new project that exceeds the total new square footage (summarized in **Table 3**) included in the LRDP through 2020 (the *AB 32* target date).
- A change in the mix of proposed new project types (e.g., another new hospital) that would result in significantly higher energy-use intensities than predicted and summarized in **Table 4.**
- An operational change at UCSF that results in a significant change in projected GHG emissions. UCSF may institute new policies or programs, or abandon current or planned programs, and by doing so, affect GHG emissions. A new long-term contract to purchase a large amount of zero-carbon electricity is one example of such a change.
- The required monitoring of the GHGRS reveals that UCSF's GHG reduction programs are not reducing emissions adequately to meet its targets.

7.0 CEQA PROJECT REVIEW

Under CEQA, the effects of GHG emissions are considered a potentially significant environmental impact. In addressing climate change, CEQA provides a useful mechanism for local agencies to evaluate new development on a comprehensive basis rather than on an individual project basis. The *CEQA Guidelines* recognize this, and include a provision for streamlining the analysis of projects that are consistent with a more comprehensive plan for the reduction of GHG emissions (*CEQA Guidelines, Section 15183.5*). The UCSF GHGRS meets an important requirement of *CEQA Guidelines Section 15183.5(b)(1)* as a plan that analyzes cumulative GHG impacts. The UCSF GHGRS uses established protocols, methodologies, and forecasts of existing and future land uses to quantify existing and projected future GHG emissions within the scope of the LRDP. It also establishes a reduction target based on California state law (*AB 32*), and lays out policies, actions, and performance standards that UCSF will enact and implement over time to reduce emissions. As demonstrated in this document, the UCSF GHGRS does provide the emissions reductions needed to achieve the reduction targets identified in the UC *Sustainable Practices Policy* and in the state-mandated reduction target embodied in *AB 32*.

By implementing the Tier 1 measures along with a mix of the Tier 2 measures identified in Section 5.3, UCSF will close the gap to meet the *AB 32* derived emissions target for 2020, allowing it to utilize the CEQA streamlining provision in *CEQA Guidelines Section 15183.5(b)(1)*. A future development project would be considered consistent with the revised GHGRS if it were consistent with the GHGRS assumptions regarding the amount and type of future development, and was consistent with the GHG reduction measures included in the revised GHGRS. Projects consistent with the revised GHGRS, including conformance with any performance measures applicable to the project, would not require additional GHG emissions analysis under *CEQA Guidelines Sections 15064(h)* and *15183.5(b)(2)*.[69]

7.1 SCREENING PROJECT FOR CONSISTENCY WITH THE GHG REDUCTION STRATEGY

In order to assist with determining project consistency with the UCSF GHGRS, a project consistency checklist is provided in **Table 9**. This checklist is intended to provide the opportunity for individual projects to demonstrate that they are minimizing GHG emissions, while ensuring that new development at UCSF will achieve its 'fair share' of emissions reductions. The UCSF GHGRS stipulates a range of prescribed and planned GHG reductions measures for meeting the 2020 GHG reduction target. The project review checklist would screen projects for important GHG reduction measures that, when implemented, will provide confidence that the project will not impede UCSF's ability to meet its 2020 GHG emissions target. This checklist may evolve over time as the mix of Tier 2 reduction measures is better defined and implemented.

For the project checklist to be valid, UCSF would need to ensure that total development through 2020 does not exceed the following growth assumptions used to develop the emissions forecasts in this GHGRS.

- 2020 total building space = 9,259,500 gross square feet (gsf), with campus specific growth limits provided in **Table 3**
- 2020 population of students + staff + faculty = 36,613
- 2020 population of students + staff + faculty + patients + visitors = 44,628

69 If there is substantial evidence that the effects of a particular project may be cumulatively considerable, notwithstanding the project's compliance with the qualified GHG reduction strategy, CEQA requires that an EIR be prepared.

Table 9: UCSF Project Consistency Checklist

Project is consistent with the 2014 LRDP growth assumptions in Section 7.1.
Proposed use is consistent with 2014 LRDP functional zones. (See LRDP Table 3.)
New building or major renovation project (except for laboratory and acute care facilities) must incorporate UC and UCSF green building requirements, including the provision that the energy performance exceeds Title 24 requirements by at least 20 percent.
New laboratory and acute care facilities must be designed and built to achieve a LEED-NC Gold rating or higher.
New laboratory buildings must be designed to meet Labs21 Environmental Performance Criteria (EPC).

1.3 User Entered Comments & Non-Default Data

Project Characteristics - This run operational only. Adjust GHG emission factor to match PG&E estimate fo latest predicted year (2020)

Land Use - Adjust square feet of residential to match PD. Day Care acreage assumed in Block 15 Residential. Smaller parking garage acreage assumed in value for hospital less 0.5 acres for existing garage

Construction Phase - This run is operational only. Ignore construction inputs and emissions as all land uses in the LRDP are phased over a 20-year period.

Vehicle Trips - Adjust trip rates to match trip generation ofthe travel demand analysis.

Woodstoves - Assumes no fireplaces or woodstoves in housing complex.

Energy Use - Energy Use is default

Energy Mitigation -

Parnassus Construction 2020

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Medical Office Building	27.60	1000sqft	0.55	27,600.00	0
Research & Development	18.20	1000sqft	0.18	18,200.00	0
Apartments Mid Rise	73.00	Dwelling Unit	0.00	73,000.00	209

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2014
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Adjust acreage to match googleEarth estimates

Construction Phase -

Off-road Equipment - UC Hall revovation interior. No Heavy-duty diesel equipment assumed.

Demolition -

Vehicle Trips - This run cobstruction only. Ignore operational input and values for this run.

Construction Off-road Equipment Mitigation - Tier 3 equipment as mitigation

Parnassus Construction 2035 Demo and Conversions

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	147.00	Dwelling Unit	0.93	114,900.00	420

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2014
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - This run construction only.

Land Use - Construction only

Construction Phase -

Off-road Equipment - Assume no heavy duty diesel equipment ith housing conversion

Demolition -

Vehicle Trips - Construction only. No operational emissions

Trips and VMT -

UCSF Parnassus Operational Loses from Project Demolition

San Francisco County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Medical Office Building	216.00	1000sqft	4.96	216,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2014
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - This run calculates the operational losses from demolition of buidings. Does not include vehicle emissions addressed in separate run.

Land Use -

Vehicle Trips - Vehicle trips on seprate run. This run is non-vehicle operational emissions from buildings to be demolished.

CO2 Intensity (lb/MWhr)	746.08	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Parnassus generated electricity from CUP. Factor assumes a hybrid of PG&E 641.345 lb CO2/MWh and CUP .37 MT/MWh=815.7 lb CO2/MWh

Land Use - Adjust population to match UCSF estimates

Vehicle Trips - Adjust trip rates to match travel demand analysis.

Woodstoves - Assume no woodstoves or fireplaces in campus housing.

Energy Mitigation -

Water Mitigation -

UCSF Parnassus Operational Project

San Francisco County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	252.00	Dwelling Unit	6.63	252,000.00	317

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2035
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	746.08	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Parnassus generated electricity from CUP. Factor assumes a hybrid of PG&E 641.345 lb CO2/MWh and CUP .37 MT/MWh=815.7 lb CO2/MWh

Land Use - Population adjusted to match UCSF Estimates

Vehicle Trips - Adjust trip rates to match travel demand estimates.

Woodstoves - Assume no Woodstoves or fireplaces in housing.

Landscape Equipment - No landscape emissions for existing building connversion

Area Coating - No New coating emission for existing building conversion

Energy Use - No change made

Water Mitigation -

Energy Mitigation -

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Research & Development	147.00	1000sqft	3.37	147,000.00	0
Medical Office Building	83.00	1000sqft	1.91	83,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2014
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	746.08	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Parnassus generated electricity from CUP. Factor assumes a hybrid of PG&E 641.345 lb CO2/MWh and CUP .37 MT/MWh=815.7 lb CO2/MWh

Land Use - This run is to estimate existing emissions for land uses to be rennovated. "Office Building" is Milberry with square footage based on 1,000 sf per unit

Vehicle Trips - No vehicle trips this run. Net new vehicle trips are in Project run.

Woodstoves - Assume no Woodstoves or fireplaces in housing.

Landscape Equipment - No landscape emissions for existing building connversion

Area Coating - No New coating emission for existing building conversion

Energy Use - No change made

Water Mitigation -

Energy Mitigation -

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Parnassus generated electricity from CUP. Factor assumes a hybrid of PG&E 641.345 lb CO2/MWh and CUP .37 MT/MWh=815.7 lb CO2/MWh

Land Use - This run is to estimate existing emissions for land uses to be rennovated. "Office Building" is Milberry with quare footage bsaed on 1,000 sf per unit

Vehicle Trips - No vehicle trips this run. Net new vehicle trips are in Project run.

Woodstoves - Assume no Woodstoves or fireplaces in housing.

Landscape Equipment - No landscape emissions for existing building connversion

Area Coating - No New coating emission for existing building conversion

Energy Use - No change made

Water Mitigation -

Energy Mitigation -

UCSF Mission Bay Construction 2025

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Research & Development	232.20	1000sqft	1.43	232,200.00	0
Research & Development	225.00	1000sqft	1.23	225,000.00	0
Enclosed Parking with Elevator	800.00	Space	0.80	271,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2014
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Adjust acreages to match Google Earth estimates

Construction Phase - ADjust number of days propopsrtionally from default to reflect 5-year construction window.

Architectural Coating -

Construction Off-road Equipment Mitigation - Tier 3 equipment as mitigation.

UCSF Mission Bay Construction 2031

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Research & Development	377.40	1000sqft	2.75	377,400.00	0
Research & Development	323.30	1000sqft	1.12	323,300.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2030
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Construction Only Run 2025-2031

Land Use - Adjust acreage to match Google-Earth estimates

Construction Phase - Adjust default number of phase days proposrtionally to reflect 5 year construction window.

UCSF Mission Bay Construction 2035

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Hospital	793.50	1000sqft	5.00	793,500.00	0
Enclosed Parking with Elevator	626.00	Space	0.00	250,400.00	0
Research & Development	193.00	1000sqft	0.80	193,000.00	0
Enclosed Parking with Elevator	800.00	Space	0.80	320,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2035
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Construction only run 2030-2035

Land Use - Adjust acreages to match GoogleEarth estimates. Acreage of smaller parking garage assumed in Hospital acreage.

Construction Phase - Adjust default number of days per phase proportionally to match 5 year development window.

Architectural Coating -

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2035
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	290	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - This run operational only. Adjust GHG emission factor to match PG&E estimate fo latest predicted year (2020)

Land Use - Adjust square feet of residential to match PD. Day Care acreage assumed in Block 15 Residential. Smaller parking garage acreage assumed in value for hospital less 0.5 acres for existing garage

Construction Phase - This run is operational only. Ignore construction inputs and emissions as all land uses in the LRDP are phased over a 20-year period.

Vehicle Trips - Adjust trip rates to match trip generation ofthe travel demand analysis.

Woodstoves - Assumes no fireplaces or woodstoves in housing complex.

Energy Use - Energy Use is default

Energy Mitigation -

Vechicle Emission Factors -

Vechicle Emission Factors -

Vechicle Emission Factors -

Construction Off-road Equipment Mitigation -

UCSF Mount Zion Construction - Demolition Losses

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Medical Office Building	85.00	1000sqft	0.83	85,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2014
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - This run to estimate nonmobile operational losses from demolition of three buidings. Ignore construction and monile source omission this run.

Land Use - Adjust acreage to match GoogleEarth estimates.

Construction Phase - Building construction phase for rennovation of hospital. Assume no off-road equipment but construction worker and vendor trips.

Off-road Equipment - Assume no offroad equipment with hospital rennovation.

Off-road Equipment -

Trips and VMT -

Demolition -

Vehicle Trips - The run costruction only. Ignore operational input and emissions htis run.

UCSF Zion Operational Program

San Francisco County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Medical Office Building	257.30	1000sqft	5.91	257,300.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2020
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Adjust acreage to match Google Earth estimate.

Vehicle Trips - Adjust Vehicle trips to match travel demand study.

Energy Use -

Energy Mitigation -

UCSF Mount Zion Construction - Project

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Hospital	91.00	Bed	0.73	65,133.94	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2014
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Adjust acreage to match GoogleEarth estimates.

Construction Phase - Building construction phase for rennovation of hospital. Assume no off-road equipment but construction worker and vendor trips.

Off-road Equipment - Assume no offroad equipment with hospital rennovation.

Off-road Equipment -

Trips and VMT -

Demolition -

Vehicle Trips - The run costruction only. Ignore operational input and emissions htis run.

Construction Off-road Equipment Mitigation - Tier 3 as mitigation

CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Theis run calculates reduction in emissions from demolition of 3 buildings.

Land Use - Adjust acreage to match Google Earth estimate.

Vehicle Trips - No reduction in vehicle trips assumed at the project level from demolition. Occupants shift to rennovated hospital per PD.

UCSF Mission Center

San Francisco County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	100.00	1000sqft	1.40	100,000.00	0
Enclosed Parking with Elevator	95.00		1.00		0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2025
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Adjust acreage to match GoogleEarth estimate.

Vehicle Trips - Adjust trip rates to match travel demand study.

Energy Mitigation -

TECHNICAL ANALYSIS
Greenhouse Gas Emissions

GHG Emission Factor for Parnassus Campus

PCUP total CO2e emissions (2011) = 68,522 MT
2011 Cogen electricity output: 95,944 MWh = 327,457 MMBtu
2011 Cogen heat output = 692,776 MMBtu
Assumed efficiency of steam production = 0.8
Assumed efficiency of electricity production = 0.35

Emissions from steam production: 32,937 MT
Emission from electricity production: 35,585 MT

Emission factor for PCUP electricity = 35,585 MT/95,944 MWh = 0.37 MT CO2e/MWh

Emission factor for PCUP steam = 32,937/692,776 MMBtu = 0.048 MT/MMBtu

I have some useful info for you in the attached spreadsheet, but I think we need to discuss so I understand what you really need for your analysis.
For the latest verified GHG inventory we have (CY 2011), it looks like 18,305 metric tons CO2e was attributed to 63,786,245 kWh of purchased electricity from PG&E and No
is attributed to the cogeneration plant, which produces electricity and steam for heating. What I don't know is how those emissions are allocated to electricity and to steam.
they are required to by the TCR protocol. Depending on what you need, we may have to allocate emissions to electricity and steam using information about the plant inputs
The CARB GHG report for 2011 (also attached) appears to show cogen output to be 95,944 MWh and 692,776 MMBtu . By my quick calculation (using the TCR-provided meth
), the emissions would be apportioned at 46,812 to electricity and 20,982 to steam, therefor the cogen electricity EF would be 46,812 divided by 94,774 = 0.49 MT CO2/MWh

CLS Calculations:

PG&E=	290	lb/MWh	(CalEEMOd)			Conversion factor	
PCUP =	0.37	MT/MWh	=	815.7138	lb/MWh	2204.632	lb/MT

2011 power =	PG&E & Noble	63786.25	MWh
	CPUC =	95944	MWh
	Total =	159730.2	MWh
Composite emission factor =		605.7767	lb/MWh

UCSF Parnassus Operational Program

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Hospital	308.00	1000sqft	2.75	308,000.00	0
Apartments Low Rise	77.00	Dwelling Unit	0.30	77,000.00	99

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2035
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	605.8	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Parnassus generated electricity from CUP. Factor assumes a hybrid of PG&E 290 lb CO2/MWh and CUP .37 MT/MWh=605.8 lb CO2/MWh

Land Use - Adjust population to match UCSF estimates

Vehicle Trips - Adjust trip rates to match travel demand analysis.

Woodstoves - Assume no woodstoves or fireplaces in campus housing.

Energy Mitigation - UCSF Polic to acheive energy reduction 10 perecnt beyond Title 24

Water Mitigation -

UCSF Parnassus Operational Project

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	252.00	Dwelling Unit	6.63	252,000.00	317

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2035
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	605.78	**CH4 Intensity (lb/MWhr)**	0	**N2O Intensity (lb/MWhr)**	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Parnassus generated electricity from CUP. Factor assumes a hybrid of PG&E 290 lb CO2/MWh and CUP .37 MT/MWh=815.7 lb CO2/MWh

Land Use - Population adjusted to match UCSF Estimates

Vehicle Trips - Adjust trip rates to match travel demand estimates.

Woodstoves - Assume no Woodstoves or fireplaces in housing.

Area Coating - No New coating emission for existing building conversion

Landscape Equipment - No landscape emissions for existing building connversion

Energy Use - No change made

Energy Mitigation -

Water Mitigation -

UCSF Zion Operational Project

San Francisco County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Medical Office Building	85.00	1000sqft	0.72	85,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2014
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Theis run calculates reduction in emissions from demolition of 3 buildings.

Land Use - Adjust acreage to match Google Earth estimate.

Vehicle Trips - No reduction in vehicle trips assumed at the project level from demolition. Occupants shift to rennovated hospital per PD.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	100.00	1000sqft	1.40	100,000.00	0
Enclosed Parking with Elevator	95.00	1000sqft	1.00	95,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	4.6	**Precipitation Freq (Days)**	64
Climate Zone	5			**Operational Year**	2025
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	290	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjust CO2 intensity factor to match PG&E estimate for latest predicted year available (2020).

Land Use - Adjust acreage to match GoogleEarth estimate.

Vehicle Trips - Adjust trip rates to match travel demand study.

Energy Mitigation -

TECHNICAL ANALYSIS
Health Risk Assessment

Toxic Air Contaminants – Project Construction

Impact AIR-3: The Project would expose persons to substantial levels of TACs, during short-term construction activities, which may lead to adverse health effects (Criterion 4). (Less than Significant)

Project construction activities would produce DPM and $PM_{2.5}$ emissions due to combustion equipment such as loaders, backhoes, and cranes, as well as haul truck trips. These emissions could result in elevated concentrations of DPM and $PM_{2.5}$ at nearby receptors (both new and existing residences and schools). These elevated concentrations could lead to an increase in the risk of cancer or other health impacts. Detailed assumptions and methodology for the HRA are included in **Appendix HRA**.

Parnassus Heights. A summary of the health impacts related to construction of Parnassus Heights are found in **Table 4.2-1**.

TABLE 4.2-1
CONSTRUCTION-RELATED HEALTH IMPACTS - PARNASSUS HEIGHTS

Receptor Type	Cancer Risk (persons per million)	Chronic Impact	Acute Impact	PM2.5 Concentration ($\mu g/m^3$)
New Residence (adult/child)	0.05/0.59	<0.01	<0.01	<0.01
School Children	0.02	<0.01	<0.01	<0.01
Existing Residence (adult/child)	0.03/0.29	<0.01	<0.01	<0.01
BAAQMD Significance Criteria	10	1	1	0.3
Significant Impact?	No	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

As shown in **Table 4.2-1**, the maximum cancer risk for the new residence-adult and residence-child associated with the project (located at Millberry Union and UC Hall) would be 0.1 and 0.6 persons per million, respectively. The maximum cancer risk for an existing residence-adult and residence-child (located to the north-northeast-northwest of the project site and Aldea Housing) would be 0.1 and 0.3 persons per million, respectively. The maximum cancer risk for a school-child receptor (such as Gratton Elementary School, Haight Ashbury Community Nursery School, and Marilyn Reed Lucia Child Care) would be less than 0.1 persons per million. Thus, the cancer risk due to construction activities alone is below the BAAQMD threshold of 10 per million and would be less than significant.

The chronic HI would be less than 0.1 at all receptors. The chronic HI would be below the BAAQMD threshold of 1 and the impact of the Project would be less than significant. The acute HI would be less than 0.1 at all receptors including recreational receptors at Mount Sutro Open Space Reserve. The acute HI would be below the BAAQMD threshold of 1 and the impact of the Project would be less than significant.

The maximum annual $PM_{2.5}$ concentrations would be less than 0.1 µg/m^3 for the new residences associated with the project, a school-child and the existing residences. The construction-related annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.3 µg/m^3, and hence is considered less than significant.

Mitigation: None required.

Mission Bay. A summary of the health impacts related to construction of Mission Bay are found in **Table 4.2-2**.

TABLE 4.2-2
CONSTRUCTION-RELATED HEALTH IMPACTS - MISSION BAY

Receptor Type	Cancer Risk (persons per million)	Chronic Impact	Acute Impact	PM2.5 Concentration (µg/m^3)
New Residence (adult/child)	0.63/7.11	0.01	0.08	0.07
School Children	0.35	0.01	0.01	0.03
Existing Residence (adult/child)	0.73/8.21	0.01	0.17	0.05
BAAQMD Significance Criteria	10	1	1	0.3
Significant Impact?	No	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

As shown in **Table 4.2-2**, the maximum cancer risk for the new residence-adult and residence-child associated with the project (Mission Bay Housing within Block 15) would be 0.7 and 8.2 persons per million, respectively. The maximum cancer risk for an existing residence-adult and residence-child (Mission Bay Housing within Block 20) would be 0.6 and 7.1 persons per million, respectively. No school children receptors are located within the project area. Thus, the cancer risk due to construction activities alone is below the BAAQMD threshold of 10 per million and would be less than significant.

The chronic HI would be less than 0.1 at all receptors. The chronic HI would be below the BAAQMD threshold of 1 and the impact of the Project would be less than significant. The acute HI would be less than 0.2 at all receptors including recreational receptors within the Campus Sport Field, Koret Quad, and Mission Creek Park. The acute HI would be below the BAAQMD threshold of 1 and the impact of the Project would be less than significant.

The maximum annual $PM_{2.5}$ concentrations would be less than 0.1 µg/m^3 for the new residences associated with the project, a school-child and the existing residences. The construction-related annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.3 µg/m^3, and hence is considered less than significant.

Mitigation: None required.

Mount Zion. A summary of the health impacts related to construction of Mount Zion are found in **Table 4.2-3**.

TABLE 4.2-3CONSTRUCTION-RELATED HEALTH IMPACTS - MOUNT ZION

Receptor Type	Cancer Risk (persons per million)	Chronic Impact	Acute Impact	PM2.5 Concentration ($\mu g/m^3$)
School Children	0.01	0.01	0.01	0.01
Existing Residence (adult/child)	0.05/0.54	0.01	0.01	0.01
BAAQMD Significance Criteria	10	1	1	0.3
Significant Impact?	No	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

As shown in **Table 4.2-3**, the maximum cancer risk for an existing residence-adult and residence-child (located to the south of Sutter and west of Divisadero) would be 0.1 and 0.5 persons per million, respectively. The maximum cancer risk for a school-child receptor (Ben Franklin Middle School and Gateway High School) would be less than 0.1 persons per million. Thus, the cancer risk due to construction activities alone is below the BAAQMD threshold of 10 per million and would be less than significant.

The chronic HI would be less than 0.1 at all receptors. The chronic HI would be below the BAAQMD threshold of 1 and the impact of the Project would be less than significant. The acute HI would be less than 0.1 at all receptors including Hamilton Recreational Center. The acute HI would be below the BAAQMD threshold of 1 and the impact of the Project would be less than significant.

The maximum annual $PM_{2.5}$ concentrations would be less than 0.1 $\mu g/m^3$ for the school-child and the existing residences. The construction-related annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

Mission Center. A summary of the health impacts related to construction of Mission Center are found in **Table 4.2-4**.

TABLE 4.2-4
CONSTRUCTION-RELATED HEALTH IMPACTS - MISSION CENTER

Receptor Type	Cancer Risk (persons per million)	Chronic Impact	Acute Impact	PM2.5 Concentration ($\mu g/m^3$)
School Children	0.04	0.01	0.01	0.01
Existing Residence (adult/child)	0.64/7.19	0.02	0.21	0.08
BAAQMD Significance Criteria	10	1	1	0.3
Significant Impact?	No	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

As shown in **Table 4.2-4**, the maximum cancer risk for an existing residence-adult and residence-child (located to the west of the project site) would be 0.6 and 7.2 persons per million, respectively. The maximum cancer risk for a school-child receptor (including Marshall Elementary School) would be less than 0.1 persons per million. Thus, the cancer risk due to construction activities alone is below the BAAQMD threshold of 10 per million and would be less than significant.

The chronic HI would be less than 0.1 at all receptors. The chronic HI would be below the BAAQMD threshold of 1 and the impact of the Project would be less than significant. The acute HI would be 0.2 or less at all receptors. The acute HI would be below the BAAQMD threshold of 1 and the impact of the Project would be less than significant.

The maximum annual $PM_{2.5}$ concentrations would be less than 0.1 $\mu g/m^3$ for the school-child and the existing residences. The construction-related annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

A summary of the cancer risks related to construction for the UCSF LRDP is found in **Table 4.2-5**. All values are below the BAAQMD threshold of 10 per million and would be less than significant.

TABLE 4.2-5
CONSTRUCTION-RELATED CANCER RISKS - UCSF LRDP

Project	New Receptor (adult/child)	Existing Receptor (adult/child)	School
Parnassus Heights	0.05/0.59	0.03/0.29	0.02
Mission Bay	0.63/7.11	0.73/8.21	0.35
Mount Zion	-	0.05/0.54	0.01
Mission Center	-	0.64/7.19	0.04

SOURCE: KB Environmental Sciences, Inc., 2014.

Toxic Air Contaminants – Project Operation

The Project would expose persons to substantial levels of TACs during Project operations, which may lead to adverse health effects (Criterion 4). (Less than Significant)

Project operation would produce DPM and $PM_{2.5}$ emissions due to motor vehicle traffic including employees, customers, deliveries, and new residences. These emissions could result in elevated concentrations of DPM and $PM_{2.5}$. These elevated concentrations could lead to an increase in the risk of cancer or other health impacts.

Mission Bay. A summary of the health impacts related to operations of Mission Bay are found in **Table 4.2-6**.

TABLE 4.2-6
OPERATION-RELATED HEALTH IMPACTS - MISSION BAY

Receptor Type	Cancer Risk (persons per million)	Chronic Impact	Acute Impact	PM2.5 Concentration ($\mu g/m^3$)
New Residence (adult/child)	0.85/0.41	<0.01	<0.01	<0.01
School Children	0.17	<0.01	<0.01	<0.01
Existing Residence (adult/child)	0.98/0.47	<0.01	<0.01	<0.01
BAAQMD Significance Criteria	10	1	1	0.3
Significant Impact?	No	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

As shown above in **Table 4.2-6**, the maximum cancer risk for the new residence-adult and residence-child at the Project Site would be 0.9 and 0.4 persons per million, respectively. The maximum cancer risk for an existing residence-adult and residence-child would be 1.0 and 0.5 persons per million, respectively. The maximum cancer risk for a school-child receptor would be 0.1 persons per million. Thus, the cancer risk is below the BAAQMD threshold of 10 per million and would be less than significant.

The chronic HI would be less than 0.1 at all receptors. The chronic HI would be well below the BAAQMD threshold of 1 and the impact of the Project would be less than significant. The acute HI would be less than 0.1 at all receptors. The acute HI would be well below the BAAQMD threshold of 1 and the impact of the Project would be less than significant.

The maximum annual $PM_{2.5}$ concentrations would be 0.1 $\mu g/m^3$ for the new residences associated with the project, a school-child receptor, and the existing residences. The operation-related annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

Toxic Air Contaminants – New Receptors

The Project would expose persons (new receptors) to substantial levels of TACs, which may lead to adverse health effects (Criterion 4). (Less than Significant)

The BAAQMD's *CEQA Air Quality Guidelines* include standards and methods for determining the significance of health risk impacts for new receptors resulting from the Project. The method for determining health risk requires the review of health risk from permitted sources and major

roadways in the vicinity of a project (i.e., within a 1,000-foot radius of the source), then adding the project impacts to determine whether the health risk thresholds for new receptors are exceeded.

BAAQMD has developed a geo-referenced database of permitted emissions sources throughout the San Francisco Bay Area, and has developed the Stationary Source Risk & Hazard Analysis Tool (dated May 2011) for estimating cumulative health risks from permitted sources. Eight permitted sources are located within 1,000 feet of new residences associated with the Project and included in the cumulative analysis.

BAAQMD has also developed a geo-referenced database of major roadways throughout the San Francisco Bay Area and has developed the *Highway Screening Analysis Tool (*dated May 2011*)* for estimating cumulative health risks from roadways. No major roadways are near the Parnassus Heights or Mount Zion project sites. Interstate 280 is located adjacent (approximately 400 feet to the west) to the Mission Bay project. US 101 is located to the north of the Mission Center project site (approximately 640 feet to the north).

BAAQMD *CEQA Air Quality Guidelines* also require the inclusion of surface streets within 1,000 feet of the project with annual average daily traffic (AADT) of 10,000 or greater[1].

Upon review the health impacts from Parnassus Avenue with 11,700 AADT was included for the Parnassus Heights. Foe the Mission Bay project, Third Street (30,265 AADT), 7th Street (22,188 AADT), and 16th Street (20,436 AADT) were included. The Mount Zion included Divisadero Street and Geary Boulevard. Mission Center included the roadways of 14th Street, Van Ness Avenue (52,718 AADT), 15th Street, Folsom Street, and Harrison Street.

A summary of the cumulative health impacts for the new residences under the Parnassus Heights project is found in **Table 4.2-7**.

Notably, for individual projects/new receptors, the threshold of significance is based the source with the highest cancer risk, $PM_{2.5}$ concentration, or hazard in comparison to other sources within the 1,000 foot radius of the receptor.[2]

[1] BAAQMD County Surface Street Screening Tables, May 2011 and CEHTP Traffic Linkage Service Demonstration, http://www.ehib.org/traffic_tool.jsp

[2] BAAQMD, *Recommended Methods for Screening and Modeling Local Risk and Hazards*, May 2011.

TABLE 4. 2-7
HEALTH IMPACTS FOR NEW RECEPTORS - PARNASSUS HEIGHTS

Site #	Facility Type	Address/Source	Cancer Risk (persons per million)	Hazard Impact	PM2.5 Concentration ($\mu g/m^3$)
2479	UCSF/Parnassus	3rd Avenue/Parnassus	4.59	<0.01	0.01
		Parnassus Avenue	0.90	<0.01	0.09
		Proposed Project (adult/child)	0.05/0.59	<0.01	<0.01
		Highest Single Source Impact	4.59	<0.01	0.09
		BAAQMD Significance Criteria (new receptor)	10	1	0.3
		Potentially Significant Impact?	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

The health impacts from nearby sources in the area would have an impact on new residence associated with the Parnassus Heights project. The highest cancer risk from any of the nearby sources would be 4.6 persons per million. Thus, the cancer risk for new receptors is below the BAAQMD threshold of 10 per million and would be less than significant.

The highest hazard index from nearby sources would be less than 0.1; well below the BAAQMD threshold of 1 and the impact of the proposed residences of the Project would be less than significant. The highest annual $PM_{2.5}$ concentrations would be 0.1 $\mu g/m^3$ as a result of roadway traffic on Parnassus Avenue. This $PM_{2.5}$ concentration at new residences would be below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

A summary of the cumulative health impacts for the new residences under the Mission Bay project is found in **Table 4.2-8**.

TABLE 4. 2-8
HEALTH IMPACTS FOR NEW RECEPTORS - MISSION BAY

Site #	Facility Type	Address/Source	Cancer Risk (persons per million)	Hazard Impact	PM2.5 Concentration ($\mu g/m^3$)
13160	UCSF/Mission Bay	600 16th Street	2.89	<0.01	0.01

		Proposed Project (adult/child)	0.63/7.11	0.01	0.07
		Highest Single Source Impact	7.11	0.01	0.07
		BAAQMD Significance Criteria (new receptor)	10	1	0.3
		Potentially Significant Impact?	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

The health impacts from nearby sources in the area would have an impact on new residence associated with the Mission Bay project. The highest cancer risk from any of the nearby sources would be 7.1 persons per million. Thus, the cancer risk for new receptors is below the BAAQMD threshold of 10 per million and would be less than significant.

The highest hazard index from nearby sources would be less than 0.1; well below the BAAQMD threshold of 1 and the impact of the proposed residences of the Project would be less than significant. The highest annual $PM_{2.5}$ concentrations would be 0.1 $\mu g/m^3$. This $PM_{2.5}$ concentration at new residences would be below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

Cumulative Impacts

Toxic Air Contaminants – Cumulative Exposure

The Project would cumulatively expose persons to substantial levels of toxic air contaminants (TACs), which may lead to adverse health effects (Criterion 4). (Less than Significant)

The BAAQMD's *CEQA Air Quality Guidelines* include standards and methods for determining the significance of cumulative health risk impacts for new projects. The method for determining health risk requires the review of health risk from permitted sources and major roadways in the vicinity of a project (i.e., within a 1,000-foot radius of the source), then adding the project impacts

to determine whether the cumulative health risk thresholds are exceeded. A summary of the cumulative health impacts for the existing residences for Parnassus Heights are found in **Table 4.2-9**.

TABLE 4.2-9
CUMULATIVE HEALTH IMPACTS - PARNASSUS HEIGHTS

Site #	Facility Type	Address/Source	Cancer Risk (persons per million)	Chronic Hazard Impact	PM2.5 Concentration ($\mu g/m^3$)
2479	UCSF/Parnassus	3rd Avenue/Parnassus	4.59	<0.01	0.01
		Parnassus Avenue	0.90	<0.01	0.09
		Proposed Project (adult/child)	0.03/0.29	<0.01	<0.01
		Grand Total (adult/child)	**5.52/5.78**	**0.03**	**0.11**
		BAAQMD Cumulative Significance Criteria	100	10	0.8
		Significant Cumulative Impact?	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

The health impacts from the Project construction and operations plus other sources (permitted sources and roadways) in the area would have a cumulative impact on nearby residence receptors. The maximum cumulative cancer risk for existing residence would be 5.5 and 5.8 persons per million for residence-adult and residence child, respectively. Thus, the cumulative cancer risk is below the BAAQMD threshold of 100 per million and would be less than significant.

The cumulative HI would be less than 0.1. The HI would be well below the BAAQMD threshold of 10 and the impact of the Project would be less than significant. The maximum cumulative annual $PM_{2.5}$ concentrations would be 0.1 $\mu g/m^3$. The cumulative annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.8 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

A summary of the cumulative health impacts for the existing residences for Mission Bay are found in **Table 4.2-10**.

TABLE 4.2-10
CUMULATIVE HEALTH IMPACTS - MISSION BAY

Site #	Facility Type	Address/Source	Cancer Risk (persons per million)	Chronic Hazard Impact	PM2.5 Concentration ($\mu g/m^3$)

		Proposed Project (adult/child)	0.73/8.21	0.01	0.07
		Grand Total (adult/child)	**14.9/22.4**	**0.09**	**0.2**
		BAAQMD Cumulative Significance Criteria	100	10	0.8
		Significant Cumulative Impact?	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

The health impacts from the Project construction and operations plus other sources (permitted sources and roadways) in the area would have a cumulative impact on nearby residence receptors. The maximum cumulative cancer risk for existing residence would be 14.9 and 22.4 persons per million for residence-adult and residence child, respectively. Thus, the cumulative cancer risk is below the BAAQMD threshold of 100 per million and would be less than significant.

The cumulative HI would be less than 0.1. The HI would be well below the BAAQMD threshold of 10 and the impact of the Project would be less than significant. The maximum cumulative annual $PM_{2.5}$ concentrations would be 0.2 $\mu g/m^3$. The cumulative annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.8 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

A summary of the cumulative health impacts for the existing residences for Mount Zion are found in **Table 4.2-11**.

TABLE 4.2-11
CUMULATIVE HEALTH IMPACTS - MOUNT ZION

Site #	Facility Type	Address/Source	Cancer Risk (persons per million)	Chronic Hazard Impact	PM2.5 Concentration ($\mu g/m^3$)
9701	Town Cleaners	2840 California Street	1.37	0.02	<0.01

		BAAQMD Cumulative Significance Criteria	100	10	0.8
		Significant Cumulative Impact?	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

The health impacts from the Project construction plus other sources (permitted sources and roadways) in the area would have a cumulative impact on nearby residence receptors. The maximum cumulative cancer risk for existing residence would be 19.7 and 20.2 persons per million for residence-adult and residence-child, respectively. Thus, the cumulative cancer risk is below the BAAQMD threshold of 100 per million and would be less than significant.

The cumulative HI would be 0.1. The HI would be well below the BAAQMD threshold of 10 and the impact of the Project would be less than significant. The maximum cumulative annual $PM_{2.5}$ concentrations would be 0.3 $\mu g/m^3$. The cumulative annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.8 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

A summary of the cumulative health impacts for the existing residences for Mission Center are found in **Table 4.2-12**.

SOURCE: KB Environmental Sciences, Inc., 2014.

The health impacts from the Project construction and operations plus other sources (permitted sources and roadways) in the area would have a cumulative impact on nearby residence receptors. The maximum cumulative cancer risk for existing residence would be 29.9 and 36.5 persons per million for residence-adult and residence child, respectively. Thus, the cumulative cancer risk is below the BAAQMD threshold of 100 per million and would be less than significant.

The cumulative HI would be 0.2. The HI would be well below the BAAQMD threshold of 10 and the impact of the Project would be less than significant. The maximum cumulative annual $PM_{2.5}$ concentrations would be 0.5 $\mu g/m^3$. The cumulative annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.8 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

Health Risk Assessment

A health risk assessment (HRA) is accomplished in four steps; hazards identification, exposure assessment, toxicity assessment, and risk characterization. These steps cover the estimation of air emissions, the estimation of the air concentrations resulting from a dispersion analysis, the incorporation of the toxicity of the pollutants emitted, and the characterization of the risk based on exposure parameters such as breathing rate, age adjustment factors, and exposure duration; each depending on receptor type.

The HRA was conducted in accordance with technical guidelines developed by federal, state, and regional agencies, including US Environmental Protection Agency (USEPA), California Environmental Protection Agency (CalEPA), California Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxics Hot Spots Program Guidance*[1], and the BAAQMD's *Health Risk Screening Analysis Guidelines*.[2]

According to CalEPA, a HRA should not be interpreted as the expected rates of cancer or other potential human health effects, but rather as estimates of potential risk or likelihood of adverse effects based on current knowledge, under a number of highly conservative assumptions and the best assessment tools currently available.

TERMS AND DEFINITIONS

As the practice of conducting a HRA is particularly complex and involves concepts that are not altogether familiar to most people, several terms and definitions are provided that are considered essential to the understanding of the approach, methodology and results:

Acute effect – a health effect (non-cancer) produced within a short period of time (few minutes to several days) following an exposure to toxic air contaminants (TAC).

Cancer risk – the probability of an individual contracting cancer from a lifetime (i.e., 70 year) exposure to TAC in the ambient air.

Chronic effect – a health effect (non-cancer) produced from a continuous exposure occurring over an extended period of time (weeks, months, years).

Hazard Index (HI) – the unitless ratio of an exposure level over the acceptable reference dose (RfC). The HI can be applied to multiple compounds in an additive manner.

Hazard Quotient (HQ) – the unitless ratio of an exposure level over the acceptable reference dose (RfC). The HQ is applied to individual compounds.

Toxic air contaminants (TAC) – any air pollutant that is capable of causing short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). The current California list of TAC lists approximately 200 compounds, including particulate emissions from diesel-fueled engines.

[1] Office of Environmental Health Hazard Assessment (OEHHA), 2003. *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*, http://www.oehha.org/air/hot_spots/pdf/HRAguidefinal.pdf

[2] Bay Area Air Quality Management District (BAAQMD), 2005. *BAAQMD Health Risk Screening Analysis Guidelines (http://www.baaqmd.gov/pmt/air_toxics/risk_procedures_policies/hrsa_guidelines.pdf)*, June 2005.

Human Health Effects - comprise disorders such as eye watering, respiratory or heart ailments, and other (i.e., non-cancer) related diseases.

Health Risk Assessment (HRA) – an analysis designed to predict the generation and dispersion of TAC in the outdoor environment, evaluate the potential for exposure of human populations, and to assess and quantify both the individual and population-wide health risks associated with those levels of exposure.

Incremental – under CEQA, the net difference (or change) in conditions or impacts when comparing the baseline to future year project conditions.

Maximum exposed individual (MEI) – an individual assumed to be located at the point where the highest concentrations of TAC, and therefore, health risks are predicted to occur.

Non-cancer risks – health risks such as eye watering, respiratory or heart ailments, and other non-cancer related diseases.

Receptors – the locations where potential health impacts or risks are predicted (schools, residences and work-sites).

LIMITATIONS AND UNCERTAINTIES

There are a number of important limitations and uncertainties commonly associated with a HRA due to the wide variability of human exposures to TACs, the extended timeframes over which the exposures are evaluated and the inability to verify the results. Among these challenges are the following:

- The HRA exposure estimates do not take into account that people do not usually reside at the same location for 70 years and that other exposures (i.e., school children) are also of much shorter durations than was assumed in this analysis. Therefore, the results of the HRA are highly overstated for those cases.

- Other limitations and uncertainties associated with HRA and identified by the CalEPA include: (a.) lack of reliable monitoring data; (b.) extrapolation of toxicity data in animals to humans; (c.) estimation errors in calculating TACs emissions; (d.) concentration prediction errors with dispersion models; and (e.) the variability in lifestyles, fitness and other confounding factors of the human population.

HAZARDS IDENTIFICATION

TAC emissions associated with the project would occur from the following project activities:

- Off-road equipment and haul trucks during construction activities
- Motor vehicle operations along nearby roadways

Diesel exhaust is a complex mixture of numerous individual gaseous and particulate compounds emitted from diesel-fueled combustion engines diesel particulate matter (DPM) is formed primarily through the incomplete combustion of diesel fuel. DPM is removed from the atmosphere through physical processes including atmospheric fall-out and washout by rain. Humans can be exposed to airborne DPM by deposition on water, soil, and vegetation; although the main pathway of exposure is inhalation.

In August 1998, the California Air Resource Board (CARB) identified DPM as a TAC. The CARB developed *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel- Fueled Engines and Vehicles* and *Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines* and approved these documents on September 28, 2000. The documents represent proposals to reduce DPM emissions, with the goal of reducing emissions and the associated health risk by 75 percent in 2010 and by 85 percent in 2020. The program aimed to require the use of state-of-the-art catalyzed DPM filters and ultra-low-sulfur diesel fuel.

In 2001, CARB assessed the state-wide health risks from exposure to diesel exhaust and to other toxic air contaminants. It is difficult to distinguish the health risks of diesel emissions from those of other air toxics, since diesel exhaust contains approximately 40 different TACs. The CARB study detected diesel exhaust by using ambient air carbon soot measurements as a surrogate for diesel emissions. The study reported that the state-wide cancer risk from exposure to diesel exhaust was about 540 per million population as compared to a total risk for exposure to all ambient air toxics of 760 per million. This estimate, which accounts for about 70 percent of the total risk from TACs, included both urban and rural areas in the state. The estimate can also be considered an average worst-case for the state, since it assumes constant exposure to outdoor concentrations of diesel exhaust and does not account for expected lower concentrations indoors, where most of time is spent.

EXPOSURE ASSESSMENT

Dispersion is the process by which atmospheric pollutants circulate due to wind and vertical stability. The results of a dispersion analysis are used to assess pollutant concentrations at or near an emission source. The results of this analysis allow predicted concentrations of pollutants to be compared directly to air quality standards and other criteria such as health risks.

Dispersion Modeling Approach

This section presents the methodology used for the dispersion modeling analysis. This section addresses all of the fundamental components of an air dispersion modeling analysis including:

- Model selection and options
- Receptor locations
- Meteorological data
- Source release characteristics

Model Selection and Options

The AERMOD (Version 12345) was used for the dispersion analysis. AERMOD is the US EPA preferred dispersion model for general industrial sources. The model can simulate point, area, volume, and line sources. The AERMOD model is the appropriate model for this analysis based on the coverage of simple, intermediate, and complex terrain. It also predicts both short-term and long-term (annual) average concentrations. The model was executed using the regulatory default options (stack-tip downwash, buoyancy-induced dispersion, and final plume rise), default wind speed profile categories, default potential temperature gradients, and no pollutant decay.

The selection of the appropriate dispersion coefficients depends on the land use within three kilometers (km) of the project site. The land use typing was based on the classification method defined by Auer (1978); using pertinent United States Geological Survey (USGS) 1:24,000 scale (7.5 minute) topographic maps of the area. If the Auer land use types of heavy industrial, light-to-moderate industrial, commercial, and compact residential account for 50 percent or more of the total area, the US EPA *Guideline on Air Quality Models* recommends using urban dispersion coefficients; otherwise, the appropriate rural coefficients were used. Based on observation of the area surrounding the project site, rural (urban is only designated within dense city centers such as downtown San Francisco) dispersion coefficients were applied in the analysis.

Receptors

Some receptors are considered more sensitive to air pollutants than others, because of preexisting health problems, proximity to the emissions source, or duration of exposure to air pollutants. Land uses such as primary and secondary schools, hospitals, and convalescent homes are considered to be relatively sensitive to poor air quality because the very young, the old, and the infirm are more susceptible to respiratory infections and other air quality-related health problems than the general public. Residential areas are also considered sensitive to poor air quality because people in residential areas are often at home for extended periods. Recreational land uses are moderately sensitive to air pollution, because vigorous exercise associated with recreation places a high demand on respiratory system function. Land use data is based on the San Francisco Zoning Map (dated April 2013).[3]

For the Parnassus Heights, the closest new residential uses would be located at Millberry Union and UC Hall, to the north of the project site, along Parnassus Avenue. Additional existing residences are located to the north-northeast-northwest of the project site and with Aldea Housing to the south of the project site). Seven schools (such as Gratton Elementary School, Haight Ashbury Community Nursery School, and Marilyn Reed Lucia Child Care) were included in the analysis as well as approximately 725 recreational receptors within the Mount Sutro Open Space Reserve. Nearly 1,680 receptors were included in the analysis. **Exhibit 1** displays the location of the Parnassus Heights receptors used in the HRA.

For the Mission Bay, the closest new residences (a total of approximately 330 receptors) would be located at Mission Bay Housing within Block 15 to the north of the project site along Mission Bay Boulevard North and north of the project site. Additional existing residences are located at Mission Bay Housing within Block 20. One daycare is located in the immediate vicinity and approximately 200 recreational receptors (Campus Sport Field, Koret Quad, and Mission Creek Park) were included in the analysis. Nearly 840 receptors were included in the analysis. **Exhibit 2** displays the location of the Mission Bay receptors used in the HRA.

For the Mission Center, the closest existing residential uses are to the west of the project site. Three schools (including Marshall Elementary School) were included in the analysis as well as ten recreational receptors. Nearly 280 receptors were included in the analysis. **Exhibit 3** displays the location of the Mission Center receptors used in the HRA.

[3] San Francisco Planning Department, http://sf-planning.org/modules/showdocument.aspx?documentid=9016

For the Mount Zion, the closest existing residential uses located to the south of Sutter and west of Divisadero; to the west of the project site. Four schools (Ben Franklin Middle School and Gateway High School) were included in the analysis as well as 15 recreational receptors including Hamilton Recreational Center. Nearly 670 receptors were included in the analysis. **Exhibit 4** displays the location of the Mount Zion receptors used in the HRA.

Terrain elevations for receptor locations were used (i.e., complex terrain) based on available USGS information for the area. Receptors were placed at a height of 1.8 meters (typical breathing height).

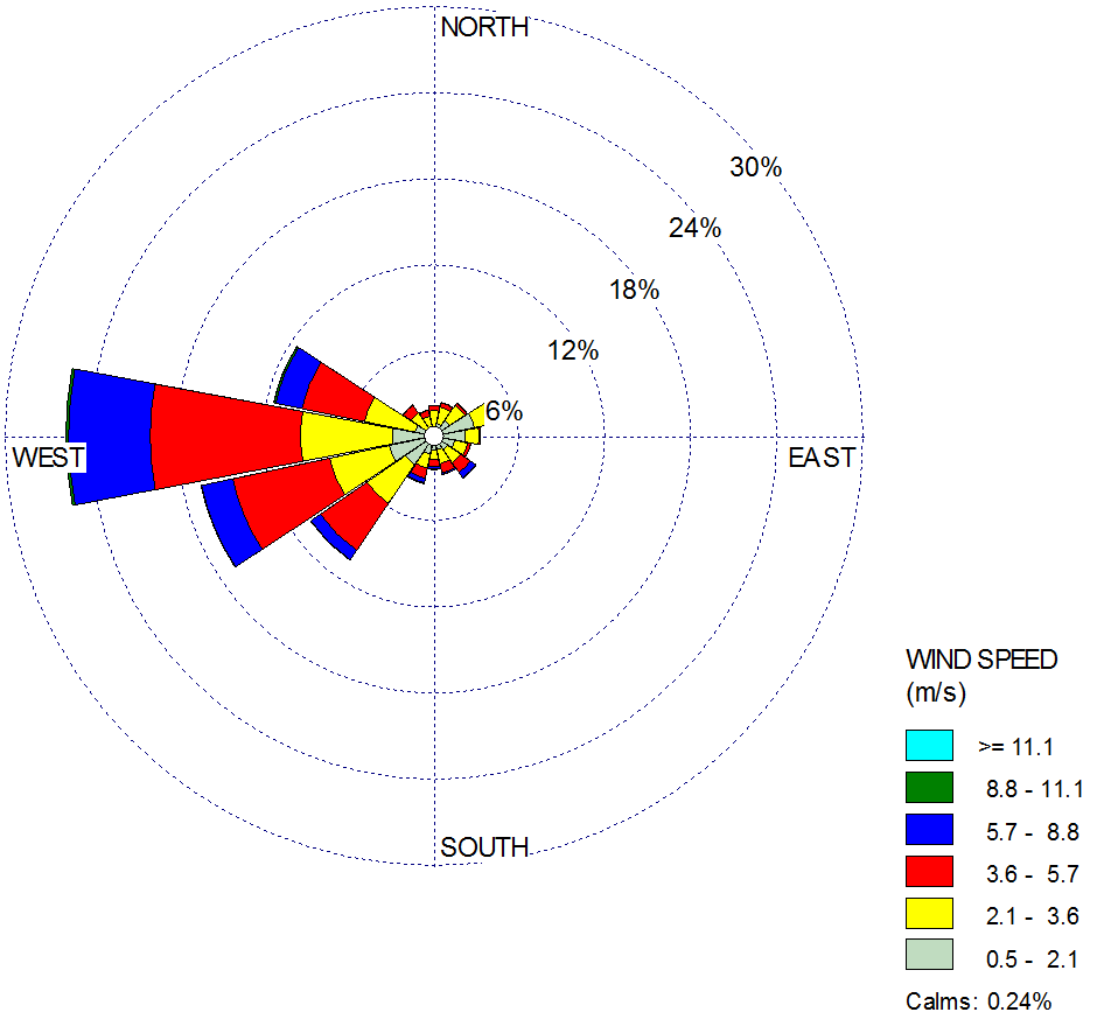
Meteorological Data

Air quality is a function of both the rate and location of pollutant emissions under the influence of meteorological conditions and topographic features affecting pollutant movement and dispersal. Atmospheric conditions such as wind speed, wind direction, atmospheric stability, and air temperature gradients interact with the physical features of the landscape to determine the movement and dispersal of air pollutants, and consequently affect air quality.

Hourly surface meteorological data and upper air meteorological data from Mission Bay in San Francisco and Oakland, California, respectively, were provided by BAAQMD and used for the modeling analysis and. **Exhibit 5** provides the annual wind roses for the meteorological station. Wind directions are predominately from the south southwest and there is a low frequency of calm wind conditions.

EXHIBIT 5
WINDROSE FOR MISSION BAY, SAN FRANCISCO, CALIFORNIA



Source Release Characteristics

Construction equipment was treated as an area source within the facility expansion area. The release height of the off-road equipment exhaust was 3.05 meters. Delivery trucks and employee trips were treated as a line source (i.e., volume sources placed at regular intervals) located along the access road. The delivery trucks were assigned a release height of 3.05 meters and an initial vertical dimension of 4.15 meters, which accounts for dispersion from the movement of vehicles.

Terrain elevations for emission source locations were used (i.e., complex terrain) based on available USGS DEM for the area. AERMAP (Version 11103) was used to develop the terrain elevations, although the project site is generally flat.

Emission Estimates

The emissions associated with the HRA were based on the air quality calculations using CALEEMod (version 2013.2.2) and the information within the project description regarding construction schedule and project operations.

Operational emissions represent values within the modeling domain, approximately 1.1 miles (Mission Bay), 0.5 miles (Mission Center), 0.5 miles (Mt. Zion), and 0.9 miles (Parnassus Heights) of roadway length (as a portion of the 12.5 miles traveled), emission factors during the operational period, the hour of the day scaling factor (ranging from 0 to 1), a percent DPM to $PM_{2.5}$ emissions (approximately 20 percent), and the CALEEMod $PM_{2.5}$ exhaust emissions for nonroad equipment.

Table 1 provides the estimated annual $PM_{2.5}$ emissions for each project, year for onroad vehicles and nonroad equipment.

TABLE 1
ANNUAL PM25 EMISSIONS (TONS PER YEAR)

Project	Year	Onroad	Nonroad
Mission Bay	2018	0.017	0.175
	2019	0.002	0.020
	2020	0.008	0.082
	2029	0.006	0.053
	2030	0.034	0.026
	2031	0.016	0.009
Mission Center	2015	0.006	0.199
	2016	<0.001	0.001
Mt Zion	2015	<0.001	0.004
Parnassus	2015	0.002	0.004
	2020	<0.001	0.002
	2030	0.003	0.003

Dispersion Modeling Results

Using AERMOD, the maximum 1-hour and average annual concentrations were determined for the emission sources of concern. These concentrations were estimated for a unit emission rate (1 gram per second) and adjusted based on the calculated project-related emission rate.

TOXICITY ASSESSMENT

The HRA was conducted following methodologies in BAAQMD's *Health Risk Screening Analysis Guidelines*[4] and in the California Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxics Hot Spots Program Guidance.*[5] This was accomplished by applying the highest estimated concentrations at the receptors analyzed to the established cancer risk estimates and acceptable reference concentrations (RfC) for non-cancer health effects.

The toxicity values used in this analysis were based on OEHHA guidance. These toxicity values are for carcinogenic effects and acute/chronic health impacts. The primary pathway for exposures was assumed to be inhalation and carcinogenic and non-carcinogenic effects were evaluated separately. The incremental risks were determined for each emission source of TAC and summed to obtain an estimated total incremental carcinogenic health risk.

The 80th percentile adult breathing rate of 302 L/kg-day was used to determine cancer risks to residents from exposure to TAC. The residential exposure frequency and duration was assumed to be 350 days per year and 70 years. For children, OEHHA recommends assuming a breathing rate of 581 L/kg-day to assess potential risk via the inhalation exposure pathway. This value represents the upper 95th percentile of daily breathing rates for children. The modeled TAC concentrations were used to represent the exposure concentrations in the air. The inhalation absorption factor was assumed to be 1.

Cancer risk estimates also incorporate age sensitivity factors (ASFs). This approach provides updated calculation procedures that factor in the increased susceptibility of infants and children to carcinogens as compared to adults. OEHHA recommends that cancer risks be weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to 2 years of age, and by a factor of 3 for exposures from 2 years through 15 years of age. For estimating cancer risks for residential receptors over a 70 year lifetime, the incorporation of the ASFs results in a cancer risk adjustment factor (CRAF) of 1.7.

Based on OEHHA recommendations, the cancer risk to residential receptors assumes exposure occurs 24 hours per day for 350 days per year. For children at school sites, exposure is assumed to occur 10 hours per day for 180 days (or 36 weeks) per year. Cancer risk to residential receptors based on a 70-year lifetime exposure. Cancer risk estimates for children at school sites are calculated based on 9 year exposure duration.

Table 2 provides a summary of the risk assessment exposure parameters used in the analysis.

TABLE 2
HEALTH RISK ASSESSMENT EXPOSURE PARAMETERS

Receptor	Breathing Rate (DBR)	Cancer Risk Adjustment Factor (CRAF)	Daily Exposure	Annual Exposure	Exposure Duration (ED)
Adult	302	1.7	24 hours	350 days	70 years
Child	581	10	24 hours	350 days	3 years
School	581	3	10 hours	180 days	9 years

RISK CHARACTERIZATION

Cancer risk is defined as the lifetime probability of developing cancer from exposure to carcinogenic substances. Cancer risks are expressed as the chance in one million of getting cancer (i.e., number of cancer cases among one million people exposed). The cancer risks are assumed to occur exclusively through the inhalation pathway. The cancer risk can be estimated by using the cancer potency factor (milligrams per kilogram of body weight per day [mg/kg-day]), the 70-year annual average concentration (microgram per cubic meter [$\mu g/m^3$]), and the lifetime exposure adjustment.

Following guidelines established by OEHHA, the incremental cancer risks attributable to the project were calculated by applying exposure parameters to modeled TAC concentrations in order to determine the inhalation dose (mg/kg-day) or the amount of pollutants inhaled per body weight mass per day. The cancer risks occur exclusively through the inhalation pathway; therefore, the cancer risks can be estimated from the following equation:

$$\text{Dose-inh} = \frac{C_{air} * \{DBR\} * A * CRAF * EF * ED * 10^{-6}}{AT}$$

Where:

Dose-inh = Dose of the toxic substance through inhalation in mg/kg-day
10^{-6} = Micrograms to milligrams conversion, Liters to cubic meters conversion
C_{air} = Concentration in air (microgram (μg)/cubic meter ($m^{3)}$)
{DBR} = Daily breathing rate (liter (L)/kg body weight – day)
A = Inhalation absorption factor
CRAF = Cancer Risk Adjustment Factor, Age Sensitivity Factor
EF = Exposure frequency (days/year)
ED = Exposure duration (years)
AT = Averaging time period over which exposure is averaged in days (25,550 days for a 70 year cancer risk)

To determine incremental cancer risk, the estimated inhalation dose attributed to the project was multiplied by the cancer potency slope factor (cancer risk per mg/kg-day). The cancer potency slope factor is the upper bound on the increased cancer risk from a lifetime exposure to a pollutant. These slope factors are based on epidemiological studies and are different values for different pollutants. This allows the estimated inhalation dose to be equated to a cancer risk.

Non-cancer adverse health impacts, acute (short-term) and chronic (long-term), are measured against a hazard index (HI), which is defined as the ratio of the predicted incremental exposure concentration from the project to a published reference exposure level (REL) that could cause adverse health effects as established by OEHHA. The ratio (referred to as the Hazard Quotient [HQ]) of each non-carcinogenic substance that affects a certain organ system is added to produce an overall HI for that organ system. The overall HI is calculated for each organ system. If the overall HI for the highest-impacted organ system is greater than one, then the impact is considered to be significant.

The HI is an expression used for the potential for non-cancer health effects. The relationship for the non-cancer health effects is given by the annual concentration ($\mu g/m^3$) and the REL ($\mu g/m^3$). The acute hazard index was determined using the "simple" concurrent maximum approach, which tends to be conservative (i.e., overpredicts).

The relationship for the non-cancer health effects is given by the following equation:

$$HI = C/REL$$

where,

HI	Hazard index; an expression of the potential for non-cancer health effects.
C	Annual average concentration ($\mu g/m^3$) during the 70 year exposure period
REL	The concentration at which no adverse health effects are anticipated.

The chronic REL for DPM was established by the California OEHHA[6] as 5 $\mu g/m^3$. There is no acute REL for DPM. However, diesel exhaust does contain acrolein and other compounds, which do have an acute REL. BAAQMD's DPM speciation table (based on profile 4674 within the U.S. EPA Speciate 4.2)[7] was used to assess the acute impacts. Acrolein emissions are approximately 1.3 percent of the total emissions. The acute REL for acrolein was established by the California OEHHA[8] as 2.5 $\mu g/m^3$.

CUMULATIVE SOURCES

The BAAQMD's *CEQA Air Quality Guidelines* include standards and methods for determining the significance of cumulative health risk impacts. The method for determining cumulative health risk requires the tallying of health risk from permitted sources and major roadways in the vicinity of a project (i.e., within a 1,000-foot radius of the source or new receptor), then adding the project impacts (in this case, construction activities) to determine whether the cumulative health risk thresholds are exceeded.

---

[6] California Office of Environmental Health Hazards Assessment Toxicity Criteria Database, 2010. http://www.oehha.ca.gov//.

[7] Provides for a speciation faction of 1.3 percent of acrolein per DPM emission rate. http://www.epa.gov////.html.

[8] California Office of Environmental Health Hazards Assessment Toxicity Criteria Database, 2010. http://www.oehha.ca.gov/ .

BAAQMD has developed a geo-referenced database of permitted emissions sources throughout the San Francisco Bay Area, and has developed the *Stationary Source Risk & Hazard Analysis Tool* (dated May 2011) for estimating cumulative health risks from permitted sources. Information associated with these sources was provided and/or verified by BAAQMD.[9] Information (cancer risks and chronic index) was adjusted for distance from source to receptor, based on BAAQMD's *Distance Adjustment Multiplier for Diesel Internal Combustion Engine* and the *Distance Adjustment Multiplier for Gasoline Dispensing Facilities*. The cancer risks for the dry cleaner stationary source were adjusted to reflect the regulation that Perchloroethylene (PCE) is prohibited from use in the US after 2023. That is, the BAAQMD data were adjusted to 17 percent (12 years of PCE usage over a 70 year lifetime) of the reported value.

One permitted source is located within 1,000 feet of the Parnassus Heights project. **Table 3** provides the cancer risk, hazard impacts, and the $PM_{2.5}$ concentrations. The Parnassus Heights facility is covered under permit 6682 (dated February 26, 2003). Four permitted sources are located within 1,000 feet of the Mission Bay project. **Table 4** provides the cancer risk, hazard impacts, and the $PM_{2.5}$ concentrations. The Mission Bay facility is covered under permit 2891.

Additional documentation includes *Health Risk Analysis for Emissions of Air Toxics from Operational Sources* (dated November 2009) and *Genentech Hall Fume Hood Risk Screen 2011* (dated December 7, 2011).

Eleven permitted sources are located within 1,000 feet of the Mission Center project. **Table 5** provides the distance adjustment factors and the screening (unadjusted) cancer risk, hazard impacts, and the $PM_{2.5}$ concentrations. **Table 6** provides the adjusted cancer risk, hazard impacts, and the $PM_{2.5}$ concentrations. The Mission Center facility is covered under permit 8266 (dated December 30, 2003).

Seven permitted sources are located within 1,000 feet of the Mount Zion project. **Table 7** provides the distance adjustment factors and the screening (unadjusted) cancer risk, hazard impacts, and the $PM_{2.5}$ concentrations. **Table 8** provides the adjusted cancer risk, hazard impacts, and the $PM_{2.5}$ concentrations. The Mount Zion facility is covered under permit 22213 (dated August 5, 2010).

BAAQMD has also developed a geo-referenced database of roadways throughout the San Francisco Bay Area and has developed the *Highway Screening Analysis Tool (*dated May 2011*)* for estimating cumulative health risks from roadways. BAAQMD *CEQA Air Quality Guidelines* also require the inclusion of surface streets within 1,000 feet of the project with annual average daily traffic (AADT) of 10,000 or greater.[10]

Parnassus Avenue (11,700 AADT) is located to the adjacent to the Parnassus Heights project. Interstate 280 is located adjacent (to the west) of the Mission Bay project. The Mission Bay project also included secondary roadways such as 3rd Street (30,265 AADT), 7th Street (22,188 AADT), and 16th Street (20,436 AADT).

US 101 is located adjacent (to the north) of the Mission Center project. The Mission Center project also included secondary roadways such as 14th Street, Van Ness Avenue (50,718 AADT), 15th Street, Folsom Street, and Harrison Street. Mount Zion included secondary roadways such as Bush Street, Divisadero Street, and Geary Boulevard (42,274 AADT).

Thus, the health impacts from these roadways were included in the cumulative analysis. **Table 9** provides the cancer risk, hazard impacts, and the $PM_{2.5}$ concentrations for the nearby surface streets.

[10] BAAQMD County Surface Street Screening Tables, May 2011 and CEHTP Traffic Linkage Service Demonstration, http://www.ehib.org/traffic_tool.jsp

TABLE 9
CUMULATIVE HEALTH IMPACTS - ROADWAYS

Project	Roadway	Cancer Risk	Hazard Impact	PM2.5 Concentration
Parnassus Heights	Parnassus Avenue	0.90	<0.01	0.09
Mission Bay	I-280	5.32	0.01	0.05
	3rd Street	0.34	<0.01	0.01
	7th Street	0.29	<0.01	0.01
	16th Street	0.39	<0.01	0.01
Mission Center	US 101	3.71	0.01	0.03
	14th Street	0.23	<0.01	0.01
	Van Ness Avenue	1.68	<0.01	0.06

Bay Area Air Quality Management District
Risk & Hazard Stationary Source Inquiry Form

This form is required when users request stationary source data from BAAQMD. This form is to be used with the BAAQMD's Google Earth stationary source screening tables.

For guidance on conducting a risk & hazard screening, including for roadways & freeways, refer to the District's Risk & Hazard Analysis flow chart. Also see the District's Recommended Methods for Screening and Modeling Local Risks and Hazards document.

Table A: Requestor Contact Information

Contact Name:	Chris Sanchez
Affiliation:	Environmental Science Assoc.
Phone:	415-896-5900
Email:	csanchez@esassoc.com
Date of Request	11/12/2013
Project Name:	UCSF - Parnassus
Address:	500 and 533 Parnassus Ave.
City:	San Francisco
County:	San Francisco
Type (residential, commercial, mixed use, industrial, etc.):	University Medical Center with housing
Project size (# of units, or building square feet):	142 resiential units at 533 Parnassus and 83 units at 500 Parnassus
Comments:	
Distances calculated assuming source is power plant at eastern edge of campus	

For Air District assistance, the following steps must be completed:

1. Complete all the contact and project information requested in Table A. Incomplete forms will not be processed. Please include a project site map.
2. Download and install the free program Google Earth, http://www.google.com/earth/download/ge/, and then download the county specific Google Earth stationary source application files from the District's website, http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Tools-and-Methodology.aspx. The small points on the map represent stationary sources permitted by the District (Map A on right). These permitted sources include diesel back-up generators, gas stations, dry cleaners, boilers, printers, auto spray booths, etc. Click on a point to view the source's Information Table, including the name, location, and preliminary estimated cancer risk, hazard index, and PM2.5 concentration.
3. Find the project site in Google Earth by inputting the site's address in the Google Earth search box.
4. Identify stationary sources near the project. Verify that the location of the source on the map matches with the source's address in the Information Table, by using the Google Earth address search box to confirm the source's address location. Please report any mapping errors to the District.
5. List the stationary source information in Table B Section 1 below.
6. Note that a small percentage of the stationary sources have Health Risk Screening Assessment (HRSA) data INSTEAD of screening level data. These sources will be noted by an asterisk next to the Plant Name (Map B on right). If HRSA values are presented, these values have already been modeled and cannot be adjusted further.
7. Email this completed form to District staff. District staff will provide the most recent risk, hazard, and PM2.5 data that are available for the source(s). If this information or data are not available, source emissions data will be provided. Staff will respond to inquiries within three weeks.

Note that a public records request received for the same stationary source information will cancel the processing of your SSIF request.

Submit forms, maps, and questions to Alison Kirk at 415-749-5169, or akirk@baaqmd.gov .

Map B: Snapshot of Google Earth with Plant G8736 Information Table Selected Showing HRSA Values

Note the asterisk next to the plant name. This means that the values that appear below are from the HRSA. These values cannot be further adjusted using our screening tools, such as the diesel multiplier sheet. These values are based on modeling. If the Information Table says "Contact District Staff" include in Table B below.

Table B: Stationary Sources

Table B Section 1: Requestor fills out these columns based on Google Earth data | **Table B Section 2: BAAQMD returns form with additional information in these columns as needed**

Distance from Receptor (feet)	Plant # or Gas Dispensary #	Facility Name	Street Address	Screening Level Cancer Risk (1)	Screening Level Hazard Index (1)	Screening Level PM2.5 (1)	Permit #s (2)	Source #s (2)	Fuel Code (3)	Type of Source(s) (4)	HRSA Ap # (5)	HRSA Date (6)	HRSA Engineer (7)	HRSA Cancer Risk in a million	Age Sensitivity Factor (8)	HRSA Adjusted Cancer Risk	HRSA Chronic Health (9)	HRSA PM2.5 Risk	Status/Comments
500	2478	UCSF	3rd Ave & parnassus	1015.19	2.879	71.4	6682	19,20		diesel egnine	6682	2/26/2003	HSD	2.700	1.7	4.59	n/a	0.014388715	HRSA only covers sources 19, 20; see emissions on next page. Consider using Beta Calculator with distance multiplier for diesel engines.

Footnotes:

1. These Cancer Risk, Hazard Index, and PM2.5 columns represent the values in the Google Earth Plant Information Table.

2. Each plant may have multiple permits and sources.
3. Fuel codes: 98 = diesel, 189 = Natural Gas.
4. Permitted sources include diesel back-up generators, gas stations, dry cleaners, boilers, printers, auto spray booths, etc.
5. If a Health Risk Screening Assessment (HRSA) was completed for the source, the application number will be listed here.
6. The date that the HRSA was completed.
7. Engineer who completed the HRSA. For District purposes only.
8. All HRSA completed before 1/5/2010 need to be multiplied by an age sensitivity factor of 1.7.
9. The HRSA "Chronic Health" number represents the Hazard Index.
10. Further information about common sources:
    a. Sources that only include diesel internal combustion engines can be adjusted using the BAAQMD's Diesel Multiplier worksheet.
    b. The risk from natural gas boilers used for space heating when <25 MM BTU/hr would have an estimated cancer risk of one in a million or less, and a chronic hazard index of 0.003 or less. To be conservative, requestor should assume the cancer risk is 1 in a million and the hazard index is 0.003 for these sources.
    c. BAAQMD Reg 11 Rule 16 required that all co-residential (sharing a wall, floor, ceiling or is in the same building as a residential unit) dry cleaners cease use of perc on July 1, 2010. Therefore, there is no cancer risk, hazard or PM2.5 concentrations from co-residential dry cleaning businesses in the BAAQMD.
    d. Non co-residential dry cleaners must phase out use of perc by Jan. 1, 2023. Therefore, the risk from these dry cleaners does not need to be factored in over a 70-year period, but instead should reflect the number of years perc use will continue after the project's residents or other sensitive receptors (such as students, patients, etc) take occupancy.
    e. Gas stations can be adjusted using BAAQMD's Gas Station Distance Mulitplier worksheet.
    f. Unless otherwise noted, exempt sources are considered insignificant. See BAAQMD Reg 2 Rule 1 for a list of exempt sources.
    g. This spray booth is considered to be insignificant.

TECHNICAL ANALYSIS
Energy

UCSF Parnassus Construction Fuel Use - 2020

CO2 emissions from GHG Calculations:

Diesel Sources	(assumes construction worker trips are also diesel)		
		CO2 Emissions	
TOTAL Diesel Sources =		**53.15**	**tons**
Convert to kilograms		4.82E+04	kg

Per CCAR GRP (2009):

Diesel fuel combustion =		10.15	kg CO2/gallon	
Diesel Combustion Rate =		4.75E+03	gallons	(over 5 year construction period)
BTU		138874	Btu/gallon	
		6.60E+08	Btu	(over 5 year construction period)
		6.60E+02	Mbtu	(over 5 year construction period)
		1.32E+02	Mbtu/yr	(average)

UCSF Parnassus Construction Fuel Use - 2025

CO2 emissions from GHG Calculations:

Diesel Sources	(assumes construction worker trips are also diesel)		
		CO2 Emissions	
TOTAL Diesel Sources =		**7.724**	**tons**
Convert to kilograms		7.01E+03	kg

Per CCAR GRP (2009):

Diesel fuel combustion =		10.15	kg CO2/gallon	
Diesel Combustion Rate =		6.90E+02	gallons	(over 5 year construction period)
BTU Conversion =		138874	Btu/gallon	
		9.59E+07	Btu	(over 5 year construction period)
		9.59E+01	Mbtu	(over 5 year construction period)
		1.92E+01	Mbtu/yr	(average)

UCSF Parnassus Construction Fuel Use - 2035

CO2 emissions from GHG Calculations:

Diesel Sources	(assumes construction worker trips are also diesel)		
		CO2 Emissions	
TOTAL Diesel Sources =		**919.3**	**tons**
Convert to kilograms		8.34E+05	kg

Per CCAR GRP (2009):

Diesel fuel combustion =	10.15	kg CO2/gallon	
Diesel Combustion Rate =	8.22E+04	gallons	(over 5 year construction period)
BTU Conversion =	138874	Btu/gallon	
	1.14E+10	Btu	(over 5 year construction period)
	1.14E+04	Mbtu	(over 5 year construction period)
	2.28E+03	Mbtu/yr	(average)
Total Construction Energy of LRDP at Parnassus =	**1.22E+04**	**Mbtu**	

UCSF Parnassus Operational Vehicle Fuel Use

Gasoline sources		
	CO2 Emissions	
Vehicle trips	845.4	tons
Convert to kilograms	7.67E+05	kg

Per CCAR GRP (2009):

Gasoline fuel combustion =	8.81	kg CO2/gallon	
Gasoline combustion rate =	8.71E+04	gallons	per year
	114100	BTU/gal	
	9.93E+09	BTU/year	
	9.93E+03	MBTU/year	

UCSF Parnassus Operational Energy Use

Program Elements (from CalEEMOd)

Natural gas =	2.74E+07	kBTU/yr
	2.74E+04	Mbtu/yr
Electricity =	5.01E+06	kWh/yr
	5.01E+03	MWh/yr

Project Elements (from CalEEMOd)

Natural gas =	1.87E+06	kBTU/yr
	1.87E+03	Mbtu/yr
Electricity =	5.01E+06	kWh/yr
	5.01E+03	MWh/yr

Demolition losses (from CalEEMOd)

Natural gas =	4.33E+06	kBTU/yr
	4.33E+03	Mbtu/yr
Electricity =	3.00E+06	kWh/yr
	3.00E+03	MWh/yr

Renovation losses (from CalEEMOd)

Natural gas =	5.46E+06	kBTU/yr
	5.46E+03	Mbtu/yr
Electricity =	2.37E+06	kWh/yr
	2.37E+03	MWh/yr

Total Demand

Natural gas =	1.95E+04	Mbtu/yr			
Electricity =	4.65E+03	MWh/yr	=	1.59E+04	Mbtu/yr

Conversion Factor =	1	kWh =	3412	Btu
	1MWh =		3412000	Btu
	1MWh =		3.412	Mbtu

UCSF Mission Bay Construction Fuel Use - 2020

CO2 emissions from GHG Calculations:

Diesel Sources	(assumes construction worker trips are also diesel)		
		CO2 Emissions	
TOTAL Diesel Sources =		**5726**	**tons**
Convert to kilograms		5.19E+06	kg

Per CCAR GRP (2009):

Diesel fuel combustion =		10.15	kg CO2/gallon	
Diesel Combustion Rate =		5.12E+05	gallons	(over 5 year construction period)
BTU		138874	Btu/gallon	
		7.11E+10	Btu	(over 5 year construction period)
		7.11E+04	Mbtu	(over 5 year construction period)
		1.42E+04	Mbtu/yr	(average)

UCSF Mission Bay Construction Fuel Use - 2025

CO2 emissions from GHG Calculations:

Diesel Sources	(assumes construction worker trips are also diesel)		
		CO2 Emissions	
TOTAL Diesel Sources =		**3465**	**tons**
Convert to kilograms		3.14E+06	kg

Per CCAR GRP (2009):

Diesel fuel combustion =	10.15	kg CO2/gallon	
Diesel Combustion Rate =	3.10E+05	gallons	(over 5 year construction period)
BTU Conversion =	138874	Btu/gallon	
	4.30E+10	Btu	(over 5 year construction period)
	4.30E+04	Mbtu	(over 5 year construction period)
	8.60E+03	Mbtu/yr	(average)

UCSF Mission Bay Construction Fuel Use - 2030

CO2 emissions from GHG Calculations:

Diesel Sources	(assumes construction worker trips are also diesel)		
		CO2 Emissions	
TOTAL Diesel Sources =		**3245**	**tons**
Convert to kilograms		2.94E+06	kg

Per CCAR GRP (2009):

Diesel fuel combustion =	10.15	kg CO2/gallon	
Diesel Combustion Rate =	2.90E+05	gallons	(over 5 year construction period)
BTU Conversion =	138874	Btu/gallon	
	4.03E+10	Btu	(over 5 year construction period)
	4.03E+04	Mbtu	(over 5 year construction period)
	8.06E+03	Mbtu/yr	(average)

UCSF Mission Bay Construction Fuel Use - 2035

CO2 emissions from GHG Calculations:

Diesel Sources	(assumes construction worker trips are also diesel)		
		CO2 Emissions	
TOTAL Diesel Sources =		**6075**	**tons**
Convert to kilograms		5.51E+06	kg

Per CCAR GRP (2009):

Diesel fuel combustion =	10.15	kg CO2/gallon	
Diesel Combustion Rate =	5.43E+05	gallons	(over 5 year construction period)
BTU Conversion =	138874	Btu/gallon	
	7.54E+10	Btu	(over 5 year construction period)
	7.54E+04	Mbtu	(over 5 year construction period)
	1.51E+04	Mbtu/yr	(average)
Total Construction Energy of LRDP at Parnassus =	**2.30E+05**	**Mbtu**	

UCSF Operational Vehicle Fuel Use

Gasoline sources		
	CO2 Emissions	
Vehicle trips	8163	tons
Convert to kilograms	7.41E+06	kg

Per CCAR GRP (2009):

Gasoline fuel combustion =	8.81	kg CO2/gallon	
Gasoline combustion rate =	8.41E+05	gallons	per year
	114100	BTU/gal	
	9.59E+10	BTU/year	
	9.59E+04	MBTU/year	

UCSF Mission Bay Operational Energy Use

Program Elements	(from CalEEMOd)				
Natural gas =	1.03E+08	kBTU/yr			
	1.03E+05	Mbtu/yr			
Electricity =	3.45E+07	kWh/yr			
	3.45E+04	MWh/yr	=	1.18E+05	Mbtu/yr

Table of Contents

1 INTRODUCTION 1

1.1 Project Sites 1
1.1.1 Parnassus Heights 1
1.1.2 Mission Bay 2
1.1.3 Mount Zion 2
1.1.4 Mission Center 2
1.2 Project Description 5
1.2.1 Parnassus Heights 5
1.2.2 Mission Bay 10
1.2.3 Mount Zion 14
1.2.4 Mission Center 16
1.2.5 UCSF Transportation Demand Management 18
1.2.6 UCSF LRDP Transportation Monitoring 18
1.3 Report Organization 19

2 EXISTING CONDITIONS 21

2.1 Elements of Analysis 21
2.2 UCSF Transportation Demand Management Plan 21
2.2.1 UCSF Shuttle System 22
2.3 Parnassus Heights 27
2.3.1 Roadway Facilities 27
2.3.2 Intersection Operating Conditions 32
2.3.3 Transit Network 38
2.3.4 Pedestrian Circulation 47
2.3.5 Bicycle Circulation 50
2.3.6 Loading Conditions 53
2.3.7 Parking Conditions 55
2.4 Mission Bay 58
2.4.1 Roadway Facilities 58

2.4.2 Intersection Operating Conditions 60
2.4.3 Transit Network 66
2.4.4 Pedestrian Circulation 73
2.4.5 Bicycle Circulation 74
2.4.6 Loading Conditions 77
2.4.7 Parking Conditions 80
2.5 Mount Zion Campus Site 82
2.5.1 Roadway Facilities 82
2.5.2 Intersection Operating Conditions 85
2.5.3 Transit Network 89
2.5.4 Pedestrian Circulation 94
2.5.5 Bicycle Circulation 95
2.5.6 Loading Conditions 97
2.5.7 Parking Conditions 99
2.6 Mission Center 102
2.6.1 Roadway Facilities 102
2.6.2 Intersection Operating Conditions 105
2.6.3 Transit Network 109
2.6.4 Pedestrian Circulation 115
2.6.5 Bicycle Circulation 116
2.6.6 Loading Conditions 118
2.6.7 Parking Conditions 120

3 TRAVEL DEMAND ANALYSIS 122

3.1 Trip Generation 123
3.1.1 Trip Generation Resources 123
3.1.2 Population Assumptions and Trip Generation Rates 124
3.1.3 Trip Generation Estimates 127
3.1.4 Net New External Vehicle Person Trips 128
3.2 Person Trips for Mission Bay Site in 2015 130
3.3 Travel Mode Split 131
3.4 Trip Distribution 134
3.4.1 Parnassus Heights 134

3.4.2 Mission Bay 137
3.4.3 Mount Zion 141
3.4.4 Mission Center 143
3.5 Peak Hour Trip Generation 145
3.6 Peak Hour Trip Assignment 145
3.6.1 Parnassus Heights 146
3.6.2 Mission Bay 147
3.6.3 Mount Zion 152
3.6.4 Mission Center 153
3.7 Loading Demand 154
3.7.1 Passenger Loading Demand 157
3.8 Parking Demand 157
3.9 Construction Demand 161
3.9.1 Parnassus Heights 161
3.9.2 Mission Bay 162
3.9.3 Mount Zion 164
3.9.4 Mission Center 165

4 TRANSPORTATION IMPACT ANALYSIS 166

4.1 Significance Criteria 166
4.1.1 Traffic 166
4.1.2 Transit 167
4.1.3 Pedestrians and Bicycles 167
4.1.4 Loading 167
4.1.5 Parking 167
4.1.6 Construction 167
4.2 Traffic Impacts 168
4.2.1 Parnassus Heights 168
4.2.2 Mission Bay 175
4.2.3 Mount Zion 185
4.2.4 Mission Center 191
4.2.5 Summary of Traffic Impacts 197
4.3 Transit Impacts 197

4.3.1 Parnassus Heights 198
4.3.2 Mission Bay 203
4.3.3 Mount Zion 211
4.3.4 Mission Center 215
4.4 Pedestrian Impacts 218
4.4.1 Parnassus Heights 218
4.4.2 Mission Bay 220
4.4.3 Mission Center 221
4.5 Bicycle Impacts 223
4.5.1 Parnassus Heights 223
4.5.2 Mission Bay 223
4.5.3 Mount Zion 224
4.5.4 Mission Center 225
4.6 Loading Impacts 227
4.6.1 Commercial Loading 227
4.6.2 Passenger Loading/Unloading 228
4.7 Parking Analysis 235
4.7.1 Changes in Parking Supply 235
4.7.2 Year 2015 Parking Utilization at Mission Bay 238
4.7.3 Year 2040 Parking Utilization 239
4.7.4 Parking Impacts 240
4.8 Construction Impacts 241
4.8.1 Parnassus Heights 241
4.8.2 Mission Bay 245
4.8.3 Mount Zion 249
4.8.4 Mission Center 251

5 CUMULATIVE CONDITIONS 253

5.1 Foreseeable Nearby Development Projects and Transportation Network Changes 253
5.1.1 Approach 253
5.1.2 Year 2015 Conditions 253
5.1.3 Year 2040 Conditions 254
5.2 Year 2040 Traffic Impacts 256

5.2.1 Parnassus Heights 257
5.2.2 Mission Bay (Year 2015) 263
5.2.3 Mission Bay (Year 2040) 267
5.2.4 Mount Zion 289
5.2.5 Mission Center 293
5.3 Year 2040 Transit Impacts 299
5.3.1 SF Muni 299
5.3.2 Regional Transit Service 301
5.3.3 UCSF Shuttle Service 301
5.4 Year 2040 Pedestrian Impacts 302
5.5 Year 2040 Bicycle Impacts 303
5.6 Year 2040 Loading Impacts 304
5.7 Year 2040 Parking Impacts 304
5.8 Year 2040 Construction Impacts 305

6 SUMMARY OF TRANSPORTATION MITIGATION AND IMPROVEMENT MEASURES 306

6.1 Mitigation Measures 306
6.2 Improvement Measures 308

Appendices

Appendix A: Approved Scope of Work

Appendix B: Roadway Network Classifications (From SF General Plan)

Appendix C: Intersection Level of Service Calculations

Appendix D: Traffic Volume and Intersection Turning Movement Counts

Appendix E: Analysis Assumptions

Appendix F: Travel Demand Calculations

1 INTRODUCTION

The University of California, San Francisco (UCSF) is one of ten campuses in the University of California (UC) system, and is the only UC campus devoted solely to the health sciences. UCSF's mission is to advance health worldwide through innovative health sciences education, research and patient care. UCSF is a multi-site campus with locations throughout the City and County of San Francisco and some locations beyond the City limits, encompassing approximately 8.04[1] million gross square feet (gsf) in owned and leased buildings. Its major academic and clinical sites are at Parnassus Heights, Mission Bay, Mission Center, and Mount Zion, with a major presence at the City's San Francisco General Hospital (SFGH) site.

This report examines the existing transportation conditions of the Parnassus Heights, Mission Bay, Mount Zion, and Mission Center campus sites and analyzes the transportation impacts of the changes proposed in the UCSF 2014 Long Range Development Plan (LRDP), which will guide campus development through the LRDP horizon year of 2035. The proposed project at the SFGH campus site is presented separately in a stand-alone transportation impact study specifically for that site. UCSF is currently reviewing its use of the Laurel Heights campus site and no changes are currently proposed as part of the LRDP; therefore, it is not included in this transportation analysis. The LRDP projects a total of 11.56 gsf at the horizon year of 2035, which does not include the Medical Center Phase Two (793,500 gsf) which is assumed to occur after the LRDP horizon year of 2035. For the purposes of both the environmental and transportation impact analysis, it is assumed that the Medical Center Phase Two would be operational by the LRDP horizon year. If all projects in the LRDP are implemented across all sites, total UCSF owned and leased space across all UCSF sites would be about 12.36 million gsf by 2035.

This transportation impact analysis evaluates the LRDP's potential impacts on traffic conditions, transit service, bicycle conditions, pedestrian conditions, loading operations, emergency access, construction activities, and parking conditions. This chapter summarizes the project study areas for the four UCSF campus sites included in this study, proposed changes for the four UCSF campus sites, and outlines the report structure. A detailed description of the scope of work is provided in **Appendix A**.

1.1 PROJECT SITES

Figure 1-1 shows the main locations of UCSF owned and leased sites in San Francisco. The transportation study areas for each campus site included in this study, in descending order of the daily average population, are presented below and shown on **Figure 1-2**.

1.1.1 Parnassus Heights

The Parnassus Heights campus site, the oldest and largest of the primary UCSF campus sites, straddles Parnassus Avenue, between the Inner Sunset and Cole Valley neighborhoods, extending between Fifth Avenue and Medical Center Way, and north to Irving and Carl Streets between Third and Hillway Avenues. The campus site is comprised of approximately 107 acres of varying elevations and built characteristics,

[1] The 8.04 million gsf total does not include the 1.13million gsf Phase One Medical Center at Mission Bay that is currently under construction.

due to the campus site being partially built into a hillside and including the Mount Sutro Open Space Preserve.

1.1.2 Mission Bay

The Mission Bay campus site is generally bounded by Mission Bay Boulevard South to the north, Owens Street to the west, Mariposa Street to the south, and Third Street to the east. The campus site is comprised of approximately 56 acres in the rapidly changing Mission Bay neighborhood north of the Potrero Hill and Dogpatch neighborhoods.

1.1.3 Mount Zion

The Mount Zion campus site is comprised of parts of six contiguous city blocks in the Western Addition neighborhood of San Francisco; generally bounded by Bush Street to the north, Scott Street to the east, Post Street to the south, and Broderick Street to the west. The campus site is comprised of approximately 8 acres of similar land use types.

1.1.4 Mission Center

The Mission Center campus site is located in the northeast portion of the Mission District. The campus site of approximately three acres is located on the southern half of the block bounded by 14th Street, Harrison Street, 15th Street, and Folsom Street.

1.2 PROJECT DESCRIPTION

The LRDP planning horizon projects 2.39 million gross square feet (gsf[2]) of new space in addition to the 1.13 million gsf of building space currently under construction in Mission Bay. The following section describes the proposed changes for the four UCSF campus sites included in this study under the LRDP.

1.2.1 Parnassus Heights

Over its 20-year planning horizon, the LRDP proposes additional housing by converting UC Hall and the Millberry Union towers to housing as well as several other projects which would construct new housing; to provide more surface parking by demolishing several buildings; to construct a New Hospital Addition to Long Hospital by demolishing Langley Porter Psychiatric Institute (LPPI) and its support buildings; to renovate and reuse Moffitt Hospital for non-acute care; to reclassify a few existing buildings as support or structured parking; to demolish a few existing buildings and convert part of their footprint to parking; to construct new trails in the Mount Sutro Open Space Reserve ("Reserve"); and to implement the Parnassus Avenue Streetscape Plan.

Figure 1-3 illustrates the existing campus site. **Figure 1-4** illustrates the proposed site plan for the Parnassus Heights campus site. As part of the LRDP, UCSF is proposing the following:

- Demolish Laboratory of Radiobiology, Medical Research 4, Koret Vision Research, LPPI and support buildings, Proctor, Surge, Woods, Environmental Health and Safety buildings over the course of the LRDP, totaling approximately 214,600 gsf, and convert the space to including, but not limited to, a New Hospital Addition, housing, office space, etc.
- Construct a New Hospital Addition building on the demolished Langley Porter Psychiatric Institute (LPPI) site, which would contain 140 beds in approximately 308,000 gsf. The addition would be seven-stories high and set back from Parnassus Avenue with a landscaped strip to provide passenger drop-off/pick-up, parking, and loading zones.
- Seismically retrofit, renovate and reuse UC Hall (approximately 148,300 gsf). The seven-story building is located on the west end of the campus site on Parnassus Avenue. The Plan would occur in two phases. The first phase would renovate three floors of UC Hall to faculty offices and convert other floors to residential use. Upon the completion of the New Hospital Addition (see above), the three floors of faculty offices would move into Moffitt Hospital and those vacated floors would also be converted to residential use. The final residential use would total approximately 210 beds and 170 units.
- Convert Millberry Union towers from office to residential use (approximately 83 beds and 83 units). The existing occupants would be relocated into the vacated Moffitt building after the completion of the New Hospital Addition. The towers would return to its original use for student housing.

[2] Gross square footage is a UC facilities term denoting the sum of all floor areas, finished and unfinished, on all floors of an enclosed structure. It excludes spaces such as attics without flooring, mezzanines, exterior courts, and balconies.

- Renovate and reuse Moffitt Hospital for non-acute care uses.
- Potentially add limited amounts of new housing or open space on the sites of 735 Parnassus near Fifth and Parnassus avenues and the Proctor site near Fifth Avenue and Kirkham Street, respectively.
- Complete the conversion of the Fifth Avenue houses to faculty housing.
- Seismically retroft the Faculty Alumni House at 745 Parnassus Avenue to meet seismic standards.
- Transportation improvements that include providing traffic calming and pedestrian safety measures, providing additional off-street contractor parking, and improving the efficiency of existing off-street loading:
    - **Reduce UCSF traffic by enhancing Transportation Demand Management (TDM) programs.** Traffic on streets in and around the campus site is an ongoing issue with neighbors. UCSF has a comprehensive TDM program to minimize commuting by private vehicle and limits parking on the campus site. UCSF intends to make further efforts to reduce commute traffic by enhancing the City CarShare and UCSF's own carpool programs, expanding bicycle parking and access to showers and lockers, and promoting ridesharing participation.
    - **Implement the *Parnassus Avenue Streetscape Plan*.** As UCSF renovates the Clinical Sciences and UC Hall buildings, and possibly build new faculty housing near Fifth and Parnassus avenues, UCSF proposes to begin implementing the *Parnassus Avenue Streetscape Plan*. This plan calls for improvements that make crossing the street safer and more convenient for pedestrians, reorganize and improve transit and UCSF shuttle operations, create more usable outdoor space, and enhance the public realm as called for in the *Physical Design Framework*. Improvements may include new paving, street furniture, lighting, and street trees, as well as sidewalk and crosswalk widening and better defined campus gateways. The streetscape plan also proposes to modify the existing UCSF shuttle stops from the gateways of the campus site to a central location fronting the campus library in the westbound direction and the Clinical Sciences building in the eastbound direction. The improvements are intended to occur in phases starting on the south side of Parnassus Avenue, at the west end at Fifth Avenue, and moving through the core of the campus site and along the front of the New Hospital Addition, finishing at Medical Center Way.
    - **Reduce congestion on Parnassus Avenue through transportation, parking, and loading improvements.** Another community concern is congestion on Parnassus Avenue where there are six Muni bus stops, two primary and two secondary UCSF shuttle stops, several garage entrances and exits, and six crosswalks. Despite numerous parking and loading spaces on the street, the overall demand for both exceeds the supply, and double parking and trucks parking in the middle of the street are common occurrences. To reduce congestion on Parnassus Avenue, UCSF proposes to develop more off-street loading and parking. UCSF proposes to provide additional off-street contractor parking spaces and increase parking enforcement to reduce competition for street parking. Most of the new parking on Koret Way will be designated for contractors, which generate less traffic throughout the day than patient

and visitor parking. In order to improve loading and delivery operations, UCSF proposes to implement a cross-docking model where vendors deliver goods to Oyster Point and goods are consolidated onto UCSF vehicles for delivery to the campus site, limiting the number of individual deliveries to this and other campus sites. UCSF also proposes to reconfigure the existing Central Receiving area, station a dockmaster, and implement a scheduling system to restrict on-site delivery times and vehicle sizes. These loading and delivery improvements are intended to reduce campus congestion, creating a more safe, attractive, and efficient campus.

- **Reduce delivery impacts on Fifth Avenue and facilitate and fund traffic calming at the Fifth and Kirkham intersection.** Some delivery trucks must pass through the Kirkham Street and Fifth Avenue intersection in order to access the loading docks on Koret Way at the back of the developed portion of the campus site. UCSF has begun working with neighbors and the City to install traffic-calming measures and pedestrian safety improvements at this intersection, and intends to minimize future truck traffic on this street by creating more loading capacity on the east and north sides of the campus site, imposing vendor restrictions, and pursuing centralized receiving off-site.
- **Minimize the impacts of the shuttle system as it grows.** UCSF shuttle system operations would expand as demand grows. Most Most Parnassus Heights neighbors prefer smaller shuttles on their streets even if they run at greater frequencies, because larger shuttles generate more noise and vibration. UCSF Transportation Services will need to consider further operational adjustments to the shuttle system as other campus sites like Mission Bay grow. Operational adjustments would be implemented by UCSF Transportation Services to address deficiencies in service as and when observed through the monthly auditing process (see Section 1.2.5.)
- **Implementation of Green Connections Plan.** In March 2014, the City and County of San Francisco completed its Green Connections plan. The plan aims to increase access to parks, open spaces, and the waterfront by building a network of 'green connectors' – city streets that will be upgraded incrementally over the next 20 years to make it safer and more pleasant to travel to open space by walking, biking, and other forms of active transportation. Two Green Connections routes converge near the UCSF Parnassus Heights campus. These routes link surrounding neighborhoods to the Mount Sutro open space area.

Figure 1-3

Parnassus Heights Existing Site Plan

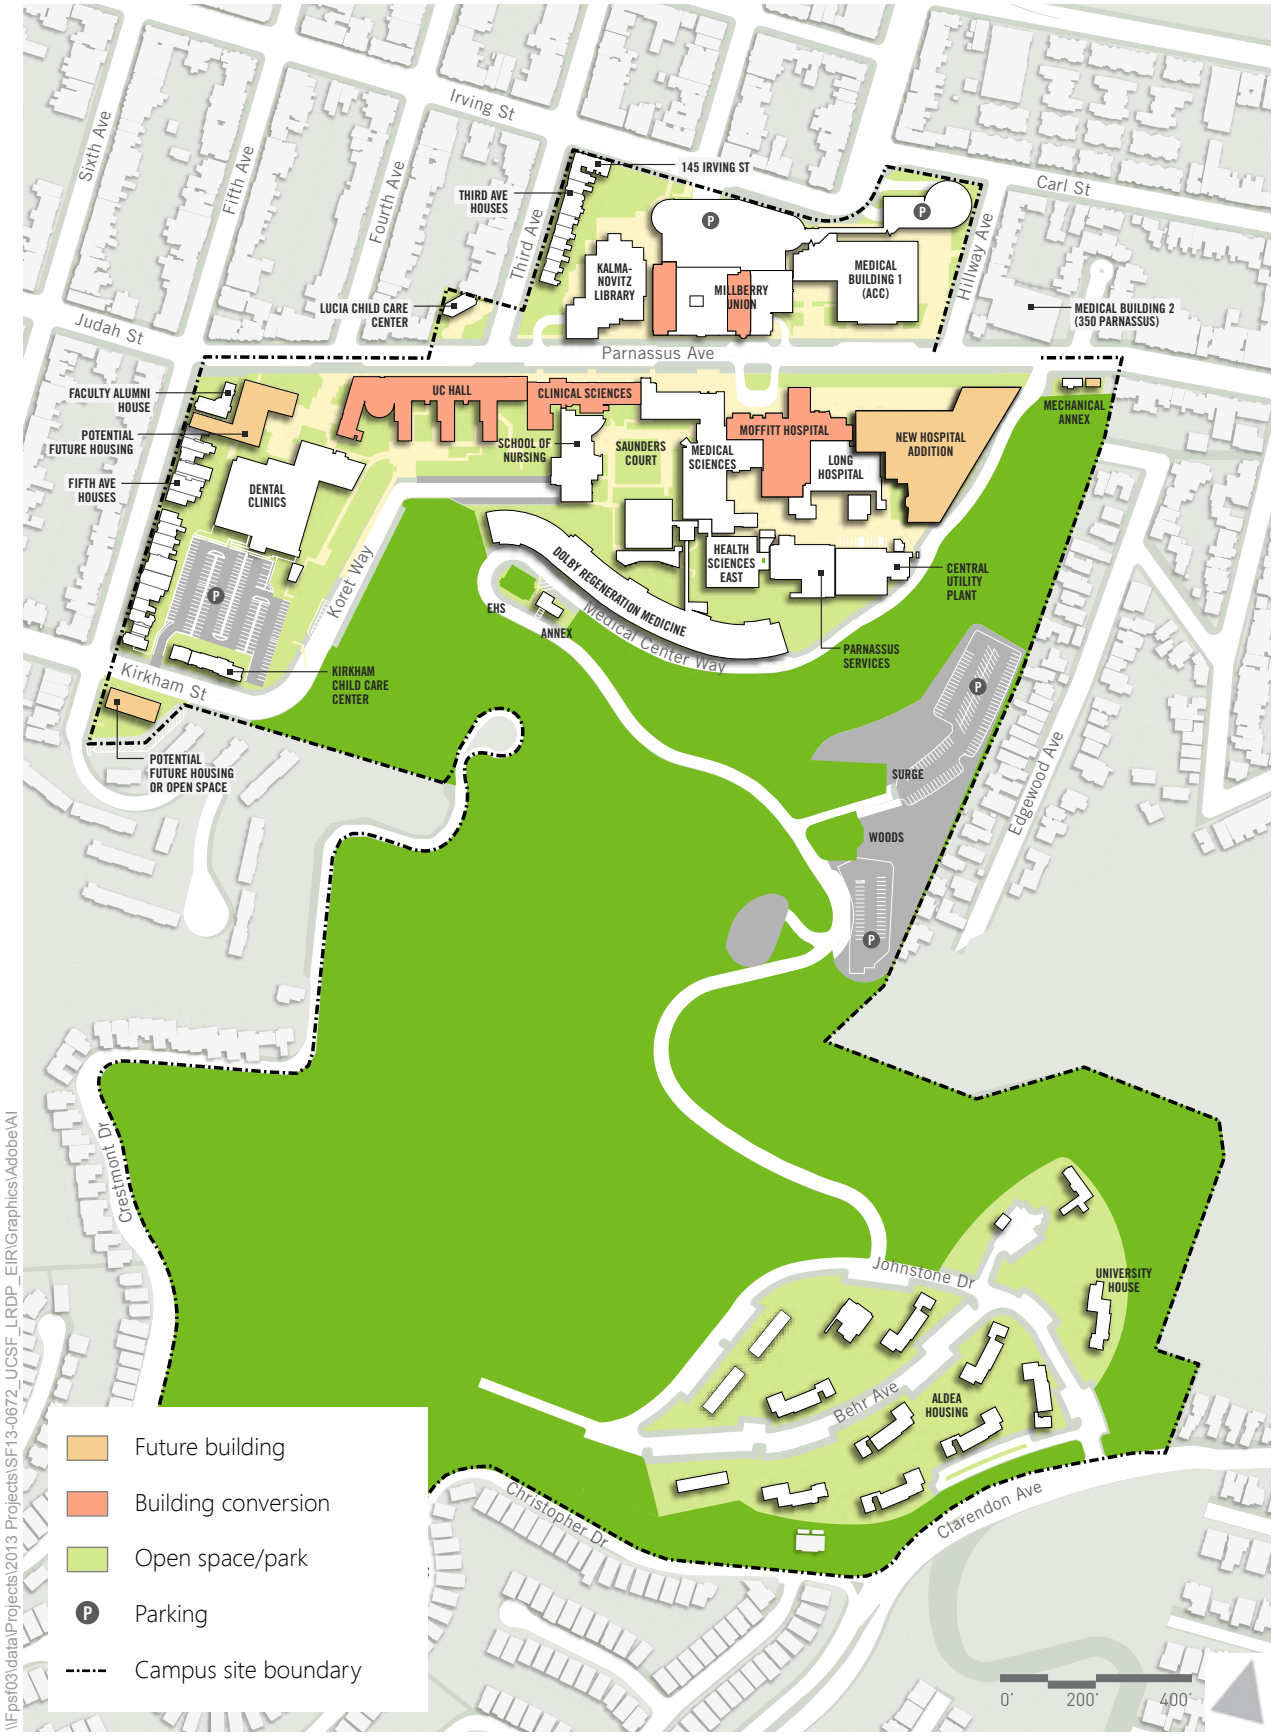

Figure 1-4

Parnassus Heights Proposed Site Plan

1.2.2 Mission Bay

The Mission Bay campus site is expected to grow substantially over the course of the LRDP. Currently there are over 3,900 UCSF faculty and staff employed at the site and 900 residents. The current employment and residents are expected to grow to 13,500 faculty and staff and 1,900 residents through the LRDP horizon year. Currently, the Women's, Cancer, and Children's hospitals and Mission Hall, totaling 1.13 million gsf is under construction and scheduled for completion in 2015. It is assumed that the 124,500 gsf cancer outpatient building would be constructed around 2020. For the purposes of the EIR and Transportation analysis, the Medical Center Phase Two is assumed to be constructed by 2035, adding 793,500 gsf. Approximately 1.45 million gsf of new space[3], north of 16th Street, is proposed under the LRDP. **Figure 1-5** illustrates the existing campus site. **Figure 1-6** shows the proposed development on each block at the Mission Bay campus site. As part of the LRDP, UCSF is proposing the following:

- Develop Blocks 15, 16, 18A, 23A, and 25A on the campus site, totaling up to 1,544,100 gsf. Development comprised of housing, child care, UCSF police building, research buildings, office buildings, clinics, retail, open space, and a parking structure. The proposed gsf of development per block is estimated below.
  - **Block 15**: 418,200 gsf – Develop Block 15 for housing, open space, and possibly child care and police services. If Child care services are constructed elsewhere, the portion dedicated to Child care will be used for housing. The open space will serve the surrounding housing community and potential Child care outdoor area.
  - **Block 16**: 289,000 – 377,400 gsf – Develop Block 16 with two research buildings or a research building and central utility plant. The research buildings would house offices and clinics. If two research buildings are constructed, open space would be developed in between the buildings as a courtyard. If the alternate utility plant is constructed, a portion of the courtyard may be used for Facilities Services.
  - **Block 18A/B**: 193,000 gsf – Develop a research building containing offices and clinics, parking structure with up to 1,540 parking spaces and includes UCSF shuttle spaces, and sports field.
  - **Block 23A**: 232,200 gsf – Develop a research building containing offices, clinics, retail uses, and potential Child care and police services; and construct an open space courtyard between the existing garage and proposed research building.
  - **Block 25A**: 323,300 gsf – Develop a research building containing offices, clinics, and retail uses.
- Complete Phase 1 of the Medical Center by developing the cancer outpatient building, about 124,500 gsf.

[3] Of the 1.54 million gsf of new space, 464,600 gsf is existing remaining entitlement and 991,800 gsf is new entitlement sought under the LRDP.

- Develop Block 14 pending San Francisco Unified School District (SFUSD) decision to continue reservation of the existing block. Site development and environmental review will be further determined upon SFUSD decision.
- Acquire property adjacent to Mission Bay in order to consolidate owned and leased properties.
    - **Develop Blocks 33 and 34** (East Campus) with up to 500,000 gsf and 500 parking spaces for research and parking use.
- Transportation Related Projects:
    - **Complete the street network** including Nelson Rising Lane, between Owens Street to the Sandler Neurosciences Center, and Fifth and Sixth streets, between Nelson Rising Lane and Mission Bay Boulevard South. Complete Fourth Street with the completion of Phase One Medical Center at Mission Bay.
    - **Relocate UCSF Shuttle stops** to provide more direct access to other campus sites and better serve persons who live and work by new buildings. Adjustments to shuttle stops would be implemented by UCSF Transportation Services to address deficiencies in service as and when observed through the monthly auditing process (see Section 1.2.5).
    - **Increase the bicycle and motorcycle parking capacity** through UCSF's TDM program as new buildings are constructed and near open spaces areas. This includes a planned Bay Area Bike Share station on Fourth Street that will be funded by UCSF.

1.2.2.1 LRDP Variant

UCSF is considering the development of clinical uses for a portion of the 500,000 gsf on the Block 33 and 34 site. The amount of clinical space that may be developed has not yet been determined, but up to about 250,000 gsf of clinical space could be developed, with the remainder 250,000 gsf as research/office use. Clinical uses are a "secondary use" under the Mission Bay South Plan and would require a finding of consistency with the Plan by the San Francisco Office of Community Investment and Infrastructure. These variants are referred to as the LRDP Variant for the remainder of this report.

Figure 1-5

Mission Bay Existing Site Plan

Figure 1-6

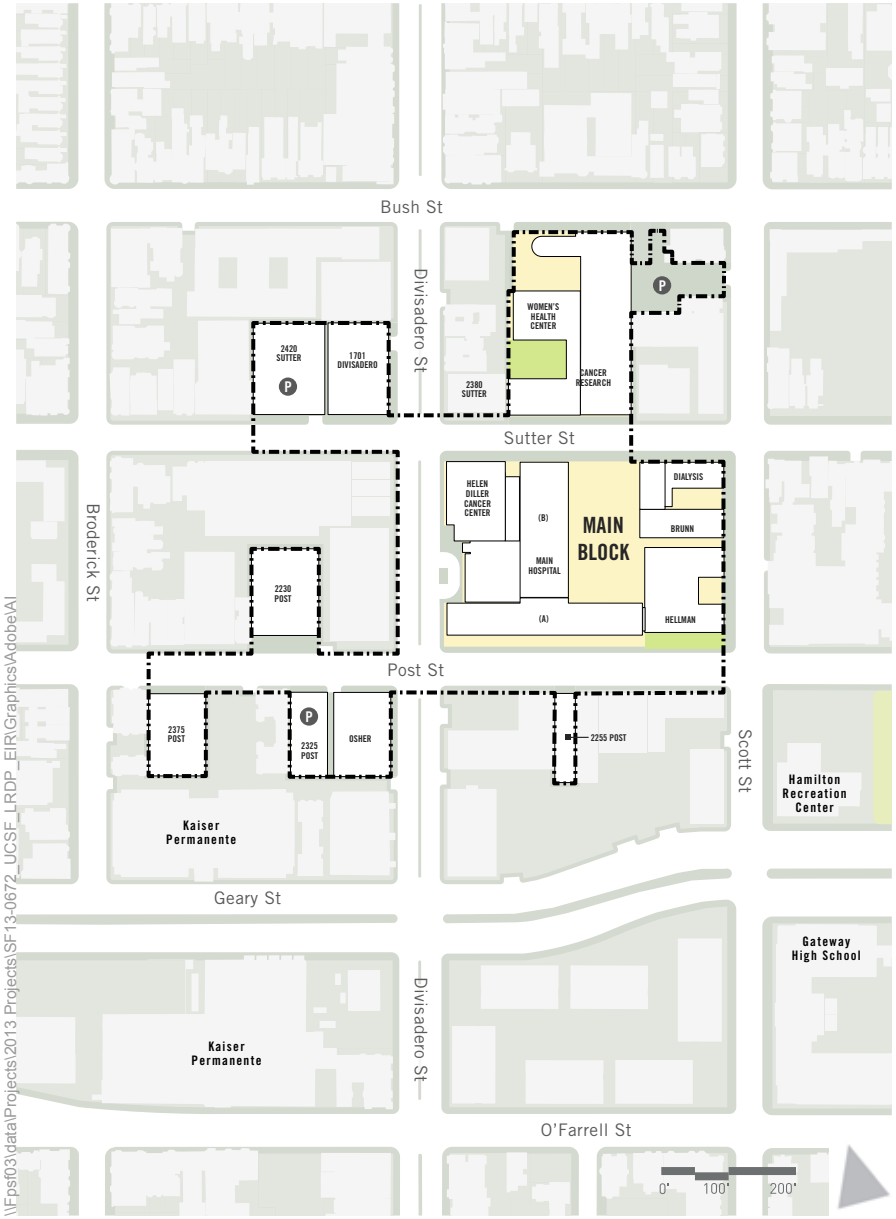
Mission Bay Proposed Site Plan

1.2.3 Mount Zion

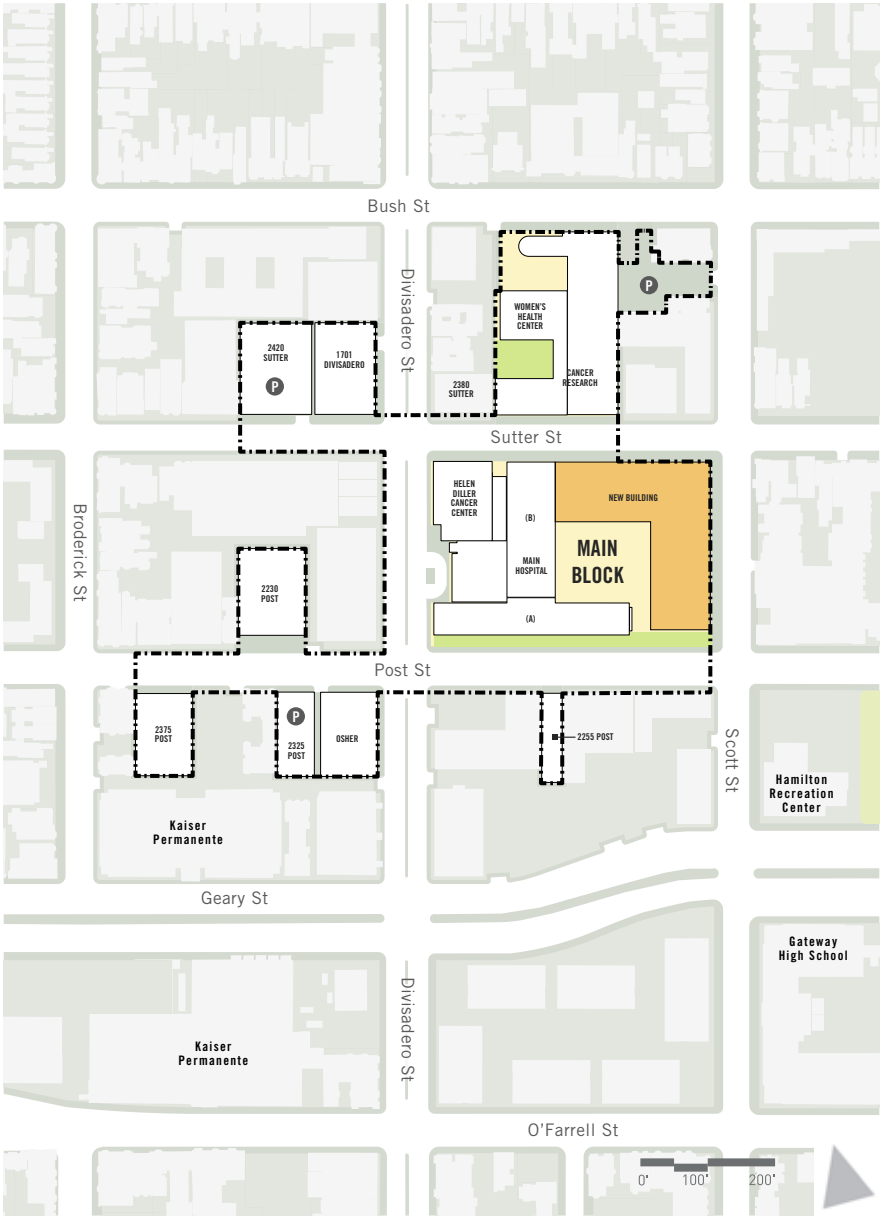
The LRDP proposes to demolish and re-develop three buildings totaling approximately 85,000 gsf, resulting in a net increase of about 172,000 gsf at the Mount Zion campus site. It is expected that with the opening of the Phase One Medical Center at Mission Bay in 2015, inpatient uses in the existing hospital would move from Mount Zion to Mission Bay. The available space from relocating programs to the Mission Bay campus site would be taken by programs relocated from the Parnassus Heights campus site and potentially other campus sites. **Figure 1-7** illustrates the existing and proposed development at the Mount Zion campus site. As part of the LRDP, UCSF is proposing to make the following changes:

- Renovate and reuse the existing hospital. UCSF plans to relocate the inpatient facilities to Phase One of the the Medical Center at Mission Bay. UCSF would then repurpose the hospital as an ambulatory care center with ambulatory surgery, growth of the cancer program, and expansion of outpatient use and support space. The decommissioned hospital may also accommodate program space and clinics displaced from the three buildings proposed for demolition.
- Demolish the Hellman, Harold Brunn Institute, and the Dialysis Center buildings and construct new medical office and/or research building(s) and additional parking. Occupants and programs in the existing buildings would be relocated to the repurposed hospital or located elsewhere. The proposed construction would take place at the demolished buildings. Additional parking may be constructed in two levels below the new buildings or developed/acquired off-site if constructing below ground is cost-prohibitive.
- Demolish or retrofit the seismically compromised 2255 Post Street building.
- Develop open space on the main block when the new building(s) are constructed.
- Coordinate with the City to improve adjacent streetscape when new building space is developed. Improvements include a wider sidewalk, planting street trees, additional passenger loading spaces, and parallel parking along the west side of Scott Street, and extended landscape along Post Street.

EXISTING SITE PLAN



PROPOSED SITE PLAN



Open space/park Parking Campus site boundary Future building

Figure 1-7

Mount Zion Existing and Proposed Site Plan

1.2.4 Mission Center

The Mission Center campus site is comprised of a single building that contains approximately 850 employees. **Error! Not a valid bookmark self-reference.** illustrates the existing and proposed development at the Mission Center campus site. The LRDP proposes to construct a new building and parking structure. The new building would be approximately four stories with up to 100,000 gsf. To support this space, a five story, 95,600 gsf garage with up to 294 parking spaces would be built between the existing and new buildings. Development of this new building would occur only if additional program space is determined to be needed in the future, and if and when funding becomes available.

Mission Center Existing and Proposed Site Plan

1.2.5 UCSF Transportation Demand Management

UCSF currently manages a robust campus-wide Transportation Demand Management (TDM) program with the goal of reducing single-occupant vehicle (SOV) trips to all campus sites. The details of this program are presented in Section 2.2. UCSF proposes expanded TDM strategies that were developed as part of an internal planning process to identify feasible TDM measures that could reasonably result in a reduction in UCSF-generated SOV trips. In order to accomplish these goals, UCSF would implement some or all of the following in the 2014 LRDP:

- Expand UCSF Vanpool Program (add new vanpools and subsidize costs to attract new riders);
- Develop more robust UCSF Carpool Matching and convert additional parking spaces to carpool only;
- Enhance existing City CarShare pods on campus sites and participate in the city's new Medical Center Rideshare program;
- Increase supply and access to bicycle parking and showers/lockers;
- Enhance shuttle system with Wifi and Next Bus;
- Limit parking for non-faculty tenants in new housing;
- Gradually increase cost of employee parking, over time; and
- Promote flexible work schedules, as possible.

1.2.6 UCSF LRDP Transportation Monitoring

As a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP, would continue to do so in particular at the four UCSF campus sites where development is proposed. As the campus sites develop, UCSF would monitor vehicle traffic conditions, transit operations, shuttle ridership, adequacy of pedestrian and bicycle facilities, and loading and parking conditions within and surrounding the campus sites. This monitoring program would be informed by the annual UCSF Employee Transportation Survey, the existing UCSF shuttle program monitoring[4], UCSF staff, students, and patients and visitors, campus site observations by Transportation Services staff, and ongoing coordination with SFMTA staff.

The results of the various monitoring efforts would be used to inform when and whether UCSF would implement additional TDM strategies that seek to minimize the number of single occupancy vehicle trips (SOV) generated by the LRDP. The additional TDM strategies target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods. Should the need for additional shuttle service

[4] UCSF monitors its shuttle ridership demand by conducting monthly audits to capture boarding data, and the data is used to continually adjust shuttle operations to meet peak ridership demand. The monthly audits are conducted for one entire week (five business days) on all routes, throughout the entire day. In addition, UCSF conducts an annual UCSF Transportation Survey that is distributed to all members of our community. The data is used to measure and benchmark the efficacy of the existing TDM programs, and assist in designing new programs.

1.2.5 UCSF Transportation Demand Management

UCSF currently manages a robust campus-wide Transportation Demand Management (TDM) program with the goal of reducing single-occupant vehicle (SOV) trips to all campus sites. The details of this program are presented in Section 2.2. UCSF proposes expanded TDM strategies that were developed as part of an internal planning process to identify feasible TDM measures that could reasonably result in a reduction in UCSF-generated SOV trips. In order to accomplish these goals, UCSF would implement some or all of the following in the 2014 LRDP:

- Expand UCSF Vanpool Program (add new vanpools and subsidize costs to attract new riders);
- Develop more robust UCSF Carpool Matching and convert additional parking spaces to carpool only;
- Enhance existing City CarShare pods on campus sites and participate in the city's new Medical Center Rideshare program;
- Increase supply and access to bicycle parking and showers/lockers;
- Enhance shuttle system with Wifi and Next Bus;
- Limit parking for non-faculty tenants in new housing;
- Gradually increase cost of employee parking, over time; and
- Promote flexible work schedules, as possible.

1.2.6 UCSF LRDP Transportation Monitoring

As a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP, would continue to do so in particular at the four UCSF campus sites where development is proposed. As the campus sites develop, UCSF would monitor vehicle traffic conditions, transit operations, shuttle ridership, adequacy of pedestrian and bicycle facilities, and loading and parking conditions within and surrounding the campus sites. This monitoring program would be informed by the annual UCSF Employee Transportation Survey, the existing UCSF shuttle program monitoring[4], UCSF staff, students, and patients and visitors, campus site observations by Transportation Services staff, and ongoing coordination with SFMTA staff.

The results of the various monitoring efforts would be used to inform when and whether UCSF would implement additional TDM strategies that seek to minimize the number of single occupancy vehicle trips (SOV) generated by the LRDP. The additional TDM strategies target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods. Should the need for additional shuttle service

[4] UCSF monitors its shuttle ridership demand by conducting monthly audits to capture boarding data, and the data is used to continually adjust shuttle operations to meet peak ridership demand. The monthly audits are conducted for one entire week (five business days) on all routes, throughout the entire day. In addition, UCSF conducts an annual UCSF Transportation Survey that is distributed to all members of our community. The data is used to measure and benchmark the efficacy of the existing TDM programs, and assist in designing new programs.

be triggered by increased ridership due to shifts in travel mode or demand generated by the LRDP, UCSF Transportation Services would first review that the additional service would not negatively affect Muni operations. Once implemented, the additional service would be monitored to the same standard as that identified above.

UCSF would also monitor pedestrian and bicycle conditions to ensure increased volumes generated by the LRDP do not cause overcrowding of sidewalks, crosswalks, bicycle routes, or bicycle parking locations within and adjacent to the campus sites. Finally, as the campus sites and surrounding neighborhoods develop in the future, UCSF would continue to monitor parking and loading conditions to ensure they are sufficient to accommodate the LRDP loading and parking demand and do not create potentially hazardous conditions or introduce delays to transit or traffic.

1.3 REPORT ORGANIZATION

The remainder of this report is divided into the following chapters:

Chapter 2 – Existing Conditions describes the operating conditions of the existing transportation network within the vicinity of the Parnassus Heights, Mission Bay, Mount Zion, and Mission Center campus sites. It includes the surrounding roadway network, intersection operating conditions, transit network and service, pedestrian and bicycle conditions, and loading and parking supply and occupancy.

Chapter 3 – Travel Demand Analysis includes the LRDP's trip generation, trip distribution, mode split, and trip assignment forecasts for private vehicles, as well as taxi, shuttle bus, transit, bicycle, pedestrian, and loading travel demand. The LRDP's trip generation was developed based on population characteristics information provided by UCSF staff and outlined in **Appendix F**.

Chapter 4 – Transportation Impact Analysis describes the anticipated operating conditions of the transportation network with the completion of the LRDP and identifies the extent to which LRDP-generated traffic would impact the transportation network. Chapter 4 discusses the transportation network under the following scenario:

> Existing Plus LRDP conditions describes the anticipated operating conditions of the transportation network under Existing conditions plus the proposed changes for the four UCSF campus sites included in this study. Operations of the transportation network after the addition of the travel demand from the project are described, including the project's impacts on study intersections, transit, bicycles, pedestrians, loading, parking, emergency vehicles, and the potential impacts of the project construction on the transportation network.

Chapter 5 – Future Year Conditions describes the anticipated operating conditions of the transportation network with the completion of the LRDP under Interim (Year 2015) and Cumulative (Year 2040) conditions and identifies the extent to which LRDP-generated traffic would impact the transportation network. Chapter 5 discusses the transportation network under the following two scenarios:

> Year 2015 conditions describe the anticipated operating conditions of the transportation network once Phase One Medical Center at Mission Bay is operational. Year 2015 conditions were developed for the Mission Bay campus site only.

Year 2040 conditions describes the anticipated operating conditions of the transportation network in Cumulative conditions with traffic associated with the LRDP and other reasonably foreseeable development projects. Future year traffic forecasts with the LRDP were estimated using the San Francisco County Transportation Authority's travel demand model, SF-CHAMP. The LRDP's contribution to future traffic growth and transit ridership in the area is described. For the Mission Bay campus site, a qualitative analysis of the Golden State Warriors proposed uses on Blocks 29-32 is included.

Chapter 6 – Transportation Mitigation and Improvement Measures describes the proposed mitigation measures identified to reduce potentially significant transportation impacts created by the LRDP, if applicable. In addition, improvement measures are provided in cases where project impacts are less than significant but measures to improve circulation or project access may be beneficial.

2 EXISTING CONDITIONS

This chapter provides a description of the existing transportation and circulation settings within the vicinity of the Parnassus Heights, Mission Bay, Mount Zion, and Mission Center campus sites. It includes descriptions of the UCSF Transportation Demand Management (TDM) Plan, existing roadway network, intersection operating conditions, transit network and service, pedestrian and bicycle conditions, loading, and parking supply and occupancy.

2.1 ELEMENTS OF ANALYSIS

The study examines Existing conditions related to the following transportation elements:

- UCSF TDM Plan – current and proposed TDM measures including UCSF shuttle service;
- Traffic Conditions – operations along key corridors providing access to and through the study areas;
- Transit Conditions – Muni and regional transit operations into and within the study areas;
- Pedestrian Conditions – qualitative assessment of conditions into and within the study areas;
- Bicycle Conditions – qualitative assessment of conditions into and within the study areas;
- Loading Conditions – passenger and freight operations within the study areas; and
- Parking Conditions – characterization of supply throughout the study areas.

2.2 UCSF TRANSPORTATION DEMAND MANAGEMENT PLAN

There are many different factors that determine how people travel to/from work, including home location, work shifts, access to transit, and travel incentives and disincentives (i.e. how convenient or costly it is to park). A TDM program is a set of policies and programs that include incentives, information, and education to encourage employees to commute to work by modes other than driving alone. The UCSF TDM program includes strategies that emphasize alternative commuting options, such as public transit, private shuttle service, biking, walking, and carpooling. The key elements of the UCSF TDM program are summarized in **Table 2-1**.

TABLE 2-1: EXISTING UCSF TDM PROGRAM ELEMENTS	
TDM Strategy	**Description**
Annual Transportation Survey	Annual employee and student survey to learn more about travel to, from, and within UCSF campus sites
Bicycle Racks	Total of approximately 970 bike stalls distributed throughout campus sites with capacity exceeding demand, with one exception – Parnassus Heights campus site
Showers and Lockers	Showers and lockers are provided at various campus sites, which can be used by bicyclists
Bicycle Permits	Free bicycle permits are provided allowing free access to enclosed bicycle parking facilities; free tire repair kits; bike fix-it stations available at Parnassus and Mission Bay campus sites; discounted SF Bike Coalition membership.
Shuttle	UCSF shuttle system serving all campus sites
Priced Permit Parking	UCSF offers over 30 varieties of parking permits to employees and students. The price of a permit varies between $40 and $250 per month. A limited number of permits are issued per year and are distributed based on a prioritization hierarchy
Priced Visitor Parking	UCSF offers short-term visitor parking. Both hourly and daily rates are available
City Carshare	UCSF staff and students qualify for personal memberships at a discounted rate. 18 City Carshare vehicles are available at various campus sites.
Pre-Tax Program	The Pre-Tax program allows employees to reduce their public transit and non-UCSF vanpool costs by about one-third. The program works by allowing participants to deduct up to $125 per month from their paycheck without paying payroll taxes on this income
Carpool Parking	Preferential parking for UCSF employees with a valid carpool permit
Zimride	UCSF-specific Zimride (ride sharing) website
Emergency Ride Home	Employees who need an emergency ride home can be reimbursed up to $50 for a transit, taxi or rental car trip
Telecommuting Policy	Eligibility to telecommute determined by job position/requirements and Department
Vanpool Program	The vanpool program requires a minimum of eight participants per vanpool. The driver participates for free and the riders pay about $240 per month per person. Currently, there are 33 vanpools that travel throughout the Bay Area, and as far as Sacramento.

Source: UCSF Transportation Services, 2013

2.2.1 UCSF Shuttle System

The core element of UCSF's TDM plan is the shuttle service that UCSF operates throughout San Francisco. The shuttle system fleet (currently 60 shuttles) provides service between transit facilities, remote parking lots, the various UCSF campus sites, and UCSF-affiliated hospitals/ medical centers within the city. The primary shuttle routes serve the Parnassus Heights, Mission Bay, Mount Zion, Mission Center, SFGH, and Laurel Heights campus sites. Service includes 13 fixed-route lines and two on-demand evening services. Fixed-route shuttle headways are generally between 15 to 25 minutes, and most routes operate between 6:00 AM and 9:00 PM, Monday through Friday. The two on-demand services operate both

UCSF shuttle stop at Parnassus Heights Campus Site

weekday and weekend nights. Riders can request on-demand service within a pre-defined border around the Parnassus Heights and Mission Bay campus sites by calling UCPD dispatch. All shuttle buses are equipped with bike racks. The service is free for UCSF faculty, staff, students, patients, and visitors.

Figure 2-1 illustrates the existing UCSF shuttle routes serving all current campus sites. **Table 2-2** summarizes the existing fixed-route UCSF shuttle routes and summarizes the route hours of operations and headways.

TABLE 2-2: UCSF SHUTTLES TO ALL CAMPUS SITES

Route	Campuses Served	Hours of Operation	Headways (minutes)[1]
Gold	Parnassus-Mt. Zion-Mission Bay-SFGH	5:45 AM – 9:25 PM	15/20
Blue	Parnassus-SFGH-Mission Bay-Mt. Zion	5:35 AM – 8:47 PM	15/20
Black	Parnassus-Mt. Zion-Laurel Heights	6:30 AM – 7:50 PM	20
Tan	Parnassus-Laurel Heights-Mt. Zion	6:50 AM – 7:45 PM	20
Purple	Parnassus (Library)-3360 Geary-Mt. Zion-3360 Geary	6:15 AM – 6:38 PM	45
Grey	Parnassus-Mission Bay	6:30 AM – 10:00 PM	20
Lime	Parnassus-BDC-MCB	6:05 AM – 8:31 PM	15
Pink	Parnassus E/R-Kezar	5:30 AM – 9:00AM	15
VA-Parnassus	Parnassus-VAMC	6:35 AM – 7:05 PM	30/60
Bronze	Aldea-Medical Building 1 (ACC)-Library-Sixth-Dental-Parnassus LPPI	6:45 AM – 6:29 PM	15/20
Red	Mission Bay-MCB-16th BART	5:55 AM – 7:45 PM	10/15
Green	Mission Bay-China Basin-654 Minnesota	6:25 AM – 6:40 PM	15
Yellow	16th BART-MCB-2300 Harrison-SFGH-2300 Harrison	6:07 AM – 8:23 PM	15

Note:
1. Multiple values indicate variability in headways during the day.

Source: UCSF Campus Life Services Transportation, Routes & Timetables, 2013-2014

UCSF's shuttle system is a key strategy in reducing the amount of car traffic to campus sites and thus reducing its greenhouse gas emissions. In 2011, 2.3 million passengers rode shuttles, an increase of one million passengers from 2003. With the opening of the UCSF Medical Center at Mission Bay in 2015, UCSF anticipates a ridership increase of approximately 5-10 percent on the Blue, Gold, and Grey routes, which provide service between the Parnassus Heights and Mission Bay campus sites.

As part of UCSF's ongoing efforts to provide efficient inter-campus shuttle service, minor adjustments were implemented in August 2012 to six shuttle routes to improve the overall quality and efficiency of shuttle services. The adjustments were intended to enhance the on-time performance and safety of the shuttle system. Further changes made in October 2013 included disallowing standees on the shuttles for safety concerns and an increase in shuttle service during the peak periods. In addition, a Shuttle Operations Study was completed in January 2014 by an outside consultant, which conducted a further review of UCSF's shuttle operations and routes in order to continue to reduce commute trips and to address neighborhood concerns regarding shuttle effects on neighboring streets.

These changes are in addition to other minor operational changes made periodically to improve operations or out of sensitivity to specific community concerns.

2.2.1.1 Capacity Utilization

The seated capacity of the Blue, Tan, Black, Purple, Green, Pink, Bronze, Yellow, and VA lines is 22 persons per vehicle. For the Lime and Red lines it is 30, and for the Grey line it is 33. The Gold line uses a mixed fleet of 22 and 30-seater vehicles.

The capacity utilization of the shuttle program was identified in the *UCSF Shuttle Operations Study Final Report*[5]. The study found that four lines operate above 100 percent capacity during the AM peak period (Grey, Blue, Gold, and Black lines). One line operates above 100 percent capacity in the midday period: the Tan line. Five lines operate above 100 percent capacity during the PM peak period: the Bronze, Tan, Gold, Grey, and Black lines. Of these instances, the highest ridership were found on the Grey and Blue lines in the AM peak period and the Yellow and Tan lines in the PM peak period, where capacity utilization is above 120 percent for one or more hours. Since this study was completed, UCSF Transportation Services has added a policy to restricting shuttle riders from standing on shuttles and subsequently increased shuttle service during peak periods to accommodate lines with greater than 100 capacity utilization.

The study also found that some lines operate below 50 percent capacity during part or all of the day. These include:

- The Lime line during all times but the PM peak;
- The Black, Gold, and Tan lines during the evening;
- The Grey line midday; and
- The Purple line during all times.

2.2.1.2 Stop Locations

UCSF shuttles stop at loading zones located on city streets at the Parnassus Heights, Mission Bay, and Mount Zion campuses. The shuttle stop is internal to the campus for the Mission Center campus. Specific stop locations and the lengths of each stop are listed below:

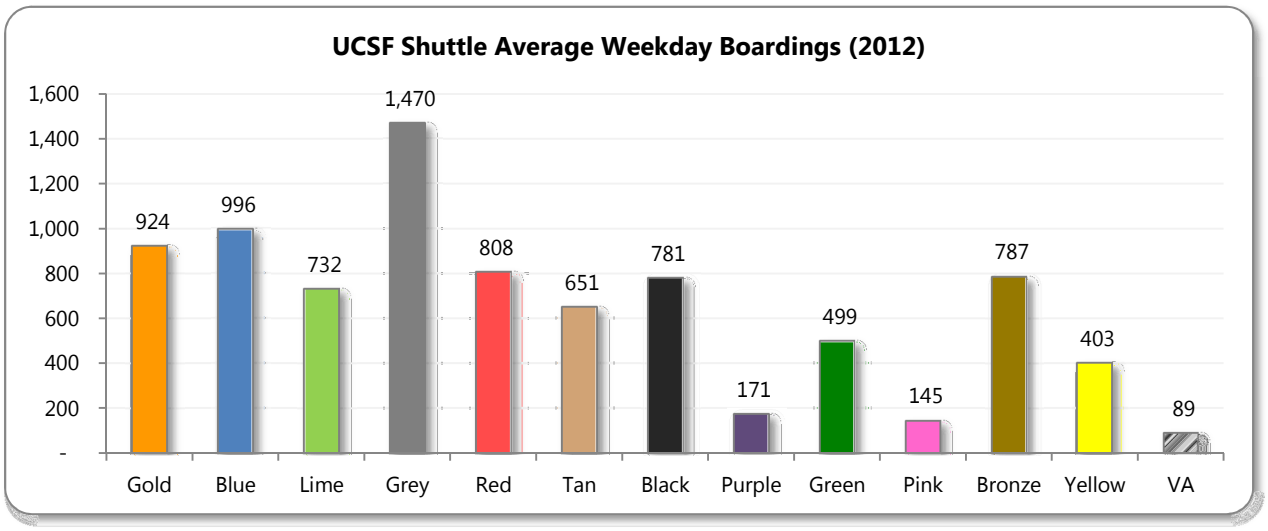
- Parnassus Heights;
  - 530 Parnassus Avenue, north side (adjacent to UCSF Library) – 140 feet
  - 401 Parnassus Avenue, south side (adjacent to Langley Porter Psychiatric Institute – 125 feet
- Mission Bay;
  - Fourth Street south of Gene Friend Way, west side – 150 feet
  - Fourth Street south of Gene Friend Way, east side – 70 feet
- Mount Zion; and
  - 2369 Sutter Street, south side – 55 feet
- Mission Center.
  - Internal to parking lot – 60 feet

In addition to the above permanent stop locations, UCSF shuttles currently use several stops on a temporary or limited basis. A shuttle stop at 1500 Owens Street on the Mission Bay Campus Site was

[5] Nelson\Nygaard. 2014. Shuttle Operations Study Final Report, January, 2014

formed recently and will likely relocate. The stops at Fourth Avenue and the ACC on the Parnassus Heights Campus Site are for drop-off only during limited times of day and for limited routes.

Inset 1 provides a summary of average weekday UCSF shuttle boardings by route. As of 2012, the route with the highest ridership is the Grey route, which provides direct service between the Parnassus Heights and Mission Bay campus sites.



Inset 1. UCSF Shuttle Boardings

2.3 PARNASSUS HEIGHTS

2.3.1 Roadway Facilities

This section describes the regional and local roadway system for the Parnassus Heights campus site. Approximately 48 percent of those traveling to and from the campus site drive alone, are dropped off, or carpool/vanpool. Roadway classification definitions, according to the Transportation Element of the San Francisco General Plan, are contained in **Appendix B**. With Golden Gate Park to the north and Mount Sutro to the south, the roadways used to access the Parnassus Heights campus site are primarily via east-west corridors – Parnassus Avenue-Judah Street, Irving Street-Carl Street, Lincoln Avenue, and Kirkham Street. Primary north-south routes to the Parnassus Heights campus site include Stanyan Street, Arguello Boulevard, Seventh Avenue, and Second Avenue through Fifth Avenue. The primary vehicular entrances to parking and loading areas for the campus site are located at the intersections of Second Avenue/Irving Street, Arguello Boulevard/Carl Street-Irving Street, along Parnassus Avenue, and at Fifth Avenue/Kirkham Street. The street network providing access to the Parnassus Heights campus site and the three other UCSF campus sites included in this study are shown in **Figure 2-2**.

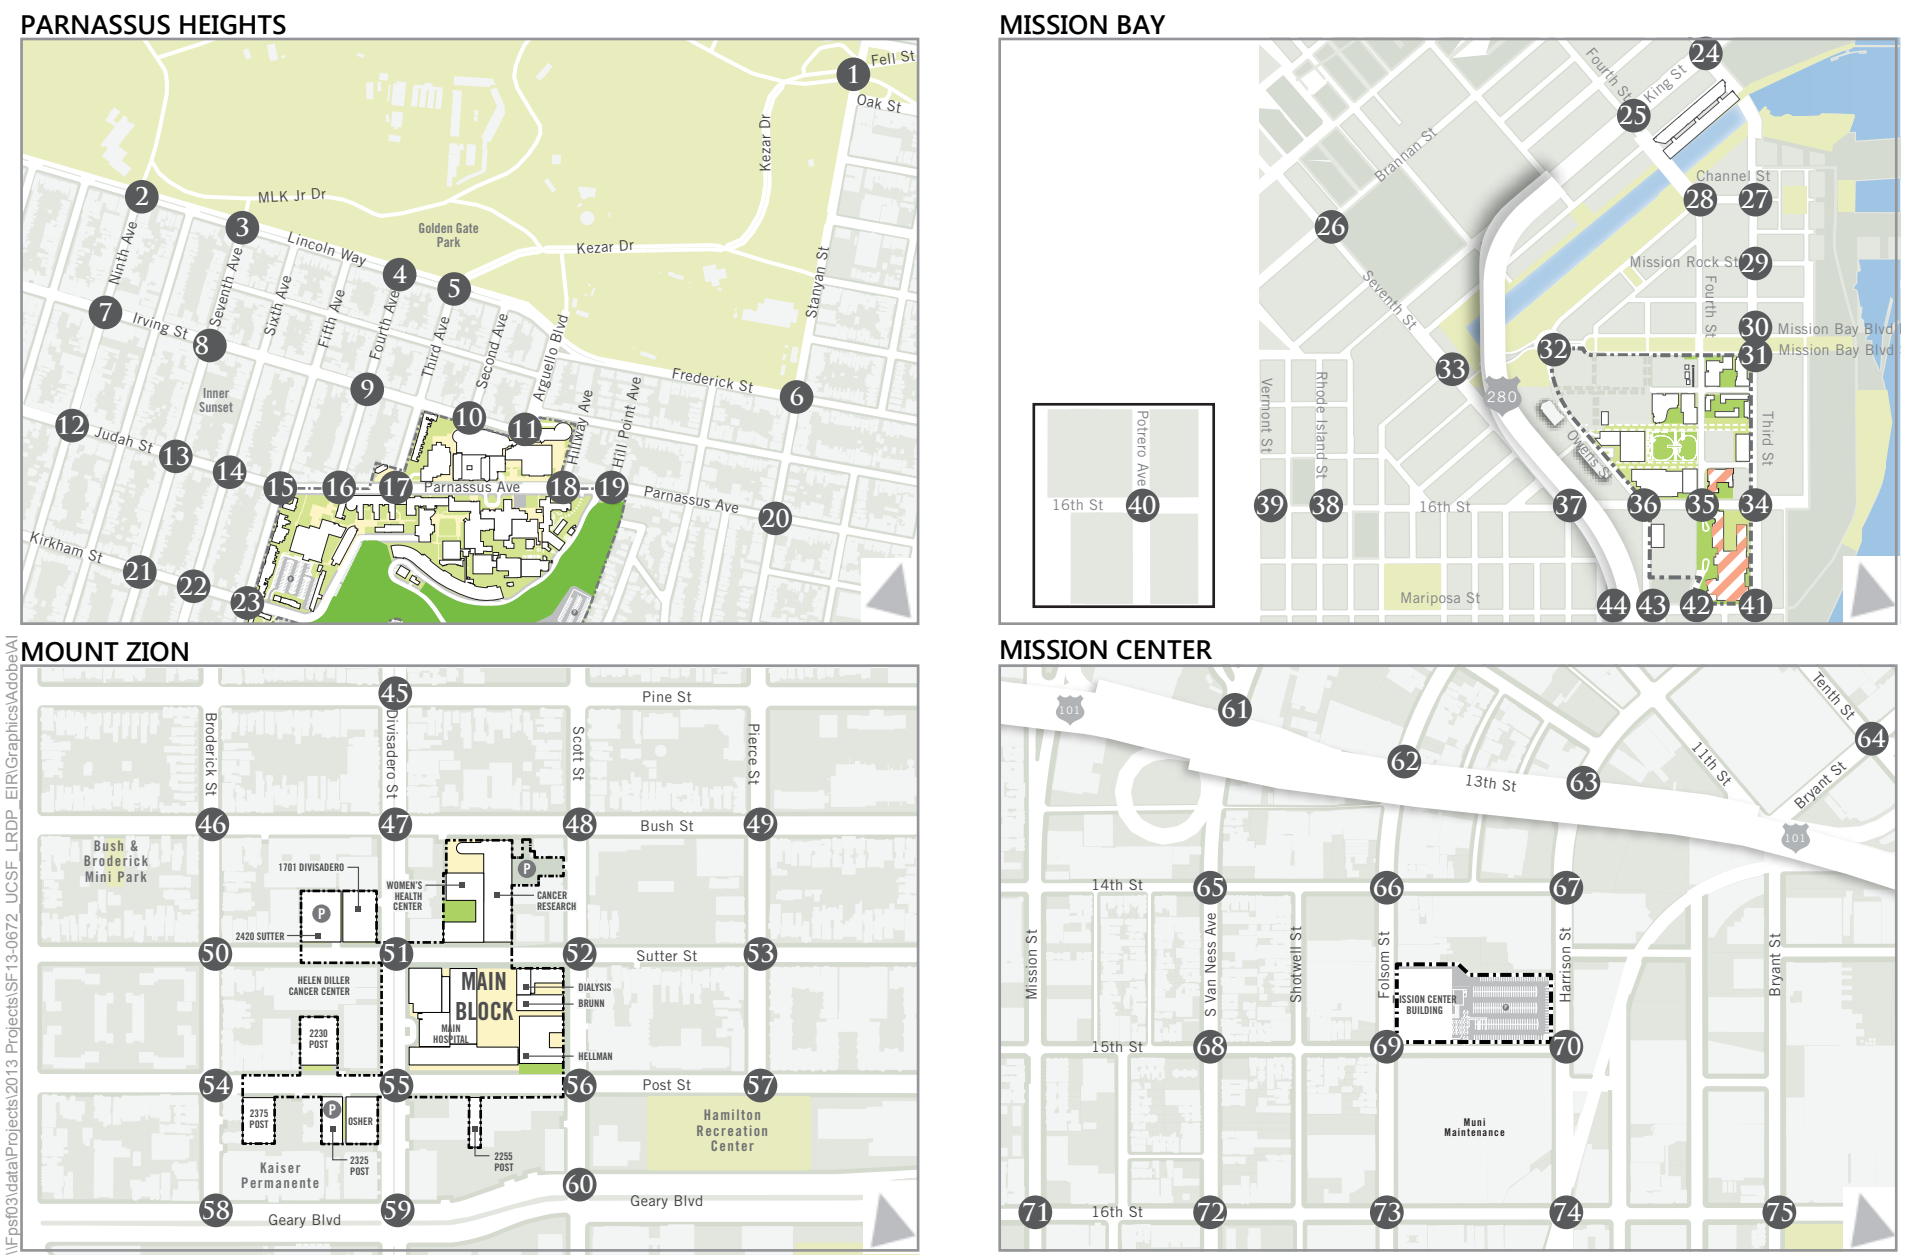

Figure 2-2

Roadway Network and Study Intersections-
All Campus Sites

\\Fps03\data\Projects\2013 Projects\SF13-0672_UCSF_LRDP_EIR\Graphics\Adobe\AI

2.3.1.1 Regional Access

Regional access to the Parnassus Heights campus site is provided by several major freeways, as discussed below.

Interstate 80 (I-80) is a six-lane freeway located approximately three miles east of the campus site and connects San Francisco to the East Bay and other points east via the San Francisco-Oakland Bay Bridge. I-80 connects to U.S. 101 east of the campus site.

U.S. Highway 101 (U.S. 101) is an eight-lane freeway located approximately two miles east of the Parnassus Heights campus site. U.S. 101 connects San Francisco with the peninsula and the South Bay to the south and with the North Bay to the north via the Golden Gate Bridge. U.S. 101 connects to I-80 east of the campus site. Within the northern part of San Francisco, U.S. 101 operates on surface streets (i.e., Van Ness Avenue and Lombard Street). Van Ness Avenue and Lombard Street are part of the Citywide Pedestrian Network outlined in the Transportation Element of the *San Francisco General Plan*.

State Highway 1 (19th Avenue) is located approximately one mile west of the campus site, connecting San Francisco to the North Bay via the Golden Gate Bridge and to the South Bay via a connection to I-280 south of the campus site. Within the study area, 19th Avenue has six lanes, with left turns prohibited at most intersections. Restricted on-street parking is permitted on both sides of the street.

2.3.1.2 Local Access

Local access to the Parnassus Heights campus site is provided by an urban street grid network. Key local roadways through the campus site are discussed in detail below and defined according to roadway classifications identified in the San Francisco General Plan Transportation Element.

Kirkham Street is a two-lane east-west Local Street that runs between the Parnassus Heights campus site (at Fourth Avenue and the Dental Clinics) to La Playa Street in the west. East of Fifth Avenue, Kirkham Street becomes Koret Way (a Campus Street) and provides access to the School of Dentistry, Laboratory of Radiology, Medical Research 4, and School of Nursing buildings. On-street parking is provided on both sides of the street in most areas. West of Sixth Avenue, Kirkham Street has Class II bicycle lanes in both directions.

Parnassus Avenue/Judah Street is a two to three-lane east-west roadway that extends from Clayton Street to 48th Avenue. The City of San Francisco designates this roadway as Parnassus Avenue east of Fifth Avenue, and Judah Street west of Fifth Avenue. The City classifies this roadway as a Secondary Transit Street east of Ninth Avenue (in the vicinity of the Parnassus Heights campus site) and a Primary Transit Street (Transit-Oriented) west of Ninth Avenue. It has dual trolley wires in both directions for the 6 Parnassus bus route; there are bus stops roughly every 500 feet for both the 6 Parnassus and 43 Masonic bus routes. On-street parking is provided on both sides of the street in most areas. A two-way left turn lane extends from Stanyan Street to the Moffitt-Long Hospital. Access to the Millberry Union Garage is across from the Moffitt/Long Hospital Drop-off/Pick-up area (whose exit is signed as right turn only); two signalized crosswalks facilitate heavy pedestrian volumes across the street in the same location. Parnassus Avenue/Judah Street is also designated as a Class III bicycle route east of Sixth Avenue. Class III bicycle routes employ shared-lane markings ("sharrows").

Carl Street/Irving Street is a two-lane east-west roadway that extends from Clayton Street to 48th Avenue. East of Arguello Boulevard, the City designates the roadway as Carl Street; and as Irving Street to

the west. The City classifies this roadway as a Primary Transit Street (transit-oriented) east of Ninth Avenue. The N Judah light rail line operates along the roadway between Cole Street and Ninth Avenue. On-street parking is provided on both sides of the street in most areas. The street provides exclusive turn pockets for vehicles to enter the UCSF parking garage at the Second Avenue/Irving Street intersection.

Hugo Street is an east-west Local Street between Arguello Boulevard and Seventh Avenue. It has one lane in each direction, and on-street parking is provided on both sides of the street. Between Seventh Avenue and Third Avenue, Hugo Street is designated as a Class III bicycle route.

Lincoln Way/Frederick Street is a two to four-lane east-west Secondary Transit Street that forms the southern boundary of Golden Gate Park. The City designates this roadway as Frederick Street east of Arguello Boulevard; to the west the City designates the roadway as Lincoln Way. On-street parking is provided on both sides of the street. At Third Avenue, Lincoln Way merges with Kezar Drive and is a main thoroughfare between the Sunset District and downtown. The 71/71L Haight-Noriega uses the entirety of Lincoln Way and Fredrick Street to travel to Stanyan Street, while the 16X Noriega Express and NX Express use Lincoln Way to merge onto Kezar Drive in order to get to the Fell-Oak one-way couplet.

Kezar Drive is a two to four-lane east-west Major Arterial Street north of Parnassus Avenue that provides the major connection from the Parnassus Heights campus site to the Fell-Oak Street one-way couplet. Kezar Drive accommodates approximately 160 restricted parking spaces. The 16X Noriega Express and NX Express bus lines use Kezar Drive to travel from Lincoln Way to Oak Street. Kezar Drive also has a Class I bike path facility.

Stanyan Street is a north-south Secondary Transit Street from Geary Boulevard to Belgrave Avenue. It forms the eastern boundary of Golden Gate Park (excluding the Panhandle section of the park). In the vicinity of the Parnassus Heights campus site (north of Frederick Street), it is a four-lane roadway; south of Fredrick, it is a two-lane street. On-street parking is provided on both sides of the street in most areas. The 71/71L Haight-Noriega bus line operates along Stanyan Street north of Frederick Street.

Willard Street is a two-lane north-south Local Street that runs from Fredrick Street to Woodland Avenue. On-street parking is provided on both sides of the street, with 90-degree parking on the east side of the street between and Carl Street and Parnassus Avenue and the west side of the street between Parnassus Avenue and Belmont Avenue.

Hillway Avenue is a two-lane Local Street between Parnassus Avenue and Carl Street. Hillway Avenue is on a steep grade and has 90-degree parking on the east side of the street.

Arguello Boulevard is a two-lane north-south Local Street that runs from Kezar Drive to Carl Street. On-street parking is provided on both sides of the street, with parking at 90-degrees between Lincoln Way/Fredrick Street and Carl Street.

Second Avenue is a two-lane north-south Local Street that runs from Lincoln Way to Irving Street, with the southern end of the street providing direct access to a large public parking deck on the UCSF campus. On-street parking is provided on both sides of the street.

Third Avenue is a two-lane Local Street between Lincoln Way and Parnassus Avenue. Between Irving Street and Parnassus Avenue, the street has 90-degree parking on the east side of the street. On-street parking is provided on both sides of the street in most areas north of Irving Street. Between Hugo Street

and Lincoln Way, Third Avenue is a designated Class III bicycle route. Third Avenue provides eastbound only access at Lincoln Way.

Fourth Avenue is a two-lane Local Street between Lincoln Way and Parnassus Avenue. Between Irving Street and Parnassus Avenue, the street has 90-degree parking on the east side of the street. On-street parking is provided on both sides of the street in most areas north of Irving Street. Fourth Avenue is unsignalized and provides eastbound only access at Lincoln Way.

Fifth Avenue is a two-lane Local Street between Lincoln Way and its terminus south of Kirkham Street. Between Irving Street and Parnassus Avenue, the street has 90-degree parking on the east side of the street. On-street parking is provided on both sides of the street in most areas north of Irving Street. Fifth Avenue is signalized and provides full access at Lincoln Way.

Sixth Avenue is a two-lane Local Street between Lincoln Way and its terminus south of Kirkham Street. On-street parking is provided on both sides of the street in most areas. Sixth Avenue is designated as a bicycle route between Hugo Street and Kirkham Street and has a southbound Class II bicycle lane and northbound sharrows. South of Kirkham Street, Sixth Avenue becomes Locksley Avenue.

Seventh Avenue is a north-south Secondary Transit Street, which provides access to Golden Gate Park and becomes Laguna Honda Boulevard to the south of the Parnassus Heights campus site. It has one northbound and two southbound lanes in the vicinity of the campus site. On-street parking is provided on both sides of the street. Seventh Avenue is designated as a Class III bicycle route between Lincoln Way and Judah Street and as a Class II bicycle lane south of Judah Street. The 36 Teresita, 43 Masonic, and 44 O'Shaughnessy bus lines operate on Seventh Avenue south of Lawton Street.

Eighth Avenue is a two-lane north-south Local Street between Lincoln Way and its southern terminus at Pacheco Street. On-street parking is provided on both sides of the street. The 66 Quintara bus line operates along Eighth Avenue between Parnassus Avenue and Lawton Street in the northbound direction only.

Ninth Avenue is a Secondary Transit Street, which provides access to Golden Gate Park and the Sunset District. It has one northbound and two southbound lanes in the vicinity of the Parnassus Heights campus site. On-street parking is provided on both sides of the street. The N Judah light rail line operates on Ninth Avenue between Irving and Judah Streets. The 43 Masonic and 66 Quintara bus lines operate along Ninth Avenue between Judah Street and Lawton Street while the 44 O'Shaughnessy line runs between Golden Gate Park and Lawton Street.

2.3.1.3 Parnassus Avenue Counts

Traffic volumes on Parnassus Avenue between Fifth Avenue and Medical Center Way were collected for seven consecutive days, 24-hours per day, in 2007. More recent counts in 2013 showed that traffic volumes on Parnassus Avenue have remained mostly unchanged since 2007. The total daily traffic volume on Parnassus Avenue is relatively low by comparison to other two-lane streets in San Francisco. For example Polk Street carries approximately 16,000 vehicles per day compared to approximately 10,000 vehicles per day on Parnassus Avenue. Although Polk Street serves more commercial retail uses, compared to the more institutional and residential uses along Parnassus Avenue, this comparison shows that a two-lane street with frequent transit service is capable of serving much more traffic than currently exists on Parnassus Avenue, and that an oft described "busy feel" on Parnassus is due more to other factors, such as double-parking and high pedestrian volumes, than to heavy traffic volumes.

Many users competing for limited space creates a 'busy feel' on Parnassus Avenue
(Bottom photo courtesy BMS Design Group)

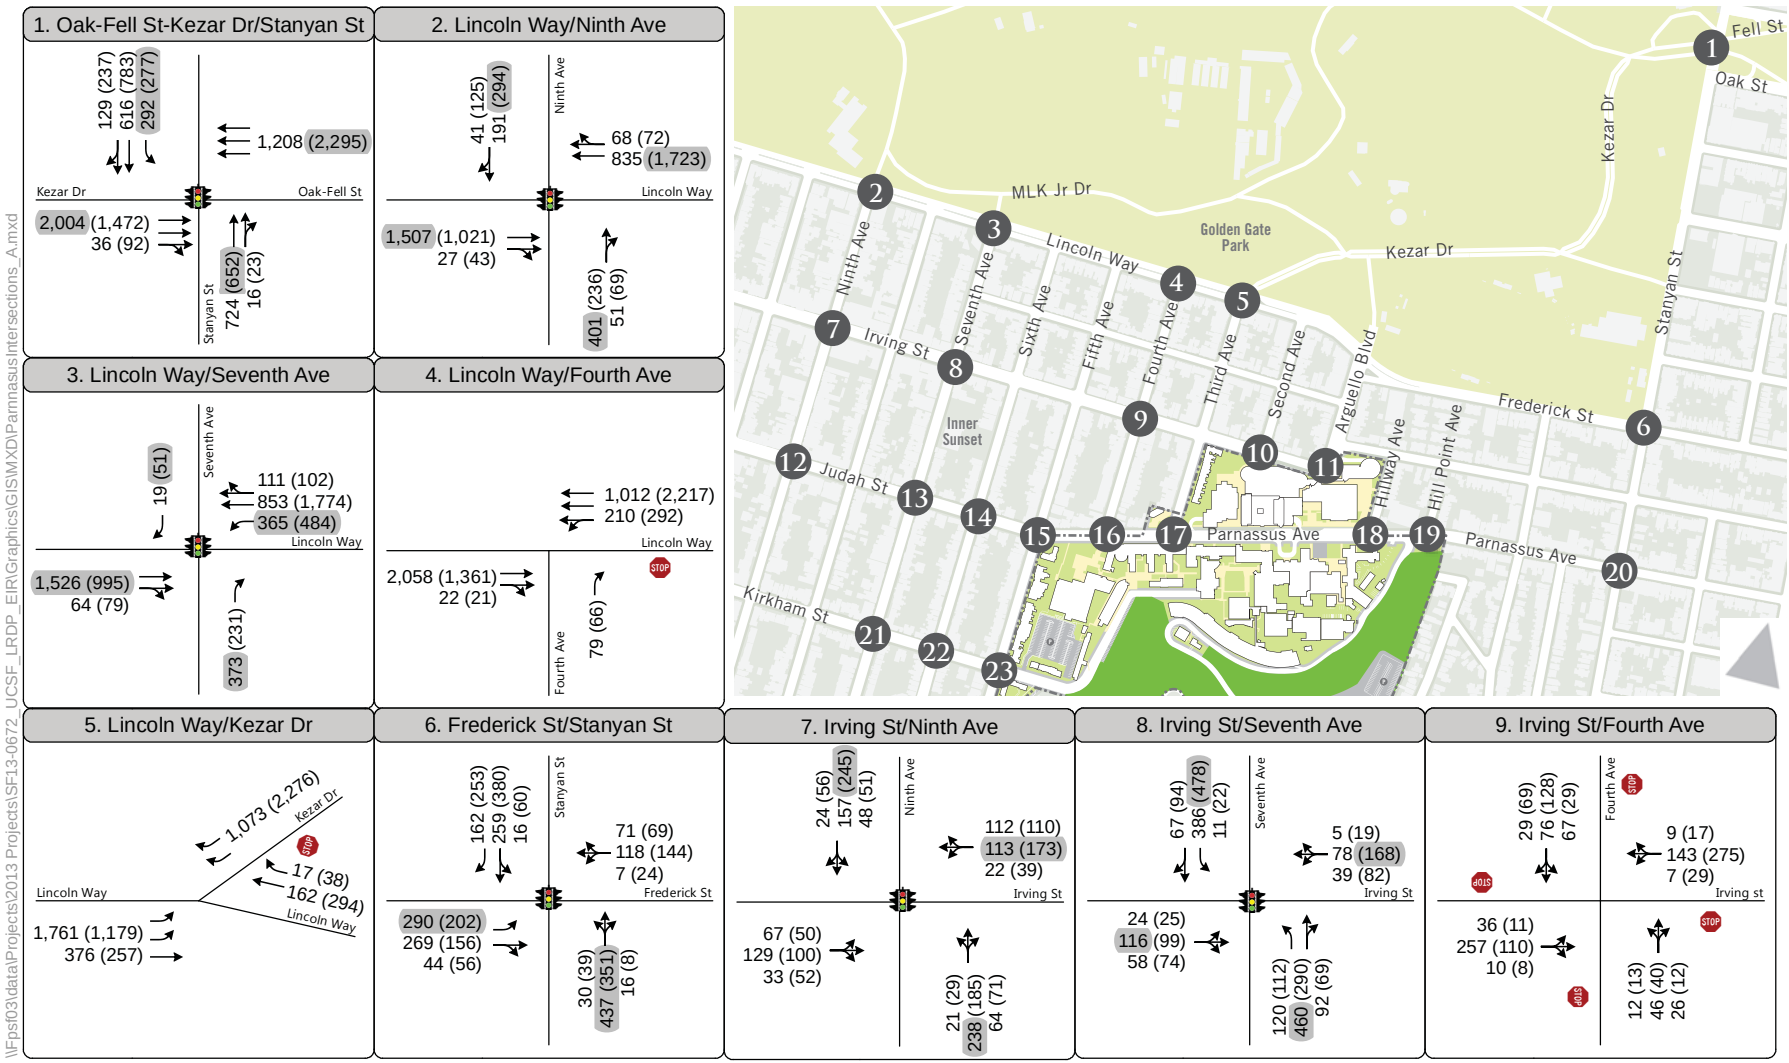
2.3.2 Intersection Operating Conditions

This report evaluates intersection operating conditions during the weekday AM (7:00AM-9:00AM) and PM (4:00PM-6:00PM) peak periods. Intersections usually form the critical capacity constraints on roadways. Therefore, most transportation analyses examine intersection operations as a measure of overall roadway conditions. The following 23 study intersections were selected for analysis through consultation with UCSF Campus Planning and San Francisco Planning Department staff. These study intersections are shown in **Figure 2-2**.

1. Oak Street-Fell Street-Kezar Drive/Stanyan Street
2. Lincoln Way/Ninth Avenue
3. Lincoln Way/Seventh Avenue
4. Lincoln Way/Fourth Avenue
5. Kezar Drive/Lincoln Way/Third Avenue
6. Fredrick Street/Stanyan Street
7. Irving Street/Ninth Avenue
8. Irving Street/Seventh Avenue
9. Irving Street/Fourth Avenue
10. Irving Street/Second Avenue
11. Irving Street/Arguello Boulevard
12. Judah Street/Ninth Avenue
13. Judah Street/Seventh Avenue
14. Judah Street/Sixth Avenue
15. Judah Street-Parnassus Avenue/Fifth Avenue
16. Parnassus Avenue/Fourth Avenue
17. Parnassus Avenue/Third Avenue
18. Parnassus Avenue/Hillway Avenue
19. Parnassus Avenue/Hill Point Avenue
20. Parnassus Avenue/Stanyan Street
21. Kirkham Street/Seventh Avenue
22. Kirkham Street/Sixth Avenue
23. Kirkham Street/Fifth Avenue

Figure 2-3A and **2-3B** display the existing AM and PM peak hour traffic volumes, lane configurations and traffic controls at each of the 23 study intersections. Intersection turning movement counts at the study intersections were collected in October 2011 and May 2013 on mid-week and non-holiday days when schools were in session. Intersection turning movement count sheets are provided in **Appendix D**.

The operating characteristics of intersections are evaluated using the concept of Level of Service ("LOS"). LOS is a qualitative description of driver comfort and convenience. Intersection levels of service range from LOS A, which indicates free flow or excellent vehicle flow conditions with short delays, to LOS F, which indicates congested or overloaded vehicle flow conditions with extremely long delays. For UCSF, LOS A through D is considered acceptable, and LOS E and LOS F are considered unsatisfactory service levels. The intersections were evaluated using the 2000 Highway Capacity Manual (HCM) methodology. Tables summarizing the relationship between average delay per vehicle and LOS for signalized and unsignalized intersections according to the 2000 HCM method can be found in **Appendix E**.



\\Fps\03\data\Projects\2013 Projects\SF13-0672_UCSF_LRDP_EIR\Graphics\GIS\MXD\ParnassusIntersections_A.mxd

Traffic Signal — Turn Lane — AM (PM) Critical Movement

Stop Sign — AM (PM) Peak Hour Traffic Volume — 1 Study Intersection

Figure 2-3A

Existing Intersection Lane Configurations, Traffic Control, and Volumes- Parnassus Heights

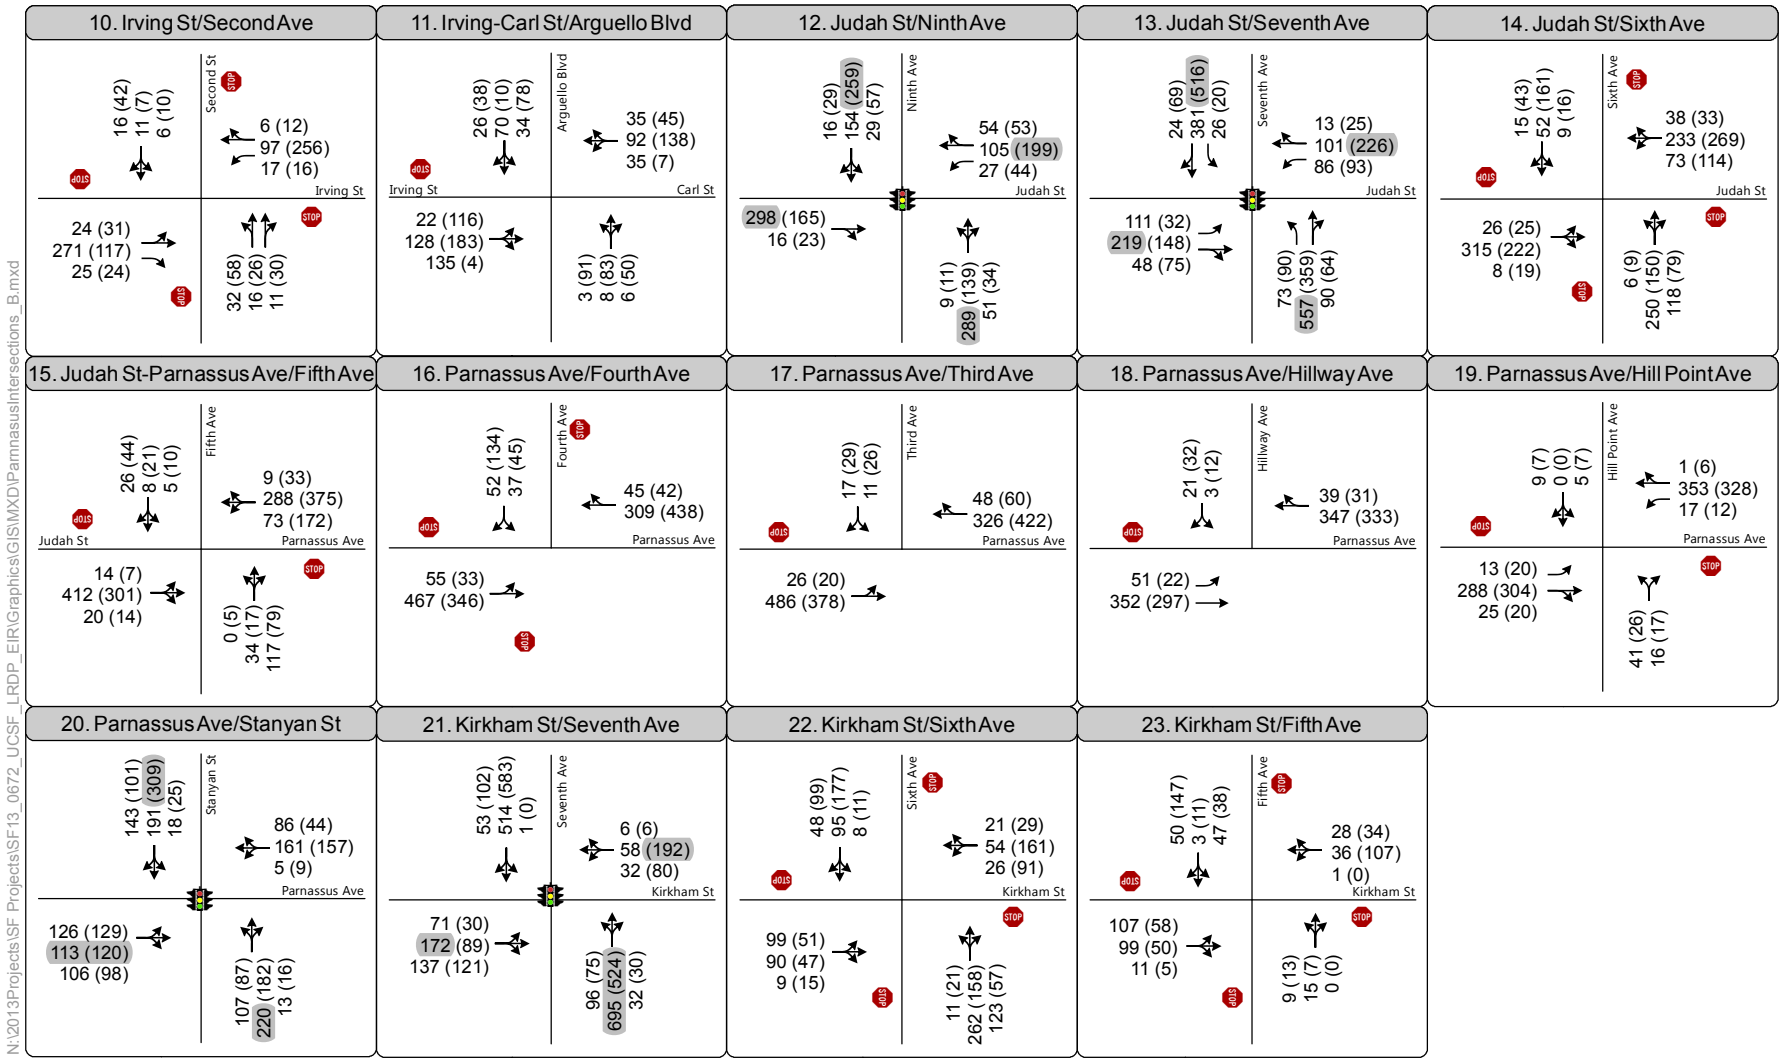


Figure 2-3B

Existing Intersection Lane Configurations, Traffic Control, and Volumes-Parnassus Heights

For signalized intersections, this methodology determines the capacity for each lane group approaching the intersection. The LOS is based on average delay (in seconds per vehicle) for the various movements within the intersection. A combined weighted average delay and LOS is presented for the intersection. For unsignalized intersections, operations are defined by the average control delay per vehicle (in seconds per vehicle) for each stop-controlled movement or movement that must yield the right-of-way, and the LOS is determined by the worst (highest average delay) approach. Generally, the delay ranges for each LOS are lower than for signalized intersections because drivers expect less delay at unsignalized intersections.

LOS was calculated at each study intersection for the weekday AM and PM peak hours, which represents the periods of the day when the transportation network as a whole experiences the highest traffic demand. As shown in **Table 2-3**, 21 of the 23 study intersections operate at an acceptable level of service (LOS D or better) during the AM peak hour and 20 study intersections operate at an acceptable level of service during the PM peak hour.

TABLE 2-3: EXISTING PEAK HOUR INTERSECTION LEVEL OF SERVICE - PARNASSUS HEIGHTS

Intersection	Traffic Control[1]	Peak Hour	Vehicle Delay[2] (seconds)	LOS[3]
1. Oak Street-Fell Street-Kezar Drive / Stanyan Street	Signal	AM PM	45 **58**	D **E**
2. Lincoln Way / Ninth Avenue	Signal	AM PM	39 **65**	D **E**
3. Lincoln Way / Seventh Avenue	Signal	AM PM	32 39	C D
4. Lincoln Way / Fourth Avenue	SSS	AM PM	**>50** 23	**F** C
5. Lincoln Way-Kezar Drive / Third Avenue	SSS	AM PM	24 29	C D
6. Fredrick Street / Stanyan Street	Signal	AM PM	26 24	C C

TABLE 2-3: EXISTING PEAK HOUR INTERSECTION LEVEL OF SERVICE - PARNASSUS HEIGHTS

Intersection	Traffic Control[1]	Peak Hour	Vehicle Delay[2] (seconds)	LOS[3]
16. Parnassus Avenue / Fourth Avenue	AWS	AM PM	15 / 18 19 / 23	B / C C / C
17. Parnassus Avenue / Third Avenue	SSS	AM PM	17 20	C C
18. Parnassus Avenue / Hillway Avenue	SSS	AM PM	13 15	B C
19. Parnassus Avenue / Hill Point Avenue	SSS	AM PM	17 16	C C
20. Parnassus Avenue / Stanyan Street	Signal	AM PM	41 29	D C
21. Kirkham Street / Seventh Avenue	Signal	AM PM	**70** 30	**E** C
22. Kirkham Street / Sixth Avenue	AWS	AM PM	13 / 16 13 / 14	B / C B / B
23. Kirkham Street / Fifth Avenue	AWS	AM PM	<10 / <10 <10 / <10	A / A A / A

Notes:

1. AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
2. Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersection, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach.
3. For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
4. **Bold** indicates unacceptable operations per UCSF LOS standards

Source: Fehr & Peers, 2014.

The following intersections operate unacceptably during the AM or PM peak hours:

- Oak Street-Fell Street-Kezar Drive and Stanyan Street (Intersection #1) operates at LOS E during the PM peak hour due to the traffic volumes on north and southbound Stanyan Street.
- Lincoln Way and Ninth Avenue (Intersection #2) operates at LOS E during the PM peak hour due to the conflicting traffic volumes on westbound Lincoln Way and southbound Ninth Avenue.
- Lincoln Way and Fourth Avenue (Intersection #4) operates at LOS F during the AM peak hour due to high conflicting traffic volumes on eastbound Lincoln Way.
- Judah Street-Parnassus Avenue and Fifth Avenue (Intersection #15) operates at LOS E during the PM peak hour due to combination of the traffic volumes on the stop-controlled approaches of Fifth Avenue and the relative lack of gaps in traffic on Judah Street-Parnassus Avenue.
- Kirkham Street and Seventh Avenue (Intersection #21) operates at LOS E during the AM peak hour due to the relatively high conflicting traffic volumes on northbound Seventh Avenue and eastbound Kirkham Street.

2.3.3 Transit Network

The Parnassus Heights campus site is well-served by public transit, both local and regional. Local service is provided by the San Francisco Municipal Railway (Muni) bus and light rail lines, which provide transit service to the campus site and throughout San Francisco and can be used to access regional transit operators. Service to and from the East Bay is provided by Bay Area Rapid Transit (BART), Alameda-Contra Costa Transit (AC Transit) and ferries; service to and from the North Bay is provided by Golden Gate Transit buses and ferries; service to and from the Peninsula and South Bay is provided by SamTrans, BART, and Caltrain. As described in Section 2.2.1, UCSF supplements Muni transit service with its own shuttle system that provides direct connections to UCSF-operated or affiliated facilities throughout San Francisco. In many cases, these shuttles provide a direct transit alternative between two campus sites that would otherwise require a transfer between two or more Muni routes. Approximately 24 percent of those traveling to the Parnassus Heights campus site use public transit, while another 12 percent rely on UCSF shuttles to get to and from the campus site. **Figure 2-4** visualizes the local transit routes, including bus and shuttle stops, in the vicinity of the Parnassus Heights campus site.

2.3.3.1 San Francisco Muni

San Francisco Municipal Railway (Muni) provides transit service within the City and County of San Francisco, including bus (both diesel and electric trolley), light rail (Muni Metro), cable car and electric streetcar lines. Muni operates a number of bus and rail lines in the Parnassus Heights campus site. **Table 2-4** presents the Muni routes serving the campus site within about a quarter-mile walk. **Table 2-5** summarizes existing ridership during the AM and PM peak hours. The route characteristics are current as of December 2013, including service frequencies during the weekday morning and evening peak periods, hours of operations and neighborhoods served, as well as ridership and capacity utilization at each line's maximum load point ("MLP"). The MLP is the location where the route has its highest number of passengers relative to its capacity. Capacity utilization relates the number of passengers per transit vehicle to the design capacity of the vehicle. The capacity per vehicle includes both seated and standing capacity, where standing capacity is between 30 to 80 percent of seated capacity in addition to seated capacity (depending upon the specific transit vehicle configuration). The capacity of a standard bus is 63 passengers.

Figure 2-4

Existing Transit Service-
Parnassus Heights

TABLE 2-4: LOCAL MUNI OPERATIONS - PARNASSUS HEIGHTS

Route	AM Peak Weekday Headways (7-9AM)[1]	PM Peak Weekday Headways (4-6PM)[1]	Hours of Operation	Neighborhoods Served by Route	Nearest Stop Location	Distance to Campus Site (feet)
6 – Parnassus	10	10	6AM – 1:30AM	Financial District, Golden Gate Heights	Several stops on Parnassus between Hillway Avenue and Fifth Avenue	0
16X – Noriega Express	9	9 – 10	Inbound: 6:30AM – 9AM Outbound: 4PM - 7PM	Financial District, Sunset District	Ninth Avenue and Lincoln Way	2,000
36 – Teresita	30	30	6AM – 11:30PM	Bernal Heights, Twin Peaks	Warren Drive and Locksley Avenue	1,500
43 – Masonic	10	12	5AM – 1:30AM	Marina District, The Excelsior	Several stops on Parnassus between Hillway Avenue and Fifth Avenue	0
44 – O'Shaughnessy	10	9	5AM – 1AM	Bayview/Hunters Point, Richmond District	Lawton Street and Seventh Avenue	1,500
66 – Quintara	20	20	6AM – 11PM	Sunset District	Lawton Street and Ninth Avenue	1,800
71/71L – Haight-Noriega/Limited	10	10	6AM – 1AM	Financial District, Haight-Ashbury, Sunset District	Frederick Street and Arguello Boulevard	600
N – Judah	7	7	3:30AM – 1:30AM	Financial District, Sunset District	Irving Street and Second Avenue	0

2.3.3.1.1 Recent and Proposed Changes to Transit Service

The Transit Effectiveness Project (TEP) serves as both a thorough review of and repositioning of San Francisco's public transit system, initiated by SFMTA in collaboration with the City Controller's Office. The TEP is aimed at improving reliability, reducing travel times, providing more frequent service and updating Muni bus routes and rail lines to better match current travel patterns. TEP recommendations include new routes and route realignments, more service on busy routes, and elimination or consolidation of certain routes or route segments with low ridership. The TEP recommendations were unanimously endorsed by the SFMTA Board of Directors in October 2008, for environmental impact review. The initial TEP recommendations were revised based on public feedback on the draft TEP environmental impact report (TEP EIR). The TEP EIR was certified on March 27, 2014, and the SFMTA Board of Directors approved most

of the Service Improvements and portions of the Transit Travel Time Reduction Proposals on March 28, 2014.[6] The TEP projects would be implemented based on funding and resource availability. The TEP Implementation Strategy anticipates that many of the improvements would be implemented sometime between Fiscal Year 2014 and Fiscal Year 2019, subject to funding sources and resource availability.[7]The following changes are proposed by the TEP for routes near the Parnassus Heights campus site.

- **6 Parnassus** - The TEP proposes changes to peak period headways, increasing from 10 minute to 12 minute headways in the AM peak period and from 10 minute to 12 minute headways during the PM peak period.
- **43 Masonic** – The TEP proposes to modify and extend the alignment of the 43 Masonic. The route will extend from Chestnut/Fillmore Streets to Fort Mason (Marina Boulevard/Laguna Street), replacing the existing Route 28 19th Avenue/28L 19th Avenue Limited terminal with new service on Lombard Street between Webster and Laguna Streets, Laguna Street between Lombard and Beach Streets, Beach and Bay Streets between Laguna and Buchanan Streets, and Buchanan Street between Bay and Beach Streets. Service in the Presidio will be modified to serve the Presidio Transit Center via Lincoln Boulevard between Letterman Drive and Graham Street, Graham Street between Lincoln Boulevard and French Court, French Court between Graham and Hallack Streets, and Hallack Street between French Court and Lincoln Boulevard. The TEP also proposes changes to peak period headways, reducing from 10 minute to 8 minute headways in the AM peak period and from 12 minute to 10 minute headways during the PM peak period.
- **44 O'Shaughnessy** – The TEP proposes changes to peak period headways, reducing from 10 minute to 7.5 minute headways in the AM peak period and from 10 minute to 7.5 minute headways during the PM peak period.
- **71/71L Haight-Noriega** – The TEP proposes to replace the 71 Haight Noriega with all-day limited stop service on Haight Street in both directions, similar to 71L service, which currently operates only in the peak period, peak direction. The route would make local stops west of Stanyan Street and on Market Street and would make limited stops between Stanyan and Market streets. The TEP also proposes changes to peak period headways, reducing from 10 minute to 7.5 minute headways in the AM peak period and from 10 minute to 7.5 minute headways during the PM peak period.
- **N Judah** - The TEP proposes changes to peak period headways, reducing from 9 minute to 8 minute headways in the AM peak period and from 9 minute to 8 minute headways during the PM peak period. In addition, the TEP proposes to implement traffic signal priority (TSP) toolkit elements in both the inbound and outbound directions, from the intersection of Carl and Cole streets to the intersection of Judah and La Playa streets. The TEP has a Moderate and Expanded Alternative. The Moderate Alternative would include transit stop changes, pedestrian improvements, and parking and turn restrictions. This alternative would also replace stop signs

[6] San Francisco Planning Department. 2014. TEP Final EIR, March 27, 2014, Available online at http://tepeir.sfplanning.org. Accessed April 3, 2014. Case No. 2011.0558E. The document and supporting information may also be viewed at the Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA in case file 2011.0558E.

[7] San Francisco Municipal Transportation Agency. 2014. TEP Implementation Workbook, March 5, 2014, Available online at: http://www.sfmta.com/sites/default/files/projects/TEP%20Implementation%20Plan%20-%20Section%201%20%282%29_1.pdf. Accessed June 27, 2014.

with traffic signals at seven intersections on Judah Street and one intersection on Irving Street. The Expanded Alternative would include the same transit stop changes, pedestrian improvements, parking and turn restrictions, and traffic signal and stop sign changes as the Moderate Alternative, except that stop signs at five of the intersections along Judah Street would be replaced with traffic calming measures, rather than traffic signals.

2.3.3.2 Regional Transit Service

In addition to Muni operations, regional transit service was considered. The following regional transit services operate within San Francisco and are accessible from the Parnassus Heights campus site via Muni or UCSF shuttles. **Table 2-6** presents the regional transit routes serving the transit study area and route characteristics as of November 2013, including service frequencies during the weekday morning and evening peak periods, hours of operations and neighborhoods served.

Golden Gate Transit

The Golden Gate Bridge, Highway, and Transportation District operates Golden Gate Transit (GGT), which provides bus and ferry service between the North Bay (Marin and Sonoma counties) and San Francisco. GGT operates 22 commuter bus routes, nine basic bus routes, and 16 ferry feeder bus routes into San Francisco. Bus routes operate at headways of 15 to 90 minutes depending on time and day of week and bus type. Golden Gate Transit also operates ferry service between the North Bay and San Francisco, connecting Larkspur and Sausalito with the Ferry Building during the morning and evening commute periods. Golden Gate Transit riders would need to transfer to Muni to access the Parnassus Heights campus site.

Alameda-Contra Costa County Transit District (AC Transit)

AC Transit operates bus service in western Alameda and Contra Costa Counties, as well as routes to the City of San Francisco and San Mateo County. AC Transit operates 33 "Transbay" bus routes between the East Bay and the Temporary Transbay Terminal, temporarily located at Howard Street and Beale Street. The Temporary Transbay Terminal is accessible from the Parnassus Heights campus site via Muni. The majority of Transbay service is provided only during commute periods in the peak direction of travel, with headways between buses from 15 to 20 minutes. The peak direction of service is into San Francisco during the AM peak period and out of San Francisco during the PM peak period. All-day service is provided on a few lines, with headways of approximately 30 minutes. AC Transit riders would need to transfer to Muni to access the Parnassus Heights campus site.

San Mateo County Transit District (SamTrans)

SamTrans operates bus and rail service in San Mateo County. A few SamTrans routes also serve the Temporary Transbay Terminal in downtown San Francisco, including Routes 292, 391, and 397. Route 292 makes San Francisco stops along Potrero Avenue and Mission Street throughout the day. AM peak hour headways are between 10 and 15 minutes, and PM peak hour headways are 20 minutes. Routes 391 and 397 run along Mission Street in San Francisco but stop only at the Temporary Transbay Terminal. Route 391 operates only during the peak travel periods with 15 minute headways; Route 397 is a late night service route with headways of one hour. SamTrans riders would need to transfer to Muni to access the Parnassus Heights campus site.

Bay Area Rapid Transit (BART)

BART provides regional commuter rail service between San Francisco and the East Bay (Pittsburg/Bay Point, Richmond, Dublin/Pleasanton and Fremont), as well as between San Francisco and San Mateo County (SFO Airport and Millbrae). Weekday hours of operation are between 4:00 AM and midnight. During the weekday PM peak period, headways are 5 to 15 minutes along each line. Within San Francisco, BART operates underground along Market Street to Civic Center Station where it turns south through the Mission District towards Daly City. The closest BART station to the Parnassus Heights campus site is the Civic Center BART station, which is accessible via Muni.

Caltrain

Caltrain provides passenger rail service on the Peninsula between San Francisco and Downtown San Jose with several stops in San Mateo County and Santa Clara County. Limited service is available south of San Jose. Caltrain service headways during the AM and PM peak periods are 10 to 60 minutes, depending on the type of train. The peak direction of service is southbound during the AM peak period and northbound during the PM peak period. Caltrain service terminates at the San Francisco Station at Fourth and King streets (Fourth/King station). The Fourth/King station is served by local, limited, and express "Baby Bullet" trains which is accessible from the Parnassus Heights campus site via Muni.

TABLE 2-6: REGIONAL TRANSIT OPERATIONS- PARNASSUS HEIGHTS

Route	AM Peak Weekday Headways (7AM-9AM)[1]	PM Peak Weekday Headways (4PM-6PM)[1]	Hours of Operation	Areas Served by Route	Nearest Stop Location	Distance to Project Site
Caltrain Local	-	-	4:30AM-12:01AM (IB) 4:55AM-1:32AM (OB)	San Francisco, San Jose	Fourth and King	3.6 miles
Caltrain Limited-Stop	10-20	20-60	5:50AM-8:00PM (IB) 6:11AM-8:19PM (OB)	San Francisco, San Jose	Fourth and King	3.6 miles
Caltrain Baby Bullet	10-40	20-40	5:45AM-7:24PM (IB) 6:57AM-7:39PM (OB)	San Francisco, San Jose	Fourth and King	3.6 miles
BART	5-15	5-15	4:00AM-12:00AM (IB/OB)	East Bay, San Francisco, San Mateo County	Civic Center	2.7 miles
AC Transit	15-20	15-20	12:00AM-12:00AM(IB/OB)	East Bay, San Francisco	Beale between Folsom and Howard	3.9 miles
SamTrans Route 292	10-15	20	3:55AM-2:28AM (IB) 4:30AM-12:00AM (OB)	San Mateo County, SFO, San Francisco	Potrero / 24th	2.8 miles
GGT commuter and basic bus routes	15-90	15-90	4:01AM-12:41AM (IB) 5:06AM-2:28AM (OB)	North Bay, San Francisco	Eighth / Folsom	2.7 miles

2.3.3.3 UCSF Shuttle System

Table 2-7 summarizes the UCSF shuttle routes serving the campus site, which includes most of the shuttle routes provided by UCSF. Shuttles to and from the Parnassus Heights campus site stop at shuttle zones along the north side of Parnassus Avenue, between Third Avenue and the Library, and on the south side of Parnassus Avenue, just west of UC Hall and also east of LPPI (as shown in **Figure 2-4**). These stops are designated by UCSF Transportation Services and reviewed/approved by SFMTA. UCSF shuttles were not observed to interfere with Muni operations at the Parnassus Heights campus site.

TABLE 2-7: UCSF SHUTTLES - PARNASSUS HEIGHTS

Route	Campus Sites Served	Hours of Operation	Headways (minutes)[1]	Average Weekday Boardings (2012)
Gold	Parnassus-Mt. Zion-Mission Bay-SFGH	5:45 AM – 9:25 PM	15/20	924
Blue	Parnassus-SFGH-Mission Bay-Mt. Zion	5:35 AM – 8:47 PM	15/20	996
Black	Parnassus-Mt. Zion-Laurel Heights	6:30 AM – 7:50 PM	20	781
Tan	Parnassus-Laurel Heights-Mt. Zion	6:50 AM – 7:45 PM	20	651
Purple	Parnassus (Library)-3360 Geary-Mt. Zion-3360 Geary	6:15 AM – 6:38 PM	45	171
Grey	Parnassus-Mission Bay	6:30 AM – 10:00 PM	20	1,470
Lime	Parnassus-BDC-MCB	6:05 AM – 8:31 PM	15	732
Pink	Parnassus E/R-Kezar	5:30 AM – 9:00AM	15	144
VA-Parnassus	Parnassus-VAMC	6:35 AM – 7:05 PM	30/60	89
Bronze	Aldea-Medical Building 1 (ACC)-Library-Sixth-Dental-Parnassus LPPI	6:45 AM – 6:29 PM	15/20	787

Notes:

1. Multiple values indicate variability in headways during the day.

Source: UCSF Campus Life Services Transportation, Routes & Timetables, 2014; Ridership data from *UCSF Shuttle Operations Study, Final Report,* January 2014, prepared by Nelson\Nygaard.

2.3.4 Pedestrian Circulation

Walking to and from the Parnassus Heights campus site is a common travel mode option for many UCSF employees and students. Approximately 11 percent of those traveling there walk to and from the campus site.

Pedestrian volumes were collected at each crosswalk in the Parnassus Heights campus site between 7:00 AM and 7:00 PM in both 2007 and 2013, as shown in **Figure 2-5**. A comparison of these counts showed that pedestrian volumes are essentially unchanged between 2007 and 2013, as evidenced by a total of approximately 25,300 and 26,000 average crossings, respectively. Some slight variations in crossing volumes at individual crosswalks was observed and since there has not been any significant development in the area since 2007, most changes in pedestrian activity would likely be related to typical seasonal or daily fluctuations or attributable to adjustments in the UCSF shuttle system routing. However, counts at the pedestrian crossing in front of the Medical Building 1 (ACC) at Irving Street increased 60 percent between 2007 and 2013. This may be an indication of increased light rail ridership.

During the same time period in which the two Parnassus Avenue signalized crosswalks accommodate approximately 18,500 crossings, the Parnassus Avenue roadway carries approximately 8,500 vehicles. Thus, on average, there are over two times more pedestrians crossing Parnassus Avenue than vehicles traveling along it. The pedestrian activity on Parnassus Avenue in the campus site area (Third Avenue to Hillway) is more than double the pedestrian activity occurring at Judah Street/Fifth Avenue to the west.

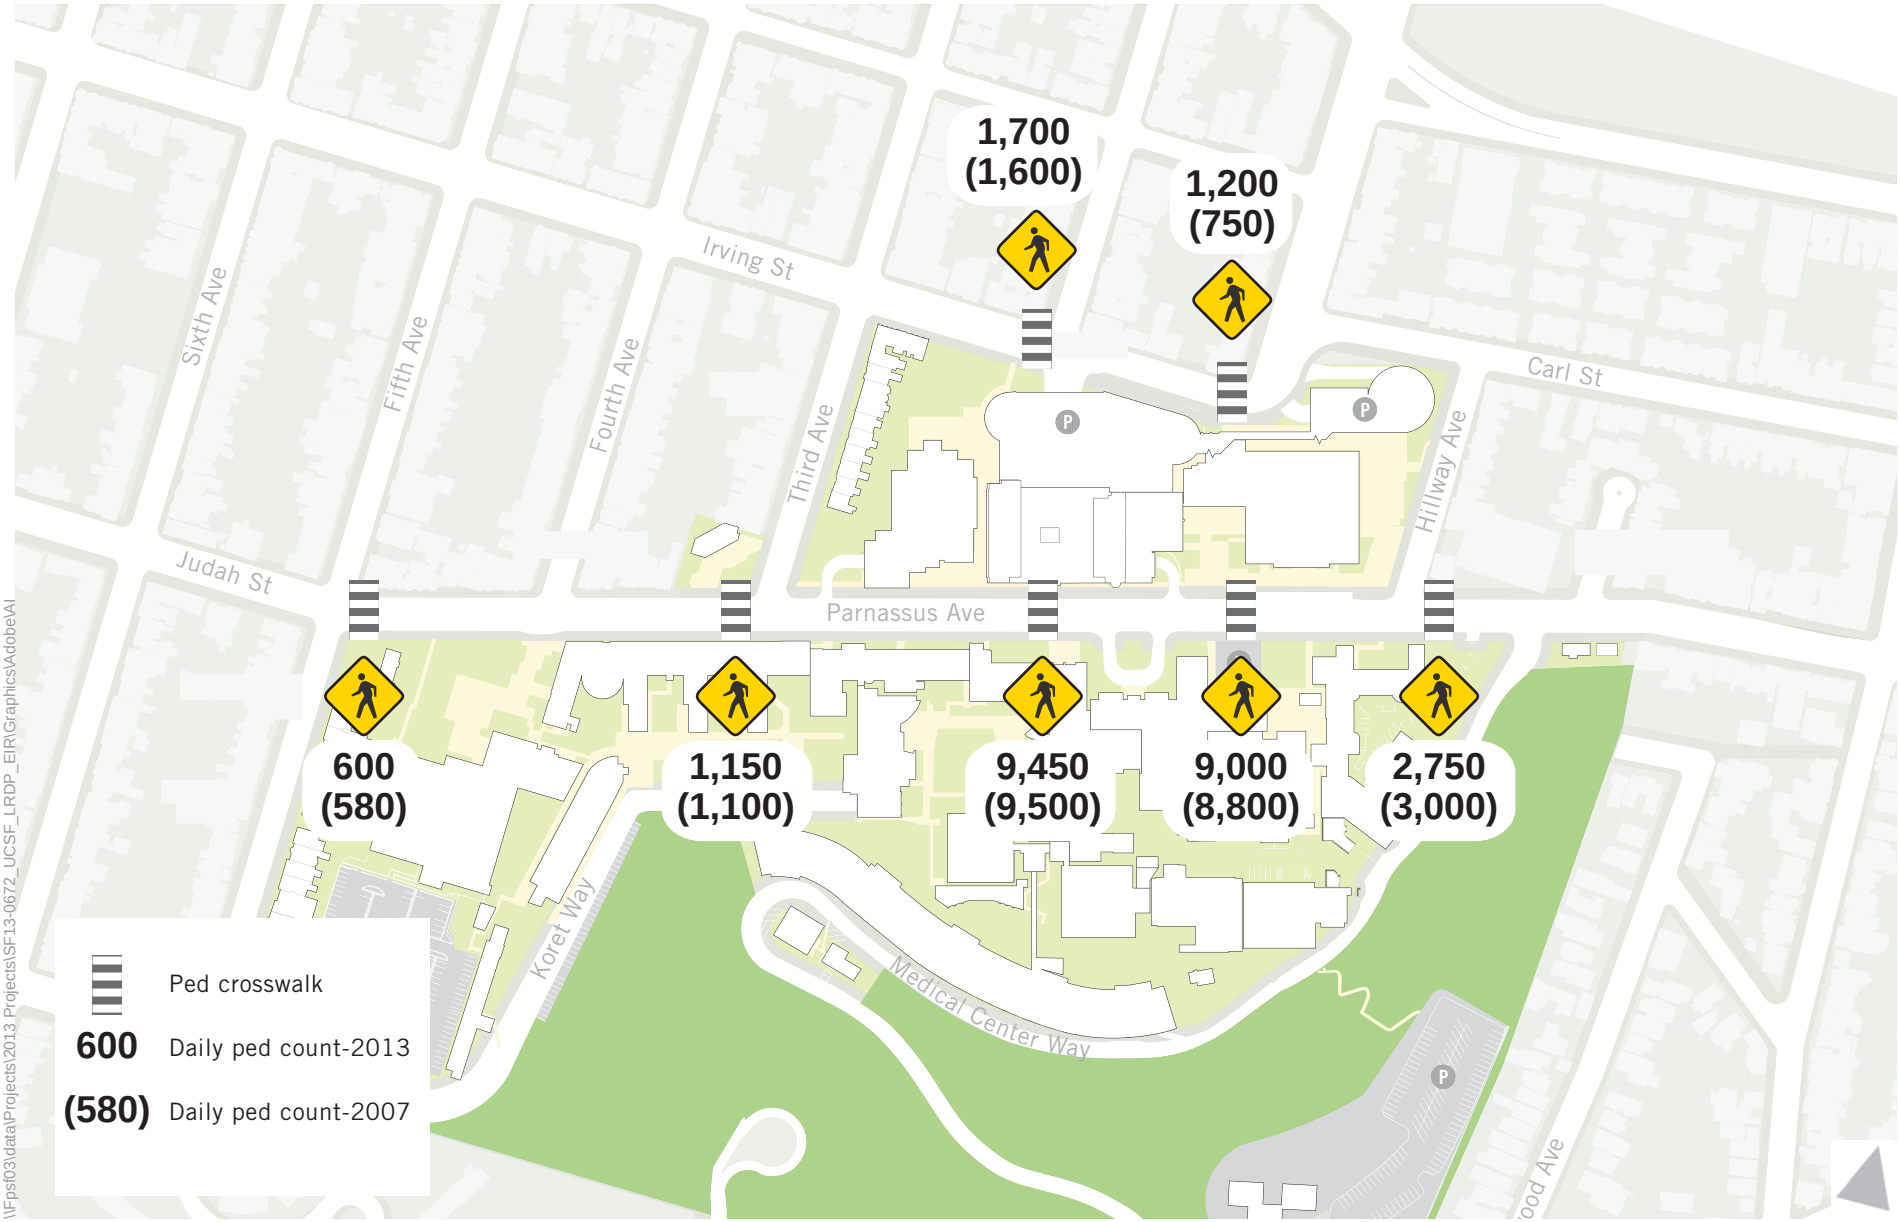

Figure 2-5

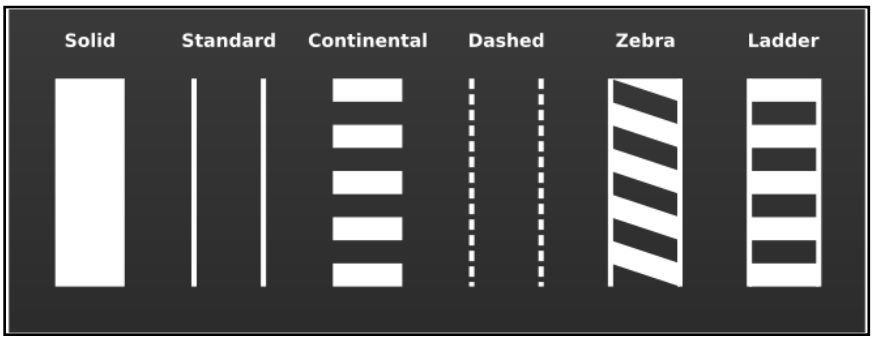
Daily Pedestrian Volumes: 2007 and 2013

Pedestrian facilities include sidewalks, crosswalks, curb ramps, and pedestrian signals. Within the campus site, sidewalks exist on both sides of the street in most locations, and are generally 12 to 15 feet wide. In some areas on the campus site, sidewalk widths exceed 20 feet. All study intersections provide painted crosswalks and directional curb ramps. High-visibility yellow continental stripe crosswalks exist on Judah Street at the intersections of Sixth and Seventh avenues. Two additional high-visibility continental stripe crosswalks exist on Parnassus Avenue adjacent to the Moffitt/Long Hospital Drop-off/Pick-up area, where there are two signalized pedestrian crosswalks with countdown timers. These signalized crossings accommodate the large number of pedestrians crossing from one side of Parnassus Avenue to the other. Most other crosswalks in the area are standard crosswalks; San Francisco typically only uses the standard crosswalk at signalized intersections, continental crosswalks at high-visibility locations (e.g., near schools), and ladder crosswalks. **Inset 3** illustrates sample crosswalk styles.

Inset 3. Crosswalk Styles



Field observations at the campus site indicate that the locations of the two signalized crosswalks across Parnassus Avenue in the campus core area are not aligned with many pedestrians' desired travel paths. A number of pedestrians exiting the UCSF Medical Center walk around Moffitt Circle and walk directly across Parnassus Avenue into the entrance to the Millberry Union, rather than walk east or west to one of the two signalized crosswalks.

2.3.5 Bicycle Circulation

Despite the hilly topography at the Parnassus Heights campus site, bicycling is a viable and common travel mode. UCSF has identified bicycling as an effective tool in reducing congestion and pollution, promoting good health, and creating a livable environment. Approximately five percent of those traveling to and from the campus site use a bicycle. In addition, approximately three percent of trips made by Parnassus Heights campus site employees and students to off campus, non-UCSF locations throughout the day are made by bike. This is consistent with the bicycling mode share throughout San Francisco. Several bikeways run within campus site vicinity, as shown in **Figure 2-6**.

Bicycle facilities in San Francisco consist of bicycle paths, separated bicycle lanes, bicycle lanes, and bicycle routes.

Bicycle Paths (Class I) provide a completely separated right-of-way for the exclusive shared use of cyclists and pedestrians. These facilities are off-street and minimize cross-flow traffic, but they can be adjacent to an existing roadway.

Example of Class II bicycle lane

Separated Bicycle Lanes (Class II) provide a striped, marked, and signed bicycle lane buffered from vehicle traffic. These facilities are located on roadways and require a minimum of four to five feet of space for exclusive bicycle traffic.

Bicycle Lanes (Class II) provide a striped, marked and signed lane for bicycle travel. These one-way facilities are located on roadways and reserve a minimum of four to five feet of space for exclusive bicycle traffic.

Example of Class III bicycle route

Bicycle Routes (Class III) provide a shared travel lane marked and signed for shared use with motor vehicle traffic. These facilities may or may not be marked with "sharrows" to emphasize that the roadway space is shared.

The following bicycle facilities are located within or near the Parnassus Heights campus site:

Parnassus Avenue is part of San Francisco Bike Route 40, an east-west bicycle route extending from Mission Bay to Ocean Beach, via 16th Street, 17th Street, Parnassus Avenue, and Kirkham Avenue. Within the Parnassus Heights campus site, the route is on Parnassus Avenue as a Class III shared-lane.

Sixth Avenue is part of a north-south bicycle route from The Presidio to San Francisco State University. In the vicinity of the campus site the route is on Sixth Avenue between Kirkham Street and Hugo Street and on Fifth Avenue between Hugo Street and Golden Gate Park, serving San Francisco Bike Routes 40 and 65. In the southbound direction, there is a Class II painted bike lane on Sixth Avenue, while the northbound direction there is a Class III shared-lane.

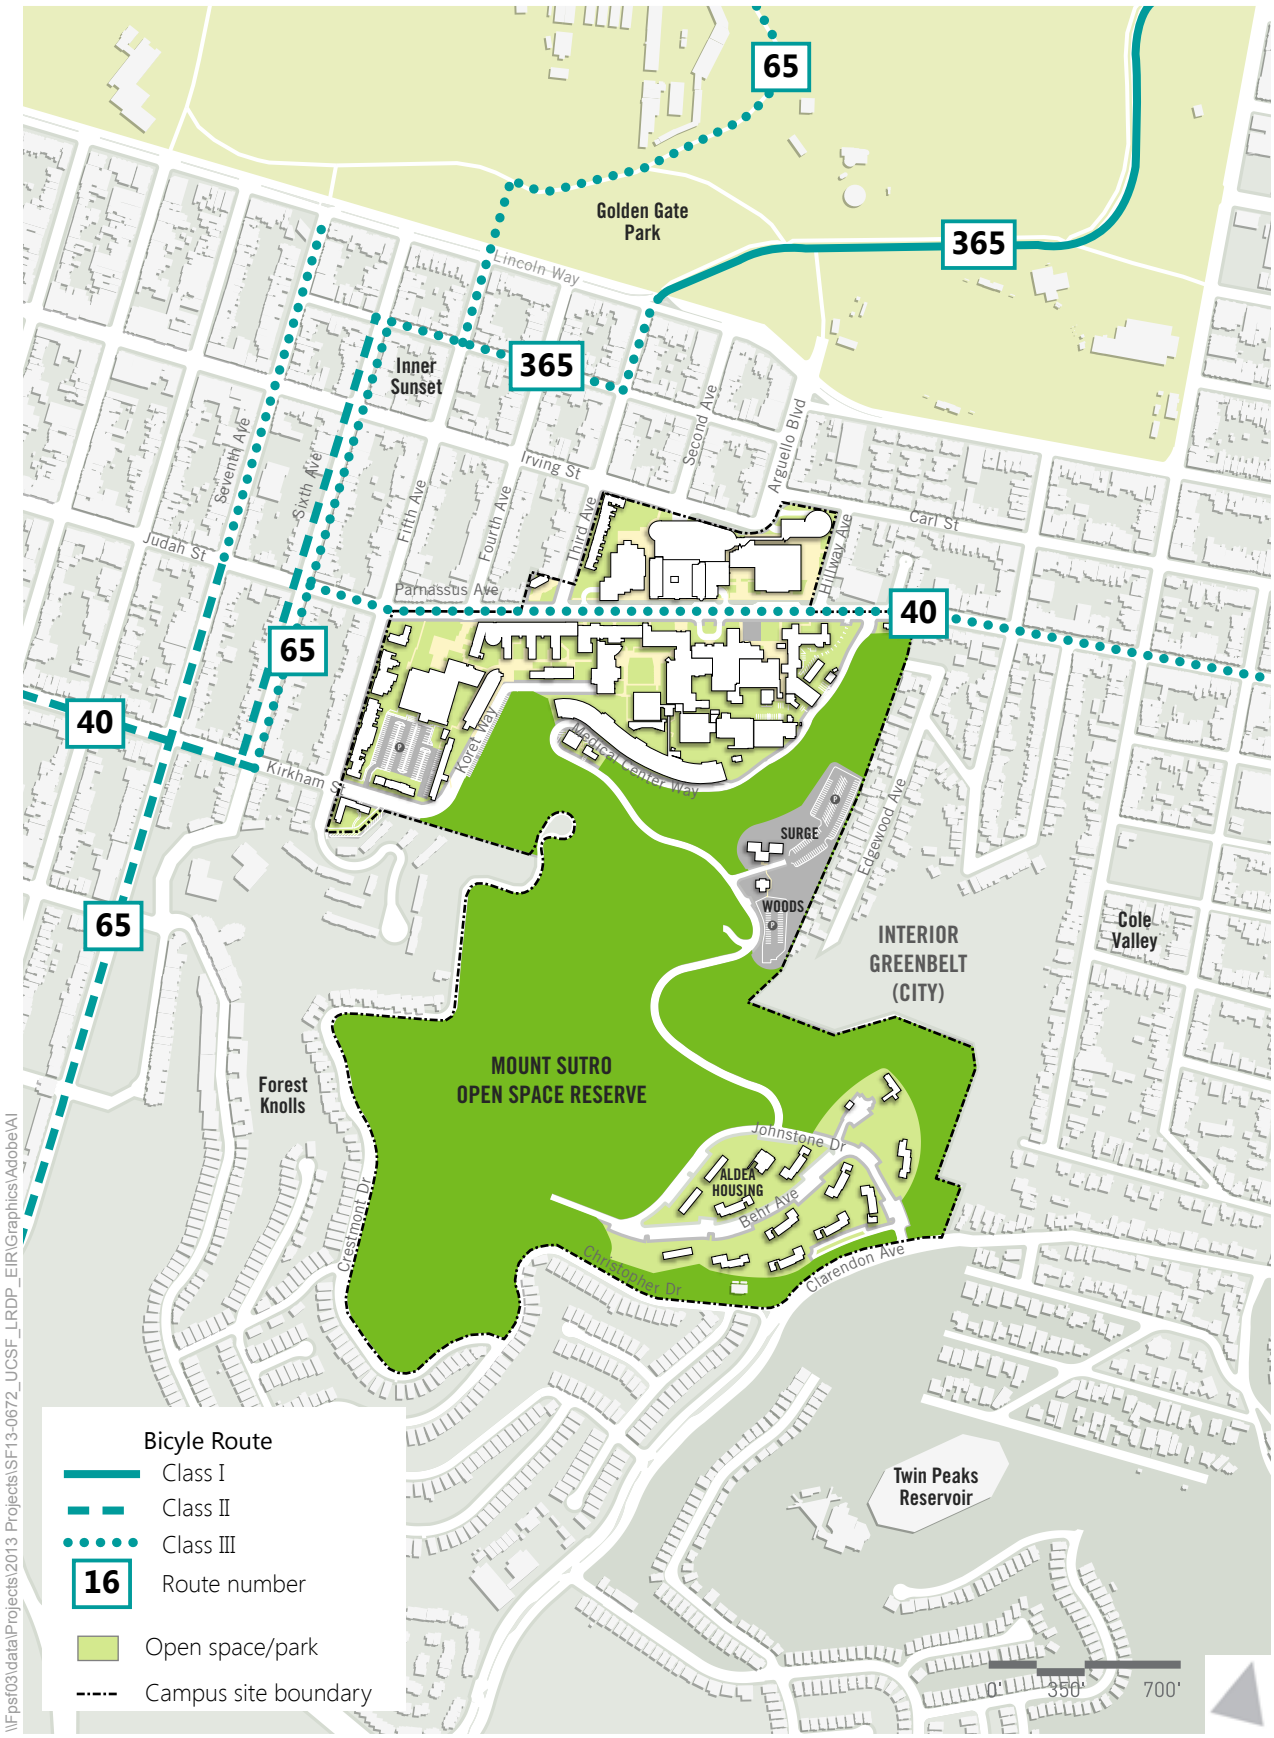


Figure 2-6

Existing Bicycle Facilities-
Parnassus Heights

Hugo Street is a short connector route from Seventh Avenue to Third Avenue and along Kezar Drive to the Golden Gate Park Panhandle serving San Francisco Bike Routes 65 and 365. Within the campus site on Hugo Street, it is a Class III bicycle route.

Seventh Avenue is part of San Francisco Bike Route 65, a north-south bicycle route extending from Golden Gate Park to Forest Hill. In the vicinity of the campus site, Seventh Avenue has Class II bicycle lanes in both directions south of Judah Street and sharrows between Judah Street and Golden Gate Park.

The SF Bike Plan does not include any short- or long-term improvements in the vicinity of the campus site.

Bicycle counts were collected along Parnassus Avenue, near Moffitt Circle, and Irving Street, near Second Avenue between 7:00 AM and 7:00 PM on a typical weekday in 2007 and again on Parnassus Avenue in 2013 during the same time period. In 2007, Irving Street/Carl Street, despite the fact that it has no official bicycle route designation, carried approximately four times as many bicycles as Parnassus Avenue, which is a designated bicycle route. In 2007, higher volumes along Irving Street and Carl Street were likely the result of the street being relatively flat compared to Parnassus Avenue or the result of the UCSF bicycle cage being located on the ground level of the Millberry Union Garage, which has an entrance at Second Avenue/Irving Street. In 2013, bicycle counts along Parnassus Avenue had increase four-fold when compared to 2007, paralleling the uptick in bicycle use throughout the city that has been reported by the SFMTA and seen anecdotally on key corridors, such as Market Street.

UCSF provides free, secured bicycle parking inside a bicycle cage in the Millberry Union Garage. There are bike racks at five additional locations throughout the campus: from east to west, they are at the Langley Porter Psychiatric Institute, the Ambulatory Care Center, the Kalmanovitz Library, the Clinical Science Building and the Dental Clinics Building. There are also on-street bicycle racks located along Parnassus Avenue; however, most bicyclists are encouraged (by signs) to park in the designated bicycle parking areas in the campus site buildings. During site visits conducted in 2013, all of the designated bicycle parking areas were parked at near capacity and numerous bikes were found to be parking on the street at parking meters and sign poles, indicating a high demand for bicycle parking facilities. Through the on-going monitoring of bicycle facilities, UCSF has since responded to user feedback about crowded bicycle parking facilities by doubling the capacity of the Millberry Union Garage bicycle cage and installing a new bike fix-it station.

2.3.6 Loading Conditions

The Parnassus Heights campus site has both service vehicle and passenger loading. There are 11 off-street service vehicle loading facilities serving the existing uses on the campus site, and summarized in **Table 2-8** and shown in **Figure 2-7**. Service vehicles may also load on-street on Parnassus Avenue.

Passenger loading takes place in the Moffitt Loop, located on Parnassus Avenue in front of Moffitt Hospital, or in passenger loading zones located along Parnassus Avenue.

TABLE 2-8: PASSENGER AND VEHICLE LOADING INFORMATION - PARNASSUS HEIGHTS

Building / Location	Loading Areas (Passenger or Vehicle)	# Vehicle Loading Spaces and Type	# Passenger Loading Spaces
Dental Clinics	Vehicle	1 parcel/truck space	--
Koret Vision	Vehicle	1 parcel/truck space	--
Nursing	Vehicle	2 parcel/truck spaces	--
Irving Dock	Vehicle	2 parcel/truck spaces	--
Moffitt Loop	Passenger	--	200 feet (10 spaces)
Millberry Tunnel	Vehicle	2 parcel/truck spaces	--
Central Receiving Area	Vehicle	3 parcel/truck spaces	--
Long Hospital	Vehicle	3 parcel/truck spaces	--
Dolby Regeneration Medicine	Vehicle	1 parcel/truck spaces	--
EHS	Vehicle	1 parcel/truck spaces	--
LPPI	Vehicle	1 parcel/truck spaces	--
On-Street Parnassus Ave	Vehicle /Passenger	250 feet (13 spaces) special truck loading zone (red designation) and 17 spaces general commercial metered (yellow designation)	140 feet (includes 5 valet spaces)
Total		47 parcel/truck spaces	340 feet

Source: UCSF, 2014

The loading area located on Parnassus Avenue in front of the Medical Building 1 (ACC) serves passenger vehicles, service vehicles, emergency vehicles, and is the drop-off location for valet service. This area in particular can become congested throughout the day, sometimes leading to vehicles blocking a lane of traffic as passenger and service loading occurs. Although all the loading areas shown in **Table 2-8** are used regularly for building deliveries, the Central Receiving Area and Long Hospital are typically the busiest locations throughout the day.

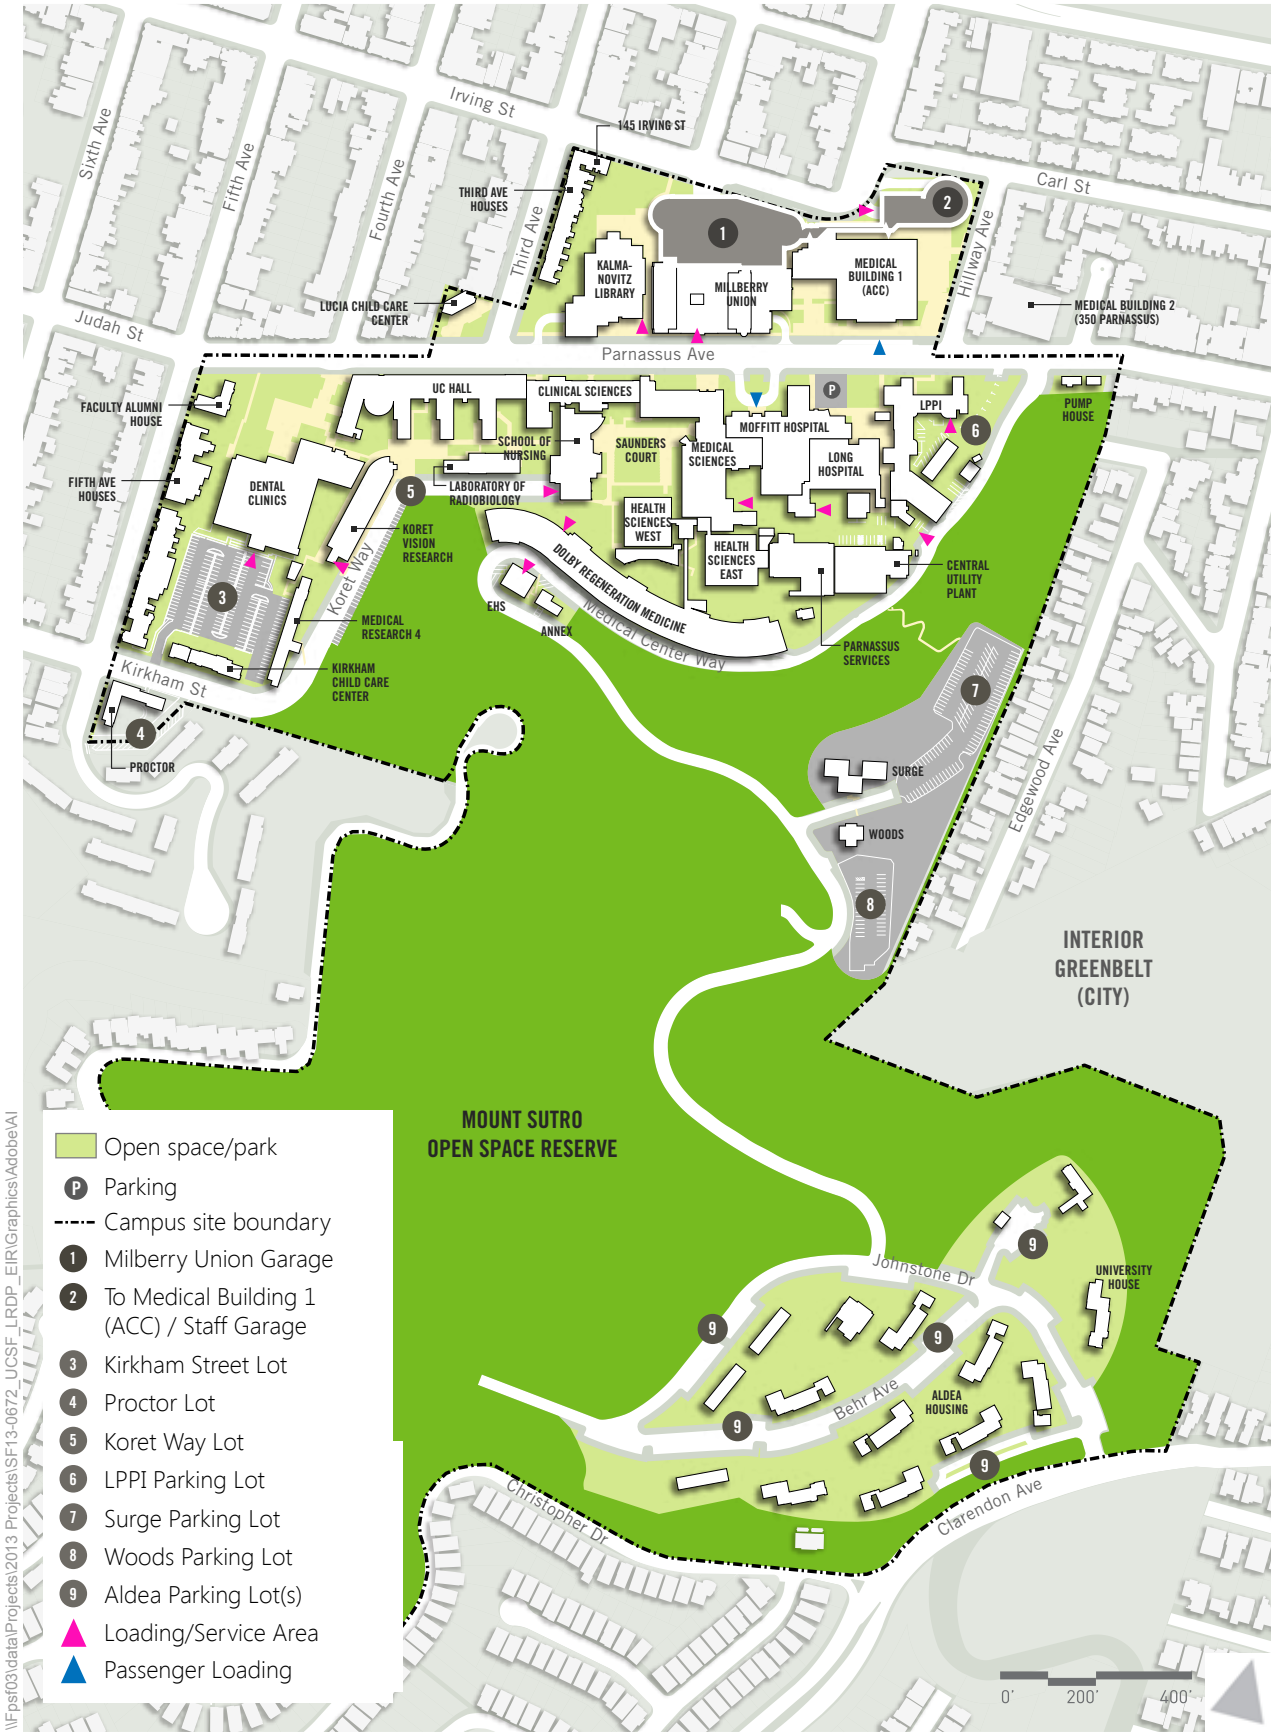

Figure 2-7

Existing Parking and Loading Locations-Parnassus Heights

2.3.7 Parking Conditions

2.3.7.1 On-Street Parking

Parking is available on most streets near the Parnassus Heights campus site. Most streets have parallel parking on both sides; however, due to the steep topography of the area, parking perpendicular to the direction of travel is provided on some streets. In such instances, parking is allowed on one side of the street only.

A variety of parking regulations apply to the on-street parking supply. The majority of the spaces are within the "J" Residential Parking Permit area (generally bounded by Lincoln Way and Haight Street, Clayton Street, Belgrave Avenue and Noriega Street, and 9th and 12th avenues), which restrict on-street parking Mondays through Friday, to a two-hour period between the hours of 8 am and 5 or 6 pm. Other parking spaces have meters and/or allow parking only during the non-peak commute periods.

Table 2-9 summarizes the on-street parking supply from a parking survey conducted in February 2014 for the area generally bounded by 6th Avenue, Lincoln Way, Stanyan Street, and Kirkham Street. Parking occupancies throughout the mid-morning (10 AM to noon), midday (noon to 2 PM), and evening (6 to 8 PM) periods is very similar, about 85 percent on average. The parking demand in this area is primarily associated with the UCSF campus site during the mid-morning and midday periods, and the residential and nearby neighborhood commercial uses during the evening period. These parking occupancies do not consider residents who park in their own driveways, which is typical in this area given the high parking demand.

2.3.7.2 Off-Street Parking

There are several UCSF-managed off-street parking facilities in the vicinity of the Parnassus Heights campus site that provide approximately 2,700 public and permit-only parking spaces. These include:

- Millberry Union / Kalmanovitz Library garage is a seven-level garage located between Judah Street and Irving Street with about a 1,075 vehicle capacity, of which approximately 1,000 spaces are available to the general public and the rest are reserved for UCSF faculty and staff. In addition, staff, faculty, and students may purchase monthly "afternoon" parking permits to park in this garage on weekdays from 2:30 PM to 8:00 AM and anytime on the weekend.
- Medical Building 1 (ACC) garage is located adjacent to the Millberry Union Garage, at the Irving Street/Arguello Boulevard intersection. It provides 1,007 marked parking spaces and can accommodate 330 additional vehicles with implementation of attendant parking. Permit parking is available for faculty, house staff, and senior management.
- Proctor surface lot is located south of Kirkham Street near the intersection of Fifth Avenue and provides 16 spaces available by permit.
- The Westside parking facility is a four-tier surface lot containing 151 parking spaces behind the Dental Clinics Building at Fourth Avenue and Kirkham Street, on the western edge of the campus site. Approximately 81 spaces are reserved for permit parking.
- Beckman surface lot contains 76 parking spaces and is located on Koret Way across from the Beckman Vision Center, 13 of those spaces are available for public parking.

TABLE 2-9: PARNASSUS HEIGHTS EXISTING ON-STREET PARKING SUPPLY AND OCCUPANCY [1]

Street Location	Overall Supply (spaces)	Occupancy [2]		
		Mid-Morning	Midday	Evening
North-South Streets				
6th Av, Lincoln Way to Kirkham St	131	74%	76%	76%
5th Av, Lincoln Way to Kirkham St	140	71%	79%	76%
4th Av, Lincoln Way to Judah St	85	89%	88%	89%
3rd Av, Lincoln Way to Judah St	82	89%	90%	82%

Kirkham St, 6th Av to 4th Av	55	95%	93%	33%
Total East-West Streets	**566**	**88%**	**88%**	**87%**
Total All Streets	**1,250**	**85%**	**84%**	**85%**

Notes:

1. Data collected in February 2014.
2. Values over 100% indicated illegal parking, such as double parked vehicles or vehicles stopped at a fire hydrant.

Source: Adavant Consulting.

- The Environmental Health and Safety Building has a 9-space surface parking lot, off Medical Center Way at the south edge of the campus site, available by permit.
- The Surge and Woods lots form a 158-space surface parking lot located off Medical Center Way above the Parnassus Heights campus site. Parking permits for this location are issued for staff.
- The Langley Porter Psychiatric Institute has a 21-space surface parking lot, off Medical Center Way at the eastern edge of the campus site, available by permit.

- The Emergency Room parking area is accessed off Parnassus Avenue at the southeast end of the campus site and provides 23 parking spaces reserved for ambulances, emergency patients, and for designated radiation and chemotherapy patients.
- Aldea surface parking lots are located within the Aldea San Miguel Housing Area in the southern portion of the campus site and contain 192 parking spaces reserved to UCSF residents.

In addition, the Kezar surface lot is a city-owned parking facility adjacent to Kezar Pavilion on Stanyan Street. UCSF has about 200 spaces reserved for staff and faculty use during the day. UCSF shuttle bus service is provided between the lot and the campus site during normal business hours every 10 to 20 minutes on average.

Table 2-10 summarizes the off-street parking supply and occupancy at the major parking facilities at the Parnassus Heights campus site. Parking surveys were conducted in February 2014 for the weekday mid-morning (10 AM to noon), midday (noon to 2 PM), and evening (6 to 8 PM) periods. As shown in the table, the overall occupancy of the spaces in the surveyed parking facilities is about 88 percent between 10 AM and 2 PM, and about 50 percent between 6 and 8 PM. An occupancy above 90 percent typically represents that the facility is at its effective capacity.

TABLE 2-10: PARNASSUS HEIGHTS EXISTING OFF-STREET PARKING SUPPLY AND OCCUPANCY [1]

Major Parking Facility	Overall Supply (spaces)	Occupancy		
		Mid-Morning	Midday	Evening
UCSF Facilities				
Millberry Union Garage	1,075	83%	87%	68%
Medical Building (ACC) Garage	1,007	90%	87%	43%
Westside Surface Lot	151	91%	84%	37%
Surge and Woods Surface Lots	158	79%	79%	19%
Total UCSF Parking Facilities	**2,391**	**86%**	**86%**	**52%**
Other Parking Facilities				
Kezar Surface Lot	306	100%	89%	58%
All Facilities	**2,697**	**88%**	**87%**	**53%**

2.4 MISSION BAY

2.4.1 Roadway Facilities

This section describes the regional and local roadway system for the Mission Bay campus site. Approximately 39 percent of those traveling to and from the campus site drive alone, are dropped off, or carpool/vanpool. The campus site sits within the Mission Bay redevelopment area and is bordered by the South of Market (SoMa) neighborhood to the north, Potrero Hill to the west and the Dogpatch to the south. The primary north-south corridors are Third Street, Fourth Street, and Seventh Street and the primary east-west corridors are 16th Street and Mariposa Street. The street network providing access to the Mission Bay campus site is shown in **Figure 2-2**.

2.4.1.1 Regional Access

Regional access to the Mission Bay campus site is provided by several major freeways, as discussed below.

I-280 is a six-lane freeway located adjacent to the Mission Bay campus site to the west and connects San Francisco to the South Bay. I-280 connects to U.S. 101 south of the campus site. Access to I-280 is provided at the on-and off-ramps at Mariposa and 18th streets.

I-80 is a six-lane freeway located approximately one mile northwest of the campus site and connects San Francisco to the East Bay and other points east via the San Francisco-Oakland Bay Bridge. I-80 connects to U.S. 101 west of the campus site. Access to I-80 is provided via Third and Seventh streets to on- and off-ramps in the SoMa neighborhood.

U.S. 101 is an eight-lane freeway located approximately one mile west of the campus site. U.S. 101 connects San Francisco with the peninsula and the South Bay to the south and with the North Bay to the north via the Golden Gate Bridge. U.S. 101 connects to I-80 east of the Mission Bay campus site. Access to U.S. 101 is provided via I-280 in the southbound direction and via 16th Street to South Van Ness in the northbound direction.

2.4.1.2 Local Access

Local access to the Mission Bay campus site is provided by an urban street grid network. Key local roadways through the campus site are summarized below and defined according to roadway classifications identified in the San Francisco General Plan Transportation Element.

Third Street is a four-lane north-south Primary Transit Important roadway that extends from Market Street to Bayshore Boulevard. Near the Mission Bay campus site, on-street parking is prohibited on both sides of the street. Third Street is designated as a Class III bicycle route with sharrows between King Street and Terry A François Boulevard in the northbound direction only. The T Third Street light rail line operates along Third Street between Channel Street and Bayshore Boulevard along a physically separated median in the roadway.

Fourth Street is a two-lane north-south Primary Transit Important roadway that extends from Market Street to 16th Street. On-street parking is provided on both sides of the street. Fourth Street is designated as a Class III bicycle route as it crosses Mission Creek, after which it transitions into Class II bicycle lanes

between Channel Street and 16th Street. The T Third Street light rail line operates on Fourth Street between King Street and Channel Street.

Seventh Street is a two-lane north-south Secondary Arterial roadway that extends from Market Street to 16th Street. On-street parking is provided on both sides of the street between Irwin Street and 16th Street. Seventh Street has Class II bicycle lanes between Brannan and 16th streets.

16th Street is a four-lane east-west Secondary Arterial roadway with left turn pockets that extends from Third Street to Castro Street. Within campus site study area, on-street parking is prohibited on both sides of the street. 16th Street has Class II bicycle lanes in both directions between Third Street and Kansas Street.

Mission Bay Boulevard North and South are a one-lane one-way east-west couplet Local Street that extends from Terry A François Boulevard to Fourth Street; right-turn only lanes are provided at intersections. It is located at the northern edge of the Mission Bay campus site and will be eventually extended to connect to the Mission Bay Circle in the future, located approximately 1,300 feet to the west, as part of the Mission Bay Redevelopment Plan. On-street parking is provided on the north side of the Mission Bay Boulevard North.

King Street is a five to six-lane east-west Primary Transit Important roadway that extends from Second Street to Fifth Street and the I-280 freeway. On-street parking is provided for half of a block between Second and Third streets and Third and Fourth streets in the westbound direction and for a quarter of a block between Fourth and Fifth streets. The N Judah and T Third Street light rail lines operate along the entirety of King Street within a physically separated median in the roadway.

Berry Street is a two-lane east-west Local Street that extends from Third Street to Owens Street. Berry Street operates as an eastbound one-way street between Third and Fourth streets. On-street parking is provided primarily in the eastbound direction, though there are some areas that have on-street parking on both sides of the street.

Channel Street is a four-lane east-west Local Street that currently extends from west of Fourth Street to Third Street. On-street parking is prohibited on both sides of the street between Third and Fourth streets, and permitted west of Fourth Street. The T Third Street rail line operates on Channel Street between Third and Fourth streets within a physically separated median in the roadway. Channel Street will be extended to the Mission Bay Circle in the future, as part of the Mission Bay Redevelopment Plan.

Mission Rock Street is a two-lane east-west Local Street that extends from Terry A François Boulevard to Fourth Street. On-street parking is provided on both sides of the street.

Mariposa Street is a four-lane east-west Local Street that extends from Illinois Street to Harrison Street that is located at the southern edge of the Mission Bay campus site. The I-280 on- and off-ramps (southbound and northbound, respectively) are located immediately east of the intersection of Pennsylvania and Mariposa streets. Both sides of the street provide on-street parking. In addition, Mariposa Street is a designated Class III bicycle route with sharrows between Illinois Street and Mississippi Street.

Owens Street is currently a two-lane north-south Local Street that extends from 16th Street to the Mission Bay Circle along the western edge of the Mission Bay campus site. On-street parking is prohibited on both

sides of the street. It will be restriped to four lanes each way as part of the Mission Bay Redevelopment Plan.

Mission Bay Drive is a four-lane Local Street that extends from the Mission Bay Circle to Seventh Street under the I-280 freeway and across the Caltrain railroad tracks; the eastbound and westbound travel lanes are separated by a landscaped median. On-street parking is prohibited and Class II bicycle lanes are provided on both sides of the street.

Mississippi Street is a north-south roadway that runs discontinuously between 16th/Seventh and César Chávez streets. In the vicinity of the Mission Bay campus site, Mississippi Street has one traffic lane each way; it is a City-designated Class II bicycle facility between 16th and Mariposa streets.

2.4.1.3 Proposed Local Roadway Changes

The 1998 Mission Bay South Area Plan proposed substantial changes to the roadway infrastructure in the vicinity of the Mission Bay campus site that are to be constructed as the area develops. Of all of these, the following infrastructure improvements are to be implemented by the Mission Bay Development Group (MBDG, the infrastructure master developer), as part of the opening of the Phase One Medical Center at Mission Bay in February 2015:

- Owens Street will be extended from 16th Street to Mariposa Street, to connect with the I-280 on- and off-ramps and to create a new intersection at Mariposa Street. The existing signal at the intersection of Mariposa Street and the I-280 northbound off-ramp will be upgraded to accommodate the new Owens Street approach.
- Mariposa Street will be widened on the north side from Owens Street to Illinois Street by approximately 15 feet, and left turn lanes will be provided at major intersections. The Mariposa Street Bridge over the Caltrain tracks will be restriped to provide two exclusive left turn lanes in the westbound direction for a total of three lanes, and create a new signalized intersection with Owens Street.
- The northbound I-280 off-ramp will be widened to the east to provide an additional lane and better align with Owens Street. Mariposa Street between the I-280 southbound on-ramp and Pennsylvania Avenue will be re-striped to accommodate the lane configurations described above.
- The existing STOP-sign controlled intersection of Mariposa Street and the I-280 southbound on-ramp will be signalized; the new signal will be interconnected with the existing signal at the off-ramp.

2.4.2 Intersection Operating Conditions

The following 21 study area intersections were selected for analysis through consultation with UCSF Campus Planning and San Francisco Planning Department staff. These study intersections are shown in **Figure 2-2**.

24. King Street/Third Street
25. King Street/Fourth Street
35. 16th Street/Fourth Street
36. 16th Street/Owens Street

26. Brannan Street/Seventh Street
27. Channel Street/Third Street
28. Channel Street/Fourth Street
29. Mission Rock Street/Third Street
30. Mission Bay Boulevard North/Third Street
31. Mission Bay Boulevard South/Third Street
32. Mission Bay Drive/Owens Street
33. Mission Bay Drive/Seventh Street
34. 16th Street/Third Street
37. 16th Street/Seventh Street
38. 16th Street/Rhode Island Street
39. 16th Street/Vermont Street
40. 16th Street/Potrero Avenue
41. Mariposa Street/Third Street
42. Mariposa Street/Fourth Street
43. Mariposa Street/I-280 Northbound Ramps
44. Mariposa Street/I-280 Southbound Ramps

Figure 2-8A and **Figure 2-8B** display the existing AM and PM peak hour traffic volumes, lane configurations and traffic controls at each of the 21 study intersections. Intersection turning movement counts at the study intersections were collected in November 2011 and May 2013 on mid-week and non-holiday days when schools were in session. Intersection turning movement count sheets are provided in **Appendix D**.

42. Mariposa Street / Fourth Street	Signal	AM PM	<10 11	A B
43. Mariposa Street / I-280 Northbound Ramp	Signal	AM PM	**73** 31	**E** C

TABLE 2-11: EXISTING PEAK HOUR INTERSECTION LEVEL OF SERVICE - MISSION BAY

Intersection	Traffic Control[1]	Peak Hour	Vehicle Delay[2] (seconds)	LOS[3]
44. Mariposa Street / I-280 Southbound Ramp	SSS	AM PM	**>50** **>50**	**F** **F**

Notes:

1. AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
2. Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersection, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach.
3. For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For an unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
4. **Bold** indicates unacceptable operations per UCSF LOS standards

Source: Fehr & Peers, 2014.

The following intersections operate at LOS E or F during the AM or PM peak hours:

- King Street and Third Street (Intersection #24) operates at LOS E during the PM peak hour due to the high conflicting traffic volumes on the westbound through and eastbound left turning movements on King Street.
- Mariposa Street and the I-280 Northbound Off-Ramp (Intersection #43) operates at LOS E during the AM peak hour due to the volume of traffic exiting I-280 via the off-ramp.
- Mariposa Street and the I-280 Southbound On-ramp (Intersection #44) operates at LOS F during the AM and PM peak hours, respectively, due to the high conflicting volumes on east and westbound Mariposa Street attempting to access I-280 via the Southbound On-ramp.

2.4.3 Transit Network

The Mission Bay campus site is well-served by both local and regional public transit. Local service is provided by Muni bus and light rail lines. Regional service is provided by BART, AC Transit, Golden Gate Transit, SamTrans, and Caltrain. In addition, there are two shuttle systems that provide service to the Mission Bay campus site: the UCSF shuttle system, as discussed in sections 2.2.1 and 2.3.3.3, and two shuttle lines operated by the Mission Bay Transportation Management Association (MBTMA). These shuttles supplement Muni transit service and provide direct connections to UCSF-operated facilities throughout San Francisco and the Powell Street BART station. Approximately 19 percent of those traveling to and from the campus site use public transit, while another approximately 29 percent rely on UCSF shuttles to get to and from the campus site. **Figure 2-9** presents the transit routes in the vicinity of the campus site.

2.4.3.1 San Francisco Muni

Table 2-12 presents the Muni routes serving the campus site within an approximately half-mile walk and **Table 2-13** presents the peak hour muni ridership for these routes.

TABLE 2-12: LOCAL MUNI OPERATIONS - MISSION BAY

Route	AM Peak Weekday Headways (7-9AM)[1]	PM Peak Weekday Headways (4-6PM)[1]	Hours of Operation	Neighborhoods Served by Route	Nearest Stop Location	Distance to Campus Site (feet)
T Third Street	9	9	4:00AM – 1:30AM	Financial District, Visitacion Valley	Third Street and Gene Friend Way	0
10 Townsend	20	20	5:00AM – 8:30PM	Pacific Heights, Potrero Hill	De Haro Street and 16th Street	2,600
22 Fillmore	9	8	2:00AM – 2:00AM	Marina District, Dogpatch	Connecticut Street and 17th Street	2,000

Notes:
1. Headway in minutes.

TABLE 2-13: PEAK HOUR MUNI RIDERSHIP - MISSION BAY

Route	AM Peak Ridership at MLP[1] (Inbound / Outbound)	AM Peak Capacity Utilization at MLP[1] (Inbound / Outbound)[2]	PM Peak Ridership at MLP[1] (Inbound / Outbound)	PM Peak Capacity Utilization at MLP[1] (Inbound / Outbound)[2]
T Third Street	735 347	**88%**[3] 42%	365 550	44% 77%
10 Townsend	141 165	75% **87%**[5]	186 171	**98%**[4] **90%**[6]
22 Fillmore	293 287	70% 68%	323 308	68% 65%

Notes:

1. Maximum load point, which is the point at which the route has the maximum number of passengers relative to capacity, is identified for those lines operating above or near 85 percent.
2. **Bold** indicates capacity utilization of 85 percent or greater, which is a typical crowding standard used by transit agencies.
3. MLP located at The Embarcadero/Brannan Street.
4. MLP located at Pacific Avenue/Powell Street.
5. MLP located at Pacific Avenue/Taylor Street.
6. MLP located at Second Street/Howard Street.

Figure 2-9

Existing Transit Service-Mission Bay

2.4.3.1.1 Recent and Proposed Changes to Transit Service

Proposed changes to transit service in in the vicinity of the Mission Bay campus site include the currently under-construction Central Subway Project and proposed TEP route changes.

The Central Subway Project is the second phase of the Third Street light rail line (i.e., T Third), which opened in 2007. Construction of the underground segment from Bryant to Clay Street is currently underway, and the Central Subway will extend the T Third line northward from its current terminus at Fourth and King streets to a surface station south of Bryant Street and go underground at a portal under I-80. From there it will continue north to stations at Moscone Center, Union Square, where it will provide passenger connections to the Powell Street Station and BART—and in Chinatown, where the line will terminate at Stockton and Clay streets. Construction of the Central Subway is scheduled to be completed in 2017, and revenue service is scheduled for 2019. This project would improve transit service between the Mission Bay campus site and Downtown.

The following changes are proposed by the TEP for routes in the vicinity of the Mission Bay campus site.

- **T Third Street** – The TEP proposes reducing peak period headways from 9 to 8 minutes.
- **10 Townsend** – The TEP proposes to rename the 10 Townsend the 10 Sansome. Service would be rerouted off of Townsend down Fourth Street. From Fourth Street the route would extend through Mission Bay to new proposed street segments on Seventh Street between Mission Bay Boulevard and Irwin Street, on Irwin Street between Seventh and 16th streets, on 16th Street between Irwin and Connecticut streets, and on Connecticut Street between 16th and 17th streets. Peak period headways would be reduced from 20 to 6 minutes. Midday headways would be reduced from 20 to 12 minutes.
- **22 Fillmore** – The TEP proposes rerouting the 22 Fillmore to continue along 16th Street, creating new connections to Mission Bay from the Mission neighborhood. The proposed route change would add transit to 16th Street between Kansas Street and Third Street and Third Street between 16th Street and Mission Bay Boulevard North. The TEP also proposes to change the AM peak period headway, reducing from 9 minute to 6 minute headways.

  Additionally, the SFMTA has proposed two transit enhancement treatment visions for 16th Street, of which one or a combination of the two will be selected by the SFMTA Board prior to implementation. The treatments are referred to as the Moderate and Expanded Alternatives in the TEP EIR. The Moderate Alternative proposes a number of physical changes to the portion of the rerouted 22 Fillmore in the vicinity of the Mission Bay campus site including, but not limited to, new transit stops, relocated transit stops, and transit bulbs (approximately 45 feet in length), as well as new traffic signals at Connecticut and Missouri streets. The Expanded Alternative includes the features listed for the Moderate Alternative as well as the conversion of a lane of mixed-flow lane of traffic to a transit-only lane along 16th Street in both directions both within and in the vicinity of the campus site as well as the prohibition of left turns at Bryant, Potrero (westbound only), Utah, San Bruno, Kansas, Rhode Island, De Haro, Carolina, Wisconsin, Arkansas, Connecticut, and Missouri streets. Both alternatives would reduce peak period headways; AM would be reduced from 9 to 6 minutes, PM peak headways would be reduced from 8 to 5.5 minutes, and

midday headways would be reduced from 10 to 7.5 minutes. The stated purpose of both alternatives is to make the 22 Fillmore more frequent, reliable, and effective along 16th Street.

Prior to the extension of the 22 Fillmore into Mission Bay via either the Moderate or Expanded Alternative, which both require the extension of overhead wire, the SFMTA proposes to implement a temporary motor coach service to coincide with the opening of the Phase One Medical Center at Mission Bay between the campus site and the 16th Street BART Station until the 22 Filmore can be extended into Mission Bay. The preliminary name for this interim service is the Muni line '55 16th Street' which is shown in **Figure 2-10**. The route would follow 16th Street between Mission Street to Third Street and Third Street from 16th Street to Mission Bay Boulevard North. The preliminarily proposed locations for new bus stops for this service in the vicinity of the campus site are on 16th Street at Fourth Street (both directions) and on Third Street just south of Mission Bay Boulevard South (southbound direction). The operating hours and service frequencies of the proposal have not yet been made public at the time of publication of this document.

2.4.3.2 Regional Transit Service

Table 2-14 presents the regional transit routes serving the Mission Bay campus site and route characteristics as of December 2013, including service frequencies during the weekday morning and evening peak periods, hours of operations and neighborhoods served.

Golden Gate Transit, AC Transit, SamTrans, and BART riders would transfer to Muni to access the Mission Bay campus site. The Caltrain station closest to the Mission Bay campus site is located at Fourth and King streets, which is six blocks (approximately 2/3 mile) from the campus site. Caltrain service headways during the AM and PM peak periods are between 10 and 20 minutes for the peak direction, depending on the type of train (e.g., local, limited, or express "Baby Bullet"). The peak direction of service is southbound in the AM peak period and northbound in the PM peak period. Headways in the non-peak direction are typically once per hour. In addition, the 22nd Street station is located directly underneath I-280 four blocks (approximately 3/4 mile) from the campus site and is served by local, limited, and "Baby Bullet" trains.

Caltrain is proposing to implement a Modernization Program that will electrify the railway to provide upgraded performance and allow more efficient operations and a higher capacity. The Program is scheduled to be complete by 2019. Currently Caltrain crosses 16th Street at grade at the intersection of 16th Street/Seventh Street/Mississippi streets. There are currently 10 trains per hour during peak periods and the Modernization Program will allow the number of trains to increase to 12 trains per hour. Additionally, Caltrain is anticipating a "blended system" which will see California High Speed Rail trains running alongside Caltrain on the same tracks. The blended system may require a grade separation at 16th/Seventh/Mississippi streets. Electrification of Caltrain (and the associated improved travel times and frequencies) as well as the introduction of High Speed Rail may improve regional transit access to the Mission Bay campus site.

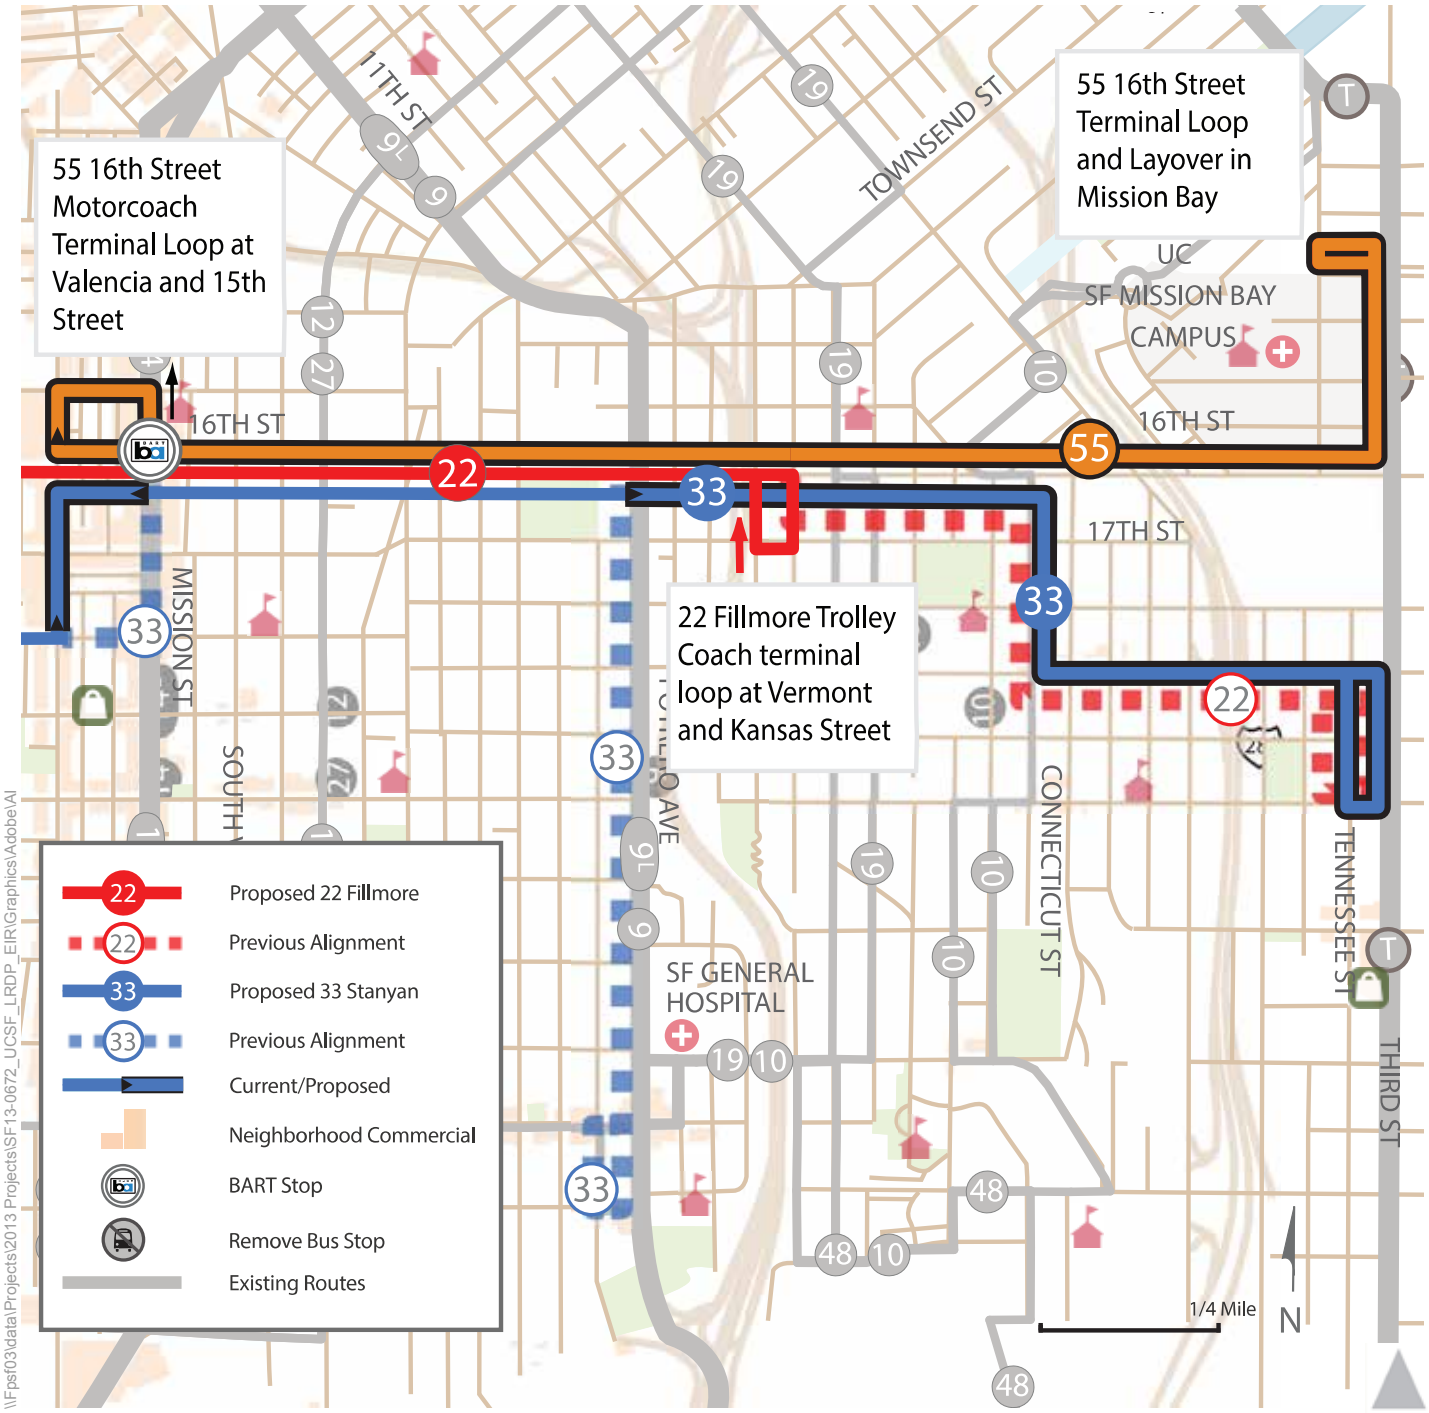

Figure 2-10

Muni Line '55' Interim Service Proposal

TABLE 2-14: REGIONAL TRANSIT OPERATIONS - MISSION BAY

Route	AM Peak Weekday Headways (7AM-9AM)[1]	PM Peak Weekday Headways (4PM-6PM)[1]	Hours of Operation	Areas Served by Route	Nearest Stop Location	Distance to Campus Site
Caltrain Local	-	-	4:30AM-12:01AM (IB) 4:55AM-1:32AM (OB)	San Francisco, San Jose	Fourth / King	0.6 miles
Caltrain Limited-Stop	10-20	20-60	5:50AM-8:00PM (IB) 6:11AM-8:19PM (OB)	San Francisco, San Jose	Fourth / King	0.6 miles
Caltrain Baby Bullet	10-40	20-40	5:45AM-7:24PM (IB) 6:57AM-7:39PM (OB)	San Francisco, San Jose	Fourth / King	0.6 miles
BART	5-15	5-15	4:00AM-12:00AM (IB/OB)	East Bay, San Francisco, San Mateo County	16th / Mission	1.5 miles
AC Transit	15-20	15-20	12:00AM-12:00AM(IB/OB)	East Bay, San Francisco	Beale between Folsom / Howard	1.5 miles
SamTrans Route 292	10-15	20	3:55AM-2:28AM (IB) 4:30AM-12:00AM (OB)	San Mateo County, SFO, San Francisco	Potrero / 24th	1.3 miles
GGT commuter and basic bus routes	15-90	15-90	4:01AM-12:41AM (IB) 5:06AM-2:28AM (OB)	North Bay, San Francisco	Seventh / Folsom	1.1 miles

2.4.3.3 UCSF Shuttle System

Table 2-15 summarizes the UCSF shuttle routes serving the campus site. Shuttles to and from the Mission Bay campus site stop at shuttle zones along Fourth Street in front of the Koret Quad and in front of the parking lot located near Campus Way, as shown on **Figure 2-9**. These stops are designated by UCSF Transportation Services and reviewed/approved by SFMTA. UCSF shuttles were not observed to interfere with Muni operations at the Mission Bay campus site.

UCSF shuttle stop at Mission Bay campus site.

TABLE 2-15: UCSF SHUTTLES - MISSION BAY				
Route	**Campuses Served**	**Hours of Operation**	**Headways (minutes)[1]**	**Average Weekday Boardings**
Gold	Parnassus-Mt. Zion-Mission Bay-SFGH	5:45 AM – 9:25 PM	15/20	924
Blue	Parnassus-SFGH-Mission Bay-Mt. Zion	5:35 AM – 8:47 PM	15/20	996
Grey	Parnassus-Mission Bay	6:30 AM – 10:00 PM	20	1,470
Red	Mission Bay-MCB-16th BART	5:55 AM – 7:45 PM	10/15	808
Green	Mission Bay-China Basin-654 Minnesota	6:25 AM – 6:40 PM	15	499

Notes:

1. Multiple values indicate variability in headways during the day.

Sources: UCSF Campus Life Services Transportation, Routes & Timetables, 2014; Ridership data from *UCSF Shuttle Operations Study, Final Report*, January 2014, prepared by Nelson Nygaard.

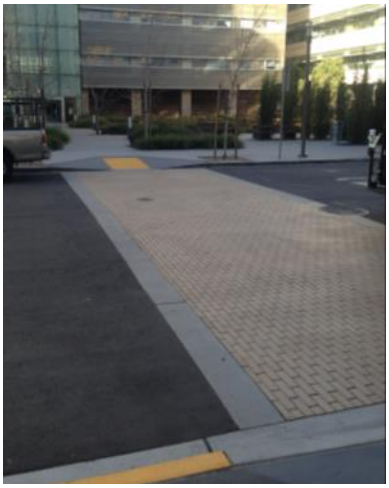
2.4.3.4 Mission Bay Transportation Management Association

The Mission Bay Transportation Management Association (MBTMA), formed several years ago in conformance with mitigation measures identified in the Mission Bay Plan SEIR, provides two shuttle bus route services (east and west) between Mission Bay and the Powell Street BART Station and the Fourth/King Caltrain Station; they are free of charge and open to all employees, residents, and visitors to the Mission Bay Area and the China Basin building at 185 Berry Street. The west route serves Seventh and Owens streets, while the east route serves Fourth Street and Mission Bay Boulevard; both operate at 15-minute intervals from 7:00 to 10:00 AM and 3:45 to 8:15 PM.

2.4.4 Pedestrian Circulation

Approximately six percent of those traveling to and from the campus site walk.

Due to the developing nature of the Mission Bay neighborhood, pedestrian volumes are currently relatively low surrounding the campus site. Pedestrian activity is generally higher towards the center of the campus site along Fourth Street and the many pedestrian alleyways and plazas such as Gene Friend Way and Campus Way. Pedestrian counts indicate that approximately 240 pedestrians cross at Fourth Street and Campus Way during the AM and PM peak hours. Pedestrian activity is also higher around transit hubs such as the UCSF shuttle stop on Fourth Street south of Gene Friend Way and the T Third Street light rail stops on Third Street at Gene Friend Way.



Decorative mid-block crosswalks decrease pedestrian walking distances on large blocks

Within the campus site area, sidewalks generally exist on both sides of the street in most locations, and are generally 12 to 15 feet wide. There are sidewalks gaps along roadway frontages of the campus site that are currently under construction including the south site of 16th Street between Seventh and Third streets and the west side of Third Street between 16th and Mariposa streets. These sidewalk gaps will be closed upon completion of construction of the adjacent buildings. All intersections surrounding the

campus site include standard painted crosswalks and directional curb ramps. Pedestrian median refuges are provided along Fourth Street to slow traffic and reduce the pedestrian exposure time while crossing the street. Pedestrian signals with count down timers are provided at all signalized intersections. In addition, to the on-street pedestrian facilities, there are numerous public pedestrian alleyways and plazas that reduce the size of the city blocks for pedestrians. This provides a fine-grained pedestrian oriented network and reduces pedestrian walking distances throughout the campus site.

2.4.5 Bicycle Circulation

The topography within and around the Mission Bay campus site is flat, which facilitates easy bicycle travel. Approximately seven percent of those traveling to and from the campus site bike. This is approximately three times greater than the bicycling mode share throughout San Francisco. Several bikeways run within the vicinity of the campus site, as shown in **Figure 2-11**.

The following bicycle facilities are located within or near the Mission Bay campus site:

King Street is part of San Francisco Bike Route Five and is a short east-west bike route that travels in front of AT&T Park between Second and Third streets with Class II bicycle lanes. The bike lane ends mid-way between Second and Third streets and turns into a Class III facility with sharrow markings. The route ends at Third Street.

16th Street is part of San Francisco Bike Route 40 and is an east-west bike route that extends from Terry A Francois Boulevard to Kansas Street. Between Third Street and Kansas Street, 16th Street has Class II bicycle lanes in both directions. Between Terry A Francois Boulevard and Third Street, 16th Street is currently designated as a Class III bicycle facility, and will be upgraded to a Class II facility as a part of the Mission Bay South Infrastructure Plan.

Figure 2-11

Existing Bicycle Facilities-
Mission Bay

Mariposa Street is part of San Francisco Bike Routes 7 and 23 and is an east-west bike route that extends from Illinois Street to Mississippi Street as a Class III bicycle facility with sharrow markings. At its eastern terminus, Mariposa Street connects to the Class II bicycle lanes on Terry A Francois Boulevard, while on its western terminus it connects to the Class II bicycle lanes that continue north on Mississippi Street.

Third Street is part of San Francisco Bike Route 5 and is a short north-south bike route that extends from King Street to Terry A Francois Boulevard and is designated as a Class III bicycle facility with sharrows. At its southern terminus, Third Street connects to the Class II bicycle lanes on Terry A Francois Boulevard.

Fourth Street is a north-south bike route that extends from Berry Street to 16th Street. Fourth Street is designated as a Class III bicycle facility as it crosses Mission Creek until Channel Street, south of which it has Class II bicycle lanes. The Fourth Street bikes lanes provide the primary bicycle access through the Mission Bay campus site.

Seventh Street is part of San Francisco Bike Route 23 and is a north-south bike route that extends from Brannan Street to 16th Street with Class II bicycle lanes.

Bike lanes on Fourth Street through the center of Mission Bay campus site.

Mississippi Street is part of San Francisco Bike Route 23 and is a north-south bike route that extends from 16th Street to Mariposa Street with Class II bicycle lanes.

Mission Bay Drive is a east-west bike route that extends from the Mission Bay Circle to Seventh Street. It is designated as a Class II bicycle facility that provides bicycle access across the Caltrain tracks into the Mission Bay campus site. The *San Francisco Bike Plan* (June 2009) ("Bike Plan") includes a planned bikeway near/along Mission Creek between Fourth Street and Harrison Street, which is listed as a long-term project in the Bike Plan.

Bicycle counts indicate the most popular bicycling route through the campus site is Fourth Street, where between 40 and 50 bicyclists were observed during the AM and PM peak hours. Campus Way is also a popular connection into the campus site from 16th Street with 10-20 bicyclists observed crossing Owens Street at Campus Way during the AM and PM peak hours.

Bicycle racks are provided throughout the Mission Bay Campus Site in front of campus buildings, on-street, and within the Community Center garage on Owens Street. Popular bicycle parking locations such as the gym were observed to be nearly fully occupied during a site visit in February 2014. In an effort to increase bike parking here at the Mission Bay Campus Site to meet the growing demand, while also taking into account the feedback received from bicyclists, UCSF has since redesigned and expanded the bike parking throughout the campus site. This included new racks that double the amount of bike parking available in each area of installation, while providing equal access to all bicycle frame shapes and sizes.

2.4.6 Loading Conditions

Commercial loading zone on Nelson Rising Lane.

The Mission Bay campus site has both service vehicle and passenger loading. There are six off-street service vehicle loading facilities serving the existing uses on the campus site, and summarized in **Table 2-16** and shown in **Figure 2-12**. Passenger and service vehicles may also load on-street at marked zones on Fourth Street, Nelson Rising Lane, Mission Bay Boulevard South, and adjacent to the Gladstone Institutes building.

Based on 2010 monthly security data, the Helen Diller Cancer Research building receives approximately 100 deliveries each month, resulting in approximately three to four deliveries per day. The four loading spaces are sufficient for existing operations. On occasion, the Rutter Center requires deliveries of materials for special events, but on average this is no more than one additional truck delivery per day of the event, which is accommodated in the existing loading spaces. Daily deliveries are typical for the Café and laundry services for the recreation center, resulting in a minimum of three deliveries per day. The two loading spaces are sufficient for existing operations.

The loading area at Genentech Hall, receives approximately 20 deliveries each day for Genentech Hall and the adjacent Byers Hall. The six parcel spaces are comprised of four dock spaces and two small delivery van spaces. Based on the existing delivery operations, the six spaces are sufficient for current operations.

In general, existing loading areas provide a sufficient amount of space for passenger and vehicle loading based on feedback from UCSF Facilities Services. No delivery vehicles were observed double parking or using other facilities. Some passenger loading vehicles used empty metered parking spots for pick-up and/or drop-off because of proximity to destination.

Future loading areas may be provided at the Research CUP/EH&S Building. The Third Street Garage may include some loading spaces which are currently used for permit parking and UCPD emergency supplies. Mission Hall is not anticipated to include an off-street loading area. UCSF Facility Services assume Campus Lane, an adjacent private street, will be marked with loading areas similar to the on-street loading zones on Nelson Rising Lane.

TABLE 2-16: PASSENGER AND VEHICLE LOADING INFORMATION- MISSION BAY

Building / Location	Loading Areas (Passenger or Vehicle)	# Vehicle Loading Spaces and Type	# Passenger Loading Spaces
Smith Cardiovascular Research	Vehicle	4 parcel/truck spaces	--
Helen Diller Cancer Research	Vehicle	4 parcel/truck spaces	--
Sandler Neurosciences Center	Vehicle	2 parcel/truck spaces	--
Mission Bay Housing	Vehicle (Compactors Only[1])	--	--
Rutter Center	Vehicle	2 parcel/truck spaces	--
Genentech Hall	Vehicle	6 parcel/truck spaces	--
On-Street Fourth Street	Vehicle/Passenger	75 feet (3 spaces)	100 feet (4 spaces)
On-Street Nelson Rising Lane	Vehicle/Passenger	260 feet (10 spaces)	220 feet (10 spaces)
On-Street Mission Bay Boulevard South	Passenger	--	80 feet (4 spaces)
On-Street Adjacent to Gladstone Institutes building	Vehicle	100 feet (4 spaces)	--

Notes:

1. Vehicle loading used for compactors, loading area prohibits passenger and delivery vehicles.

Source: UCSF, 2013

Figure 2-12

Existing Parking and Loading Locations-Mission Bay

2.4.7 Parking Conditions

2.4.7.1 On-Street Parking

Most on-street parking provided in the vicinity of the Mission Bay campus site is regulated with a combination of two-hour, four-hour and unlimited time meters; exceptions include portions of Terry François Boulevard, Mission Bay Boulevard North and South, 16th Street, and Mariposa Street. Parking limits are generally in effect between 9 AM and 6 PM, with longer hours (until 10 PM). Parking is prohibited on 16th Street, west of Third Street; in addition, portions of Mariposa and Illinois Streets have baseball game-day-only tow-away parking prohibitions.

Mission Bay experiences a high parking utilization on most streets, including those with lower time limits. The streets which are surrounded by finished construction and occupied buildings have low parking availability, especially on weekday days. On other streets where parking demand is managed by two-hour time limits, too few of the parking spaces are used, which is an inefficient use of the existing parking supply. SFMTA through its SFPark program is implementing changes to the parking rates and time limits in the Mission Bay and Dogpatch neighborhoods to better manage and operate the existing on-street parking supply.

Table 2-17 summarizes the on-street parking supply and occupancy from parking surveys conducted along 16th Street, Mission Bay Boulevard, Fourth Street, Mission Rock Street, China Basin Street and Terry A. François Boulevard, in August 2011 and September 2013 on weekday mid-morning (9 to 11 AM), midday (1:30 to 3 PM) and late evening (6:30 to 8 PM) periods, including during an evening baseball game at AT&T Park. Overall street parking occupancy during the mid-morning is 48 percent and 89 percent during the midday period, while the late evening period occupancy is 61 percent during a baseball game, and 24 percent on a no-event day. Although, as expected, the street parking occupancy in the late evening is higher when a game takes place at AT&T Park, it is not as high as during the midday, which represents the peak parking demand period.

TABLE 2-17: MISSION BAY EXISTING ON-STREET PARKING SUPPLY AND OCCUPANCY [1]

Street Location	Overall Supply (spaces)	Occupancy			
		Mid-Morning [2]	Midday	Late Evening	Late Evening with SF Giants Game
T. François Blvd, from MB Blvd to 16th St	144	55%	88%	16%	40%
Fourth St, bet. Mission Rock St & 16th St	71	30%	89%	8%	77%
Mission Rock St, from Third St to Fourth St	25	49%	84%	20%	72%
China Basin St, from Third St to Fourth St	57	22%	88%	32%	53%
MB Blvd, from T. François Blvd to Fourth St	73	53%	92%	47%	84%
16th St, east of Third St	40	90%	90%	35%	68%
Total	**410**	**48%**	**89%**	**24%**	**61%**

Notes:

1. Data collected in September 2013, except as noted.
2. Data collected by SFMTA in August 2011.

Source: Adavant Consulting, Fehr & Peers, SFMTA

2.4.7.2 Off-Street Parking

The Mission Bay campus site currently has almost 1,600 parking spaces located in the 1630 Third Street Garage, the Community Center Garage (1675 Owens Street), and in three surface parking lots. They all offer a combination of public, patient, and UCSF-only permitted parking spaces. Additional off-street public parking is available nearby at the 1670 Owens Street Garage (about 800 spaces) and at the 450 South Street Garage (approximately 1,400 spaces), both owned by Alexandria Real Estate, Inc.

Table 2-18 summarizes the off-street parking supply and occupancy from parking surveys conducted in March and September 2013 on weekday morning (6:30 to 8:30 AM), midday (11:30 AM to 1:30 PM), and evening (3:30 to 5:30 PM) periods. Parking occupancy was also collected at two of the parking facilities during the late evening (6:30 to 8 PM) during an evening baseball game at AT&T Park.

TABLE 2-18: MISSION BAY EXISTING OFF-STREET PARKING SUPPLY AND OCCUPANCY [1]

Parking Facility	Overall Supply (spaces)	Occupancy			
		Morning	Midday	Evening	Late Evening with SF Giants Game
UCSF Facilities					
1630 Third Street Garage	732	43%	92%	68%	76%
Community Center (1675 Owens St) Garage	593	30%	78%	66%	--
Surface Parking Lots [2]	254	55%	81%	65%	--
Total UCSF Facilities	**1,579**	**40%**	**85%**	**67%**	**76%**
Other Parking Facilities					
450 South Street Garage	1,400	4%	77%	26%	18%
1670 Owens Street Garage	800	6%	22%	17%	--
Total Other Parking Facilities	**2,200**	**5%**	**57%**	**23%**	**18%**
All Facilities	**3,779**	**19%**	**69%**	**41%**	**38%**

Notes:

1. Data collected in March and September 2013.
2. Includes the west side of Block 23, the Orthopedic Institute west of Owens St, and the Child Care Center. Mostly reserved to UCSF faculty, staff and patients.

Source: Adavant Consulting, Fehr and Peers, UCSF

Overall off-street parking occupancy during the morning period is 19 percent and 69 percent during the midday period, while the overall occupancy in the evening is 41 percent. The overall parking occupancy at the UCSF parking facilities is substantially higher than at the other garages, reaching 85 percent at midday, the peak parking demand period. An occupancy above 90 percent, such as at the Third Street garage, typically represents that the facility has reached its effective capacity. Similar to the street parking occupancy conditions described in the previous section, the off-street parking occupancy in the late evening when a game takes place at AT&T Park is not as high as during the midday period.

2.5 MOUNT ZION CAMPUS SITE

2.5.1 Roadway Facilities

The Mount Zion campus site is located at the crossroads of San Francisco between the more modestly-scaled neighborhoods of the Richmond District to the west and more downtown-scaled areas to the east. As such, the roadways serving the campus site are primarily east-west corridors – Geary Boulevard, Pine Street, and Bush Street. Primary north-south access to the campus site is provided via Divisadero Street. The primary vehicular entrances to parking and loading areas for the campus site are located along Sutter Street and Post Street between Broderick Street and Divisadero Street, along Geary Boulevard between Divisadero Street and Scott Street, and along Scott Street between Geary Boulevard and Post

Street. Approximately 60 percent of those traveling to and from the campus site drive alone, are dropped off, or carpool/vanpool. The street network providing access to the Mount Zion campus site is shown in **Figure 2-2**.

2.5.1.1 Regional Access

Regional access to the Mount Zion campus site is provided by several major regional freeways, as discussed below.

I-80 is a six-lane freeway located approximately two miles southeast of the campus site and connects San Francisco to the East Bay and other points east via the San Francisco-Oakland Bay Bridge. I-80 connects to U.S. 101 east of the Mount Zion campus site.

U.S. 101 is an eight-lane freeway located approximately one mile east of the Mount Zion campus site. U.S. 101 connects San Francisco with the peninsula and the South Bay to the south and with the North Bay to the north via the Golden Gate Bridge. U.S. 101 connects to I-80 east of the campus site. Within the northern part of San Francisco, U.S. 101 operates on surface streets (i.e., Van Ness Avenue and Lombard Street). Van Ness Avenue and Lombard Street are part of the Citywide Pedestrian Network outlined in the Transportation Element of the *San Francisco General Plan* and are located one mile east and one mile north of the campus site, respectively.

2.5.1.2 Local Access

Local access to the Mount Zion campus site is provided by an urban street grid network. Key local roadways through the campus site are discussed in detail below and defined according to roadway classifications identified in the San Francisco General Plan Transportation Element.

Geary Boulevard is a six-lane east-west arterial that extends from Gough Street to 48th Avenue. The City classifies this arterial as a Major Arterial, a Neighborhood Commercial Street, and a Primary Transit Important Street. From Steiner Street to Baker Street (within the campus area) the roadway has a center median with foliage. On-street parking is provided on both sides of the street within the vicinity of the campus site. The 38 Geary, 38L Geary Limited, and Golden Gate Transit bus lines operate in both directions along Geary Boulevard, while the NX Judah Express operates only in the westbound direction during weekday peaks.

Pine Street is a three-lane, one-way westbound roadway that extends from Market Street to Presidio Avenue. The City classifies this roadway as a Major Arterial. It is also designated as part of the Neighborhood Pedestrian Street network between Scott Street and Divisadero Street. Pine Street is the westbound component of the Pine/Bush Street one-way couplet. On-street parking is provided on both sides of the street. The 1AX California A Express, 31AX Balboa A Express, 31BX Balboa B Express, 38AX Geary A Express, and 38BX Geary B Express bus lines utilize Pine Street to travel from Market Street to northwestern San Francisco neighborhoods.

Bush Street is a three-lane, one-way eastbound roadway that extends from Davis Street to Presidio Avenue. The City classifies this roadway as a Major Arterial. It is also designated as part of the Neighborhood Pedestrian Street network between Scott Street and Divisadero Street. Bush Street is the eastbound component of the Pine/Bush Street one-way couplet. On-street parking is provided on both sides of the street. The 1AX California A Express, 31AX Balboa A Express, 31BX Balboa B Express, 38AX

Geary A Express, 38BX Geary B Express, and NX Judah Express bus lines utilize Bush Street to travel from northwestern San Francisco neighborhoods to Market Street.

Divisadero Street is a four-lane north-south roadway that extends from Marina Boulevard to 14th Street. The City classifies this roadway as a Major Arterial between Pine Street and Lombard Street, a Secondary Arterial between Castro Street and California Street, and a Secondary Transit and Neighborhood Commercial Street between Haight Street and California Street. On-street parking is provided on both sides of the street. The 24 Divisadero bus line operates in both directions along Divisadero Street between Jackson Street and Waller Street, providing transit service between Pacific Heights and Bayview.

Sutter Street is a two-lane east-west roadway that travels from Market Street to Presidio Avenue. The City classifies this roadway as a Transit Conflict and a Secondary Transit Preferential Street. It is also designated as part of the Neighborhood Pedestrian Street network between Scott Street and Divisadero Street. On-street parking is provided on both sides of the street. The 2 Clement bus line operates in both directions along Sutter Street within the campus site, but only travels westbound on Sutter Street between Laguna Street and Market Street.

Post Street is a two-lane east-west Local Street that extends from Market Street to Presidio Avenue. On-street parking is provided on both sides of the street. The City classifies this roadway as a Secondary Transit Preferential Street. It is also designated as part of the Neighborhood Pedestrian Street network between Piece Street and Divisadero Street. Post Street is part of Bike Route 16 and has Class II bicycle lanes in both directions between Presidio Avenue and Steiner Street, west of which turns into a Class III bicycle route.

Pierce Street is a two-lane north-south Local Street that extends from Clay Street to Post Street. On-street parking is provided on both sides of the street**.**

Scott Street is a two-lane north-south Local Street that extends from Marina Boulevard to Duboce Avenue. On-street parking is provided on both sides of the street, with 45-degree parking on the southbound side of Scott Street between Sutter Street and Post Street.

Broderick Street is a two-lane north-south Local Street that extends from Marina Boulevard to Waller Street. On-street parking is provided on both sides of the street, with parking at 90-degrees between Sutter Street and Post Street. Broderick Street is designated as a Class III bicycle route between Clay Street and Post Street.

2.5.2 Intersection Operating Conditions

The following 16 campus site area intersections were selected for analysis through consultation with UCSF Campus Planning and San Francisco Planning Department staff. These study intersections are shown in **Figure 2-2**.

45. Pine Street/Divisadero Street
46. Bush Street/Broderick Street
47. Bush Street/Divisadero Street
48. Bush Street/Scott Street
49. Bush Street/Pierce Street
50. Sutter Street/Broderick Street
51. Sutter Street/Divisadero Street
52. Sutter Street/Scott Street
53. Sutter Street/Pierce Street
54. Post Street/Broderick Street
55. Post Street/Divisadero Street
56. Post Street/Scott Street
57. Post Street/Pierce Street
58. Geary Boulevard/Broderick Street
59. Geary Boulevard/Divisadero Street
60. Geary Boulevard/Scott Street

Figure 2-13A and **Figure 2-13B** display the existing AM and PM peak hour traffic volumes, lane configurations and traffic controls at each of the 16 study intersections. Intersection turning movement counts at the study intersections were collected in May 2013 on mid-week and non-holiday days when schools were in session. Intersection turning movement count sheets are provided **in Appendix D**.

Figure 2-13B

Existing Intersection Lane Configurations, Traffic Control, and Volumes-Mount Zion

As shown in **Table 2-19**, all of the study intersections operate at an acceptable level of service (LOS D or better) during both the AM and PM peak hours.

TABLE 2-19: EXISTING PEAK HOUR INTERSECTION LEVEL OF SERVICE - MOUNT ZION

Intersection	Traffic Control[1]	Peak Hour	Vehicle Delay[2] (seconds)	LOS[3]
45. Pine Street / Divisadero Street	Signal	AM PM	14 32	B C
46. Bush Street / Broderick Street	Signal	AM PM	17 11	B B
47. Bush Street / Divisadero Street	Signal	AM PM	48 18	D B
48. Bush Street / Scott Street	Signal	AM PM	30 17	C B
49. Bush Street / Pierce Street	Signal	AM PM	30 15	C B
50. Sutter Street / Broderick Street	AWS	AM PM	<10 / <10 <10 / <10	A / A A / A
51. Sutter Street / Divisadero Street	Signal	AM PM	12 12	B B
52. Sutter Street / Scott Street	AWS	AM PM	10 / 11 11 / 12	B / B B / B
53. Sutter Street / Pierce Street	AWS	AM PM	<10 / <10 <10 / <10	A / A A / A
54. Post Street / Broderick Street	Signal	AM PM	14 12	B B
55. Post Street / Divisadero Street	Signal	AM PM	17 14	B B
56. Post Street / Scott Street	Signal	AM PM	17 15	B B
57. Post Street / Pierce Street	SSS	AM PM	12 11	B B
58. Geary Boulevard / Broderick Street	SSS	AM PM	15 17	B C
59. Geary Boulevard / Divisadero Street	Signal	AM PM	34 30	C C
60. Geary Boulevard / Scott Street	Signal	AM PM	21 20	C B

Notes:

1. AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
2. Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersection, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach.
3. For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For an unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
4. **Bold** indicates unacceptable operations per UCSF LOS standards

Source: Fehr & Peers, 2014.

2.5.3 Transit Network

The Mount Zion campus site is well-served by public transit, both local and regional. Local service is provided by Muni bus lines. Regional service is provided by BART, AC Transit, Golden Gate Transit, SamTrans, and Caltrain. UCSF supplements Muni transit service with its own shuttle system that provides direct connections to UCSF-operated facilities throughout San Francisco. In many cases, these shuttles provide a direct transit alternative between two campus sites that would otherwise require a transfer between two or more Muni routes. Approximately 25 percent of those traveling to and from the campus site use public transit, while another six percent rely on UCSF shuttles to get to and from the campus site. **Figure 2-14** presents the transit routes in the vicinity of the campus site.

2.5.3.1 San Francisco Muni

Table 2-20 presents the Muni routes serving the campus site within a quarter-mile walk and **Table 2-21** presents the peak hour muni ridership for these routes.

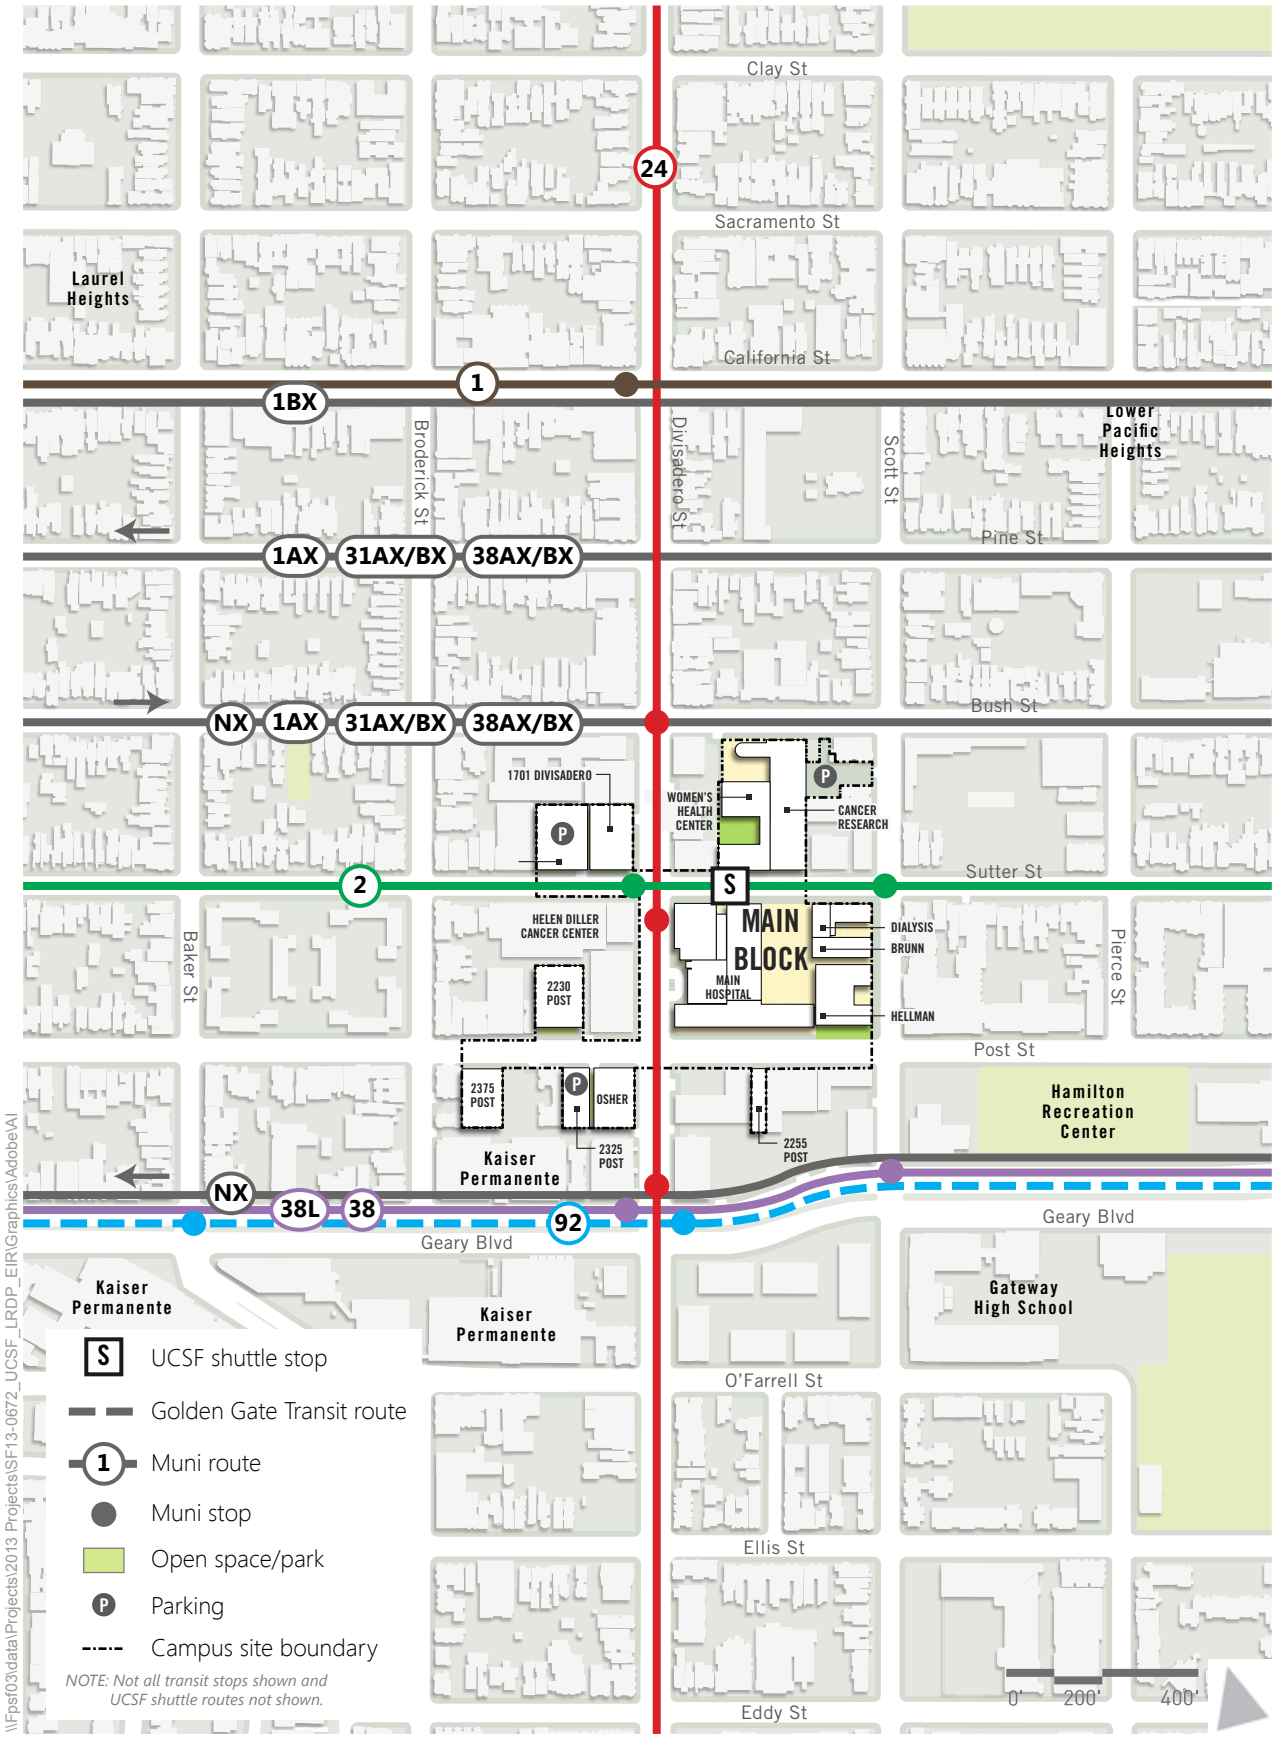

Figure 2-14

Existing Transit Service-Mount Zion

TABLE 2-20: LOCAL MUNI OPERATIONS - MOUNT ZION

Route	AM Peak Weekday Headways (7-9AM)[1]	PM Peak Weekday Headways (4-6PM)[1]	Hours of Operation	Neighborhoods Served by Route	Nearest Stop Location	Distance to Campus Site (feet)
1 – California	7	7	4:45AM – 1:30AM	Financial District, Richmond District	California Street / Divisadero Street	1,200

Notes:

1. Maximum load point, which is the point at which the route has the maximum number of passengers relative to capacity, is identified for those lines operating above or near 85 percent.
2. MLP located at California Street/Presidio Avenue.
3. MLP located at Sutter Street/Mason Street.
4. MLP located at Geary Boulevard/Laguna Street.
5. MLP located at Geary Street/Van Ness Avenue.

Source: SF Muni, 2013; SFMTA, Fall 2011; prepared by Fehr & Peers, 2013.

2.5.3.1.1 Recent and Proposed Changes to Transit Service

The following changes are proposed by the TEP for lines in the vicinity of the Mount Zion campus site:

- **1 California** – The TEP proposes changes to PM peak headways east of Presidio Avenue from 7 to 6 minute headways.
- **2 Clement** – The TEP proposes supplemental trolley coach service added between Downtown (Sansome/Market streets) and Presidio Avenue. Peak period route headways would be reduced from 12 to 7.5 minutes.
- **24 Divisadero** – The TEP proposes reducing peak period headways from 10 to 9 minutes.

In addition, although not included in the TEP, the 38 Geary/38L Geary Limited would be converted to a Bus Rapid Transit (BRT) line, with reduced stops and reduced headways which will be specified in the Geary Corridor Bus Rapid Transit Project currently underway. The project alternatives propose implementing transit improvements in the Geary corridor with high-frequency (i.e. headways every five minutes or less during peark period times), BRT-branded bus service operating on physically demarcated, bus-only lanes from 34th Avenue to Market Street. The bus-only lanes would be differentiated from other lanes by colored pavement, signage, buffers, and street markings. Creating these bus-only lanes would involve converting one existing mixed-flow traffic lane (or general-use lane) on Geary Boulevard to a bus-only lane from 34th Avenue to Gough Street. From Van Ness Avenue to Market Street, where buses currently operate on Geary Boulevard in the westbound direction and on O'Farrell Street in the eastbound

direction, enhanced markings and signage have been applied to make the existing bus-only lanes more conspicuous and self-enforcing. Other enhancements would be deployed as well, including transit signal priority (TSP), specialized BRT-branded bus vehicles, and distinctive BRT-branded stations.

2.5.3.2 Regional Transit Service

Table 2-22 presents the regional transit routes serving the Mount Zion campus site and route characteristics as of November 2013, including service frequencies during the weekday morning and evening peak periods, hours of operations and neighborhoods served.

AC Transit, SamTrans, Caltrain, and BART riders would transfer to Muni to access the Mount Zion campus site. Golden Gate Transit riders would be able to walk to the nearest stop, located at Geary Boulevard and Divisadero Street approximately 700 feet from the campus site.

TABLE 2-22: REGIONAL TRANSIT OPERATIONS - MOUNT ZION

Route	AM Peak Weekday Headways (7AM-9AM)[1]	PM Peak Weekday Headways (4PM-6PM)[1]	Hours of Operation	Areas Served by Route	Nearest Stop Location	Distance to Campus Site
Caltrain Local	-	-	4:30 AM-12:01 AM (IB) 4:55 AM-1:32 AM (OB)	San Francisco, San Jose	Fourth and King	2.7 miles

2.5.3.3 UCSF Shuttle System

Table 2-23 summarizes the UCSF shuttle routes serving the campus site. Shuttles to and from the Mount Zion campus site stop at a shuttle loading zone located midblock on Sutter Street between Divisadero Street and Scott Street (as shown in **Figure 2-13**). These stops are designated by UCSF Transportation Services and reviewed/approved by SFMTA. UCSF shuttles were not observed to interfere with Muni operations at the Mount Zion campus site.

TABLE 2-23: UCSF SHUTTLES - MOUNT ZION

Route	Campuses Served	Hours of Operation	Headways (minutes)[1]	Average Weekday Boardings (2012)
Gold	Parnassus-Mt. Zion-Mission Bay-SFGH	5:45 AM – 9:25 PM	15/20	924
Blue	Parnassus-SFGH-Mission Bay-Mt. Zion	5:35 AM – 8:47 PM	15/20	996
Black	Parnassus-Mt. Zion-Laurel Heights	6:30 AM – 7:50 PM	20	781
Tan	Parnassus-Laurel Heights-Mt. Zion	6:50 AM – 7:45 PM	20	651
Purple	Parnassus (Library)-3360 Geary-Mt. Zion-3360 Geary	6:15 AM – 6:38 PM	45	171

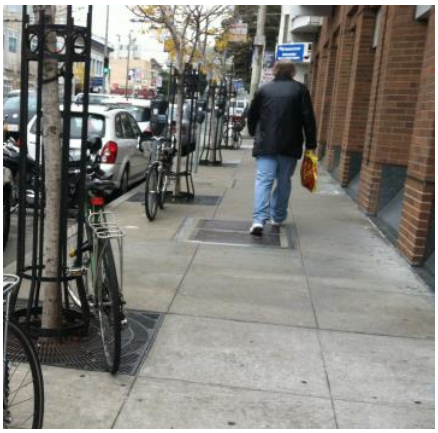
Notes:
1. Multiple values indicate variability in headways during the day.

Sources: UCSF Campus Life Services Transportation, Routes & Timetables, 2014; Ridership data from *UCSF Shuttle Operations Study, Final Report*, January 2014, prepared by Nelson Nygaard.

2.5.4 Pedestrian Circulation

Approximately six percent of those traveling to and from the campus site walk.

Pedestrian activity is high around the campus site, particularly along Divisadero Street between Geary Boulevard and Bush Street. Pedestrian counts indicate that the highest pedestrian activity occurs along Divisadero Street at Geary Boulevard and Sutter Street, with over 900 total pedestrians counted crossing each of those intersections during the AM and PM peak hours. Pedestrian volumes are generally lower on Post, Bush, and Pine streets, and fall to less than 100 pedestrians on most crosswalks on other north-south streets parallel to Divisadero Street. Besides the campus site itself, the many ground level shops, restaurants and services in the area attract foot traffic.



Sidewalks with street trees and other pedestrian amenities surround the Mount Zion campus site

Within the campus site area, sidewalks generally exist on both sides of the street in most locations, and are generally 11 to 15 feet wide. Continental crosswalks are provided at the intersections of Divisadero Street/Bush Street and Divisadero Street/Sutter Street, while standard crosswalks are provided at other intersections surrounding the campus site. Curb ramps are generally provided at all intersections in the vicinity of the

campus site. Pedestrian signals are present at signalized intersections surrounding the campus site with the exception of the signalized intersection of Divisadero Street/Sutter Street.

2.5.5 Bicycle Circulation

Approximately three percent of those traveling to and from the Mount Zion campus site use a bicycle. This is consistent with the bicycling mode share throughout San Francisco. Several bikeways run within the vicinity of the campus site, as shown in **Figure 2-15**.

The following bicycle facilities are located within or near the Mount Zion campus site:

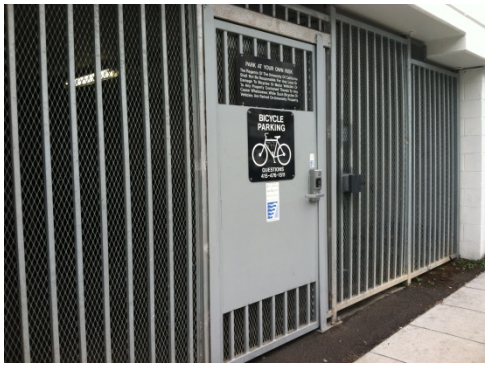
Post Street is part of San Francisco Bike Route 16, an east-west bike route extending from Van Ness Avenue to Presidio Avenue. Between Van Ness Avenue and Steiner Street, Post Street is designated as a Class III bicycle route with sharrows. From Steiner Street to Presidio Avenue, Post Street has Class II bicycle lanes in both directions.

Clay Street is part of San Francisco Bike Route 10, an east-west bike route that extends from the Embarcadero to Cherry Street via Broadway Street, Pacific Avenue, Webster Street, and Clay Street. Between the Embarcadero and Columbus Avenue, Bike Route 10 is a Class III route with sharrows, while the rest of the route is Class III but with no sharrows.

The SF Bike Plan does not include any short- or long-term improvements in the study area.

Bicycle counts indicate the most popular bicycling route through the campus site is Post Street, where between 40 and 70 bicyclists were counted during the AM and PM peak hours. Fewer than 10 bicyclists were counted on most other streets during the AM and PM peak hours in the study area.

Short-term bicycle parking is provided in "u-racks" in front of UCSF buildings on Sutter, Divisadero, and Post streets, and within the 2230 Post Street garage. Secure bicycle parking is provided in a bicycle cage in the 2325 Post Street and 2420 Sutter Street garages. Bicycle parking was observed to be less than half full at most short-term and secure bicycle parking locations.



Secure bicycle parking cage at 2325 Post Street

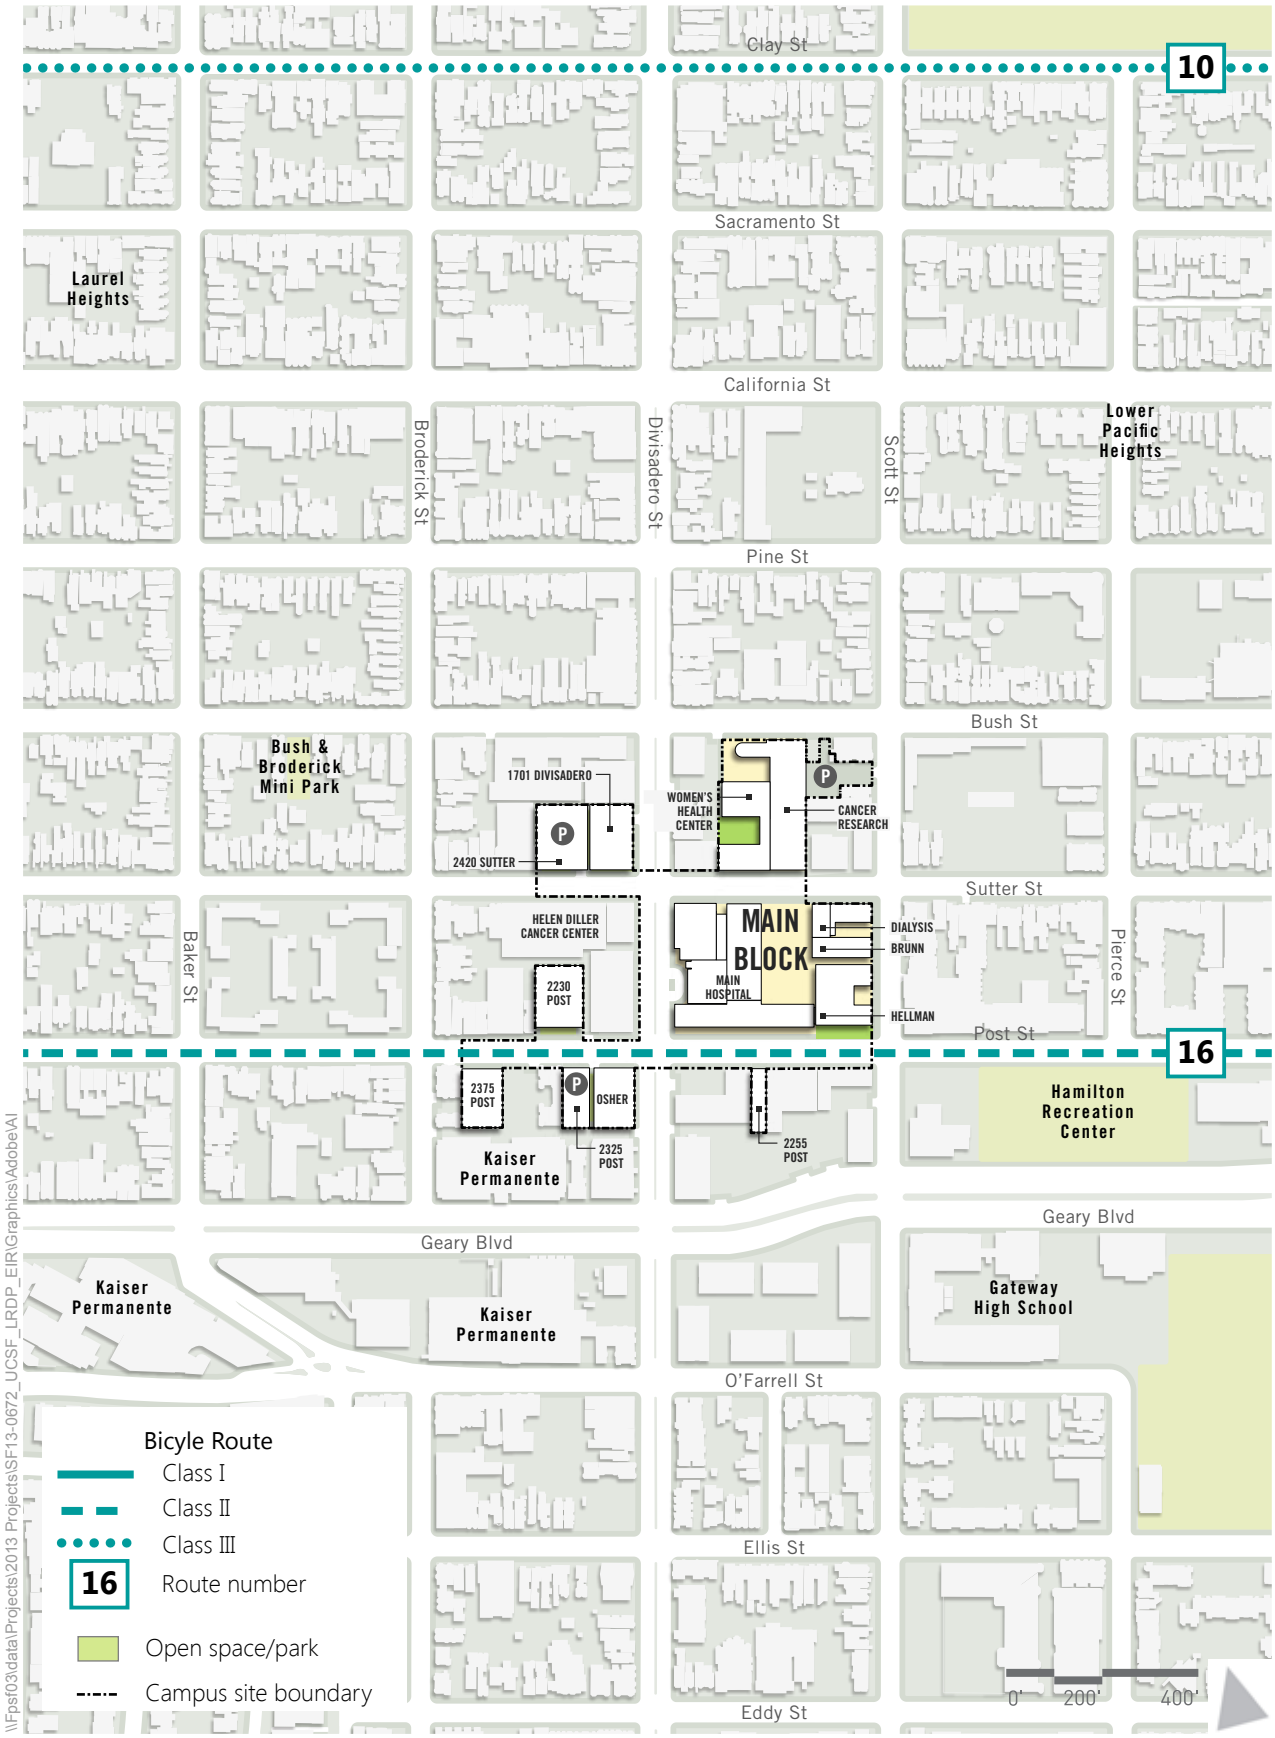


Figure 2-15

Existing Bicycle Facilities-Mount Zion

2.5.6 Loading Conditions

The Mount Zion campus site has both service vehicle and passenger loading. There are three off-street service vehicle loading facilities serving the existing uses on the campus site, and summarized in **Table 2-24** and shown in **Figure 2-16**. Passenger and service vehicles may also load on-street in marked zones on Sutter Street, Post Street, and Scott Street.

The off-street loading dock at the building on Sutter Street between Divisadero and Scott streets receives approximately 20 deliveries a day, not including additional deliveries made by catering, food services, waste management and other contractors. The loading area fronting the Scott Street facility serves passenger vehicles, emergency vehicles, and a valet service. Based on field observations, the loading area appears to currently be at capacity, as multiple passenger vehicles were seen occupying metered parking spots. Valet service, which frequently turns over during peak periods is also offered from a driveway loop in front of the hospital fronting Divisadero Street. Existing vehicle and most passenger loading areas provide sufficient amount of space for existing demand.

TABLE 2-24: PASSENGER AND VEHICLE LOADING INFORMATION - MOUNT ZION

Building / Location	Loading Areas (Passenger or Vehicle)	# Vehicle Loading Spaces and Type	# Passenger Loading Spaces
Sutter Street (between Divisadero and Scott)	Vehicle	3 parcel/truck space	--
2330 Post Street	Vehicle	1 parcel/truck spaces	--
Cancer Research	Vehicle	3 parcel/truck spaces	--
Hospital Driveway Loop (Divisadero Street)	Passenger	--	75 feet (3 spaces)
On-Street Sutter Street	Passenger	--	60 feet (2.5 spaces)
On-Street Post Street	Vehicle/Passenger	60 feet (1-2 spaces)	130 feet (6 spaces)
On-Street Scott Street	Passenger	--	75 feet (3 spaces)

Source: UCSF, 2013

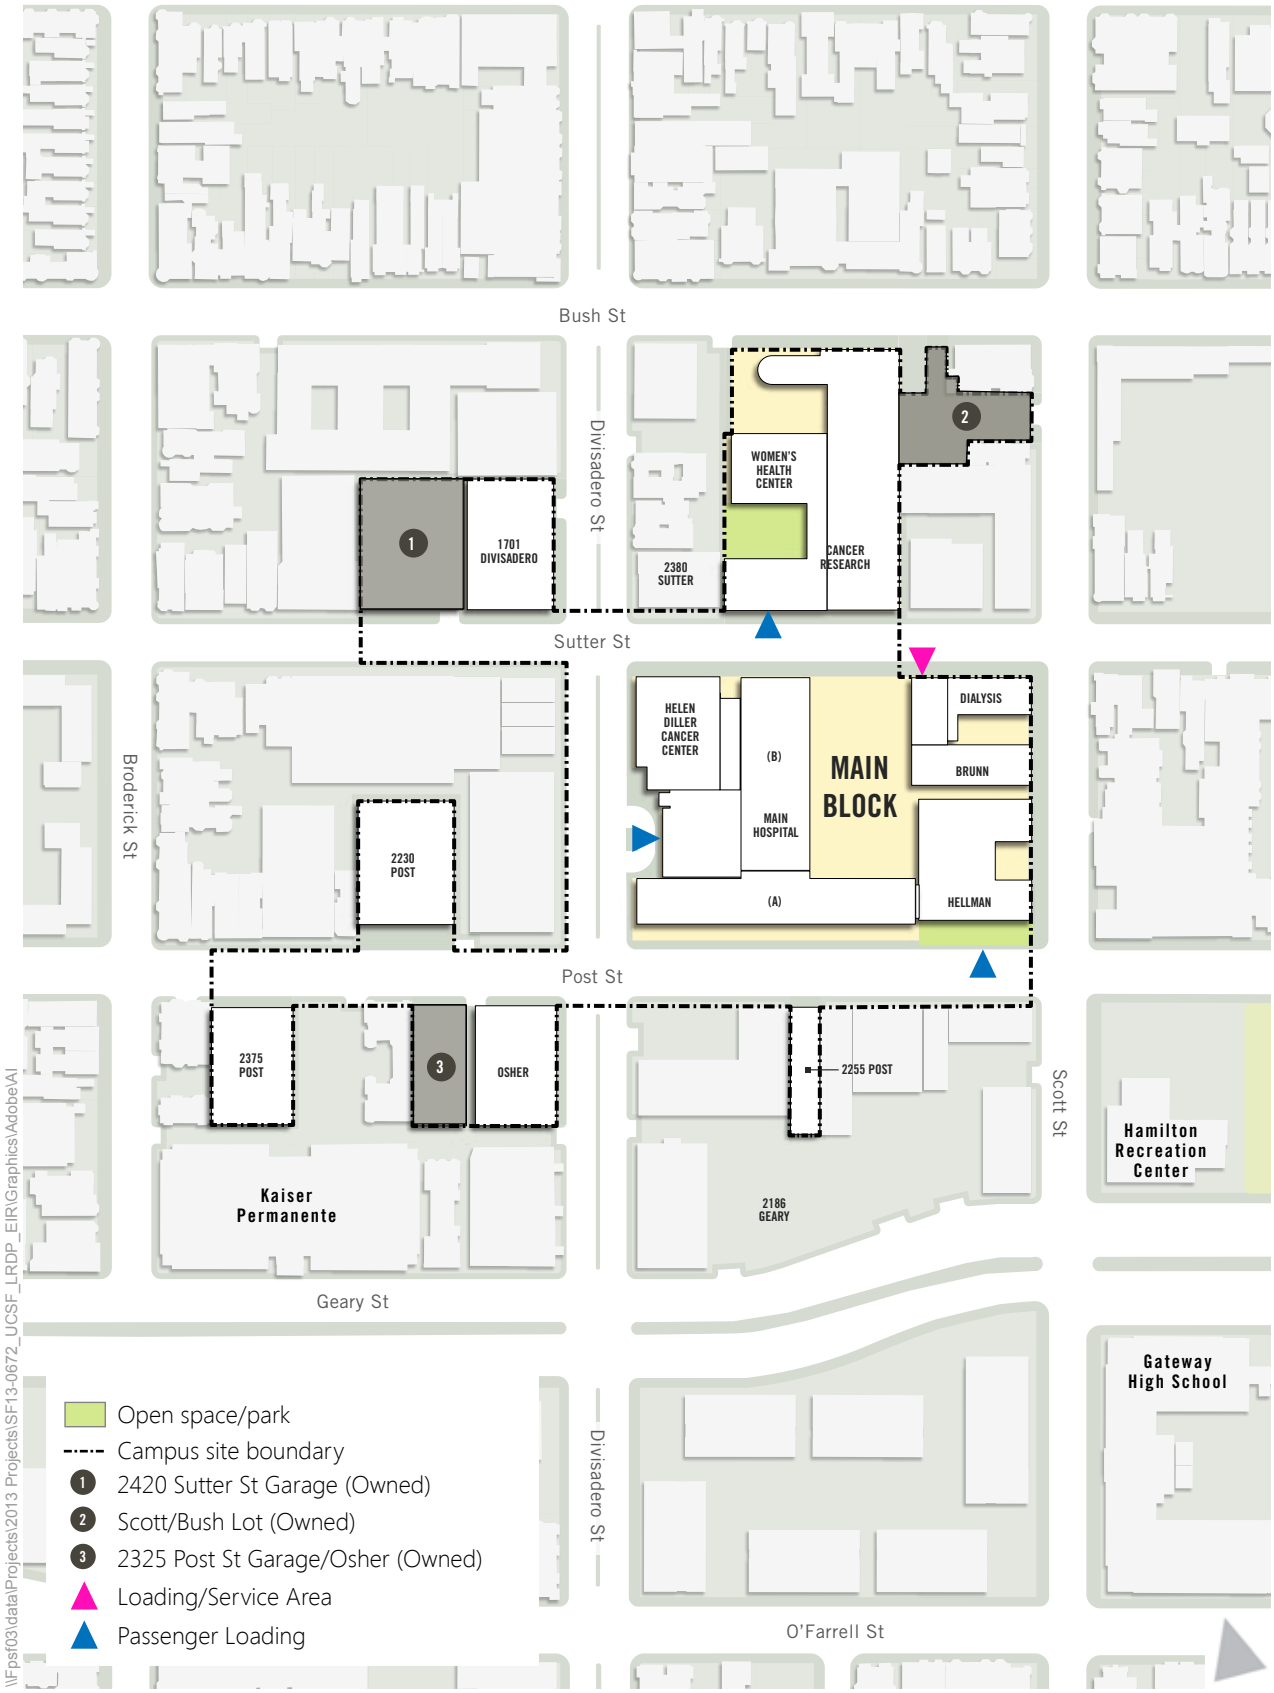

Figure 2-16

Existing Parking and Loading Locations-Mount Zion

2.5.7 Parking Conditions

2.5.7.1 On-Street Parking

The majority of the streets in the vicinity of the Mount Zion campus site are within the "G" Residential Parking Permit area (generally bounded by Broadway, Polk Street, Post Street, and Presidio Avenue), which restrict on-street parking Monday through Friday, to a two-hour period between the hours of 8 AM and 6 PM Metered parking with 30-minute and one-hour time limits is provided along Divisadero Street and on portions of Post and Sutter streets on one to two blocks to the east and west of Divisadero Street.

Table 2-25 summarizes the on-street parking supply and utilization from a parking survey conducted in March 2014 of approximately 1,240 spaces within the area generally bounded by Pine Street to the north, Geary Boulevard to the south, Baker Street to the west, and Pierce Street to the east. Parking occupancies throughout the mid-morning (10 AM to noon), midday (noon to 2 PM), and evening (6 to 8 PM) periods are very similar, close to 90 percent (i.e., very close to their effectively capacity). Most of the available parking during the peak parking demand periods is at non-metered spaces subject to residential permit parking restrictions, or at spaces subject to daytime passenger loading/unloading regulations. Overall, on-street metered parking is typically at capacity.

2.5.7.2 Off-Street Parking

There are three UCSF-managed and six public parking facilities in the vicinity of the Mount Zion campus site, providing a combined total of about 1,160 parking spaces. In addition, there are several private customer-only parking facilities that serve other medical office building in the area. The public parking facilities typically close in the late evening (e.g., at about 9 PM) and are not generally available for residential parking.

The UCSF-managed parking facilities include:

- 1701 Divisadero Street garage, located at the northwest corner of Divisadero and Sutter streets, under a medical office building. It provides 156 marked spaces for parking by UCSF permit holders only. Vehicle access is via a single driveway (entry and exit) at Sutter Street.
- 2420 Sutter Street garage, located between Divisadero and Broderick streets, consists of one level of underground parking and six levels of above-ground parking. Vehicle entry/exit is provided off of Sutter Street and also connects underground to the 1701 Divisadero Street garage. It provides 172 public parking spaces and 56 UCSF permit-holders only spaces. If needed, attendant parking can increase the capacity of the garage by approximately 20 vehicles.
- 2325 Post Street garage, located between Divisadero and Broderick streets, consists of a two-level above-ground parking structure. Vehicle entry/exit to the ground level (20 spaces) is provided off of Post Street, while vehicular access to the upper level (29 spaces) is provided off of Garden Street.
- Bush Street surface lot, located at the southwest corner of Bush and Scott Streets, provides 20 UCSF permit holders only spaces. It has two vehicle access points, at Bush Street (entry only) and at Scott Street (exit only).

TABLE 2-25: MOUNT ZION EXISTING ON-STREET PARKING SUPPLY AND OCCUPANCY [1]

Street Location	Overall Supply (spaces)	Occupancy [2]		
		Mid-Morning	Midday	Evening
North-South Streets				
Pine St, from Baker St to Steiner St	91	88%	81%	89%
Bush St, from Baker St to Steiner St	91	93%	88%	103%
Sutter St, from Baker St to Steiner St	54	56%	69%	83%
Post St, from Baker St to Steiner St	74	92%	96%	96%
Geary Blvd, from Baker St to Steiner St	67	91%	87%	85%
Pine St, from Baker St to Steiner St	86	85%	86%	94%

Pierce St, from Pine St to Geary Blvd	151	74%	73%	46%
Total East-West Streets	**777**	**89%**	**91%**	**84%**
Total All Streets	**1,240**	**88%**	**89%**	**88%**

Notes:

1. Data collected in March 2014.
2. Values over 100% indicated illegal parking, such as double parked vehicles or vehicles stopped at a fire hydrant.

Source: Adavant Consulting.

The general public parking facilities include:

- 1635 Divisadero Street garage, located between Divisadero and Broderick streets, has approximately 430 marked spaces; attendant parking on the upper levels can increase the total capacity of the garage by approximately 50 vehicles. It has two vehicle access points, at Sutter Street (entry and exit) and at Post Street (exit only).
- 2355 Post Street surface lot, located on the south side of the street between Divisadero and Broderick streets. It has approximately 30 marked spaces, and can provide 37 additional spaces with attendant parking.
- 2186 Geary Boulevard surface lot located on the north side of Geary Boulevard between Divisadero and Scott Street. It has 70 marked spaces and can provide 25 additional spaces with attendant parking.
- 2120 Geary Boulevard surface lot, located on the north side of Geary Boulevard between Divisadero and Scott streets, serves an adjacent medical office building and provides general

public parking. It has 30 marked spaces and can provide 16 additional spaces with attendant parking.

- 1515 Scott Street surface lot, located at the northwest corner of Geary Boulevard and Scott Street, serves an adjacent medical office building and provides general public parking. It has 35 marked spaces and can provide 10 additional spaces with attendant parking. There are two access points, at Scott Street and Geary Boulevard.
- 2300 Sutter Street garage, located on the west side of the street, between Bush and Sutter streets. It provides 23 public parking spaces on the first floor of the garage.

Table 2-26 summarizes the off-street parking supply and occupancy from parking surveys conducted at UCSF-owned and public parking facilities in February and March 2014, on weekday mid-morning (10 AM to noon), midday (noon to 2 PM), and evening (4 to 6 PM) periods.

TABLE 2-26: MOUNT ZION EXISTING OFF-STREET PARKING SUPPLY AND OCCUPANCY [1]

Parking Facility	Overall Supply (spaces)	Occupancy		
		Mid-Morning	Midday	Evening
UCSF Facilities				
1701 Divisadero St & 2420 Sutter St Garages	384	84%	81%	24%
2325 Post St Garage	49	95%	95%	45%
Bush St Surface Lot	20	60%	60%	45%

All Facilities	**1,159**	**88%**	**83%**	**23%**

Notes:

1. Data collected in February and March 2014.
2. Supply includes attendant parking spaces.

Source: Adavant Consulting, UCSF

Overall off-street parking occupancy during the mid-morning period is 88 percent and 83 percent during the midday period, while the overall occupancy in the evening is 23 percent. The overall peak parking occupancy at the UCSF-managed parking facilities is generally lower than at the other facilities. During mid-morning, the peak parking demand period, the UCSF parking facilities near the Mount Zion campus

site operate at about 84 percent of their capacity, while the non-UCSF facilities operate at 91 percent. An occupancy above 90 percent typically represents that the facility has reached its effective capacity.

2.6 MISSION CENTER

2.6.1 Roadway Facilities

The Mission Center campus site is located in the Mission neighborhood. Approximately 52 percent of those traveling to and from the campus site drive alone, are dropped off, or carpool/vanpool. The primary north-south corridors are Mission Street, Howard Street/South Van Ness Avenue, Folsom Street, Harrison Street, and Bryant Street. Primary east-west routes to the campus are 10th Street, 13th/Division Street, and 16th Street. The primary vehicular entrances to parking and loading areas for the campus site are located along Harrison Street between 14th Street and 15th Street and along 15th Street between Harrison Street and Folsom Street. The street network providing access to the Mission Center campus site is shown in **Figure 2-2**.

2.6.1.1 Regional Access

Regional access to the Mission Center campus site is provided by several major regional freeways, as discussed below.

I-80 is a six-lane freeway located approximately half a mile northeast of the campus site and connects San Francisco to the East Bay and other points east via the San Francisco-Oakland Bay Bridge. I-80 connects to U.S. 101 east of the Mission Center campus site. Access to I-80 is provided via the on- and off-ramps at Harrison Street at Eighth and Fifth streets.

U.S. 101 is an eight-lane freeway located one block north of the Mission Center campus site. U.S. 101 connects San Francisco with the peninsula and the South Bay to the south and with the North Bay to the north via the Golden Gate Bridge. Within the northern part of San Francisco, U.S. 101 operates on surface streets (i.e., Van Ness Avenue and Lombard Street). Van Ness Avenue and Lombard Street are part of the Citywide Pedestrian Network outlined in the Transportation Element of the *San Francisco General Plan*. Access to the campus site is provided at South Van Ness Avenue and Mission Street several blocks west of Mission Center.

2.6.1.2 Local Access

Local access to the Mission Center campus site is provided by an urban street grid network. Key local roadways near the campus site are discussed in detail below and defined according to roadway classifications identified in the San Francisco General Plan Transportation Element.

Mission Street is a four-lane roadway that extends from The Embarcadero to A Street in Daly City. The City of San Francisco classifies this roadway as a Primary Transit Oriented street. On-street parking is provided on both sides of the street. The 14 Mission and 14L Mission Limited Muni bus lines operate on Mission Street between The Embarcadero and San Jose Avenue; the 49 Mission/Van Ness bus line operates on Mission Street between South Van Ness Avenue and Ocean Avenue; and the 33 Stanyan operates on Mission Street between 16th Street and 18th Street. SamTrans Routes KX, 292, and 397 also

operate along Mission Street between the Temporary Transbay Terminal and 10th Street. Several Golden Gate Transit basic and commute bus routes operate on Mission Street between the Temporary Transbay Terminal and Eighth Street.

Howard Street/South Van Ness Avenue is a two to four-lane roadway that extends from The Embarcadero (as Howard Street) to Cesar Chavez Street (as South Van Ness Avenue), with Howard Street merging into South Van Ness Avenue just north of 13th Street. In addition, Howard Street operates as a southbound one-way street between Fremont Street and 11th Street. The City classifies this roadway as a Major Arterial. On-street parking is provided on both sides of the street. SamTrans Route 397 operates on Howard Street/South Van Ness Avenue between 10th Street and Cesar Chavez Street. Several Golden Gate Transit basic and commute bus routes operate on Howard Street between First Street and Eighth Street.

Folsom Street is a three to four-lane roadway that extends from The Embarcadero to Ripley Street. In addition, Folsom Street operates as a northbound one-way street north of 11th Street. The City classifies this roadway as a Major Arterial east of 13th Street and a Local Street west of 13th Street. On-street parking is provided on both sides of the street. The 12 Folsom/Pacific bus line operates on Folsom Street between Second Street and Cesar Chavez Street. Several Golden Gate Transit basic and commute bus routes operate on Folsom Street between Fremont Street and Seventh Street. Folsom Street is designated as a Class II bicycle facility between 11th Street and 19th Street, but only has a northbound bike lane between 11th Street and 14th Street.

Harrison Street is a three to four-lane roadway that extends from The Embarcadero to Cesar Chavez Street. The City classifies this roadway as a Secondary Transit street north of 11th Street (which transitions into a Primary Transit Important street until Fourth Street), a Major Arterial street between 11th and 13th streets, and a Local Street south of 13th Street. In addition, Harrison Street operates as a southbound one-way street between Third Street and 10th Street. On-street parking is provided on both sides of the street. The 12 Folsom/Pacific, 27 Bryant, and 47 Van Ness bus lines operate on Harrison Street between Fifth and 11th streets. Harrison has Class II bicycle lanes between 11th and 23rd streets, after which the street transitions into a Class III bicycle route.

Bryant Street is a two to four-lane roadway that extends from The Embarcadero to Cesar Chavez Street. In addition, Bryant Street operates as a northbound one-way street between Second and 13th streets. The City classifies this roadway as a Secondary Transit street north of 11th Street (which transitions into a Primary Transit Important street until Third Street), a Major Arterial street between 11th Street and 13th Street, and a Local Street south of 13th Street. On-street parking is provided on both sides of the street. The 27 Bryant bus line operates on Bryant Street between Fifth Street and Cesar Chavez Street, while the 47 Van Ness bus line operates between 13th Street and Fourth Street.

10th Street is a four-lane, one-way eastbound roadway that extends from Division Street to Market Street. The City classifies this roadway as a Major Arterial. On-street parking is provided on both sides of the street. San Mateo transit (SamTrans) operates on 10th Street between Mission Street and Division Street.

13th/Division Street is a six-lane roadway that extends from Bryant Street to Mission Street underneath the US101 Central Freeway. The City classifies this roadway as a Major Arterial. On-street parking is provided on both sides of the street.

16th Street is a four-lane roadway that extends from Third Street to Castro Street. The City classifies this roadway as a Primary Transit-Oriented street. On-street parking is provided on both sides of the street.

The 22 Fillmore bus line operates on 16th Street between Kansas Street and Church Street, while the 33 Stanyan bus line operates between Potrero Avenue and Mission Street.

11th Street is a two-lane roadway that extends from Bryant Street to Market Street. On-street parking is provided on both sides of the street. The City classifies this roadway as a Secondary Transit street. On-street parking is provided on both sides of the street. The 9 San Bruno and 9L San Bruno Limited bus lines operate along the entirety of 11th Street, while the 47 Van Ness bus line operates on 11th Street between Mission Street and Bryant Street. 11th Street has Class II bicycle lanes along its entire length.

14th Street is a two-lane Local Street that extends from Harrison Street to Buena Vista Terrace and operates one-way eastbound between Market Street and Folsom Street. On-street parking is provided on both sides of the street. 14th Street is designated as a Class III bicycle route with sharrows between Harrison and Folsom streets.

15th Street is a two-lane Local Street that extends from Harrison Street to Roosevelt Way and operates one-way westbound between South Van Ness Avenue and Guerrero Street. On-street parking is provided on both sides of the street.

17th Street is a two-lane Local Street that extends from Pennsylvania Street to Stanyan Street. On-street parking is provided on both sides of the street. Near the campus site, 17th Street has Class II bicycle lanes in both directions.

Florida Street is a two-lane Local Street that extends from Division Street to 16th Street. On-street parking is provided on both sides of the street, with parking at 90-degrees between Division Street and 15th Street on the eastern side of the street.

Alabama/Treat/Division Street is a two-lane Local Street that extends from Bryant to 16th Streets. Both sides of the street provide on-street parking, with parking at 90-degrees between 15th and 16th streets on the eastern side of the street.

Shotwell Street is a two-lane Local Street that extends from 14th to 16th streets. On-street parking is provided on both sides of the street.

2.6.2 Intersection Operating Conditions

The following 15 campus area intersections were selected for analysis through consultation with UCSF Campus Planning and San Francisco Planning Department staff. These study intersections are shown in **Figure 2-2**.

61. 13th Street/South Van Ness Avenue
62. 13th Street/Folsom Street
63. 13th Street/Harrison Street
64. 10th Street/Bryant Street
65. 14th Street/South Van Ness Avenue
66. 14th Street/Folsom Street
67. 14th Street/Harrison Street
68. 15th Street/South Van Ness Avenue
69. 15th Street/Folsom Street
70. 15th Street/Harrison Street
71. 16th Street/Mission Street
72. 16th Street/South Van Ness Avenue
73. 16th Street/Folsom Street
74. 16th Street/Harrison Street
75. 16th Street/Bryant Street

Figure 2-17A and **Figure 2-17B** displays the existing AM and PM peak hour traffic volumes, lane configurations and traffic controls at each of the 15 study intersections. Intersection turning movement counts at the study intersections were collected in May 2013 on mid-week and non-holiday days when schools were in session. Intersection turning movement count sheets are provided in **Appendix D**.

As shown in **Table 2-27**, 14 of the 15 study intersections operate at an acceptable level of service (LOS D or better) during the AM peak hour and all 15 operate at an acceptable level of service during the PM peak hour.

Existing Intersection Lane Configurations, Traffic Control, and Volumes- Mission Center

TABLE 2-27: EXISTING PEAK HOUR INTERSECTION LEVEL OF SERVICE - MISSION CENTER

Intersection	Traffic Control[1]	Peak Hour	Vehicle Delay[2] (seconds)	LOS[3]
61. 13th Street / South Van Ness Avenue	Signal	AM PM	**71** 30	**E** C
62. 13th Street / Folsom Street	Signal	AM PM	26 29	C C
63. 13th Street / Harrison Street	Signal	AM PM	16 19	B B
64. Tenth Street / Bryant Street	Signal	AM PM	14 16	B B
65. 14th Street / South Van Ness Avenue	Signal	AM PM	15 16	B B
66. 14th Street / Folsom Street	Signal	AM PM	16 15	B B
67. 14th Street / Harrison Street	AWS	AM PM	11 / 12 20 / 24	B / B C / C
68. 15th Street / South Van Ness Avenue	Signal	AM PM	15 18	B B
69. 15th Street / Folsom Street	Signal	AM PM	12 29	B C
70. 15th Street / Harrison Street	AWS	AM PM	10 / 12 14 / 15	B / B B / C
71. 16th Street / Mission Street	Signal	AM PM	26 16	C B
72. 16th Street / South Van Ness Avenue	Signal	AM PM	37 20	D B
73. 16th Street / Folsom Street	Signal	AM PM	38 28	D C
74. 16th Street / Harrison Street	Signal	AM PM	21 30	C C
75. 16th Street / Bryant Street	Signal	AM PM	20 35	C D

Notes:

1. AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
2. Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersection, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach.
3. For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For an unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
4. **Bold** indicates unacceptable operations per UCSF LOS standards

Source: Fehr & Peers, 2014.

As shown in **Table 2-27**, the following intersection operates unacceptably (LOS E) during the AM or PM peak hours:

- 13th Street and South Van Ness Avenue (Intersection #61) operates at LOS E during the AM peak hour due to the high volume of southbound traffic on South Van Ness Avenue.

2.6.3 Transit Network

The Mission Center campus site is well-served by public transit, both local and regional. Local service is provided by Muni bus lines. Regional service is provided by BART, AC Transit, Golden Gate Transit, SamTrans, and Caltrain. UCSF supplements Muni transit service with its own shuttle system that provides direct connections to UCSF-operated facilities throughout San Francisco. In many cases, these shuttles provide a direct transit alternative between two campus sites that would otherwise require a transfer between two or more Muni routes. Approximately 25 percent of those traveling to and from the campus site use public transit, while another 13 percent rely on UCSF shuttles to get to and from the campus site. **Figure 2-18** presents the transit routes in the vicinity of the campus site.

2.6.3.1 San Francisco Muni

Table 2-28 presents the Muni routes serving the campus site within an approximately quarter-mile walk and **Table 2-29** presents the peak hour muni ridership for these routes.

2.6.3.1.1 Recent and Proposed Changes to Transit Service

The following changes are proposed by the TEP for lines in the vicinity of the Mission Center campus site:

- **9L San Bruno Limited** – The TEP proposes changes to AM peak headways from 12 to 10 minute headways.
- **12 Folsom/Pacific** – The TEP proposes that the 12 Folsom/Pacific line be discontinued, though many portions of the discontinued line would still be served by rerouting the 27 Bryant line and the introduction of a new line, the 11 Downtown Connector.
- **14L Mission Limited** – The TEP proposes changes to AM and PM peak headways from 9 to 7.5 minute headways.
- **22 Fillmore** – The TEP proposes rerouting the 22 Fillmore to continue along 16th Street, creating new connections to Mission Bay from the Mission neighborhood. The proposed route change would add transit to 16th Street between Kansas Street and Third Street and Third Street between

16th Street and Mission Bay Boulevard North. The TEP also proposes to change the AM peak period headway, reducing from 9 minute to 6 minute headways.

Additionally, the SFMTA has proposed two transit enhancement treatment visions for 16th Street, of which one or a combination of the two will be selected by the SFMTA Board prior to implementation. The treatments are referred to as the Moderate and Expanded Alternatives in the TEP EIR. The Moderate Alternative proposes a number of physical changes to the portion of the rerouted 22 Fillmore in the vicinity of the Mission Bay campus site including, but not limited to, new transit stops, relocated transit stops, and transit bulbs (approximately 45 feet in length), as well as new traffic signals at Connecticut and Missouri streets. The Expanded Alternative includes the features listed for the Moderate Alternative as well as the conversion of a lane of mixed-flow lane of traffic to a transit-only lane along 16th Street in both directions both within and in the vicinity of the campus site as well as the prohibition of left turns at Bryant, Potrero (westbound only), Utah, San Bruno, Kansas, Rhode Island, De Haro, Carolina, Wisconsin, Arkansas, Connecticut, and Missouri streets. Both alternatives would reduce peak period headways; AM would be reduced from 9 to 6 minutes, PM peak headways would be reduced from 8 to 5.5 minutes, and midday headways would be reduced from 10 to 7.5 minutes. The stated purpose of both alternatives is to make the 22 Fillmore more frequent, reliable, and effective along 16th Street.

Prior to the extension of the 22 Fillmore into Mission Bay via either the Moderate or Expanded Alternative, which both require the extension of overhead wire, the SFMTA proposes to implement a temporary motor coach service to coincide with the opening of the Phase One Medical Center at Mission Bay between the campus site and the 16th Street BART Station for an initial service phase. The preliminary name for this interim service is the Muni line '55' which is shown in **Figure 2-10**. The route would follow 16th Street between Mission Street to Third Street and Third Street from 16th Street to Mission Bay Boulevard North. The preliminarily proposed locations for new bus stops for this service in the vicinity of the campus site are on 16th Street at Fourth Street (both directions) and on Third Street just south of Mission Bay Boulevard South (southbound direction). The operating hours and service frequencies of the proposal have not yet been made public at the time of publication of this document.

- **33 Stanyan** – The TEP proposes two alignment changes. First, the line would be rerouted to Valencia Street between 16th and 18th streets to alleviate transit congestion on Mission Street. Second, the line would continue along 16th Street to Connecticut Street, south to 18th Street, east to Third Street, south to 20th Street, and west to Tennessee Street to replace the segment of the 22 Fillmore that is proposed to be discontinued. The TEP also proposes reducing peak period headways from 15 to 12 minutes.
- **47 Van Ness** – The TEP proposes changes to AM and PM peak headways from 10 to 7.5 minute headways. The TEP also proposes two alignment changes. First, the line would terminate at the intersection of Van Ness Avenue and North Point Street, which would discontinue service on portions of North Point, Stockton, Beach, and Powell streets. Second, the southern portion of the line would operate along Division and Townsend streets instead of Bryant and Harrison streets to provide a faster connection to the Caltrain station at Fourth and King streets and better connections to commercial and residential centers along 13th and Division streets. This second

realignment would discontinue service on portions of Mission, 11th, Harrison, Bryant, Fifth, and Fourth streets.

2.6.3.2 Regional Transit Service

Table 2-30 presents the regional transit routes serving the Mission Center campus site and route characteristics as of November 2013, including service frequencies during the weekday morning and evening peak periods, hours of operations and neighborhoods served.

Golden Gate Transit, AC Transit, SamTrans, Caltrain, and BART riders would transfer to Muni to access the Mission Center campus site.

TABLE 2-30: REGIONAL TRANSIT OPERATIONS - MISSION CENTER

Route	AM Peak Weekday Headways (7AM-9AM)[1]	PM Peak Weekday Headways (4PM-6PM)[1]	Hours of Operation	Areas Served by Route	Nearest Stop Location	Distance to Campus Site
Caltrain Local	-	-	4:30 AM-12:01 AM (IB) 4:55 AM-1:32 AM (OB)	San Francisco, San Jose	Fourth and King	1.3 miles
Caltrain Limited-Stop	10-20	20-60	5:50 AM-8:00 PM (IB) 6:11 AM-8:19 PM (OB)	San Francisco, San Jose	Fourth and King	1.3 miles
Caltrain Baby Bullet	10-40	20-40	5:45 AM-7:24 PM (IB) 6:57 AM-7:39 PM (OB)	San Francisco, San Jose	Fourth and King	1.3 miles
BART	5-15	5-15	4:00 AM-12:00 AM (IB/OB)	East Bay, San Francisco, San Mateo County	16th Street and Mission	1,700 feet
AC Transit	15-20	15-20	12:00 AM-12:00 AM(IB/OB)	East Bay, San Francisco	Beale between Folsom and Howard	2.1 miles
SamTrans Route 292	10-15	20	3:55 AM-2:28 AM (IB) 4:30 AM-12:00 AM (OB)	San Mateo County, SFO, San Francisco	Mission and Seventh	1.3 miles
GGT commuter and basic bus routes	15-90	15-90	4:01 AM-12:41 AM (IB) 5:06 AM-2:28 AM (OB)	North Bay, San Francisco	Folsom and Eighth	0.6 miles

Notes:

2.6.3.3 UCSF Shuttle System

Table 2-31 summarizes the routes serving the campus site, which includes some of the shuttle routes provided by UCSF. Shuttles to and from the Mission Center campus site stop in the parking lot located adjacent to the Mission Center building, entering from Harrison Street and exiting onto 15th Street.

TABLE 2-31: UCSF SHUTTLES TO MISSION CENTER CAMPUS SITE - MISSION CENTER

Route	Campuses Served	Hours of Operation	Headways (minutes)[1]	Average Weekday Boardings (2012)
Lime	Parnassus-BDC-MCB	6:05 AM – 8:31 PM	15	732
Red	Mission Bay-MCB-16th Street BART	5:55 AM – 7:45 PM	10/15	808
Yellow	16th Street BART-MCB-2300 Harrison-SFGH-2300 Harrison	6:07 AM – 8:23 PM	15	403

Notes:
1. Multiple values indicate variability in headways during the day.

Sources: UCSF Campus Life Services Transportation, Routes & Timetables, 2014; Ridership data from *UCSF Shuttle Operations Study, Final Report*, January 2014, prepared by Nelson Nygaard.

2.6.4 Pedestrian Circulation

Traveling to and from the campus site via walking is a relatively small travel mode for many UCSF Mission Center employees and students. Approximately three percent of those traveling to and from the campus site walk, although those using Muni or BART arrive to the campus site via foot as well.

Most intersections surrounding the Mission Center campus site were observed to have 50 to 100 pedestrians crossing at most crosswalks. The highest pedestrian volumes were observed on 16th Street, with 400 to 600 pedestrians observed at Bryant Street, and steadily increasing pedestrian traffic proceeding west on 16th Street to a peak of over 2,000 pedestrians at Mission and 16th streets near the BART station.

Sidewalks surrounding the Mission Center Campus Site.

Within the campus site area, sidewalks exist on both sides of the street in most locations, and are generally 11 to 15 feet wide. Standard crosswalks are provided at most intersections surrounding the campus site; however, no crosswalks are striped across 14th Street at the T-intersection with Trainor Street, nor across Harrison Street at the T-intersection with Alameda Street. Curb ramps are generally provided at most intersections and pedestrian signals are present at signalized intersections in the campus site vicinity.

2.6.5 Bicycle Circulation

The topography at and around the Mission Center campus site is relatively flat, which facilitates easy bicycle travel. Approximately six percent of those traveling to and from the campus site ride bikes, which is approximately double the bicycling mode share throughout San Francisco. Several bikeways run within the project vicinity, as shown in **Figure 2-19**.

The following bicycle facilities are located near the Mission Center campus site:

11th Street is part of San Francisco Bike Routes 25 and 30, an east-west bike route that extends from Market Street to 13th Street with Class II bicycle lanes.

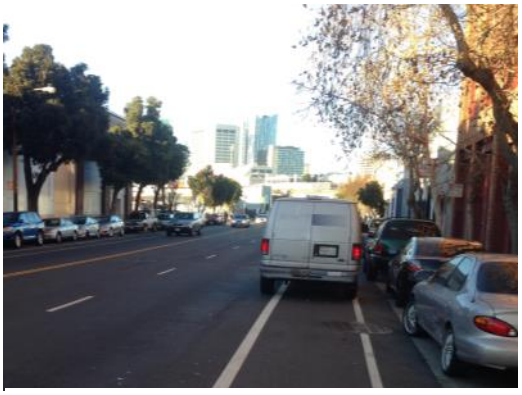
13th Street/Division is part of Bike Route 36, an east-west bike route that extends from Townsend Street to Bryant Street with Class II physically-separated bike lanes between Brannan Street and Townsend Street.

14th Street is part of Bike Routes 30 and 36, an east-west bike route that extends from Harrison Street to Market Street with a Class II bicycle lane and Class III sharrows.

17th Street is part of Bike Routes 25 and 40, an east-west bike route that extends from Kansas Street to Market Street with Class II bicycle lanes between Kansas Street and Church Street. Between Church Street and Market Street, 17th Street is designated as a Class III bicycle route, but does not have shared-lane markings.

Harrison Street is part of Bike Routes 25, 33, and 36, a north-south bike route that extends from 11th Street to Cesar Chavez Street. From 11th Street to 23rd Street, the route has Class II bicycle lanes. South of 23rd Street to Cesar Chavez, the route is designated as a Class III bicycle facility with no shared-lane markings.

Folsom Street is part of Bike Route 30, a north-south bike route that extends from 11th Street to 19th Street as a Class II route. However, the segment of Folsom between 11th Street and 14th Street has a single, northbound bike lane.



Bike lanes on Folsom Street are often blocked by double parking vehicles.

The SF Bike Plan includes planned short-term improvements to Bicycle Route 25 on Howard Street and Route 40 on 17th Street. Improvements to Howard Street include bicycle lanes from Ninth Street to 11th Street. Improvements to 17th Street include bicycle lanes between Market Street and Corbett Avenue.

The streets surrounding the campus site serve as popular bicycle routes connecting the Mission neighborhood with Downtown San Francisco. Bicycle routes connecting to downtown such as Harrison, Folsom, and 14th streets all see over 200 bicyclists during the AM peak hours. These routes are slightly less traveled in the PM peak hour, but still generally exceed 50 to 100 bicyclists. Other popular streets for bicycling include Division Street and 16th Street, which is not a signed bicycle route, but sees between 20 and 40 bicyclists during the AM and PM peak hours.

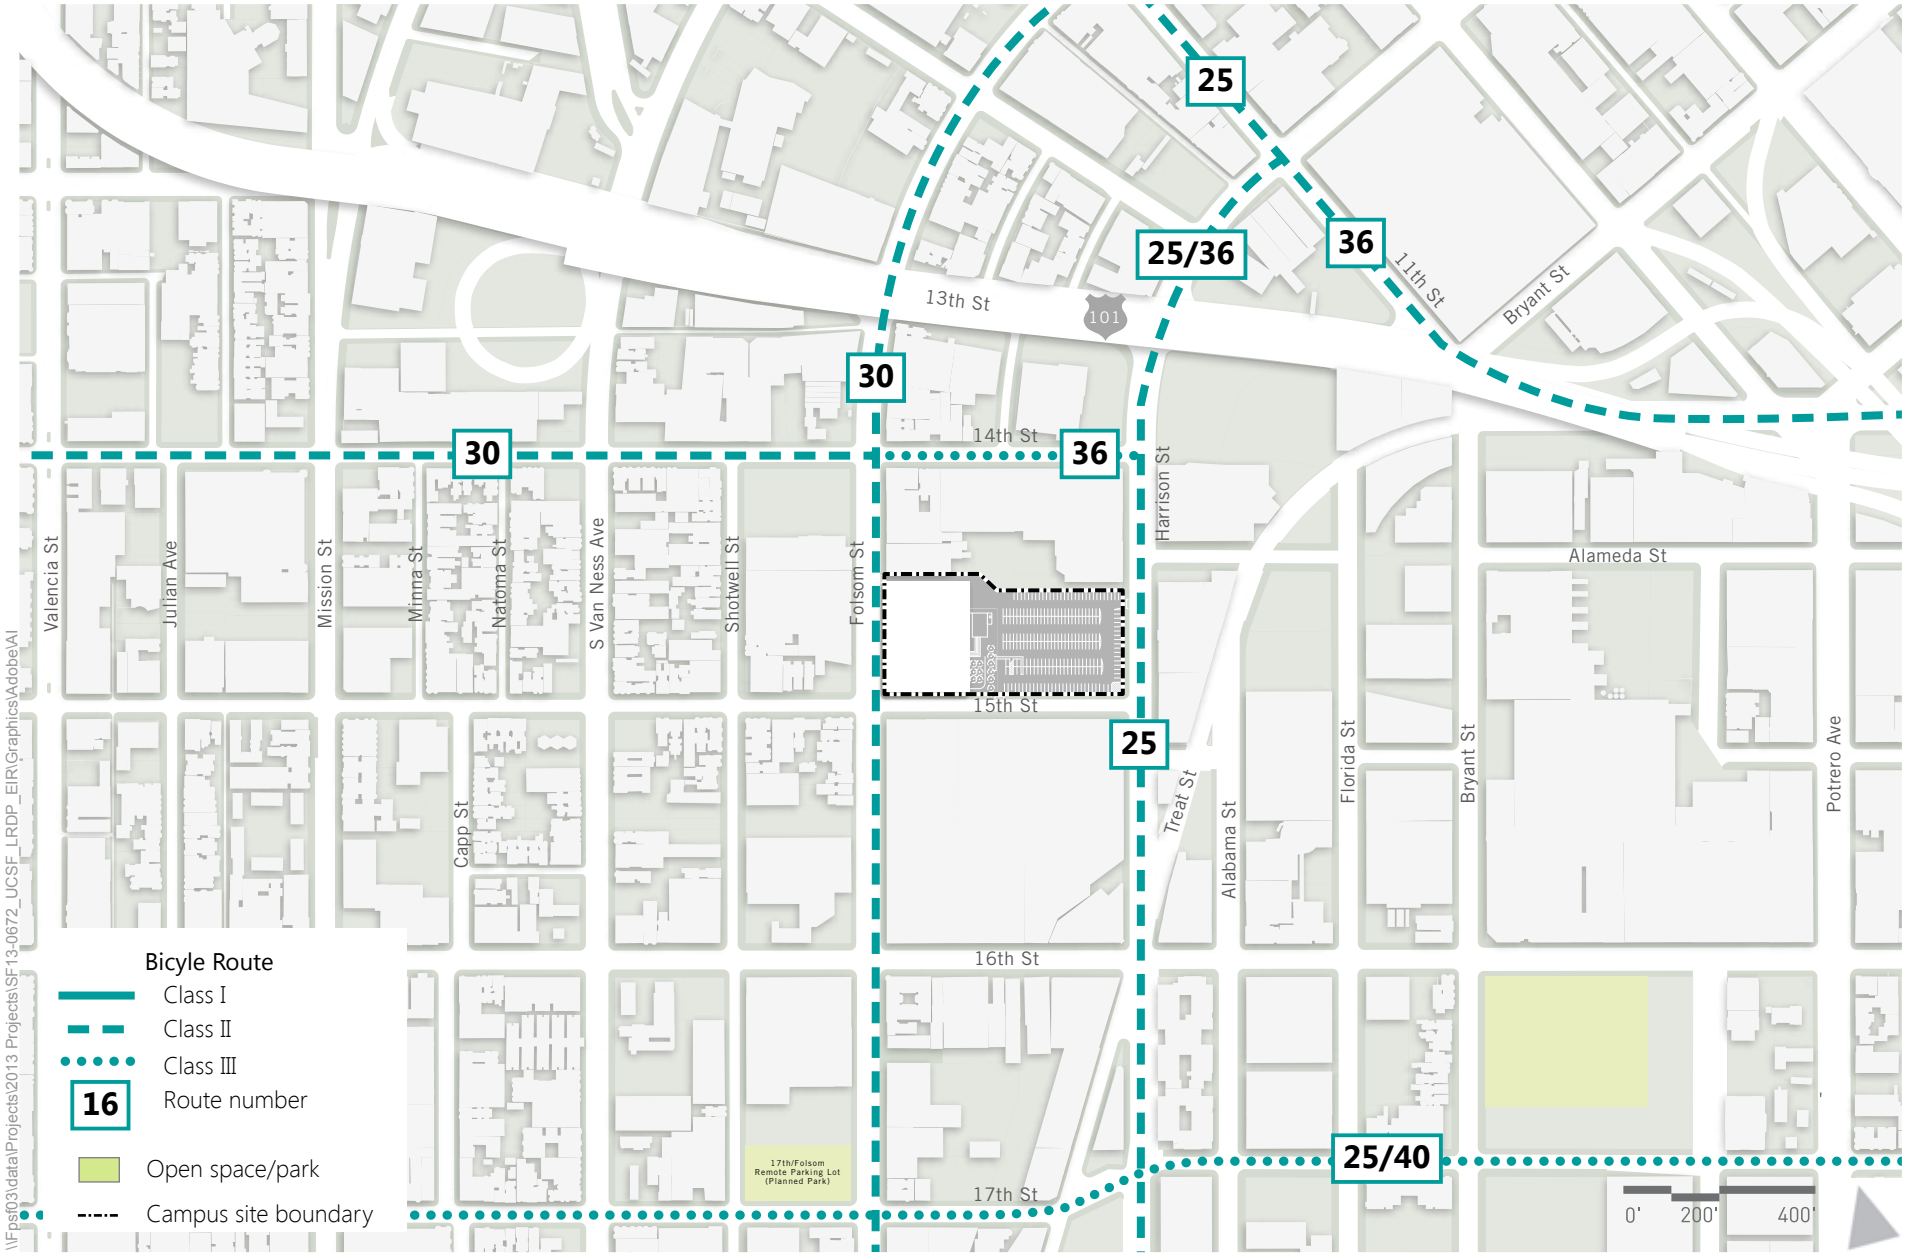


Figure 2-19

Existing Bicycle Facilities-
Mission Center

Bicycle racks are provided adjacent to the main entrance to the Mission Center Building. In an effort to increase bike parking and respond to feedback received from bicyclists, UCSF has recently redesigned and expanded the bike parking with new user-friendly racks.

2.6.6 Loading Conditions

The Mission Center campus site has both service vehicle and passenger loading. There are two off-street service vehicle loading facilities serving the existing uses on the campus site, and summarized in **Table 2-32** and shown in **Figure 2-20**. Marked zones for passenger and service vehicles are unavailable on adjacent streets, with most passenger loading occurring within the parking lot, adjacent to the building.

The Mission Center building receives approximately 12 deliveries per day in the designated off-street loading area. Additional parcel deliveries are made at the front of the building on Folsom Street, sometimes, which have been observed to block the northbound bicycle lane due to the lack of a curbside loading zone. Existing vehicle loading areas are sufficient for existing demand, although a curbside loading zone on Folsom Street, adjacent to the building, would improve conditions for bicyclists whom may have their path blocked due to vehicles loading in the northbound bicycle lane. This potential loading zone is discussed further in Section 4.5.4.

TABLE 2-32: PASSENGER AND VEHICLE LOADING INFORMATION - MISSION CENTER

Building / Location	Loading Areas (Passenger or Vehicle)	# Vehicle Loading Spaces and Type	# Passenger Loading Spaces
Mission Center Parking Lot	Vehicle	2 parcel/truck spaces	70 feet (3 spaces)

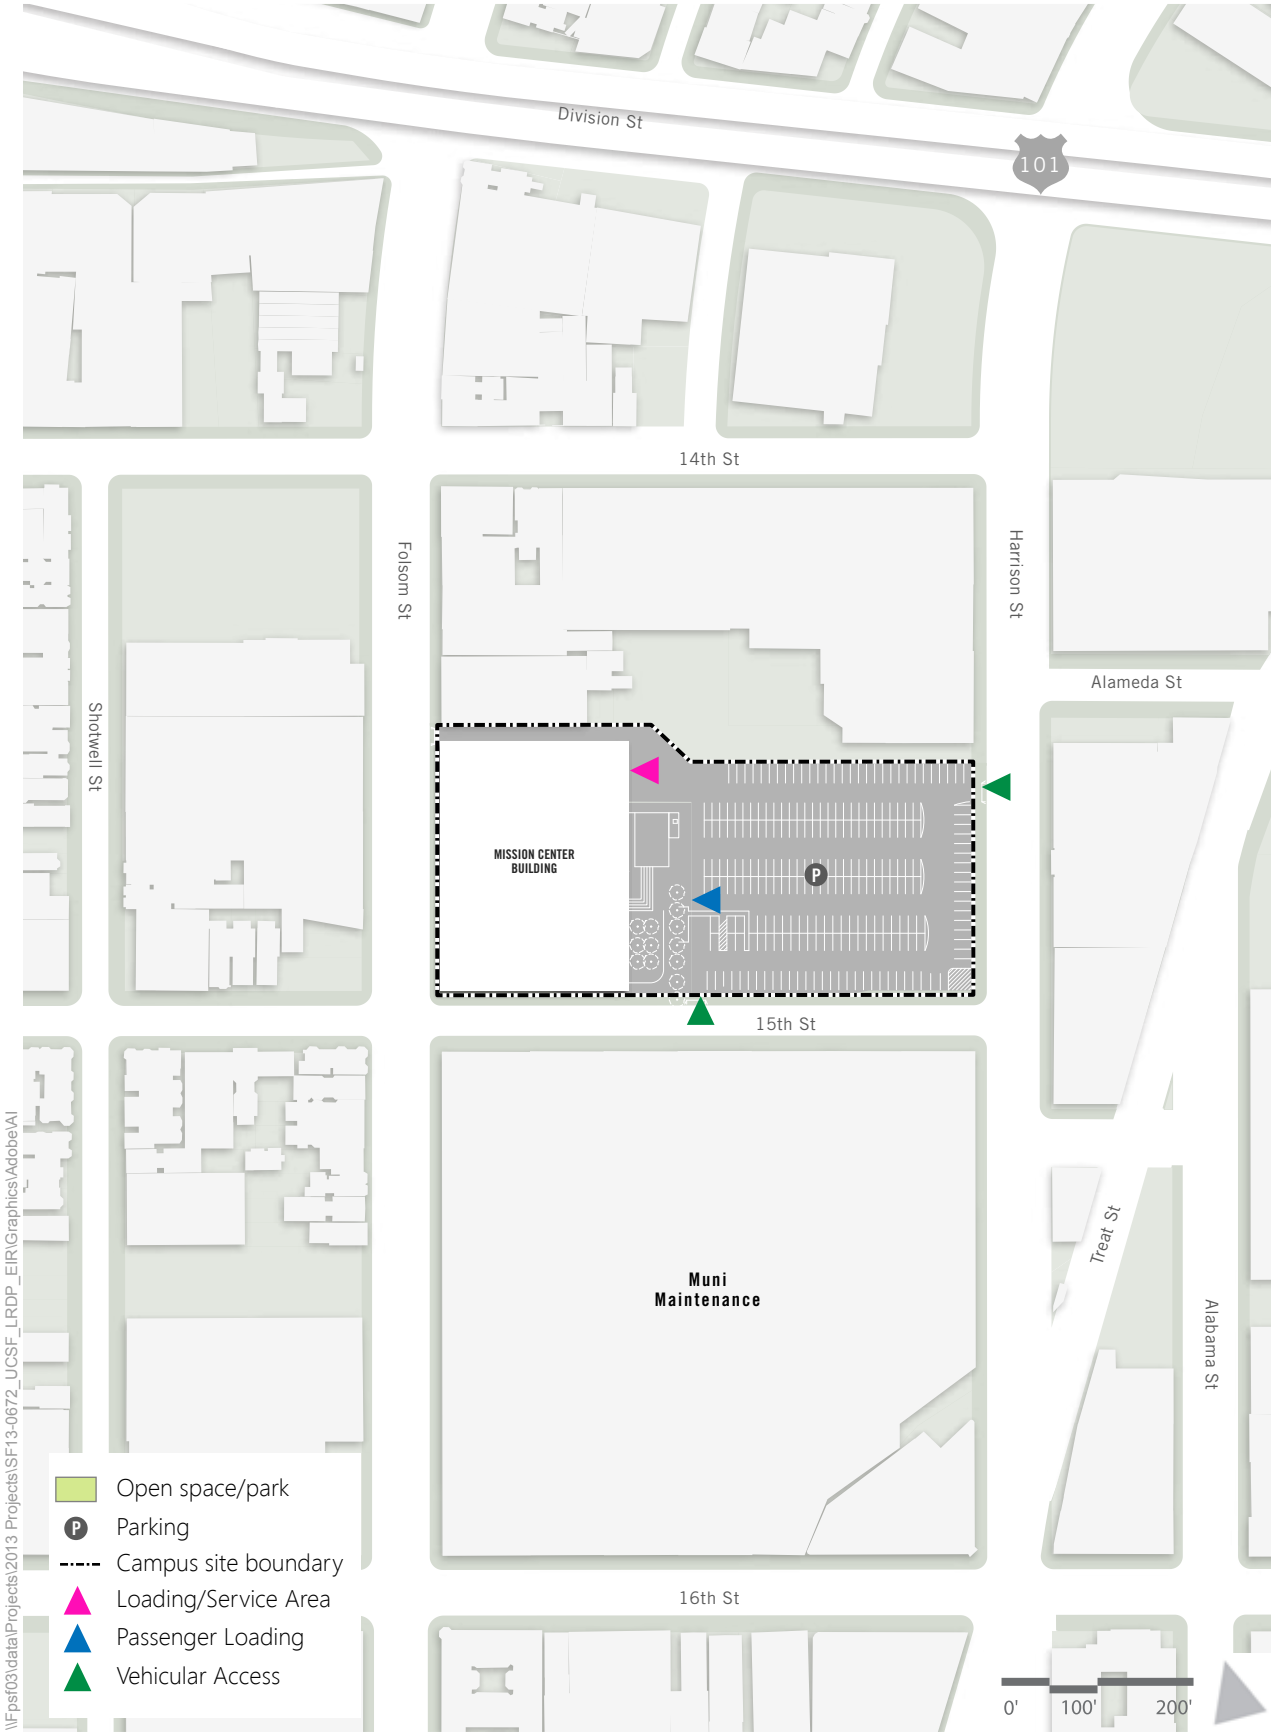

Figure 2-20

Existing Parking and Loading Locations-Mission Center

2.6.7 Parking Conditions

2.6.7.1 On-Street Parking

The majority of the on-street parking spaces in the vicinity of the Mission Center campus site are generally unrestricted. On-street parking on South Van Ness Avenue is limited to a one-hour period between the hours of 8 AM and 6 PM. Overnight parking is prohibited along Alameda, Alabama and portions of Treat streets west of Harrison Street.

Table 2-33 summarizes the on-street parking supply and utilization from a parking survey conducted by SFMTA in May and October 2012 of approximately 890 spaces, within the area generally bounded by 13th Street to the north, 17th Street to the south, South Van Ness Avenue to the west, and Harrison Street /Alabama Streets to the east.

TABLE 2-33: MISSION CENTER EXISTING ON-STREET PARKING SUPPLY AND OCCUPANCY [1]

Street Location	Overall Supply (spaces)	Occupancy		
		Mid-Morning	Midday	Evening
North-South Streets				
South Van Ness Av, from 13th St to 17th St	126	87%	86%	85%
Shotwell St, from 14th St to 17th St	114	97%	96%	89%
Folsom St, from 13th St to 17th St	124	98%	98%	76%
Harrison St, from 13th St to 17th St	117	98%	95%	72%
Treat St, from 15th St to 17th St	70	93%	97%	73%

Notes:

1. Data collected in May and October 2012.

Source: Adavant Consulting, SFMTA.

Parking occupancies throughout the mid-morning (10 AM to noon) and midday (noon to 2 PM), periods are very similar, at 95 percent (i.e., at their effective capacity); parking utilization in the evening (6:30 Pm to 8 PM) period is about 80 percent.

2.6.7.2 Off-Street Parking

The Mission Center campus site provides 224 marked parking spaces at an adjacent surface lot on the east side of the building. The vast majority (207) of the spaces are reserved for UCSF permit-holders, with 17 spaces available for general paid parking. There are two access points, at Harrison and 15th streets.

Additional non-UCSF owned public parking is available at nearby facilities, including a surface lot at 3111 17th Street at the northwest corner of 17th and Folsom streets (220 spaces), a surface lot at 24 Florida Street near Treat Street (139 spaces), and a surface lot at 1550 Bryant Street near 15th Street, with access off Florida Street (41 spaces). **Table 2-34** summarizes the off-street parking supply and occupancy from parking surveys conducted at these facilities in February, during the weekday mid-morning (10 AM to noon), midday (noon to 2 PM), and evening (4 to 6 PM) periods.

TABLE 2-34: MISSION CENTER SITE EXISTING OFF-STREET PARKING SUPPLY AND OCCUPANCY

Parking Facility	Overall Supply (spaces)	Occupancy [1]		
		Mid-Morning	Midday	Evening
UCSF Facilities				
Mission Center Surface Lot (1855 Folsom St)	224	84%	86%	23%
Other Parking Facilities				
3111 17th Street Surface Lot	220	78%	75%	38%
24 Florida St Surface Lot	139	94%	96%	54%
1550 Bryant St Surface Lot	41	120%	124%	66%
Total Other Parking Facilities	**400**	**88%**	**88%**	**46%**
All Facilities	**624**	**86%**	**87%**	**38%**

Notes: Data collected in February 2014.

1. Values above 100% indicate attendant parking.

Source: Adavant Consulting

Overall off-street parking occupancy during the mid-morning period is 86 percent and 87 percent during the midday period, while the overall occupancy in the evening is 38 percent. The overall peak parking occupancy at the UCSF surface parking lot is slightly lower than at the other facilities. During mid-morning, the peak parking demand period, the parking lot at the Mission Center campus site operates at 86 percent of its capacity, while the other facilities have a combined utilization of 88 percent.

3 TRAVEL DEMAND ANALYSIS

This chapter describes the vehicle, pedestrian, bicycle, and transit travel demand that would be generated by the proposed 2014 LRDP, based on factors developed from extensive surveys conducted at existing UCSF facilities over the past few years. The impact of new travel associated with the 2014 LRDP was estimated using a four-step process: trip generation, mode split, trip distribution, and trip assignment.

In the first step, the number of person trips generated by the 2014 LRDP was estimated on a daily, AM and PM peak hour basis. Next, the person trips were assigned to different modes of travel; automobile, transit, UCSF shuttle, bicycles, etc. Then, the geographic distribution of the trip origins and destinations was predicted. Finally, project trips for each mode were assigned to specific streets, UCSF routes and transit lines along the transportation network. The results of this four-step process are described in the following sections. In addition to the travel demand generated by the 2014 LRDP, this chapter also summarizes its expected parking, commercial loading, and construction-related travel demands.

The 2014 LRDP proposes various levels of growth at each campus site through the plan horizon year of 2035. Some known projects, such as Phase Two Medical Center at Mission Bay, are currently projected to occur between 2035 and 2040, after the 2014 LRDP horizon year, but have been incorporated into the travel demand estimates presented in this document. As such, the transportation analysis represents a conservative approach as it includes development five years past the 2014 LRDP horizon, to the year 2040.

Table 3-1 summarizes the existing and estimated average daily population growth by campus site by 2040. These population assumptions are different than those presented in the 2014 LRDP document. In addition to accounting for the 2035/2040 population increases described above, they include a certain level of population double-counting as well. Faculty and staff that would be present at two campus sites on the same day are counted twice, once at each location, as they would generate trips at both sites. In addition, a 10 percent reduction factor has been applied to all staff, to account for those who might be absent from each campus site due vacation, illness, or working elsewhere.[8]

As shown in **Table 3-1**, each campus site is expected to increase in weekday daily population through the LRDP horizon year/2040 with the highest growth expected at the Mission Bay site. In total, the four campus sites are expected to grow their combined average weekday daily population by approximately 20,250 people, a 71 percent increase.

[8] The 10 percent average employee absentee rate is based on information provided by UCSF; the 1996 UCSF LRDP estimated an employee absentee rate of 11 percent.

TABLE 3-1: SUMMARY OF GROWTH IN AVERAGE DAILY POPULATION BY CAMPUS SITE [1]			
Campus Site	**Existing (2011/2012)**	**Future (2035/2040) [2]**	**Growth**
Parnassus Heights	17,596	18,662	1,066 (6%)
Mission Bay	5,671	22,839	17,169 (303%)
Mount Zion	4,452	5,990	1,538 (35%)
Mission Center	780	1,260	480 (62%)
Total	***28,499***	***48,752***	***20,253 (71%)***

Notes:

1. Average weekday daily population for the four main campus sites only; includes the following groups: staff, patients and their visitors, other visitors, child care staff and children, and residents. Faculty and staff that would be present at two campus sites on the same day are counted twice, once at each location, as they would generate trips at both sites.
2. The data shown in this table reflects the future average weekday daily population through the LRDP horizon year (2035) for the Parnassus Heights, Mount Zion, and Mission Center campus sites, and year 2040 for the Mission Bay campus site.

Source: UCSF, Adavant Consulting, 2014

Travel demand characteristics and forecasts for the UCSF campus sites were developed by Adavant Consulting and its assumptions have been reviewed by the UCSF Campus Planning staff. **Appendix F** shows detailed tables of the summaries below.

3.1 TRIP GENERATION

Travel demand estimates for the four campus sites are based on the current and projected average number of physicians, staff and visitors, child care, residents, etc., at each campus site on a typical weekday. Forecasting the net new travel demand involves estimating the number of trips generated by the LRDP at each campus site, less trips associated with the existing uses on-site.

The following sections describe trip generation resources, person trip generation rates, person trip generation estimates, and the estimation of existing and future person trips at each campus site.

3.1.1 Trip Generation Resources

Medical, academic, and clinical facilities as well as residential housing generate travel demand in unique ways, depending on their location, specialties, and surrounding land uses. In order to forecast travel demand for the campus sites, the following UCSF-specific data sources were obtained and processed:

- UCSF Mount Zion Transportation Surveys, 1992, 1999
- UCSF Parnassus Heights Transportation Surveys, 1992, 1999
- UCSF 1996 LRDP FEIR, 1997
- UCSF 1996 LRDP Amendment #1 FSEIR, 2002
- UCSF Survey of Residents at Aldea and Avenue Housing, 2013
- UCSF Transportation Services, Annual Commuter Surveys for 2012 and 2013

In addition to the UCSF-specific data sources, the following documents were also consulted:

- Institute of Transportationg Engineers (ITE), *Trip Generation Report* (9th Edition), 2012
- San Francisco Planning Department, *Transportation Impact Analysis Guidelines for Environmental Review*, 2002

Further, the number of persons entering and exiting key UCSF buildings at the Mission Bay and Parnassus Heights campus sites was recorded over a two-day period in October 2013 in order to refine and validate the travel demand assumptions.

3.1.2 Population Assumptions and Trip Generation Rates

Typical weekday, as well as weekday AM and PM peak hour person trip generation rates were developed through an iterative process for each population group, based on the number of people arriving and departing each campus site gathered from the surveys. The conditions for the development of these trip rates were:

- Reflect logical travel journeys to/from and within the campus site for each population type (staff, patients and visitors, other visitors, etc.);
- Have the same value across all campus sites for each land use type (hospital, research/office, residential);
- Produce results that are in line with those obtained from the staff, patient and visitor surveys and data collection efforts previously conducted at the campus sites; and
- Result in overall trip generation rates that are comparable to those shown in other transportation studies of similar facilities, from previous UCSF studies, or obtained from other recognized sources.

Estimates for staffing and patient and visitor levels for a typical weekday were provided by UCSF Campus Planning staff and are based on the types and intensities of services proposed to be located at each campus site according to the LRDP. The population groups include the following:

Staff: Staff includes faculty, physicians, fellows, residents, nurses, nurse practitioners, postdocs, and students. It also includes "visiting" faculty, physician researchers, etc. who are not based at that specific campus site, but come to it occasionally for teaching, patients' visits, to perform surgery, or to research. The four campus sites currently have approximately 17,000 staff members combined (including some double counting as described above) on a typical weekday. There would be an increase in the total number of staff members of approximately 29,100 individuals on a typical weekday by 2035/2040.

Patients and Visitors: The patients and visitors group includes inpatients, visitors to the inpatients, and outpatients and their companions. There are currently a total of approximately 8,000 existing patients and visitors to the Parnassus Heights, Mission Bay and Mount Zion campus sites on a typical weekday. There would be an increase of approximately 13,700 total patients and visitors on a typical weekday by 2035/2040 on a typical weekday.

Other Visitors: This population group includes community center visitors (at Parnassus Heights and Mission Bay), staff visitors, vendors, and service providers. There are approximately 1,720 existing visitors

in this group at the four campus sites, which would increase to approximately 2,570 visitors by 2035/2040 on a typical weekday.

Child care: This population group at the Parnassus Heights and Mission Bay campus sites includes child care staff and child care children. There are currently approximately 230 child care staff and children, which would increase to approximately 390 through 2035/2040 on a typical weekday. For travel demand purposes, child care children generate person and vehicle trips under the drop-off mode of travel.

Residential: The residential population at the Parnassus Heights and Mission Bay campus sites includes on-campus residents (contract holders, spouses, and children), visitors to the residents, vendors and residential service providers. There are approximately 1,540 existing residents at the two campus sites, which would increase to approximately 2,970 residents through 2035/2040 on a typical weekday.

The resultant existing and future average population assumptions for a typical weekday at each campus site are summarized in **Table 3-2** by population group.

TABLE 3-2: EXISTING AND FUTURE AVERAGE DAILY POPULATION ESTIMATES ON A TYPICAL WEEKDAY BY CAMPUS SITE AND POPULATION GROUP [1]

Population Group	Existing Population (2012/2013)	Future Population(2035/2040) [1]	Growth

3.1.3 Trip Generation Estimates

The daily trip generation rates and additional number of total person trips (including internal to each campus site) expected by 2040 at each campus site are summarized in **Table 3-3**. The daily person trip rates presented in the table for staff patients and visitors were originally developed for the UCSF LRDP FEIR (1997), while the daily person trip rates for the residential uses have been obtained from Table 3-2, (p. 3-12) of the UCSF LRDP Amendment #1 FSEIR (2002). These rates were verified against field video counts taken at representative residential, research and medical office buildings at the Parnassus and Mission Bay campus sites and found to be appropriate for use in the evaluation of the 2014 LRDP. The daily person trip rate for child care represents a weighted average of staff (2.23 daily person trips per employee) and children (2.00 daily person trips per child).

Table 3-3 shows that in total, the four campus sites are expected to generate approximately 46,000 new person trips on a typical weekday, which represents an increase of approximately 72 percent over current values.

TABLE 3-3: NEW DAILY PERSON TRIPS BY CAMPUS SITE AND POPULATION GROUP

Grand Total	***20,253***	***2.27***	***46,029***

Notes:

1. The data shown reflects the future daily trips through the LRDP horizon year (2035) for the Parnassus Heights, Mount Zion, and Mission Center campus sites, and year 2040 for the Mission Bay campus site. Faculty and staff that would be present at two campus sites on the same day are counted twice, once at each location, as they would generate trips at both sites.
2. The daily person-trip rates shown in this table represent the average value for each population group as a whole. Separate trip generation rate assumptions were developed for each category within the groups (e.g., faculty, physicians, residents etc. within staff), which are shown in **Appendix F**.

Source: Adavant Consulting, 2014

3.1.4 Net New External Vehicle Person Trips

As shown in **Table 3-3**, proposed projects at the four campus sites through 2035/2040 would yield approximately 46,000 additional daily person trips. This value reflects the total number of additional person trips that would be generated by the 2014 LRDP; they have not been adjusted to subtract trips associated with the existing land uses at the campus sites and internal trips expected to occur within each campus site. An internal trip is an origin-destination pair within the same site (e.g. a researcher at the Parnassus Heights campus site traveling from her office to the Millberry Union to eat lunch and returning back to her office afterwards).

Thus, the number of internal trips within each campus site needs to be assessed, such that they are subtracted from the total in order to determine the number of net new external person trips that would be generated by each campus site. The proportion of trips occurring within a campus site will be different for each population group. Using information from previous transportation analyses and surveys of UCSF campus sites, it has been assumed that trips internal to each site would represent 10 percent of all the staff (including child care staff) daily trips, 50 percent of the child care children daily trips (i.e. at least half of the children have a parent working on site), and 10 to 70 percent of the residents daily trips (depending on the campus and the resident population type). All patient, visitor, and vendor daily trips are assumed

to be external (one trip end inside and the other outside the campus site). **Appendix F** presents the application of the internal trip rates.

Table 3-4 summarizes the net new daily trip generation external to each campus as proposed by the 2014 LRDP (Those trips that do not have both trip ends within the same campus site). As shown in the table, conservatively, no internal person trips were assumed to occur within the Mount Zion and Mission Center campus sites given their smaller size.

TABLE 3-4: EXISTING AND FUTURE DAILY INTERNAL AND EXTERNAL PERSON TRIPS

Total	***5,167***	***58,690***	***11,233***	***98,654***	***6,066***	***39,963***

Note:
1. The data shown reflects the future daily person trips through the LRDP horizon year (2035) for the Parnassus Heights, Mount Zion, and Mission Center campus sites, and year 2040 for the Mission Bay campus site.

Source: Adavant Consulting, 2014

Table 3-4 shows that the through 2035/2040, the four campus sites would generate about 39,960 net new external person trips per day.

3.2 PERSON TRIPS FOR MISSION BAY SITE IN 2015

An interim trip generation assessment was also conducted at the Mission Bay campus site only for the year 2015, when Phase One Medical Center and the Mission Hall projects, currently under construction, are expected to open. The population and person trip increases at the Mission Bay site by 2015 are summarized in **Table 3-5**.

TABLE 3-5: 2012/13 TO 2015 DAILY POPULATION AND PERSON TRIP GROWTH AT THE MISSION BAY CAMPUS SITE BY POPULATION GROUP

Population Group	Average Daily Population Growth (2012/13 to 2015)	Additional Daily Person Trips by 2015		
		Internal	External	Total
Mission Bay				
Staff	2,405	536	4,826	5,363
Patients and Visitors	2,127	0	4,254	4,254
Other Visitors	170	0	340	340
Child care	0	0	0	0
Residential	0	0	0	0
Total Mission Bay	***4,702***	***536***	***9,420***	***9,957***

Source: UCSF, Adavant Consulting, 2014

As shown in the table, with the opening of Phase One Medical Center and Mission Hall by 2015, there would be an increase in population of approximately 4,700 individuals, which represents an increase of 9,420 external daily person trips.

3.3 TRAVEL MODE SPLIT

Travel mode split is the relative proportioning of LRDP-generated trips to various travel modes. Modes of travel categories include automobile, transit, walking and other, where other includes bicycle, motorcycle, and taxi. An average vehicle occupancy factor was applied to the number of automobile person trips to determine the number of vehicle trips.

Travel mode split and average vehicle occupancy assumptions for each campus site were based on information collected by UCSF and its transportation planning consultants, as described in Section 3.1.1. The methodology estimates the future modal share based on the current modal splits for each campus by population type, which take into account the transit accessibility, UCSF shuttle service, parking availability, and TDM measures being provided at each campus site; this approach is consistent with the travel demand methodologies established by the SF Planning Department.

Table 3-6 summarizes the external person trips percentages by mode of travel for each campus site. As shown in the table, the majority of Parnassus Heights campus site trips arrive or depart by taking public transit or the UCSF shuttle service. A majority of Mission Bay campus site trips are drive alone, followed by public transit, and the UCSF shuttle service. The majority of Mount Zion and Mission Center campus sites trips arrive or depart by driving alone, followed by travel by public transit.

Notes:

1. Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

Source: Adavant Consulting, 2014

3.4 TRIP DISTRIBUTION

Project-generated person trips were assigned to San Francisco and regional origins/destinations, including the four San Francisco Superdistricts (northeast, northwest, southeast, and southwest quadrants of the City), the East Bay, the North Bay, and the South Bay, as well as areas outside the Bay Area region. Information collected by UCSF as part of their ongoing surveys of employees, patients, visitors and residents were used in this analysis.

The information includes origin/destination data by campus and by specific population group, including faculty, medical residents and nurses, students, staff, patients and visitors, vendors and services, and housing residents; the existing geographical trip distribution was used in the travel demand analysis; this approach is consistent with the travel demand methodologies established by the SF Planning Department. The following sections describe the trip distribution percentages by campus site, the detailed trip distributions by population group are presented in **Appendix F**.

3.4.1 Parnassus Heights

Table 3-4 shows approximately 1,930 new daily external trips to be attracted/generated by the Parnassus Heights campus site. These additional external person trips are distributed locally and regionally as described above. The resulting trip distribution percentages are shown in **Table 3-8**.

TABLE 3-8: PARNASSUS HEIGHTS CAMPUS SITE – 2040 PEAK HOUR TRIP DISTRIBUTION BY POPULATION GROUP[1]

Population Group	Staff	Patient and Visitors	Other Visitors [3]	Child care	Residential	All Population Groups Combined
San Francisco						
Superdistrict 1 / Northeast Quadrant	11%	43%	0%	11%	24%	19%
Superdistrict 2 / Northwest Quadrant	14%	3%	0%	14%	10%	11%
Superdistrict 3 / Southeast Quadrant	31%	17%	0%	31%	46%	39%
Superdistrict 4 / Southwest Quadrant	10%	4%	0%	10%	11%	10%
Outside of San Francisco						
East Bay	6%	22%	0%	6%	3%	5%
North Bay[2]	-2%	-1%	0%	-2%	2%	0%
South Bay	30%	13%	0%	30%	3%	16%
Out of Region[2]	0%	-1%	0%	0%	1%	0%
Total	***100%***	***100%***	***0%***	***100%***	***100%***	***100%***

Notes:

1. Trip distribution accounts for external trips only.
2. Negative trip distribution percentage occurs because the net peak hour trips origin/destination is less than the existing conditions.
3. No additional "Other Visitor" external trips would be generated/attracted to the Parnassus Heights campus site as part of the LRDP.

Source: Adavant Consulting, 2014

As shown in **Table 3-8**, most staff, patient and visitors, child care and resident trips come from Superdistrict 1, the Northeast quadrant of San Francisco, and Superdistrict 3, the Southeast quadrant. **Figure 3-1** shows general directions of approach and departure of LRDP-generated trips, based on the percentages presented in **Table 3-8**.

Figure 3-1

2040 Net New Trip Distribution-
Parnassus Heights

3.4.2 Mission Bay

As noted in **Table 3-4**, Phase One Medical Center and the Mission Hall projects at the Mission Bay campus site would generate 9,420 net new external daily person trips. Those trips are distributed regionally, with the resulting trip distribution percentages for the 2015 year are shown below in **Table 3-9**.

TABLE 3-9: MISSION BAY CAMPUS SITE – 2015 PEAK HOUR TRIP DISTRIBUTION BY POPULATION GROUP[1]

Population Group	Staff	Patient and Visitors	Other Visitors	Child care [2]	Residential [2]	All Population Groups Combined
San Francisco						
Superdistrict 1 / Northeast Quadrant	8%	22%	16%	0%	0%	13%
Superdistrict 2 / Northwest Quadrant	10%	7%	11%	0%	0%	9%
Superdistrict 3 / Southeast Quadrant	22%	9%	11%	0%	0%	17%
Superdistrict 4 / Southwest Quadrant	7%	20%	19%	0%	0%	11%
Outside of San Francisco

Out of Region	0%	8%	6%	0%	0%	3%
Total	***100%***	***100%***	***100%***	***0%***	***0%***	***100%***

Notes:

1. Trip distribution accounts for external trips only.
2. No new child care or residential external person trips would be generated by 2015.

Source: Adavant Consulting, 2014

As shown above, a majority of net peak hour trips come from the South Bay, while a sizeable portion of staff, patients and visitors, and other visitors come from the Northeast and Southwest quadrants of San Francisco. UCSF staff does not anticipate net new trips generated from child care or residents by 2015. **Figure 3-2** shows general directions of approach and departure of LRDP-generated trips, based on the percentages presented in **Table 3-9**.

Figure 3-2

2015 Net New Trip Distribution-Mission Bay

Table 3-4 indicates that the 2014 LRDP would generate approximately 33,750 net new external daily person trips at the Mission Bay site by 2040. Due to the different mix in population growth between 2015 and 2040, the trip distribution for the project trips in 2015 differs slightly from that of year 2040. **Table 3-10** shows the year 2040 trip distribution which includes the net new trips between the existing and year 2040.

TABLE 3-10: MISSION BAY CAMPUS SITE – 2040 PEAK HOUR TRIP DISTRIBUTION BY POPULATION GROUP[1]

Population Group	Staff	Patient and Visitors	Other Visitors	Child care	Residential	All Population Groups Combined
San Francisco						
Superdistrict 1 / Northeast Quadrant	7%	22%	16%	7%	44%	11%
Superdistrict 2 / Northwest Quadrant	8%	7%	11%	8%	5%	8%
Superdistrict 3 / Southeast Quadrant	19%	9%	10%	19%	38%	18%

Total	***100%***	***100%***	***100%***	***100%***	***100%***	***100%***

Notes:

1. Trip distribution accounts for external trips only,

Source: Adavant Consulting, 2014

As shown in **Table 3-10**, a majority of staff and Child care trips would come to/from the South Bay and Superdistrict 3, the Southeast quadrant of San Francisco. Most patients and visitors and other visitors are from Superdistricts 1 and 4, the Northeast and Southwest quadrants of San Francisco, with a sizeable amount coming from the East Bay and South Bay areas. A majority of residential trips are distributed to Superdistricts 1 and 3, the Northeast and Southeast quadrants of the City, with few residents traveling outside of San Francisco. **Figure 3-3** shows general directions of approach and departure of LRDP-generated trips, based on the percentages presented in **Table 3-10**.

Figure 3-3

2040 Net New Trip Distribution-Mission Bay

3.4.3 Mount Zion

Table 3-4 shows approximately 3,220 additional external person trips at the Mount Zion campus site by 2040. These new external trips have been distributed regionally as previously described. The resulting trip distribution percentages are shown in **Table 3-11**.

TABLE 3-11: MOUNT ZION CAMPUS SITE – 2040 PEAK HOUR TRIP DISTRIBUTION BY POPULATION GROUP[1]

Population Group	Staff	Patient and Visitors	Other Visitors	All Population Groups Combined
San Francisco				
Superdistrict 1 / Northeast Quadrant	4%	34%	24%	10%
Superdistrict 2 / Northwest Quadrant	18%	25%	20%	19%
Superdistrict 3 / Southeast Quadrant	8%	10%	12%	8%
Superdistrict 4 / Southwest Quadrant	8%	16%	15%	9%
Outside of San Francisco				
East Bay	21%	3%	12%	18%
North Bay	13%	3%	10%	11%
South Bay	28%	10%	3%	25%
Out of Region[2]	0%	-1%	4%	0%
Total	***100%***	***100%***	***100%***	***100%***

Notes:

1. Trip distribution accounts for external trips only,
2. Negative trip distribution percentage occurs because the net peak hour trips origin/destination is less than the existing conditions.

Source: Adavant Consulting, 2014

As shown above, a majority of staff would come from outside of San Francisco, with almost 30-percent arriving from the South Bay. Unlike staff, most patients, visitors and other visitors are distributed within San Francisco. **Figure 3-4** shows general directions of approach and departure of LRDP-generated trips, based on the percentages presented in **Table 3-11**.

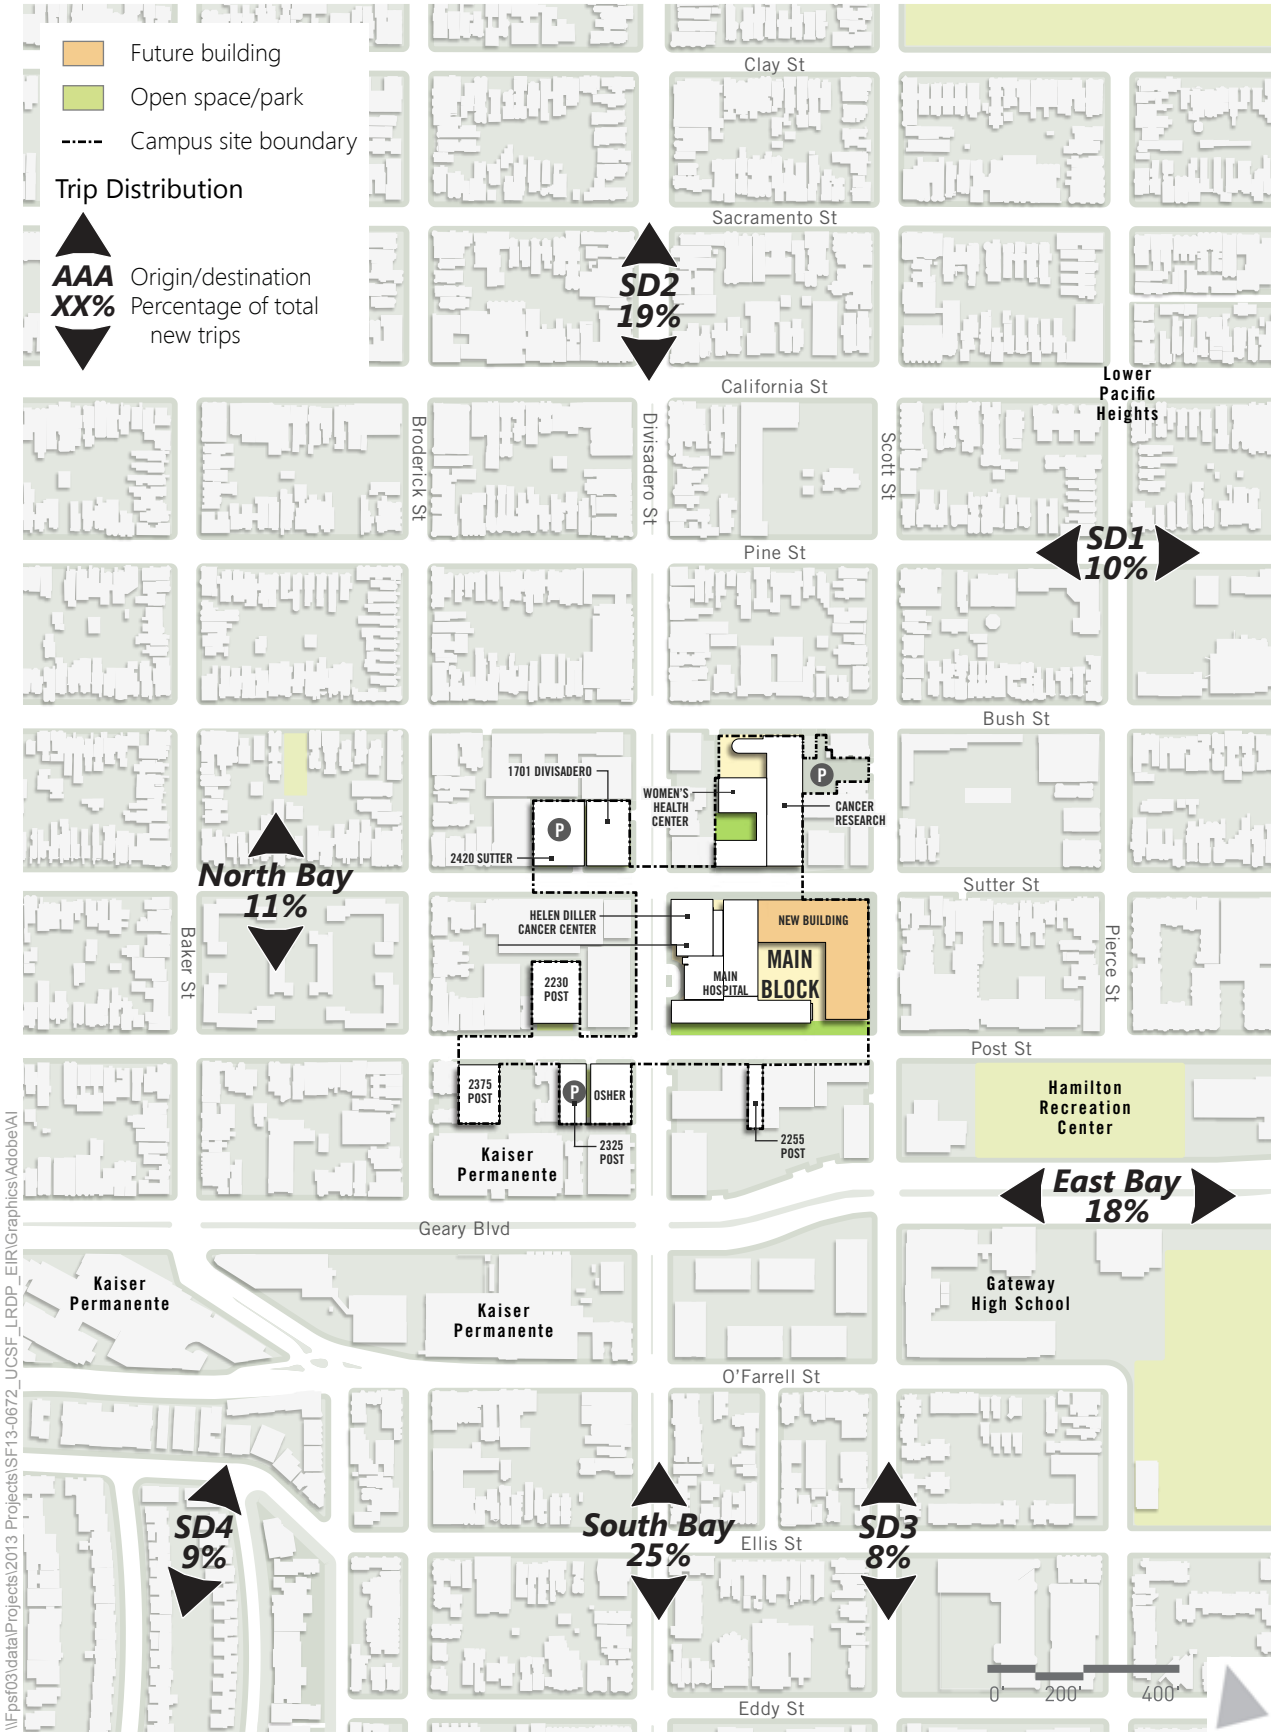

Figure 3-4

2040 Net New Trip Distribution-Mount Zion

3.4.4 Mission Center

Table 3-4 shows 1,064 external trips at the Mission Center campus site. These external trips have been distributed regionally as previously described in the document. The resulting trip distribution percentages are summarized in **Table 3-12**.

TABLE 3-12: MISSION CAMPUS SITE – 2040 PEAK HOUR TRIP DISTRIBUTION BY POPULATION GROUP[1]

Population Group	Staff	Other Visitors	All Population Groups Combined
San Francisco			
Superdistrict 1 / Northeast Quadrant	8%	16%	8%
Superdistrict 2 / Northwest Quadrant	10%	11%	10%
Superdistrict 3 / Southeast Quadrant	22%	11%	22%

Notes:

1. Trip distribution accounts for external trips only,

Source: Adavant Consulting, 2014

As shown in **Table 3-12** approximately half of the staff and other visitors are distributed in San Francisco while the remaining half is distributed outside of the City. **Figure 3-5** shows general directions of approach and departure of LRDP-generated trips, based on the percentages presented in **Table 3-12**.

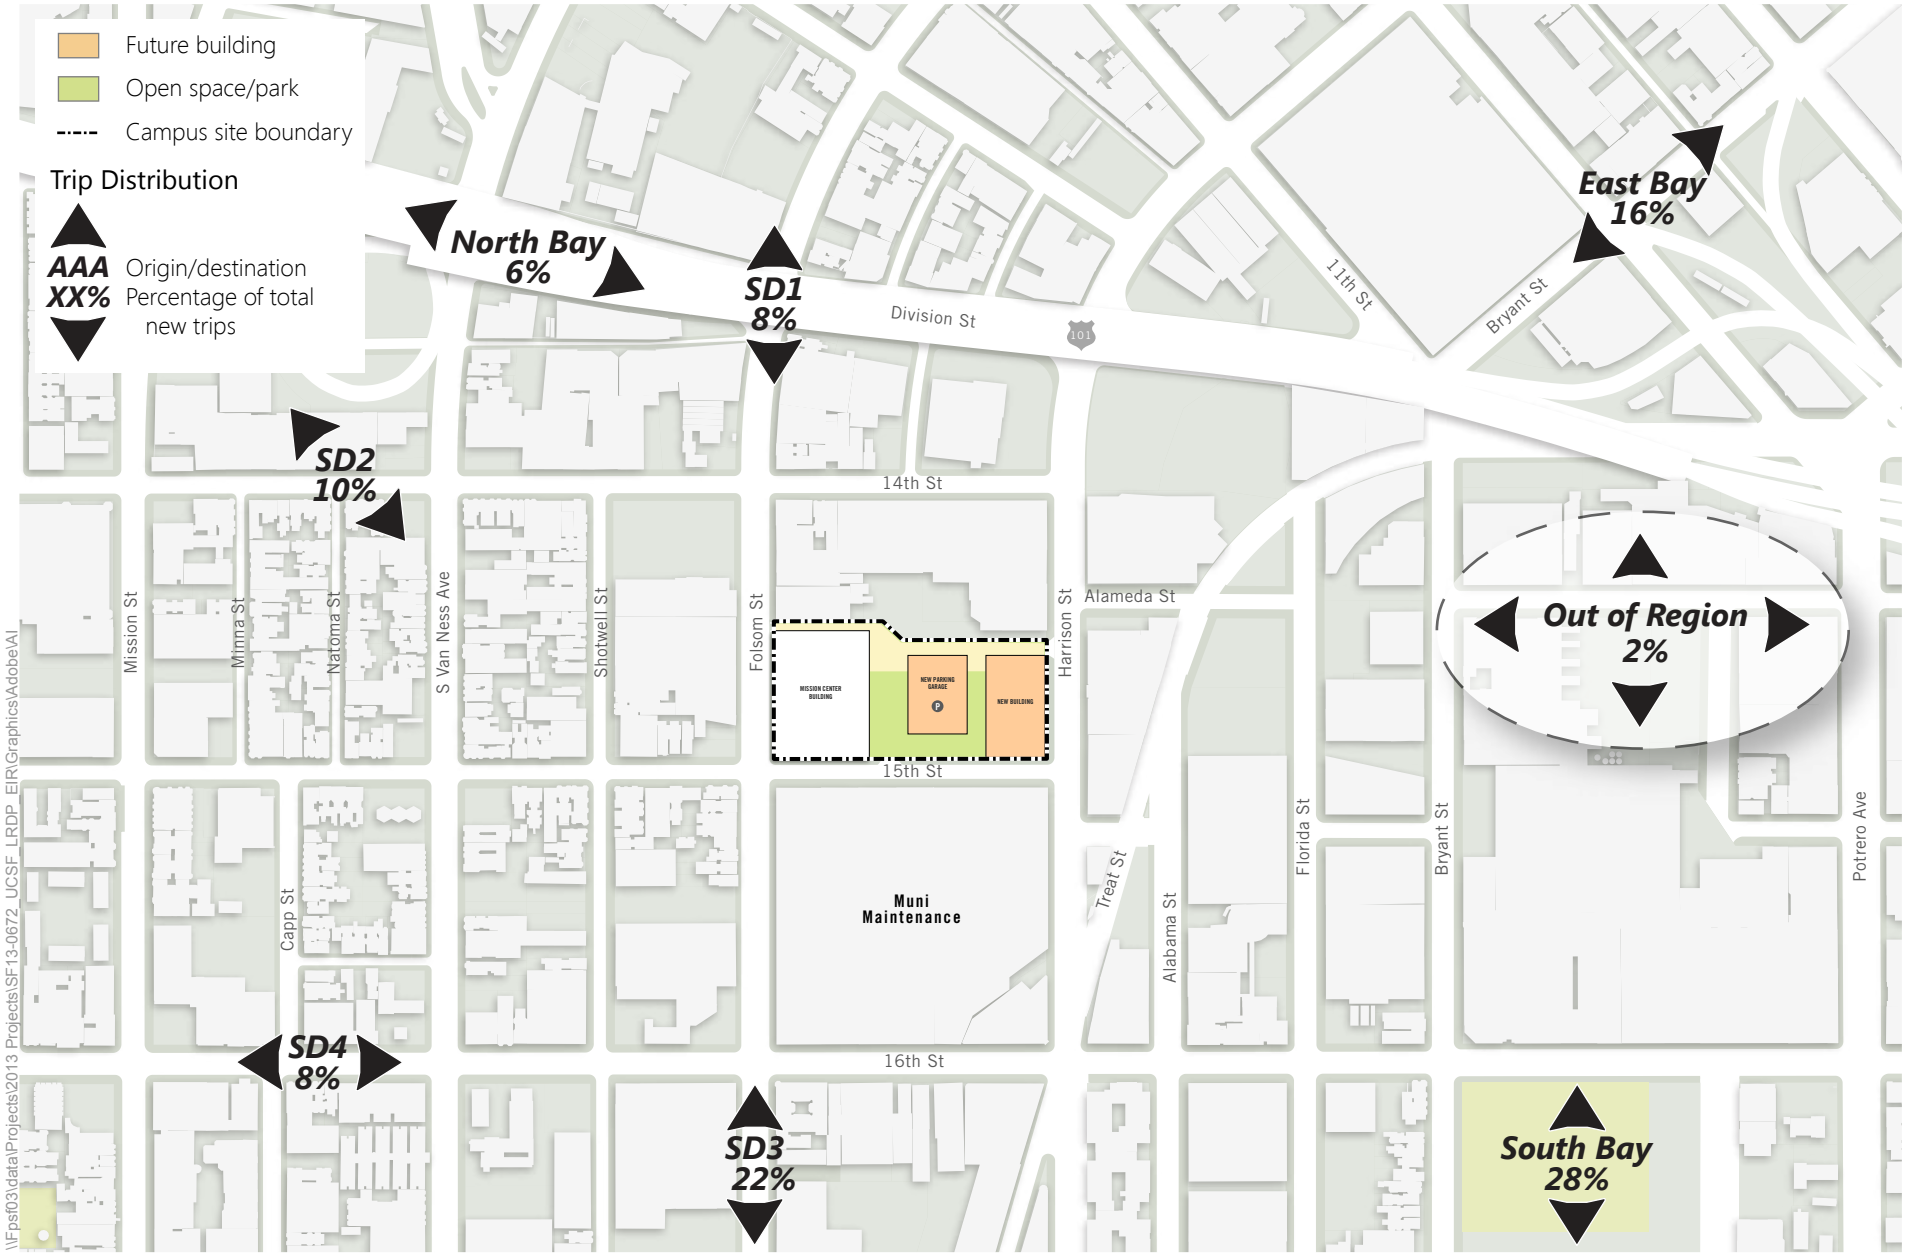

Figure 3-5

2040 Net New Trip Distribution-
Mission Center

3.5 PEAK HOUR TRIP GENERATION

The AM and PM peak hour trips were then estimated by applying appropriate peak hour factors to the daily trips presented in Table 3-13. The peak hour trips were, in turn, allocated as inbound or outbound to each campus site, depending on the time period. The peak hour assumptions differ slightly by campus site according to field survey data, and are summarized in **Table 3-13**.

TABLE 3-13: AM AND PM PEAK HOUR % OF DAILY TRAVEL ASSUMPTIONS FOR EXTERNAL TRIPS

3.6 PEAK HOUR TRIP ASSIGNMENT

External project trips summarized in **Table 3-4** are then assigned to specific modes and routes that LRDP-generated AM and PM peak hour trips would likely take to and from each campus site. Vehicle trips are

assigned to roadways and intersection turning movements according to the trip distribution percentages identified in the previous section. Similarly, transit trips are assigned to specific transit service providers and routes using the trip distribution and mode split percentages from the tables above based on the most direct transit route to and from their origin or destination.

The subsections below describe the peak hour vehicle and transit trip assignments for the four major campus sites.

3.6.1 Parnassus Heights

The Parnassus Heights campus site would generate 1,927 net new external daily person trips of which 405 would be vehicle trips and 1,037 would be transit (public transit plus UCSF shuttle bus service) riders. Approximately 17 percent of daily trips would be expected to occur during the AM peak hour and about 15 percent during the PM peak hour. **Table 3-14** shows the AM and PM peak hour new vehicle trips by population group, **Table 3-15** shows the AM and PM peak hour additional transit trips by transit service provider, and **Table 3-16** shows the AM and PM peak hour pedestrian and bicycle trips.

TABLE 3-14: PARNASSUS HEIGHTS CAMPUS SITE – EXISTING TO 2035 NEW PEAK HOUR VEHICLE TRIPS[1]

Population Group	AM Peak Hour			PM Peak Hour		
	In	Out	Total	In	Out	Total
Staff	18	4	22	2	21	23
Patients and Visitors	6	0	6	1	3	4
Other Visitors	0	0	28	0	0	0
Child care	11	10	21	10	10	20
Residential	14	32	46	32	13	45
Total	***49***	***46***	***95***	***45***	***47***	***92***

Notes:

1. Peak hour trips account for external trips only. Includes UCSF shuttle vehicles.

Source: Adavant Consulting, 2014

TABLE 3-15: PARNASSUS HEIGHTS CAMPUS SITE – EXISTING TO 2035 NEW PEAK HOUR TRANSIT TRIPS[1]

Transit Mode	AM Peak Hour			PM Peak Hour		
	In	Out	Total	In	Out	Total
SF Muni	45	12	57	18	39	57
BART	12	1	13	2	10	12
AC Transit	1	0	1	0	1	1
Caltrain	1	0	1	0	1	1
SamTrans	1	0	1	0	1	1
Golden Gate Transit	2	0	2	0	2	2
UCSF Shuttle	60	57	117	48	46	94
Total	***122***	***70***	***192***	***68***	***100***	***168***

Notes:

1. Peak hour trips account for external trips only. Some transit users may use multiple transit modes on a single trip (e.g. BART+Muni, AC Transit+Muni, Muni+UCSF Shuttle, etc.). The table accounts for the total number of trips on each system, therefore transfer trips are counted multiple times.

Source: Adavant Consulting, Fehr & Peers, 2014

TABLE 3-16: PARNASSUS HEIGHTS CAMPUS SITE – EXISTING TO 2035 NEW PEAK HOUR WALK AND BICYCLE TRIPS[1]

Mode	AM Peak Hour	PM Peak Hour
Walk	36	33
Bicycle	17	15
Total	***53***	***48***

Notes:

1. Peak hour trips account for external trips only. Accounts for pedestrians or bicyclists walking/biking as their main mode of travel to the campus site.

Source: Adavant Consulting, 2014

As shown in **Table 3-14**, approximately 95 new vehicle trips would occur during the AM and PM peak with approximately half entering and half exiting the site. **Table 3-15** shows approximately 190 new transit riders in the AM peak hour and 170 new transit riders in the PM peak hour. A majority of transit users would be expected to travel to/from the campus site by Muni and the UCSF shuttle bus service. **Table 3-16** shows approximately 50 new pedestrians and bicyclists are expected during the AM and PM peak hour.

3.6.2 Mission Bay

The Mission Bay campus site would generate 9,420 net new external daily person trips by 2015 (completion of Phase One Medical Center and Mission Hall projects) of which 4,051 would be vehicle trips and 1,491 would be transit (public transit plus UCSF shuttle bus service) riders. Approximately 18 percent of daily trips would occur during the AM peak hour and about 16-percent during the PM peak hour. **Table 3-17** shows the 2015 AM and PM peak hour additional vehicle trips by population group, **Table**

3-18 shows the AM and PM peak hour new transit trips by transit service provider, and **Table 3-19** shows AM and PM peak hour walk and bicycle trips.

Notes:

1. Peak hour trips account for external trips only. Accounts for pedestrians or bicyclists walking/biking as their main mode of travel to the campus site.

Source: Adavant Consulting, 2014

As shown in **Table 3-17**, approximately 610 new vehicles are estimated to arrive and 70 vehicles are estimated to depart, totaling about 680 new vehicle trips during the AM peak hour. There are an estimated 60 vehicles estimated to arrive and 430 vehicles estimated to depart during the PM peak hour, totaling approximately 490 additional vehicles at the campus site. **Table 3-18** shows that approximately 690 and 560 new transit riders would arrive or depart the campus site during the AM and PM peak hour, respectively. A majority of transit users at the Mission Bay campus site are expected to use SF Muni, BART, and the UCSF shuttle bus service. **Table 3-19** shows approximately 590 new pedestrians and bicyclists during the AM and approximately 460 new pedestrians and bicyclists during the PM peak hour.

By the year 2040, the Mission Bay campus site would generate 33,749 net new external daily trips of which 14,974 would be vehicle trips and 12,728 would be transit trips. Approximately 18-percent of daily trips would occur during the AM peak hour and about 16-percent during the PM peak hour. **Table 3-20** shows the year 2040 AM and PM peak hour additional vehicle trips by population group, **Table 3-21** the AM and PM peak hour new transit trips by transit service provider, and **Table 3-22** shows the AM and PM peak hour walk and bicycle trips.

TABLE 3-22: MISSION BAY CAMPUS SITE – EXISTING TO 2040 NEW PEAK HOUR WALK AND BICYCLE TRIPS[1]

Mode	AM Peak Hour	PM Peak Hour
Walk	498	427
Bicycle	374	320
Total	***872***	***747***

Notes:

2. Peak hour trips account for external trips only. Accounts for pedestrians or bicyclists walking/biking as their main mode of travel to the campus site.

Source: Adavant Consulting, 2014

As shown in **Table 3-20**, approximately 2,560 vehicles are estimated to arrive and 320 vehicles are estimated to depart the campus site during the AM peak hour, totaling 2,880 new vehicle trips. There would be an estimated 330 vehicles arriving and 2,080 vehicles departing the campus site during the PM peak hour, totaling 2,410 new vehicles. By 2040, transit usage is expected to increase by about 3,180 and 2,920 riders during the AM and PM peak hour, respectively. Most transit riders would be expected to use SF Muni, BART, and the UCSF shuttle bus service. **Table 3-22** shows approximately 870 new pedestrians and bicyclists during the AM and approximately 750 new pedestrians and bicyclists during the PM peak hour.

3.6.2.1 LRDP Variant

Under the LRDP Variant, the Mission Bay campus site would generate slightly more vehicle trips than the LRDP. As shown in **Table 3-23**, approximately 2,620 new vehicles are estimated to arrive and 330 vehicles are estimated to depart, totaling about 2,950 new vehicle trips during the AM peak hour. There are an

estimated 340 vehicles estimated to arrive and 2,110 vehicles estimated to depart during the PM peak hour, totaling approximately 2,450 additional vehicles at the campus site. These represent increases of approximately two percent in the total number of vehicles generated by the LRDP Variant when compared to the LRDP during both the AM and PM peak hours. As shown in **Table 3-24,** the LRDP Variant is estimated to generate approximately 3,000 new transit trips during the AM peak hour and 3,000 new transit trips during the PM peak hour, a two to three percent increase when compared to the 2014 LRDP.

TABLE 3-23: MISSION BAY CAMPUS SITE – EXISTING TO 2040 LRDP VARIANT NEW PEAK HOUR VEHICLE TRIPS[1]

The table accounts for the total number of trips on each system, therefore transfer trips are counted multiple times.

Source: Adavant Consulting, 2014

The travel demand for other modes including walking and bicycling would be commensurate with the percentage increase, approximately two to three percent, in new peak hour vehicle and transit trips generated by the 2014 LRDP plan for the Mission Bay campus site.

3.6.3 Mount Zion

The Mount Zion campus site would generate 3,223 net new external person trips through the LRDP horizon year (2035) of which 1,292 would be vehicle trips and 975 would be transit trips. Approximately 22-percent of daily trips would occur during the AM peak hour and 11-percent during the PM peak hour. **Table 3-25** shows the new AM and PM peak hour vehicle trips at the Mount Zion campus site by population group, **Table 3-26** shows the new AM and PM peak hour transit trips by transit service provider, and **Table 3-27** shows the peak hour pedestrian and bicycle trips.

Source: Adavant Consulting, 2014

As shown in **Table 3-25**, approximately 230 vehicles are estimated to arrive and 60 vehicles are estimated to depart the campus site, totaling approximately 290 new vehicle trips during the AM peak hour. Approximately 20 new vehicles would arrive and about 130 vehicles would depart the campus site, totaling 150 new vehicles during the PM peak hour. As summarized in **Table 3-26**, it is estimated that approximately 260 and 160 new transit riders would arrive or depart the campus site during the AM and PM peak hours, respectively. A majority of transit users are expected to arrive/depart by SF Muni. **Table 3-27** shows approximately 60 new AM peak hour walk and bicycle trips and 50 new PM peak hour walk and bicycle trips.

3.6.4 Mission Center

The Mission Center campus site would generate 1,064 net new external trips through the LRDP horizon year (2035) of which 539 would be vehicle trips and 410 would be transit trips. Approximately 22-percent of daily trips would occur during the AM peak hour and about 21-percent during the PM peak hour. **Table 3-28** shows the new AM and PM peak hour vehicle trips by population group at the Mission Center campus site, **Table 3-29** shows the AM and PM peak hour new transit trips by transit service provider, and **Table 3-30** shows the AM and PM peak hour walk and bicycle trips.

Source: Adavant Consulting, 2014

As shown in **Table 3-28**, 118 vehicles are estimated to arrive and 4 vehicles are estimated to depart the Mission Center campus site, totaling 122 new vehicle trips during the AM peak hour. There would be an estimated five vehicles arriving and 104 vehicles departing the campus site, totaling 109 new vehicles during the PM peak hour. **Table 3-29** shows that 105 and 101 new transit riders would arrive or depart the campus site during the AM and PM peak hour, respectively. A majority of transit users at the Mission Center campus site would be expected to use SF Muni, BART, or the UCSF bus shuttle service. **Table 3-30** shows approximately 20 new AM and PM peak hour walk and bicycle trips.

3.7 LOADING DEMAND

The *SF Guidelines* methodology for estimating commercial vehicle and freight loading demand is typically used to calculate the demand associated with new development projects in San Francisco. Daily truck trips

are calculated based on gross square-footage, a nine-hour day, and a 25-minute average stay. Average hourly demand can then be converted to a peak hour demand by applying peaking factors specified in the *SF Guidelines*. **Table 3-31** shows the calculated demand based on the gross square feet (GSF) estimates by 2035/2040.

TABLE 3-31: EXISTING AND FUTURE ESTIMATED OFF-STREET LOADING DEMAND (BASED ON SF GUIDELINES)[1]

Campus	Existing Demand		Future Demand [2]		Growth	
	Daily	Peak Hour	Daily	Peak Hour	Daily	Peak Hour
Parnassus Heights	1,722	100	1,753	101	31	2
Mission Bay	671	39	2,185	126	1,514	88
Mount Zion	566	33	673	39	106	6
Mission Center	133	8	175	10	42	2
Total	3,092	180	4,786	276	1,693	98

Notes:

1. Estimated loading demand based on existing and LRDP proposed GSF. Calculations based on *SF Guidelines*, Appendix D, Freight Delivery and Service Demand Methodology.
2. The data shown in this table reflects the future off-street loading demand through the LRDP horizon year (2035) for the Parnassus Heights, Mount Zion, and Mission Center campus sites, and year 2040 for the Mission Bay campus site.

Table 3-31 shows that all campus sites should anticipate an increase in daily and peak hour loading demand. However, since the campus sites are unique trip generators, wherein multiple complimentary land uses exist at each campus site, rather than a single land use (e.g. office, research, etc.), loading demand was estimated based on existing loading surveys conducted at the Parnassus Heights campus site and then applied to the other campus sites. Daily (7:00 AM to 7:00 PM) loading data was observed for three average weekdays in October 2013 at approximately half of the 54 loading spaces at the Parnassus Heights campus site. The survey recorded the arrival and departure time of each delivery/pick-up, thereby denoting the number of loading trips and duration of each trip. **Table 3-32** shows the results of the data collection efforts at the Parnassus Heights campus site.

TABLE 3-32: PARNASSUS HEIGHTS – EXISTING LOADING DEMAND[1]

Daily	AM Peak Hour	Average Loading Duration	Existing 1,000 GSF	Average Loading Trip per 1,000 GSF
337	56	30 minutes	3,956	0.09

Notes:

1. Daily and AM peak hour loading demand estimated using a factor calculated from data collected at 21 of the 54 loading spaces than factored up to account for all loading spaces.

Source: Fehr &Peers, 2013

Table 3-32 shows that the Parnassus Heights campus site receives on average 0.09 loading trips per 1,000 GSF, yielding 337 daily trips and 56 AM peak hour trips. Data collected noted that each loading space was occupied for an average of 30 minutes.

Using the empirical data shown in **Table 3-32**, a factor was applied to the *SF Guidelines* rates to calibrate the loading demand rates such that they match the existing data collected at the Parnassus Heights campus site. The factor derived from observations at the Parnassus Heights campus site was selected to apply to the other campus sites because the Parnassus Heights campus site represents the most established campus site with the largest diversity of uses. This factor tends to result in more specialized deliveries for specific uses, making this an inherently conservative analysis. **Table 3-33** summarizes the revised existing and future year off-street loading demand when the same factor is applied to the other campus sites. The estimates shown in **Table 3-33** more accurately reflect the existing loading demand at each campus site, and thus more accurately forecast both the future loading demand at each campus site, but also the loading demand associated with the 2014 LRDP projects in place at each campus site.

TABLE 3-33: EXISTING AND FUTURE ESTIMATED OFF-STREET LOADING DEMAND[1]

Campus	Existing Demand (2012/2013)		Future Demand (2035/2040) [2]		Growth	
	Daily	Peak Hour	Daily	Peak Hour	Daily	Peak Hour
Parnassus Heights	336	52	351	55	15	2
Mission Bay	220	34	497	77	277	43
Mount Zion	80	13	102	16	21	3
Mission Center	25	4	41	6	17	3
Total	662	103	992	154	330	51

Notes:

1. Estimated loading demand based on existing, LRDP proposed GSF, and loading data collected at Parnassus Heights.
2. The data shown in this table reflects the future off-street loading demand through the LRDP horizon year (2035) for the Parnassus Heights, Mount Zion, and Mission Center campus sites, and year 2040 for the Mission Bay campus site.

Source: Fehr & Peers, 2014

Table 3-33 results for the Parnassus Heights campus site are similar to the data collected and summarized in **Table 3-32**. **Table 3-33** shows that through 2035/2040, approximately two or three additional peak hour loading trips will be added to each campus site except at Mission Bay, which will generate approximately 40 new loading trips. The estimated increase in loading trips at Mission Bay is reasonable since it includes the new Phase One Medical Center and Mission Hall projects that will become operational in 2015, the 991,800 gross square feet of development being proposed by the 2014 LRDP, and the Phase Two Medical Center project planned to open sometime after 2035, which together would nearly triple the existing square footage at the campus site. The estimated increase in loading trips at the Mission Bay campus site under the LRDP Variant would likely increase by a similar amount to the vehicle and transit trips (approximately two to three percent increase) due to the introduction of clinical space, to that generated by the LRDP.

UCSF shuttles stop at loading zones located on city streets at the Parnassus Heights, Mission Bay, and Mount Zion campus sites. The shuttle loading zone is internal to the campus at the Mission Center campus site. The loading zones are white curb spaces that accommodate UCSF shuttles at the curbside. As part of existing observations documented in Chapter 2, loading demand of existing shuttle vehicles was observed to be accommodated within the existing loading zones. Per Section 1.2.6, UCSF Transportation Services audits shuttle vehicle loading and operations on a regular basis. In the event that UCSF identifies a need for an expanded or additional loading zone, they would apply to SFMTA for an expanded white

curb loading area for shuttle buses at a location that would not interfere with Muni vehicle passenger loading.

3.7.1 Passenger Loading Demand

In order to estimate passenger loading demand at each campus site, the drop-off/taxi service mode split and a portion of the carpool mode split percentages presented in **Table 3-6** was applied to the peak AM and PM peak hour person trips. **Table 3-34** summarizes the estimated passenger loading trips for the existing and 2035/2040 as well as both the delta and percent growth generated by the LRDP.

TABLE 3-34: EXISTING AND FUTURE ESTIMATED PASSENGER LOADING DEMAND[1]

Campus Site	Mode Split [2]	Existing Demand (2012/2013)		Future Demand (2035/2040) [3]		Growth		Percent Growth	
		AM	PM	AM	PM	AM	PM	AM	PM
Parnassus Heights	6.2%	368	333	388	351	20	18	*5%*	*5%*
Mission Bay	3.8%	88	75	324	278	236	203	*268%*	*271%*
Mount Zion	7.6%	154	74	207	100	53	26	*34%*	*35%*
Mission Center	1.5%	6	5	9	9	3	4	*50%*	*80%*
Total		*616*	*487*	*928*	*738*	312	251	*51%*	*52%*

Notes:

1. Peak hour trips account for external trips only.
2. Analysis assumes additional 10% of estimated carpool/vanpool use drop-off/passenger loading area before parking.
3. The data shown in this table reflects the future passenger loading demand through the LRDP horizon year (2035) for the Parnassus Heights, Mount Zion, and Mission Center campus sites, and year 2040 for the Mission Bay campus site.

Source: Adavant Consulting, 2014

Table 3-34 shows that the expected peak hour passenger loading demand will increase by approximately 5 percent at the Parnassus Heights campus site. The Mount Zion campus site is anticipated to increase its peak hour passenger loading demand by approximately 35 percent and the Mission Center campus site is anticipated to increase by approximately 50- to 80-percent. Passenger loading growth is anticipated to increase at the Mission Bay campus site by roughly threefold. The major contributor of the increase in anticipated passenger loading demand is the opening of Phases One and Two of the Medical Center at Mission Bay. The estimated increase in passenger loading trips at the Mission Bay campus site under the LRDP Variant would likely increase by a similar amount to the vehicle and transit trips (approximately two to three percent increase) due to the introduction of clinical space, to that generated by the LRDP.

3.8 PARKING DEMAND

Parking demand estimates for the four campus sites were calculated based on the current and projected population (physicians, staff and visitors, child care, residents, etc.) information at each campus site, as well as the expected mode of travel to/from each campus site, as described in Section 3.4.

Thus, forecasting the net new parking demand of the LRDP involves estimating the number of daily parked vehicles generated by the LRDP at each campus site, less the current demand at each campus site. The number of daily parked vehicles includes all vehicles arriving at each campus site, but excluding taxis, UCSF shuttle buses, and those who drop-off or pick up staff, patients, or visitors.

The resulting increases in daily vehicle parking for a typical weekday at each campus site are summarized in **Table 3-35** by population group.

Table 3-35 shows that in total, the four campus sites are expected to generate approximately 7,600 new daily parked vehicles on a typical weekday, which represents an increase of approximately 76 percent over current values. Over 85 percent of the additional daily parked vehicles would occur at the Mission Bay campus site. The increase in parked vehicles from existing conditions includes Phase One Medical Center and Mission Hall at the Mission Bay campus site (approximately 1,780 vehicles), which are not part of the 2014 LRDP growth.

The number of daily parked vehicles is then adjusted in order to estimate the peak parking space demand, as different vehicles would occupy the same parking space during the day in many instances, for example, in the case of staff, patients or visitors arriving for different work shifts or medical appointments throughout the day. Thus, the peak parking space demand ratios are equal (one vehicle parks in a space all day) or less (multiple vehicles park in the same space throughout the day) than one, depending on the population group.

TABLE 3-35: EXISTING AND FUTURE DAILY VEHICLE PARKING ESTIMATES ON A TYPICAL WEEKDAY BY CAMPUS SITE AND POPULATION GROUP

Population Group	Existing Daily Vehicle Parking (2012/13)	Future Daily Vehicle Parking (2035/2040) [1]	Growth

Source: Adavant Consulting, 2014

The peak parking space demand ratios used in the analysis are summarized in **Table 3-36** by population group. They have been derived from previous parking studies conducted at the UCSF campus sites, including the 2008 Medical Center at Mission Bay EIR and the 1996 LRDP EIR.

TABLE 3-36: PEAK PARKING SPACE DEMAND RATES BY POPULATION GROUP

Population Group	Peak Parking Space Demand Rate
Staff	0.85
Patients	0.30
Visitors	0.40
Vendors and Services	0.60
Residents	1.00

Source: UCSF, Adavant Consulting, 2014

Table 3-37 provides an estimate of the additional number of parking spaces that would be occupied at each campus site during the peak parking demand period, typically from mid-morning until early afternoon, as a result of the LRDP. In total, the four campus sites are expected to generate a peak demand of approximately 5,200 new parking spaces on a typical weekday. Over 85 percent of the additional demand for parking spaces (about 4,470) would occur at the Mission Bay campus site. The estimated increase in parking demand at the Mission Bay campus site under the LRDP Variant would likely increase by a similar amount to the vehicle and transit trips (approximately two to three percent increase) due to the introduction of clinical space, to that generated by the LRDP.

TABLE 3-37: PEAK PARKING DEMAND ON A TYPICAL WEEKDAY BY CAMPUS SITE AND POPULATION GROUP

Population Group	Increase in Parking Space Demand by 2035/2040 [1]				
	Parnassus Heights	Mission Bay	Mount Zion	Mission Center	Four Campus Sites

Total	***225***	***4,471***	***309***	***206***	***5,211***

Note:

1. The data shown in this table reflects the future peak parking demand through the LRDP horizon year (2035) for the Parnassus Heights, Mount Zion, and Mission Center campus sites, and year 2040 for the Mission Bay campus site.

Source: Adavant Consulting, 2014

An interim parking demand assessment was also conducted at the Mission Bay campus site only for the year 2015, when Phase One Medical Center project and Mission Hall are expected to open. The increase in

daily vehicle parking and peak parking demand at the Mission Bay campus site by 2015 are summarized in **Table 3-37** for each population group.

TABLE 3-38: INTERIM YEAR 2015 DAILY VEHICLE PARKING AND PEAK PARKING DEMAND GROWTH ON A TYPICAL WEEKDAY AT THE MISSION BAY SITE BY POPULATION GROUP

Population Group	Daily Vehicle Parking Growth (Number of Vehicles)	Increase in Peak Parking Demand (Number of Parking Spaces)
Mission Bay		
Staff	861	732
Patients and Visitors	788	265
Other Visitors	128	62
Child care	0	0
Residential	0	0
Total Mission Bay	***1,777***	***1,059***

Source: UCSF, Adavant Consulting, 2014

As shown in the table, with the opening of Phase One Medical Center and the completion of Mission Hall by 2015 would be an increase of approximately 1,780 daily parked vehicles on a typical weekday, which represents an increase in peak parking demand of about 1,060 spaces.

3.9 CONSTRUCTION DEMAND

Implementation of the LRDP would occur using a coordinated, phased construction schedule that would preserve UCSF's operations during the construction period. The construction will occur in phases beginning with Phase One Medical Center at Mission Bay, scheduled to open in 2015, and through the LRDP horizon year in 2035. The sections below describe the estimated construction schedule and construction truck demand per workday. The type of truck will vary per the construction project but could include a combination of hauler, excavation, materials delivery, cement, and/or smaller, more specialized trucks for specific functions.

A discussion regarding the coordination of construction of LRDP projects with the construction of non-UCSF development projects within the vicinity of the campus sites follows in Section 4.8.5.

3.9.1 Parnassus Heights

The Parnassus Heights campus site construction schedule is described in **Table 3-39**. Construction is anticipated to begin in 2015 with implementation of the cushioning actions and conclude by 2036 with the demolition of the Koret Vision Research Building. Generally, each project anticipates no more than 10 truck trips per workday; however some projects, such as the renovation of UC Hall and construction of the New Hospital Addition, may require up to 20 to 30 truck trips on average through the duration of the project.

TABLE 3-39: PARNASSUS HEIGHTS PROPOSED CONSTRUCTION ESTIMATES			
Construction Project	**Project Completed By**	**GSF**	**Average Range of Truck Trips per Workday[1]**
Demolish Laboratory of Radiobiology	2020	18,200	1-5
Demolish Medical Research 4 Building	2020	12,100	1-5
Demolish the Surge Building	2020	11,400	1-5
Demolish the Woods Building	2020	3,900	1-5
Build Housing on Fifth and Parnassus Site	2020	48,400	1-5
Renovate/Reuse UC Hall - Phase One	2020	74,700	1-20
Parnassus Avenue Streetscape – Phase One	2020	--	1-5
Parnassus Avenue Streetscape – Phase Two	2025	--	1-5
Demolish the LPPI Building and Two Support Buildings	2031	107,200	1-20
Construct the New Hospital Addition	2031	308,000	1-30
Renovate and Convert Millberry Union Towers to Housing	2036	46,600	1-10
Demolish the Environmental Health and Safety Building	2036	6,200	1-5
Demolish the Proctor Building	2036	9,000	1-5
Build Housing on Proctor Site	2036	30,400	1-5
Renovate Moffitt Hospital	2036	--	1-10
Renovate/Reuse UC Hall - Phase Two	2036	68,300	1-10
Demolish the Koret Vision Research Building	2036	43, 00	1-10

Notes:

1. Average number of truck trips will range through each phase of the project.

Source: UCSF, 2014

3.9.2 Mission Bay

The Mission Bay campus site construction schedule is described in **Table 3-40**. Construction is anticipated to begin in 2016 with construction of Block 15 and the Surcharging Project on Block 14. Construction is estimated to go beyond the LRDP horizon year with construction of Phase Two Medical Center. With the exception of Phase Two Medical Center and development of Block 15, most construction projects will generate no more than approximately 40 truck trips per workday through the duration of construction. Construction of Block 15 and Phase Two Medical Center is anticipated to generate up to 50 and 90 truck

trips per workday, respectively. Phase One Medical Center is not included in the table, as it is nearing completion at the time of publication.

The estimated range of average truck trips per day and the duration of the construction period would be the same at the Mission Bay campus site under the LRDP Variant as that generated by the LRDP, as the same square footage of space is proposed to be developed under both scenarios.

TABLE 3-40: MISSION BAY PROPOSED CONSTRUCTION DATA[1]			
Construction Project	**Project Completed By**	**GSF**	**Average Range of Truck Trips per Workday[1]**
Block 15 housing	2020	418,200	10-50
Block 33	2020	275,000	10-30
Block 33/34 Parking Garage	2020	167,500	10-30
Phase 1B Cancer Outpatient Building	2020	124,500	5-15
Surcharging- Blocks 15 & 18	2020	42,700	10-30
Block 23A	2025	232,200	10-30
Block 34	2025	225,000	10-30
Block 18 – Garage Phase 1	2025	271,000	10-30
Block 16	2031	289,000	10-40
Block 25B	2031	323,000	10-40
Block 18 – Research/Office Building	2036	193,000	10-30
Block 18 – Garage Phase 2	2036	271,000	10-30
Phase Two Medical Center	2036	793,500	20-90

Notes:

1. Average number of truck trips will range through each phase of the project.

Source: UCSF, 2014

3.9.3 Mount Zion

The Mount Zion campus site construction schedule is described in **Table 3-41**. Construction is anticipated to begin in 2015 with the renovation and reuse of the existing hospital and conclude by 2020 with the demolition or retrofit of Building "N" (2255 Post Street). Generally, each project anticipates no more than 15 truck trips per workday, however the construction of a new medical office and/or research building will require up to 30 truck trips through the duration of construction, which is approximately two years.

TABLE 3-41: MOUNT ZION PROPOSED CONSTRUCTION DATA			
Construction Project	**Project Completed By**	**GSF**	**Average Number of Truck Trips per Workday**
Renovate and reuse existing hospital	2020	50,000	1-10
Demolish the Hellman, Harold Brunn Institute and the Dialysis Center Buildings	2020	85,000	1-15
Construct additional parking	2020	78,000	1-10
Construct a new medical office and/or research building(s)	2020	257,000	10-30
Demolish or retrofit the "N" building (2255 Post Street)	2020	7, 500	1-5
Source: UCSF, 2014			

3.9.4 Mission Center

The Mission Center campus site construction schedule is described in **Table 3-42**. Construction is anticipated to begin in 2022 with the new parking structure and end in 2025 with the completion of the new building fronting Harrison Street and 15th Street. Both projects anticipate no more than 15 truck trips per workday through the duration of construction. As noted earlier, development of this new building is to occur only if additional program space is determined to be needed in the future, and if and when funding becomes available.

4 TRANSPORTATION IMPACT ANALYSIS

This chapter presents the assessment of transportation impacts resulting from the 2014 LRDP. The impacts are grouped into eight areas: traffic, transit, pedestrians, bicyclists, loading, emergency vehicle access, parking, and transportation-related construction impacts. Transportation conditions were assessed for Existing plus LRDP. Future year analysis under Year 2015 conditions for the Mission Bay campus site and Year 2040 conditions for all campus sites are presented in Chapter 5.

4.1 SIGNIFICANCE CRITERIA

Below is a list of significance criteria used by UCSF to assess whether the 2014 LRDP would result in significant impacts to the transportation network. These criteria are organized by transportation mode to facilitate the transportation impact analysis.

4.1.1 Traffic

Signalized Intersections – a significant impact would occur if:

- LRDP traffic causes intersection LOS D or better to deteriorate to LOS E or F.
- LRDP traffic causes intersection LOS E to deteriorate to LOS F.
- LRDP increases traffic by five percent on critical movements[9] operating at LOS E or F of an intersection operating at LOS E or F under Existing conditions.

Unsignalized Intersections – a significant impact would occur if:

- LRDP traffic causes the LOS at the worst approach to deteriorate from LOS D or better to LOS E or F and Caltrans signal warrants would be met.
- LRDP traffic causes Caltrans signal warrants to be met when the worst approach is already operating at LOS E or F.
- LRDP adds traffic to an intersection that operates at LOS E or F under Existing conditions and makes a considerable contribution (five percent on critical approaches[10] operating at LOS E or F) to the worsening of the average delay per vehicle and Caltrans signal warrants would be met.

Cumulative – a significant impact would occur if:

- LRDP would make a considerable contribution to the deterioration of intersection conditions (LOS E or F) if LRDP-generated traffic contributes five percent or more to the critical movements operating at LOS E or F under Cumulative conditions.

[9] The critical movement is the one whose signal phase requires more green time to serve its demand volume than the concurrent movement's signal phase.
[10] The critical approach is when a critical movement is a single shared movements lane.

4.1.2 Transit

The LRDP would have a significant effect on the environment if project demand for public transit causes the need for development or expansion of mass transit facilities, the development of which would cause significant environmental impacts.

4.1.3 Pedestrians and Bicycles

The LRDP would have a significant effect on the environment if it would cause a substantial conflict among autos, bicyclists, pedestrians, and transit vehicles.

4.1.4 Loading

The LRDP would have a significant effect on the environment if it would result in a loading demand during the peak hour of loading activities that could not be accommodated within proposed on-site loading facilities or within convenient on-street loading zones, or if it created potentially hazardous conditions or significant delays affecting traffic, transit, bicycles, or pedestrians.

4.1.5 Parking

LRDP-generated parking demand that is not met by the project is not considered significant.

4.1.6 Construction

Construction-related impacts generally would not be considered significant due to their temporary and limited duration.

4.2 TRAFFIC IMPACTS

The net new vehicle trip estimates for the 2014 LRDP developed in Chapter 3 were added to Existing peak hour intersection volumes to represent Existing Plus LRDP conditions. Vehicle trips are assigned to routes using trip distribution percentages and routes to and from the trip end. The sections below describe the estimated peak hour vehicle trips going to and from each campus site and the 2014 LRDP's impacts on study intersections.

Consistent with the significance criteria presented in Section 4.1, the LRDP was determined to have a significant impact at an intersection if LRDP-generated trips would cause an intersection operating at LOS D or better under Existing conditions to operate at LOS E or LOS F, or intersection operating at LOS E under Existing conditions to deteriorate to LOS F conditions. At intersections that operate at LOS E or LOS F under Existing conditions, and would continue to operate at LOS E or LOS f under Existing Plus LRDP conditions, the increase in project vehicle trips were reviewed to determine whether the increase would contribute considerably to critical movements operating at LOS E or LOS F.

4.2.1 Parnassus Heights

Existing Plus LRDP conditions peak hour turning movement volumes for the Parnassus Heights campus site are shown on **Figure 4-1A**, **4-1B, 4-1C,** and **4-1D**. **Table 4-1** presents intersection levels of service and delay for the AM and PM peak hours for the Existing and Existing Plus LRDP scenarios.

It should be noted that at some of the study intersections, the average delay per vehicle would remain the same (e.g., Judah Street/Ninth Avenue). Using the HCM methodology, the level of service is calculated based on an average of the total vehicular delay per approach, weighted by the number of vehicles at each approach. Increases in traffic volumes at an intersection usually result in increases in the overall intersection delay. However, if there are increases in the number of vehicles at movements with low delays, the average weighted delay per vehicle may remain the same or decrease. At side-street stop controlled intersections (SSSC), the average delay of the worst-operating stop controlled movement is shown, rather than the average delay of the intersection as a whole. At all all-way stop controlled intersections (AWSC), both the average delay of the worst-operating stop controlled movement and the average delay of the intersection as a whole are shown.

TABLE 4-1: PEAK HOUR INTERSECTION LEVEL OF SERVICE COMPARISON - PARNASSUS HEIGHTS

Intersection	Traffic Control[1]	Peak Hour	Existing		Existing Plus LRDP	
			Vehicle Delay[2] (seconds)	LOS[3]	Vehicle Delay[2] (seconds)	LOS[3]
23. Kirkham Street / Fifth Avenue	AWS	AM PM	<10 / <10 <10 / <10	A / A A / A	<10 / <10 <10 / <10	A / A A / A

Notes:
1. AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
2. Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersection, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach.
3. For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
4. **Bold** indicates unacceptable operations per UCSF LOS standards

Source: Fehr & Peers, 2014.

In general, the addition of LRDP-generated traffic would result in small changes in the average delay per vehicle at the study intersections, and all study intersections would continue to operate at the same service levels as under Existing conditions. As presented in Chapter 2, 18 of the 23 study intersections operate at acceptable levels of service (LOS D or better) under both AM and PM peak hour conditions under Existing conditions. These 18 intersections would continue to operate acceptably under Existing Plus LRDP conditions; therefore, the Proposed LRDP Project would have a ***less-than-significant impact*** at these 18 intersections.

The following five intersections operate at unacceptable levels of service (LOS E or F) under Existing conditions, and would continue to operate at the same LOS under Existing Plus LRDP conditions:

- Intersection #1: Oak Street – Fell Street – Kezar Drive / Stanyan Street (PM)
- Intersection #2: Lincoln Way / Ninth Avenue (PM)
- Intersection #4: Lincoln Way / Fourth Avenue (AM)
- Intersection #15: Judah Street – Parnassus Avenue / Fifth Avenue (PM)
- Intersection #21: Kirkham Street / Seventh Avenue (AM)

Each of these intersections operated unacceptably under Existing conditions; therefore, the LRDP's contribution to each intersection's critical movements was identified to determine if the LRDP had a significant impact at each intersection.

The Oak Street – Fell Street – Kezar Drive/Stanyan Street (Intersection #1) signalized intersection operates at LOS E in the PM peak hour under Existing and Existing Plus LRDP conditions. The critical northbound through movement operates at LOS F during the PM peak. The LRDP would add four vehicle trips to the critical northbound through movement, which represents a one percent increase from Existing conditions. While this movement is expected to operate at LOS F under Existing Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movements at the intersection – southbound left and westbound through – are expected to operate at acceptable levels of service and not

receive an increase in vehicular traffic of five percent or more. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Lincoln Way/Ninth Avenue (Intersection #2) signalized intersection operates at LOS E in the PM peak hour under Existing and Existing Plus LRDP conditions. The critical southbound through movement operates at LOS E during the PM peak. The LRDP would add three vehicle trips to this critical movement, which represents a one percent increase from Existing conditions. The other critical movement at the intersection – the westbound through – is expected to operate at LOS F and the LRDP would add five vehicle trips, which represents less than one percent increase from Existing conditions. While these movements are expected to operate unacceptably under Existing Plus LRDP conditions, the LRDP's contribution would not be considered significant. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Lincoln Way/Fourth Avenue (Intersection #4) unsignalized intersection operates at LOS F in the AM peak hour under Existing and Existing Plus LRDP conditions. The westbound left turn movement operates at LOS F during the AM peak. The LRDP would add three vehicle trips to this critical movement, which represents a one percent increase from Existing conditions. While the westbound left turn is expected to operate at LOS F under Existing Plus LRDP conditions, the LRDP's contribution would not be considered significant. In addition, the increase in traffic does not warrant a signal according to the Caltrans signal warrant for unsignalized intersections in urban areas (Warrant 3). Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Judah Street – Parnassus Avenue/Fifth Avenue (Intersection #15) unsignalized intersection operates at LOS E in the PM peak hour under Existing and Existing Plus LRDP conditions. The southbound approach (one shared left, right, and through lane) operates at LOS E during the PM peak. The LRDP would add no vehicle trips to the southbound approach; therefore, the LRDP's contribution would not be considered significant. In addition, the increase in traffic does not warrant a signal according to the Caltrans signal warrant for unsignalized intersections in urban areas (Warrant 3). Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Kirkham Street/Seventh Avenue (Intersection #21) signalized intersection operates at LOS E in the AM peak hour under Existing and Existing Plus LRDP conditions. The critical northbound through movement operates at LOS F during the AM peak. The LRDP would add 12 vehicle trips to the critical northbound through movement, which represents a two percent increase from Existing conditions. While the northbound through movement is expected to operate at LOS F under Existing Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – the eastbound through – is also expected to operate at LOS F and the LRDP would add one vehicle trip, which represents less than one percent increase from Existing conditions. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

4.2.2 Mission Bay

Existing Plus LRDP conditions peak hour turning movement volumes for the Mission Bay campus site are shown on **Figures 4-2A** , **4-2B**, **4-2C**, and **4-2D**. **Table 4-2** presents intersection levels of service and delay for the AM and PM peak hours for the Existing and Existing Plus LRDP scenarios. The Existing Plus LRDP conditions reflects modifications to the lane geometries and signal timing plans proposed by both the LRDP and foreseeable (funded) infrastructure improvements for several study intersections

surrounding and within the Mission Bay campus site. These modifications are assumed to be in place in early 2015 and are also assumed in the Existing Plus LRDP conditions traffic analysis:

- 16th Street / Third Street – Addition of one through lane on the westbound approach of Third Street.
- 16th Street / Fourth Street – Addition of a northbound leg to provide access to UCSF Medical Center and conversion of the existing three-leg intersection into a four lane intersection. The new northbound approach will include one left turn pocket and one shared through/right turn lane. The eastbound approach will be reconfigured to have one left turn pocket, one through lane, and one shared through/right turn lane. The westbound approach will be reconfigured to have one left turn pocket, one through lane, and one shared through/right turn lane.
- 16th Street / Owens Street – Extension of Owens Street south of 16th Street to connect with Mariposa Street, converting the existing three-leg intersection into a four-leg intersection. The new northbound approach will include one left turn pocket, one through lane, and one shared through/right turn lane. The eastbound approach will be reconfigured to include one left turn pocket, one through lane, and one shared through/right turn lane. The westbound approach will be reconfigured to include one left turn pocket, one through lane, and one shared through/right turn lane.
- Mariposa Street / Third Street – Addition of one through lane in the eastbound direction on Mariposa Street. Addition of one westbound left turn pocket and the conversion of the shared through/left turn lane to a through lane only.
- Mariposa Street / Fourth Street – Signalization and addition of a southbound leg to provide access to the UCSF Medical Center, widening of Mariposa Street, and conversion of the existing three-leg intersection into a four-leg intersection. The new southbound approach will include one left turn pocket and one shared through/right turn lane. The westbound approach will be reconfigured to include one left turn pocket, one through lane, and one shared through/right turn lane. The eastbound approach will be reconfigured to include one left turn pocket, one through lane, and one shared through/right turn lane.
- Mariposa Street / I-280 Northbound Off-Ramp – Extension of Owens Street south of 16th Street to the intersection of Mariposa Street / I-280 Off-Ramp to convert the existing three-leg intersection into a four leg intersection. The new southbound approach will include two right turn lanes. The westbound approach will be reconfigured to include two through lanes and one shared through/right turn lane. The northbound approach will be reconifigured to include one left turn pocket, one through lane, and one shared through/right turn lane. The eastbound approach will be reconfigured to include one shared through/left turn lane and one through lane.
- Mariposa Street / I-280 Southbound On-Ramp – Signalization of this intersection to operate in conjunction with the Northbound Off-Ramp. The eastbound approach will be reconfigured to include a shared through/right turn lane and one right turn lane. The westbound approach will be reconfigured to include an additional westbound left turn lane.

			Vehicle Delay[2] (seconds)	LOS[3]	Vehicle Delay[2] (seconds)	LOS[3]

Notes:

1. AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
2. Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersection, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach.
3. For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For an unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
4. **Bold** indicates unacceptable operations per UCSF LOS standards
5. Intersection is signalized under Existing Plus LRDP condition

Source: Fehr & Peers, 2014.

In general, the addition of LRDP-generated traffic would result in small changes in the average delay per vehicle at most study intersections, with the exception of those that serve as major access points on 16th Street. Most study intersections would continue to operate at the same service levels as under Existing conditions. As presented in Chapter 2, 18 of the 21 study intersections operate at acceptable levels of service (LOS D or better) under both AM and PM peak hour conditions under Existing conditions. These 18 intersections would continue to operate acceptably under Existing Plus LRDP conditions. Therefore, the LRDP would have a ***less-than-significant impact*** at these 18 intersections.

The reconfiguration of Mariposa Street/I-280 Northbound Ramp (Intersection #43) and signalization and reconfiguration of Mariposa Street/I-280 Southbound Ramp (Intersection #44) would result in an improvement at these intersections from unacceptable levels of service (LOS E or F) to acceptable levels of service (LOS D or better) between Existing conditions and Existing Plus LRDP conditions. Therefore, the LRDP would have a ***less-than-significant impact*** at these two intersections.

King Street / Third Street (Intersection #24) would operate at unacceptable levels of service (LOS E or F) during the PM peak hour under Existing conditions, and would continue to operate at the same LOS under Existing Plus LRDP conditions; therefore, the LRDP's contribution to the critical movements was identified to determine if the LRDP caused a significant impact at the intersection.

The King Street / Third Street (Intersection #24) signalized intersection operates at LOS E in the PM peak hour under Existing and Existing Plus LRDP conditions. The critical eastbound left turn movement operates at LOS F during the PM peak. The LRDP would add 36 vehicle trips to the critical eastbound left turn movement, which represents a four percent increase from Existing conditions. The other critical movements at this intersection – northbound through and westbound through – operate at LOS C and E, respectively, during the PM peak. Since the northbound through movement is expected to operate at LOS C, the LRDP's contribution would not be considered significant. The LRDP would add two vehicle trips to the westbound through, which is an increase of less than one percent. While this critical movement is expected to operate at LOS E under Existing Plus LRDP conditions, the LRDP's contribution would not be considered significant. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

4.2.2.1 LRDP Variant

Traffic conditions associated with the LRDP Variant would be similar to those described above for the LRDP. **Table 4-3** presents intersection levels of service and delay for the AM and PM peak hours for the Existing and Existing Plus LRDP Variant. Similar to the Existing Plus LRDP scenario, the Existing Plus LRDP Variant conditions reflects modifications to the lane geometries and signal timing plans proposed by both the LRDP and foreseeable (funded) infrastructure improvements for several study intersections surrounding and within the Mission Bay campus site, as discussed above.

4. **Bold** indicates unacceptable operations per UCSF LOS standards
5. Intersection is signalized under Existing Plus LRDP condition

Source: Fehr & Peers, 2014.

In general, the addition of LRDP Variant-generated traffic would result in small changes in the average delay per vehicle at most study intersections, with the exception of those that serve as major access points on 16th Street. All the study intersections would continue to operate at the same service levels as under Existing Plus LRDP conditions. As presented in Chapter 2, 18 of the 21 study intersections operate at acceptable levels of service (LOS D or better) under both AM and PM peak hour conditions under Existing conditions. These 18 intersections would continue to operate acceptably under Existing Plus LRDP Variant conditions. Therefore, the LRDP Variant would have a ***less-than-significant impact*** at these 18 intersections.

4.2.3 Mount Zion

Existing Plus LRDP conditions peak hour turning movement volumes for the Mount Zion campus site are shown on **Figure 4-3A**, **4-3B**, **4-3C**, and **4-3D**. **Table 4-4** presents intersection levels of service and delay for the AM and PM peak hours for the Existing and Existing Plus LRDP scenarios.

The addition of LRDP-generated traffic would result in small changes in the average delay per vehicle at the study intersections, and all study intersections would continue to operate at the same service levels as under Existing conditions. During the AM and PM peak hours, all 16 of the study intersections would continue to operate at acceptable levels of service (LOS D or better) under Existing Plus LRDP conditions, therefore the LRDP would have a ***less-than-significant impact*** at these intersections.

Source: Fehr & Peers, 2014.

In general, the addition of LRDP-generated traffic would result in minor changes in the average delay per vehicle at the study intersections, and most study intersections would continue to operate at the same service levels as under Existing conditions.

As presented in Chapter 2, 14 of the 15 study intersections operate at acceptable levels of service (LOS D or better) under both AM and PM peak hour conditions under Existing conditions. These 14 intersections would continue to operate acceptably under Existing Plus LRDP conditions; therefore, the LRDP would have a ***less-than-significant impact*** at these 14 intersections.

The following intersection operates at unacceptable levels of service (LOS E or F) under Existing conditions, and would continue to operate at the same LOS under Existing Plus LRDP conditions:

- Intersection #61: 13th Street / South Van Ness Avenue (AM)

This intersection operated unacceptably under Existing conditions; therefore, the LRDP's contribution to the intersection's critical movements was identified to determine if the LRDP caused a significant impact at the intersection.

The 13th Street/South Van Ness Avenue (Intersection #61) signalized intersection operates at LOS E in the AM peak hour under Existing and Existing Plus LRDP conditions. The critical southbound through movement operates at LOS F during the AM peak. The LRDP would add 14 vehicle trips to the critical southbound through movement, which represents a one percent increase from Existing conditions. While the southbound through movement is expected to operate at LOS F under Existing Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movements at the intersection – eastbound right turn and westbound left turn – are not expected to receive an increase in vehicular traffic due to the LRDP. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

4.2.5 Summary of Traffic Impacts

No significant impacts are identified under Existing Plus LRDP conditions. The LRDP would not cause intersections operating acceptably (LOS D or better) under Existing conditions to degrade to unacceptable operations (LOS E or F) with the addition of LRDP-generated traffic. The LRDP would add traffic to intersections operating unacceptably under Existing conditions; however, LRDP-generated traffic would not increase traffic by five percent or more on critical movements operating at LOS E or F at these intersections. Therefore, the LRDP would have a ***less-than-significant impact*** to traffic operations.

4.3 TRANSIT IMPACTS

LRDP horizon project transit trips were estimated based on existing travel surveys of UCSF staff and visitors and available transit data as described in Chapter 3. Transit trips by transit mode are assigned to specific transit routes using the trip distribution percentages as shown in Chapter 3. The sections below describe the estimated AM and PM peak hour trips traveling to and from each campus site by transit route and provider.

As discussed in Section 4.1.2, the LRDP would have a significant effect on the environment if project demand for public transit causes the need for development or expansion of mass transit facilities, the development of which would cause significant environmental impacts. LRDP impacts on public transit are analyzed relative to this standard of significance. In addition, for informational purposes, the analysis of public transit impacts on Muni relative to the City of San Francisco's crowding standard of 85 percent is discussed below.

4.3.1 Parnassus Heights

The increase in Parnassus Heights campus site peak hour transit trips generated by the LRDP are described in **Table 4-6**. These net new peak hour transit trips are expected to use a combination of local and regional transit services and UCSF shuttle service.

TABLE 4-6: NET NEW PEAK HOUR TRANSIT TRIPS – PARNASSUS HEIGHTS

Total	***122***	***70***	***192***	***68***	***100***	***168***

Notes:

1. Peak hour trips account for external trips only. Some transit users may use multiple transit modes on a single trip (e.g. BART+Muni, AC Transit+Muni, Muni+UCSF Shuttle, etc.). The table accounts for the total number of trips on each system, therefore transfer trips are counted multiple times.

Source: Adavant Consulting, 2014

As shown in **Table 4-6**, approximately 200 and 170 new transit trips are expected during the AM and PM peak hour, respectively. About 50 percent of transit users will use a UCSF shuttle and about 30-percent will use Muni to commute to and from the campus site, while the remaining transit riders will use BART, AC Transit, Caltrain, SamTrans, or Golden Gate Transit.

4.3.1.1 SF Muni

Existing Muni transit stops are located within a half-mile of the center of the campus site, with multiple stops located through the campus on Parnassus Avenue and adjacent to the campus site on Ninth Avenue, Irving Street and Lincoln Way. Major stop relocations adjacent to the campus site are not anticipated at this time. As part of the Parnassus Avenue Streetscape Plan, UCSF proposes that Muni consolidate the three transit stops on Parnassus Avenue into two transit stops in order to improve Muni's operating efficiency and provide more flexibility with respect to curb space allocation. As summarized in Chapter 2, the Transit Effectiveness Project (TEP) proposes to reduce headways for the following routes: 43 Masonic, 44 O'Shaughnessy, and 71/71L Haight-Noriega.

The Muni trips as assigned in **Table 4-6** were added to the load of the lines that serve the campus site at their maximum load point. **Table 4-7** shows the maximum load point and capacity utilization for the transit routes with the LRDP-generated transit trips added to them to reflect the Existing Plus LRDP scenario.

TABLE 4-7: TRANSIT CAPACITY UTILIZATION – PARNASSUS HEIGHTS

Note: Pass. = Passenger ; Util. = Utilization

Bold: > % 85 Capacity Utilization

Source: Adavant Consulting, Fehr & Peers, 2014

The estimated number of LRDP-generated Muni trips is about a two-percent increase in ridership traveling to and from the Parnassus Heights campus site, which would not require the expansion of transit service or facilities. As shown in **Table 4-7**, the 43 Masonic Inbound and N Judah Inbound during the AM peak hour and the 71/71L – Haight-Noriega/Limited Outbound during the PM peak hour operate above 85 percent capacity utilization, which represents Muni's crowding standard. The LRDP adds 7, 22, and 4

new peak hour trips to these currently crowded lines, respectively, which are approximately two percent increases in demand or less, which are all within daily fluctuations in demand.

As described in Section 1.2.6, as a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP, would continue to do so in particular at the four UCSF campus sites where development is proposed. As the Parnassus Heights campus site develops, UCSF would monitor vehicle traffic conditions, transit operations, and shuttle ridership within and surrounding the campus site. This monitoring program would be informed by the annual UCSF Employee Transportation Survey, the existing UCSF shuttle program monitoring[11], UCSF staff, students, and patients and visitors, and campus site observations by Transportation Services staff, and ongoing coordination with SFMTA staff.

The results of the various monitoring efforts would be used to inform when and whether UCSF would:

- Implement additional TDM strategies that seek to minimize the number of single occupancy vehicle trips (SOV) generated by the LRDP;
- Revise UCSF Shuttle system operations; and/or
- Introduce or enhance campus-wide or specific measures to reduce conflicts with Muni service.

Should the need for additional shuttle service be triggered by increased ridership due to shifts in travel mode or demand generated by the LRDP, UCSF Transportation Services would first review that the additional service would not negatively affect Muni operations. Once implemented, the additional service would be monitored to the same standard as that identified above. Further, should conflicts between shuttle service and Muni service arise, UCSF Transportation Services would coordinate with SFMTA staff to resolve these conflicts and ensure UCSF shuttles do not negatively affect Muni operations. Additionally, none of the specific proposals of the LRDP would reduce access to or reconfigure transit stops in a way that would degrade transit service to the campus site; therefore the new transit trips generated by the LRDP would result in a ***less-than-significant impact***.

4.3.1.2 Regional Transit Service

UCSF staff, patrons and students are anticipated to continue to use BART, AC Transit, Caltrain, SamTrans, and Golden Gate Transit for regional transit service through the LRDP horizon year. Regional service stations are likely to remain at existing locations, over half a mile away, and can be accessed by other transit modes such as SF Muni and the UCSF shuttle.

Less than 20 additional regional transit trips are expected during each AM and PM peak hours. This increase would not require the expansion of regional transit service or facilities; therefore the new regional transit trips generated by the LRDP would result in a ***less-than-significant impact***.

[11] UCSF monitors its shuttle ridership demand by conducting monthly audits to capture boarding data, and the data is used to continually adjust shuttle operations to meet peak ridership demand. The monthly audits are conducted for one entire week (five business days) on all routes, throughout the entire day. In addition, UCSF conducts an annual UCSF Transportation Survey that is distributed to all members of our community. The data is used to measure and benchmark the efficacy of the existing TDM programs, and assist in designing new programs.

4.3.1.3 UCSF Shuttle

As part of the Parnassus Avenue Streetscape Plan, UCSF will reorganize UCSF shuttle operations by centralizing pick-up and drop-off locations. Existing shuttle stations located at the campus site gateways will be relocated to the center of the campus site on Parnassus Avenue, fronting the campus library in the westbound direction and the Clinical Sciences building in the eastbound direction. The LRDP does not propose specific changes to shuttle service headways, although UCSF Transportation Services may change headways based on shifting shuttle demand as LRDP projects are constructed and occupied at each respective campus site.

An additional approximately 120 AM peak hour shuttle person trips and 100 PM peak hour shuttle person trips, an approximately 15 percent increase during both peak hours are anticipated through the LRDP horizon year. This increased ridership would require an additional 5-7 shuttles during the AM and PM peak hours, an approximately 10-15 percent increase compared to the existing shuttles service at the Parnassus Heights campus site. As described in Section 4.3.1.1, UCSF Transportation Services would monitor shuttle conditions to ensure the shuttle loading zone would be adequate to accommodate the additional service and that the shuttle service would not conflict with Muni operations.

The increased shuttle trips would not require the expansion of UCSF shuttle service or facilities beyond what would be expected through the regular monitoring by UCSF Transportation Services, nor would the increased shuttle demand cause a substantial conflict among autos, bicyclists, pedestrians, and transit vehicles. Therefore, the new UCSF shuttle trips generated by the LRDP would result in a ***less-than-significant impact***.

4.3.2 Mission Bay

The increase in Mission Bay campus site peak hour transit trips generated by the LRDP are described in **Table 4-8**. These net new peak hour transit trips are expected to use a combination of local and regional transit services and UCSF shuttle service.

TABLE 4-8: NEW PEAK HOUR TRANSIT TRIPS – MISSION BAY

Transit Route	AM Peak Hour			PM Peak Hour		
	In	Out	Total[1]	In	Out	Total[1]

All Mission Bay Shuttles	1,039	75	1,114	105	964	1,069
Total	**2,986**	**193**	**3,178**	**251**	**2,671**	**2,923**

Notes:

1. Peak hour trips account for external trips only. Some transit users may use multiple transit modes on a single trip (e.g. BART+Muni, AC Transit+Muni, Muni+UCSF Shuttle, etc.). The table accounts for the total number of trips on each system, therefore transfer trips are counted multiple times.

Source: Adavant Consulting, Fehr & Peers, 2014

As shown in **Table 4-8**, approximately 3,000 new transit trips are expected during the AM and PM peak hours. Approximately 30-percent of all transit trips, about 900 AM peak hour trips and 800 PM peak hour trips, will commute to and from the campus site by SF Muni and approximately 35-percent will use the UCSF and MBTMA shuttles. The remaining 35-percent of new transit trips will be on BART, AC Transit, Caltrain, SamTrans, and Golden Gate Transit.

4.3.2.1 SF Muni

As presented in **Table 2-12**, existing Muni stops are located within a half-mile to the campus site and are accessible by walking. As described in Chapter 2, the TEP proposes several changes on routes traversing through and within the vicinity of the Mission Bay campus site.

T Third Street: The TEP proposes to reduce the peak period headways of the T Third Street route from 9.5 minutes to 8.5 minutes.

10 Townsend: The TEP proposes to rename the 10 Townsend to the 10 Sansome, re-route service from Townsend Street through Mission Bay, and reduce headways during peak periods to every 6 minutes and midday headways to every 12 minutes.

22/55 Fillmore: The TEP proposes to re-route the 22 Fillmore by continuing its route on 16th Street between Kansas and Rhode Island Streets to the Mission Bay campus site and reduce headways to every 5.5 to 6 minutes during peak headways and every 7.5 minutes during the midday. As described in Section 2.4.3, prior to the extension of the 22 Fillmore into Mission Bay via either the Moderate or Expanded Alternative, the SFMTA proposes to implement a temporary motor coach service to coincide with the opening of Phase One Medical Center at Mission Bay between the campus site and the 16th Street BART Station for an initial service phase. The preliminary name for this interim service is the Muni line '55.' The route would follow 16th Street between Mission Street to Third Street and Third Street from 16th Street to Mission Bay Boulevard North.

The Muni trips as assigned in **Table 4-8** were added to the load of Muni lines that serve the campus site. Specifically, the Muni trips were added to capacity utilization of the lines at the maximum load point between the campus site and the point at which the line where riders transfer to/from regional transit (i.e. 16th Street BART – 22 Fillmore, Temporary Transbay Terminal – 10 Townsend, T Third Street – Embarcadero BART). **Table 4-9** and **Table 4-10** show the maximum load point and capacity utilization for the transit routes with the LRDP-generated transit trips added to them to reflect the Existing Plus LRDP scenario with and without the Muni line 55 route, which is anticipated to begin service to coincide with the opening of Phase One Medical Center at Mission Bay, and is thus considered in the analysis of the LRDP projects in place at the Mission Bay Campus Site. The analysis of ridership for the scenario including the Muni line 55 route was performed using existing ridership information and can be found in **Appendix F**.

TABLE 4-9: TRANSIT CAPACITY UTILIZATION (NO ROUTE 55) – MISSION BAY							
	Direction	Existing			Existing Plus LRDP

TABLE 4-10: TRANSIT CAPACITY UTILIZATION (WITH ROUTE 55) – MISSION BAY							
	Direction	Existing			Existing Plus LRDP		
		Pass. Load	Peak Hour Capacity[1]	Capacity Util.	New Transit Trips	Pass. Load	Capacity Util.
AM Peak Hour							
22/55 Fillmore	Inbound	193	704	27%	5	198	28%
	Outbound	273	704	39%	208	481	68%
PM Peak Hour							
22/55 Fillmore	Inbound	323	757	43%	215	538	71%
	Outbound	210	757	28%	7	217	29%

Note: Pass. = Passenger ; Util. = Utilization.

1. Peak Hour Capacity reflects the addition of 55 Route Service with AM and PM peak hour service frequencies of approximately four buses per hour.

Source: Adavant Consulting, Fehr & Peers, 2014

As shown in **Table 4-9**, once the estimated number of LRDP-generated Muni trips are added to the T Third Street and 10 Townsend, those Muni routes would still continue to operate satisfactorily according to Muni crowding standards (Note the 10 Inbound Townsend during the PM peak hour operated at greater than 85% capacity utilization, both with and without the LRDP-generated trips, but the LRDP does not contribute to crowding on the line in a significant way).

The 22 Fillmore would operate at greater than 85% capacity utilization with the addition of LRDP-generated trips, but as shown in **Table 4-10**, with the addition of the interim 55 Route, the combination of the 22 Fillmore and the 55 Route would operate at less than 85% capacity utilization during both the AM and PM peak hours.

The estimated number of LRDP-generated Muni trips traveling to and from the Mission Bay campus site would not require the expansion of transit service or facilities. Long-term funding for the 55 Route is uncertain. If Muni were to discontinue the service, UCSF would replace the transit capacity with shuttle service adequate to fill the gap in transit service. Thus, this analysis includes the 55 Route as a de facto permanent service.

As described in Section 1.2.6, as a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP, would continue to do so in particular at the four UCSF campus sites where development is proposed. Similar to the Parnassus Heights campus site, UCSF would monitor vehicle traffic conditions, transit operations, and shuttle ridership within and surrounding the Mission Bay campus site.

Should the need for additional shuttle service be triggered by increased ridership due to shifts in travel mode or demand generated by the LRDP, UCSF Transportation Services would first review that the additional service would not negatively affect Muni operations. Once implemented, the additional service would be monitored to the same standard as that identified above. Further, should conflicts between shuttle service and Muni service arise, UCSF Transportation Services would coordinate with SFMTA staff to resolve these conflicts and ensure UCSF shuttles do not negatively affect Muni operations. Additionally, none of the specific proposals of the LRDP would reduce access to or reconfigure transit stops in a way that would degrade transit service to the campus site; therefore the new transit trips generated by the LRDP would result in a ***less-than-significant impact***.

4.3.2.2 Regional Transit Service

In addition to Muni operations for travel within San Francisco, regional transit services such as BART, AC Transit, Caltrain, SamTrans, and Golden Gate Transit were considered for the analysis. Existing stations are located over a mile away and can access the Mission Bay campus site by Muni or UCSF and MBTMA shuttles. Major service changes are not anticipated in the near-term.

The number of new LRDP-generated regional transit trips would not require the expansion of regional transit service or facilities; therefore the new regional transit trips generated by the LRDP would result in a ***less-than-significant impact***.

4.3.2.3 UCSF and Mission Bay Transportation Management Association Shuttle Trips

The LRDP does not propose specific changes to shuttle service headways, although UCSF Transportation Services may change headways based on shifting shuttle demand as LRDP projects are constructed and occupied at each respective campus site and MBTMA may do the same as development occurs in the

Mission Bay area. With the opening of the Phase One Medical Center at Mission Bay, additional shuttle stops will be provided fronting the new hospital; however headways and service route changes are unanticipated at this time.

An additional approximately 1,110 AM peak hour shuttle person trips and 1,070 PM peak hour shuttle person trips, an approximately 90% and 185% increase in shuttle person trips during the AM and PM peak hours, respectively, are anticipated through the LRDP horizon year. This increased ridership would require approximately 70 new shuttles during the AM and PM peak hours to the Mission Bay Campus Site, which would represent a 160% increase in shuttle service to this campus site. As described in Section 4.3.2.1, UCSF Transportation Services would monitor shuttle conditions to ensure the shuttle loading zones would be adequate to accommodate the additional service and that the shuttle service would not conflict with Muni operations. If new shuttle loading zones within the Mission Bay Campus Site are required to accommodate this increased shuttle service, UCSF Transportation Services would work with the SFMTA to determine the appropriate locations for these stops and seek approval of these new stops.

The increased shuttle trips would not require the expansion of UCSF shuttle service or facilities beyond what would be expected through the regular monitoring by UCSF Transportation Services, nor would the increased shuttle demand cause a substantial conflict among autos, bicyclists, pedestrians, and transit vehicles. Therefore, the new UCSF shuttle trips generated by the LRDP would result in a ***less-than-significant impact***.

4.3.2.4 LRDP Variant

The increase in Mission Bay campus site peak hour transit trips generated by the LRDP Variant are described in **Table 4-11**. These net new peak hour transit trips are expected to use a combination of local and regional transit services and UCSF shuttle service.

TABLE 4-11: NEW PEAK HOUR TRANSIT TRIPS – MISSION BAY (LRDP VARIANT)

Notes:

1. Peak hour trips account for external trips only. Some transit users may use multiple transit modes on a single trip (e.g. BART+Muni, AC Transit+Muni, Muni+UCSF Shuttle, etc.). The table accounts for the total number of trips on each system, therefore transfer trips are counted multiple times.

Source: Adavant Consulting, Fehr & Peers, 2014

As shown in **Table 4-11**, approximately 3,000 new transit trips are expected during the AM and PM peak hours. Approximately 30-percent of all transit trips, about 900 AM peak hour trips and 800 PM peak hour trips, will commute to and from the campus site by SF Muni and approximately 35-percent will use the UCSF and MBTMA shuttles. The remaining 35-percent of new transit trips will be on BART, AC Transit, Caltrain, SamTrans, and Golden Gate Transit.

4.3.2.4.1 SF Muni

Muni conditions associated with the LRDP Variant would be similar to those described above for the 2014 LRDP. The Muni trips as assigned in **Table 4-11** were added to the load of Muni lines that serve the campus site. Specifically, the Muni trips were added to capacity utilization of the lines at the maximum load point between the campus site and the point at which the line where riders transfer to/from regional transit (i.e. 16th Street BART – 22 Fillmore, Temporary Transbay Terminal – 10 Townsend, T Third Street – Embarcadero BART). **Table 4-12** and **Table 4-13** show the maximum load point and capacity utilization for the transit routes with the LRDP Variant-generated transit trips added to them to reflect the Existing Plus LRDP Variant scenario with and without the Muni line 55 route, which is anticipated to begin service to coincide with the opening of Phase One Medical Center at Mission Bay, and is thus considered in the analysis of the LRDP projects in place at the Mission Bay campus site. The analysis of ridership for the scenario including the Muni line 55 route was performed using existing ridership information and can be found in **Appendix F**.

	Outbound	273	704	39%	199	472	67%
PM Peak Hour							
22/55 Fillmore	Inbound	323	757	43%	214	537	71%
	Outbound	210	757	28%	8	218	29%

Note: Pass. = Passenger ; Util. = Utilization.

1. Peak Hour Capacity reflects the addition of 55 Route Service with AM and PM peak hour service frequencies of approximately four buses per hour.

Source: Adavant Consulting, Fehr & Peers, 2014

As shown in **Table 4-12,** once the estimated number of LRDP Variant-generated Muni trips are added to the 10 Townsend, this Muni route would still continue to operate satisfactorily according to Muni crowding standards (Note the 10 Inbound Townsend during the PM peak hour operated at greater than 85% capacity utilization, both with and without the LRDP Variant-generated trips, but the LRDP Variant does not contribute to crowding on the line in a significant way).

The T Third Street would operate at greater than 85% capacity utilization with the addition of LRDP Variant-generated trips under the AM peak hour in the outbound direction (towards UCSF). While this is not considered a significant impact per UCSF transit standards, this would exceed Muni's crowding standards. Therefore, the following Improvement Measure has been identified:

Improvement Measure IM-TR-1: Study and Implement Uses to Minimize Transit Trips on the Muni T Third Street Line

- Development of clinical uses on Blocks 33/34 is considered a "secondary use" under the Mission Bay South Redevelopment Plan, which requires findings by the Office of Community Investment and Infrastructure that the use is consistent with the Mission Bay South Redevelopment Plan. UCSF would continue to study the amount of clinical space proposed under the LRDP Variant, and would refine the proposal before bringing it forth to the City for approval. In refining the LRDP Variant, UCSF would consider reducing the size of the clinical facilities at Blocks 33/34 to a level that will reduce the transit ridership on the T Third Street to less than the Muni's capacity utilization of 85 percent.

The 22 Fillmore would operate at greater than 85% capacity utilization with the addition of LRDP Variant-generated trips, but as shown in **Table 4-13**, with the addition of the interim 55 Route, the combination of the 22 Fillmore and the 55 Route would operate at less than 85% capacity utilization during both the AM and PM peak hours.

The estimated number of LRDP Variant-generated Muni trips traveling to and from the Mission Bay campus site would not require the expansion of transit service or facilities. Long-term funding for the 55 Route is uncertain. If Muni were to discontinue the service, UCSF would replace the transit capacity with shuttle service adequate to fill the gap in transit service. Thus, this analysis includes the 55 Route as a de facto permanent service.

As described in Section 1.2.6, as a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP, would continue to do so in particular at the four UCSF campus sites where development is proposed. Similar to the Parnassus Heights campus site, UCSF would monitor vehicle traffic conditions, transit operations, and shuttle ridership within and surrounding the Mission Bay campus site.

Should the need for additional shuttle service be triggered by increased ridership due to shifts in travel mode or demand generated by the LRDP Variant, UCSF Transportation Services would first review that the additional service would not negatively affect Muni operations. Once implemented, the additional service would be monitored to the same standard as that identified for the 2014 LRDP above. Further, should conflicts between shuttle service and Muni service arise, UCSF Transportation Services would coordinate with SFMTA staff to resolve these conflicts and ensure UCSF shuttles do not negatively affect Muni operations. Additionally, none of the specific proposals of the LRDP Variant would reduce access to or reconfigure transit stops in a way that would degrade transit service to the campus site; therefore the new transit trips generated by the LRDP Variant would result in a ***less-than-significant impact***.

4.3.2.4.2 Regional Transit Service

Regional transit conditions associated with the LRDP Variant would be similar to those described above for the 2014 LRDP. Under the LRDP Variant, the Mission Bay campus site would generate slightly more regional transit trips than the 2014 LRDP. The increase in regional transit trips would be commensurate with the percentage increase in new peak hour vehicle trips generated by the 2014 LRDP plan for the Mission Bay campus site. The number of new LRDP Variant-generated regional transit trips would not require the expansion of regional transit service or facilities; therefore the new regional transit trips generated by the LRDP Variant would result in a ***less-than-significant impact***.

4.3.2.4.3 UCSF and Mission Bay Transportation Management Association Shuttle Trips

UCSF and MBTMA shuttle transit conditions associated with the LRDP Variant would be similar to those described above for the 2014 LRDP. Under the LRDP Variant, the Mission Bay campus site would generate slightly more shuttle trips than the LRDP. The increase in shuttle trips would be commensurate with the percentage increase in new peak hour vehicle trips generated by the 2014 LRDP plan for the Mission Bay campus site. The increased shuttle trips would not require the expansion of UCSF shuttle service or facilities beyond what would be expected through the regular monitoring by UCSF Transportation Services, nor would the increased shuttle demand cause a substantial conflict among autos, bicyclists, pedestrians, and transit vehicles. Therefore, the new UCSF shuttle trips generated by the LRDP Variant would result in a ***less-than-significant impact***.

4.3.3 Mount Zion

The increase in Mount Zion campus site peak hour transit trips generated by the LRDP are described in **Table 4-14**. These new peak hour transit trips are expected to use a combination of local and regional transit services and UCSF shuttle service.

TABLE 4-14: NET NEW PEAK HOUR TRANSIT TRIPS – MOUNT ZION

Notes:

1. Peak hour trips account for external trips only. Some transit users may use multiple transit modes on a single trip (e.g. BART+Muni, AC Transit+Muni, Muni+UCSF Shuttle, etc.). The table accounts for the total number of trips on each system, therefore transfer trips are counted multiple times.

Source: Adavant Consulting, 2014

As shown in **Table 4-14**, approximately 260 and 160 net new transit trips are expected during the AM and PM peak hour, respectively. About 60-percent of transit users will use SF Muni and 20-percent will use BART to commute to and from the campus site, while the remaining 20-percent of transit users will use the UCSF shuttle, Caltrain, SamTrans or Golden Gate Transit.

4.3.3.1 SF Muni

As presented in **Table 4-15** existing Muni stops are located within a half-mile of the campus site and are accessible by walking. As described in Chapter 2, the TEP proposes several changes on routes traversing adjacent to and within the Mount Zion campus site. The 1 California, 2 Clement, and 24 Divisadero will reduce peak period headways and a supplemental trolley coach service will be added to the 2 Clement. The TEP does not propose any change to transit stop locations within the study area. In addition, Muni proposes to convert the 38 Geary/38L Geary Limited to Bus Rapid Transit (BRT), a transit service with high service frequencies that is proposed to begin service by 2020.

The Muni trips as assigned in **Table 4-14** were added to the load of the lines that serve the campus site at their maximum load point. **Table 4-15** shows the maximum load point and capacity utilization for the transit routes with the LRDP-generated transit trips added to them to reflect the Existing Plus LRDP scenario.

TABLE 4-15: TRANSIT CAPACITY UTILIZATION – MOUNT ZION

	Direction	Existing			Existing Plus LRDP		
		Pass. Load	Peak Hour Capacity	Capacity Util.	New Transit Trips	Pass. Load	Capacity Util.

Note: Pass. = Passenger ; Util. = Utilization
Bold: > % 85 Capacity Utilization
Source: Adavant Consulting, Fehr & Peers, 2014

The estimated number of LRDP-generated Muni trips is about a 35 percent increase in ridership traveling to and from the Mount Zion campus site, which would not require the expansion of transit service or facilities. As shown in **Table 4-15**, the LRDP-generated transit trips for the 38 Geary corridor were split evenly between the 38 Geary and the 38L Geary Limited Outbound during the PM peak hour, resulting in the 38 Geary Limited outbound operating above the 85 percent capacity utilization, which represents Muni's crowding standard. It should be noted that transit riders could choose to travel on either bus line, thus if one bus line is over 85 percent capacity utilization (38L Geary Limited) and a parallel transit line that serves the same stops and destinations is under capacity and could accommodate additional transit riders without going over 85 percent capacity utilization (38 Geary), this would not be considered significant. If the BRT were implemented, the transit capacity along the 38 Geary corridor would increase, which would in turn decrease the capacity utilization of this corridor.

As described in Section 1.2.6, as a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP, would continue to do so in particular at the four UCSF campus sites where development is proposed. Similar to the Parnassus Heights Campus Site, UCSF would monitor vehicle traffic conditions, transit operations, and shuttle ridership within and surrounding the Mount Zion Campus Site.

Should the need for additional shuttle service be triggered by increased ridership due to shifts in travel mode or demand generated by the LRDP, UCSF Transportation Services would first review that the additional service would not negatively affect Muni operations. Once implemented, the additional service would be monitored to the same standard as that identified above. Further, should conflicts between shuttle service and Muni service arise, UCSF Transportation Services would coordinate with SFMTA staff to resolve these conflicts and ensure UCSF shuttles do not negatively affect Muni operations. Additionally, none of the specific proposals of the LRDP would reduce access to or reconfigure transit stops in a way that would degrade transit service to the campus site; therefore the new transit trips generated by the LRDP would result in a ***less-than-significant impact***.

4.3.3.2 Regional Transit Service

In addition to Muni service, Mount Zion campus site staff and patrons are anticipated to continue to travel using regional transit services such as BART, Caltrain, SamTrans, and Golden Gate Transit. Regional service stations are accessible from the Mount Zion campus site via Muni or UCSF shuttles, and Golden Gate Transit riders can walk to the nearest stop, located on Geary Boulevard and Divisadero Street.

Less than 70 additional regional transit trips are expected during each AM and PM peak hours. This increase would not require the expansion of regional transit service or facilities; therefore the new regional transit trips generated by the LRDP would result in a ***less-than-significant impact***.

4.3.3.3 UCSF Shuttle

UCSF shuttle service operations summarized in Chapter 2 will continue to serve the Mount Zion campus site. The LRDP does not propose specific changes to shuttle service headways, although UCSF Transportation Services may change headways based on shifting shuttle demand as LRDP projects are constructed and occupied at each respective campus site.

An additional approximately 30 AM and PM peak hour shuttle person trips, an approximately 40 percent increase during both peak hours are anticipated through the LRDP horizon year.

This increased ridership would require an additional two shuttles during the AM and PM peak hours to the Mount Zion Campus Site. As described in Section 4.3.3.1, UCSF Transportation Services would monitor shuttle conditions to ensure the shuttle loading zone would be adequate to accommodate the additional service and that the shuttle service would not conflict with Muni operations.

The increased shuttle trips would not require the expansion of UCSF shuttle service or facilities beyond what would be expected through the regular monitoring by UCSF Transportation Services, nor would the increased shuttle demand cause a substantial conflict among autos, bicyclists, pedestrians, and transit vehicles. Therefore, the new UCSF shuttle trips generated by the LRDP would result in a ***less-than-significant impact***.

4.3.4 Mission Center

The increase in Mission Center campus site peak hour transit trips generated by the LRDP are described in **Table 4-16**. These net new peak hour transit trips are expected to use a combination of local and regional transit services and UCSF shuttle service.

TABLE 4-16: NET NEW PEAK HOUR TRANSIT TRIPS – MISSION CENTER

Notes:

1. Peak hour trips account for external trips only. Some transit users may use multiple transit modes on a single trip (e.g. BART+Muni, AC Transit+Muni, Muni+UCSF Shuttle, etc.). The table accounts for the total number of trips on each system, therefore transfer trips are counted multiple times.

Source: Adavant Consulting, 2014

As shown in **Table 4-16**, approximately 100 net new transit trips are expected during the AM and PM peak hour. About 35-percent of transit users will use SF Muni, 30 percent will use UCSF shuttles, and 25-percent will use BART to commute to and from the campus site, while the remaining 10-percent of transit users will use AC Transit, Caltrain, SamTrans, or Golden Gate Transit.

4.3.4.1 SF Muni

As presented in **Table 2-28**, existing Muni stops are located within a half-mile of the campus site and are accessible by walking. As described in Chapter 2, the TEP proposes several changes on routes adjacent to the Mission Center campus site. The 9L San Bruno Limited, 14/14L Mission Limited, and 22 Fillmore will reduce peak period headways. The 12 Folsom/Pacific will be discontinued though a majority of the route will be served by rerouting the 27 Bryant and the new 11 Downtown Connector. In addition to increasing peak period headways, the 22 Fillmore will be rerouted to continue along 16th Street, connecting to Mission Bay. The TEP does not propose any change to transit stop locations within the study area.

The Muni trips as assigned in **Table 4-16** were added to the load of the lines that serve the campus site at their maximum load point. **Table 4-17** shows the capacity utilization for the transit routes with the LRDP-generated transit trips added to them to reflect the Existing Plus LRDP scenario.

Note: Pass. = Passenger ; Util. = Utilization

Bold: > % 85 Capacity Utilization

Source: Adavant Consulting, Fehr & Peers, 2014

The estimated number of LRDP-generated Muni trips represents less than five percent increase in ridership on any Muni line in the vicinity of the Mission Center campus site, which would not require the expansion of transit service or facilities. As described in Section 1.2.6, as a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP, would continue to do so in particular at the four UCSF campus sites where development is proposed. Similar to the Parnassus Heights Campus Site, UCSF would monitor vehicle traffic conditions, transit operations, and shuttle ridership within and surrounding the Mission Center Campus Site.

Should the need for additional shuttle service be triggered by increased ridership due to shifts in travel mode or demand generated by the LRDP, UCSF Transportation Services would first review that the additional service would not negatively affect Muni operations. Once implemented, the additional service would be monitored to the same standard as that identified above. Further, should conflicts between shuttle service and Muni service arise, UCSF Transportation Services would coordinate with SFMTA staff to resolve these conflicts and ensure UCSF shuttles do not negatively affect Muni operations. Additionally, none of the specific proposals of the LRDP would reduce access to or reconfigure transit stops in a way that would degrade transit service to the campus site; therefore the new transit trips generated by the LRDP would result in a ***less-than-significant impact***.

4.3.4.2 Regional Transit Service

In addition to Muni service, Mission Center staff, patrons and students are anticipated to continue to use BART, AC Transit, Caltrain, SamTrans, and Golden Gate Transit for regional transit service through the LRDP horizon year. Regional service stations are likely to remain at existing locations, over half a mile away, and can be accessed by other transit modes such as SF Muni and the UCSF shuttle and by walking in the case of the 16th Street BART.

Less than 40 additional regional transit trips are expected during each AM and PM peak hours. This increase would not require the expansion of regional transit service or facilities; therefore the new regional transit trips generated by the LRDP would result in a ***less-than-significant impact***.

4.3.4.3 UCSF Shuttle

UCSF shuttle service operations summarized in Chapter 2 will continue to serve the Mission Center campus site. With the LRDP, the shuttle stop and loading area will be shifted to 15th Street, just east of the vehicle access point. The proposed shuttle loading areas should accommodate two shuttles loading at one time. The new shuttle stop would displace three on-street spaces with parking meters. The LRDP does not propose specific changes to shuttle service headways, although UCSF Transportation Services may change headways based on shifting shuttle demand as LRDP projects are constructed and occupied at each respective campus site.

An additional approximately 30 AM and PM peak hour shuttle person trips, an approximately 60 percent increase during both peak hours are anticipated through the LRDP horizon year. This increased ridership would require an additional two shuttles during the AM and PM peak hours to the Mission Bay Campus Site. As described in Section 4.3.4.1, UCSF Transportation Services would monitor shuttle conditions to ensure the shuttle loading zone would be adequate to accommodate the additional service and that the shuttle service would not conflict with Muni operations.

The increased shuttle trips would not require the expansion of UCSF shuttle service or facilities beyond what would be expected through the regular monitoring by UCSF Transportation Services, nor would the increased shuttle demand cause a substantial conflict among autos, bicyclists, pedestrians, and transit vehicles. Therefore, the new UCSF shuttle trips generated by the LRDP would result in a ***less-than-significant impact***.

4.4 PEDESTRIAN IMPACTS

LRDP horizon pedestrian trips were estimated based on existing travel surveys of UCSF staff and visitors as described in Chapter 3. Pedestrian trips generated by the four UCSF campus sites would include walk trips to and from nearby residences, commercial uses, and local and regional transit stops. The sections below describe the proposed modifications to pedestrian facilities surrounding the campus sites, estimated peak hour pedestrian trips, and potential conflicts to pedestrian circulation associated with each campus site.

As part of the LRDP, UCSF would design new buildings to ensure that the ground floor frontage and public realm elements do not impact the pedestrian environment. Buildings would be assessed based on their retail uses, useable open space, and active building entries to ensure they are oriented toward the sidewalk or pedestrian plazas to create a compelling public realm and promote walking as a form of travel.

4.4.1 Parnassus Heights

UCSF proposes a variety of improvements to pedestrian and transit facilities at the campus site. The *Parnassus Avenue Streetscape Plan* proposes to make crossing Parnassus Avenue safer and more convenient for pedestrians, reorganize and improve transit and UCSF shuttle operations, create more

usable outdoor space, and enhance the public realm. Specific improvements may include new paving, street furniture, lighting, and street trees, as well as sidewalk and crosswalk widening and better defined campus site gateways. The *Parnassus Avenue Streetscape Plan* also proposes to modify the existing UCSF shuttle stops from the gateways of the campus site to a central location fronting the campus library in the westbound direction and the Clinical Sciences Building in the eastbound direction. The improvements would occur in phases starting on the south side of Parnassus Avenue, at the west end at Fifth Avenue, and move through the core of the campus site and along the front of the New Hospital Addition, finishing at Medical Center Way. In addition to the *Streetscape Plan*, the LRDP proposes to construct new trails in the Mount Sutro Open Space Reserve.

The LRDP would add approximately 210 pedestrian trips to the surrounding streets (including 40 walk trips and 170 transit-access trips) during the AM peak hour and approximately 190 pedestrian trips (including 30 walk trips and 160 transit-access trips) during the PM peak hour.[12] Pedestrian trips would primarily use Parnassus Avenue and Carl-Irving Streets to travel to the surrounding residential neighborhoods or to the commercial areas in the Inner Sunset and Cole Valley. LRDP-generated transit trips will begin as pedestrian trips traveling to the nearest Muni or UCSF shuttle stops. Most transit riders would use the Muni and UCSF shuttle stops within the campus site on Parnassus Avenue and Carl Street. Other transit riders would walk along Parnassus Avenue or Irving Street to Muni stops on Ninth Avenue and Lincoln Way.

The *Parnassus Avenue Streetscape Plan* proposes to consolidate the existing Muni bus stops along Parnassus Avenue through the Parnassus Heights campus site. The bus stops would be consolidated from three stops in each direction between Fourth and Hillway avenues to two stops. At Fourth Avenue, the eastbound bus stop is proposed as a far-side stop with a 60 foot bus bulb. No modification is proposed for the existing westbound near-side stop. At Hillway Avenue, both the eastbound and westbound bus stops are proposed to be far-side stops with 60 foot bus bulbs. These changes would improve transit travel times through the campus by reducing the number of stops buses would need to make. Although these changes would require some pedestrians to potentially travel a slightly greater distance to reach a transit stop, they would not impact pedestrian access as the stop spacing would still be far below the established standards.[13]

The proposed UCSF shuttle stop changes would shift shuttle riders to the new shuttle stops located at the campus library in the westbound direction and the Clinical Sciences building in the eastbound direction. Proposed changes to buildings along Parnassus Avenue would likely shift some pedestrian traffic to the New Hospital Addition near Hillway Avenue and to the potential future housing at Parnassus and Fifth

[12] Transit access trips for the pedestrian impact discussion are calculated based on the daily trip generation presented in **Table 3-3** and the AM and PM peak hour percentage of daily trips presented in **Table 3-13**. These are different from the total transit trips presented in Section 4.3 as the transit impact analysis double counts the riders who use multiple transit modes on a single trip (e.g. BART+Muni, AC Transit+Muni, Muni+UCSF Shuttle, etc.).

[13] The SFMTA's stop spacing policy is that bus stops should be: between 800 and 1,000 feet on grades less than 10 percent; between 500 and 600 feet on grades between 10 and 15 percent; and between 300 and 400 feet on grades greater than 15 percent. The existing distance between the two stops is relatively small at approximately 500 feet. A pedestrian emerging from a building between these stops would have a maximum walking distance of approximately 250 feet. After the stop consolidation, the maximum walking distance to the Hillway Avenue stops would only increase to approximately 550 feet which is well within the established threshold. The stops to the east of the Hillway Avenue stops are approximately 600 feet away, but this distance would not be affected by the proposal.

avenues. The proposed streetscape plan would accommodate the new pedestrian trips generated by the LRDP in addition to the shifts in pedestrian traffic that would occur in the future. Overall, the LRDP would improve pedestrian accessibility on the campus site frontage through the *Parnassus Avenue Streetscape Plan* and new trails in the Reserve. The immediate area surrounding the Parnassus Heights campus site includes robust pedestrian facilities that provide access to nearby neighborhoods, commercial uses, and transit stops. The LRDP would not create substantial conflicts between pedestrians and autos, bicyclists, or transit vehicles. Therefore, the LRDP's impact to pedestrian circulation and facilities at the Parnassus Heights campus site would be ***less than significant***.

4.4.2 Mission Bay

The LRDP proposes the extension of several streets through the campus site including Nelson Rising Lane east of Fourth, Fifth, and Sixth streets south of Mission Bay Boulevard South, and Owens Street south of 16th Street. These streets would be designed with sidewalks, curb cuts, and crosswalks that minimize conflicts between vehicles and pedestrians and meet San Francisco's *Better Streets Plan* standards. In addition to these street extensions, UCSF is upgrading existing sidewalks along 16th Street and constructing a new public pedestrian plaza on Fourth Street between 16th and Mariposa streets in coordination with on-going construction. Beyond the campus site, no improvements to the pedestrian facilities in the area are proposed.

The LRDP would add approximately 2,840 pedestrian trips to the streets surrounding the Mission Bay campus site (including 500 walk trips and 2,340 transit-access trips) during the AM peak hour and approximately 2,440 pedestrian trips (including 430 walk trips and 2,010 transit-access trips) during the PM peak hour. The new pedestrian trips would be distributed throughout the North, South, and East Campuses, along the many roadways and pedestrian alleyways crossing through the campus site. Pedestrian trips leaving the campus site to residential and commercial destinations would primarily occur along 16th and Mariposa streets to the west, along Third and Minnesota streets to the south, and along Third, Fourth, and Seventh streets to the north. Muni transit riders would travel along Third Street to the T Third Street light rail line stops on Third Street and Gene Friend Way or Mariposa Street, and along 16th and Connecticut streets to the 22 Fillmore stop at 18th and Connecticut streets. Caltrain riders would travel north along Fourth Street to the station at Fourth and King streets. UCSF shuttle riders would stay within the campus site and use shuttle stops located on Fourth or Owens streets, MBTMA shuttle riders would walk to shuttle stops along Owens Street and Mission Bay Boulevard South.

As described in Section 4.3, the TEP proposes several changes on routes traversing through and within the vicinity of the Mission Bay campus site. The proposed Muni route 55 and changes to the 22 Fillmore would extend Muni service along 16th Street to proposed stops on 16th Street within the campus site. The TEP would change the 10 Townsend to the 10 Sansome and modify this route to travel through Mission Bay along Mission Bay Boulevard to Seventh Street. These proposed changes would shorten the walking distance for transit riders and reduce travel time to the transit stops for each of these routes. Although pedestrian volumes are currently relatively low due to the developing nature of the Mission Bay neighborhood, existing pedestrian facilities are designed to accommodate higher pedestrian volumes than the LRDP would generate in the future, including the 12 to 15 foot wide sidewalks and crosswalks.

The immediate area surrounding the Mission Bay campus site includes existing or proposed pedestrian facilities that provide access to nearby neighborhoods, commercial uses, and transit stops. The LRDP would not create substantial conflicts between pedestrians and autos, bicyclists, or transit vehicles.

Therefore, the LRDPs impact to pedestrian circulation and facilities at the Mission Bay campus site would be ***less than significant*.**

4.4.2.1 LRDP Variant

Pedestrian conditions associated with the LRDP Variant would be similar to those described above for the 2014 LRDP. Under the LRDP Variant, the Mission Bay campus site would generate slightly more pedestrian trips than the 2014 LRDP. The increase in pedestrian trips would be commensurate with the percentage increase in new peak hour vehicle trips generated by the 2014 LRDP plan for the Mission Bay campus site. The LRDP Variant does not propose changes to the pedestrian environment compared to the 2014 LRDP. Similar to the 2014 LRDP, the LRDP Variant would not create substantial conflicts between pedestrians and autos, bicyclists, or transit vehicles. Therefore, the LRDP Variant's impact to pedestrian circulation and facilities at the Mission Bay campus site would be *less than significant*. Mount Zion

The LRDP does not propose changes to pedestrian amenities or introduce new conflicts to the pedestrian network surrounding the Mount Zion campus site. Pedestrian access to the Mount Zion campus site would remain similar to the existing configuration. Overall, the LRDP would not change pedestrian accessibility on the campus site frontage. Further, the LRDP would not conflict with proposed changes to Geary Boulevard to accommodate BRT service.

The LRDP would add approximately 250 pedestrian trips to the streets surrounding the Mount Zion campus site (including 40 walk trips and 210 transit-access trips) during the AM peak hour and approximately 140 pedestrian trips (including 40 walk trips and 100 transit-access trips) during the PM peak hour. Pedestrian trips would primarily use Divisadero Street to access nearby commercial uses and distribute across the grid street network to access the surrounding residential neighborhoods in Pacific Heights and the Western Addition. LRDP-generated transit trips will begin as pedestrian trips traveling to the Muni and Golden Gate Transit stops on Divisadero Street, Sutter Street, Geary Boulevard, or California Street. Most pedestrians will travel along Divisadero Street to these transit stops including the proposed Geary BRT stop located at Geary Boulevard and Divisadero Street. The TEP does not propose any changes to transit stop locations within the study area. UCSF shuttle riders will walk to the stop located within the center of the campus site on Sutter Street between Divisadero and Scott streets. Existing pedestrian facilities adequately accommodate existing pedestrian volumes and overcrowding is not expected to occur due to the LRDP.

The immediate area surrounding the Mount Zion campus site includes robust pedestrian facilities that provide access to nearby neighborhoods, commercial uses, and transit stops. The LRDP would not create substantial conflicts between pedestrians and autos, bicyclists, or transit vehicles. Therefore, the LRDP's impact to pedestrian circulation and facilities at the Mount Zion campus site would be **less than significant**.

4.4.3 Mission Center

The LRDP does not propose changes to pedestrian amenities or introduce new conflicts to the pedestrian network surrounding the Mission Center campus site. Pedestrian access to the Mission Center campus site would remain similar to the existing configuration. Overall, the LRDP would not change pedestrian accessibility on the campus site frontage.

The LRDP would add approximately 100 pedestrian trips to the streets surrounding the Mission Center campus site (including 10 walk trips and 90 transit-access trips) during the AM peak hour and approximately 90 pedestrian trips (including 10 walk trips and 80 transit-access trips) during the PM peak hour. Pedestrian trips would primarily use 15th Street to access the surrounding street grid network and connect to residential and commercial neighborhoods in Mission and SoMa. LRDP-generated transit trips will begin as pedestrian trips traveling along 15th, 16th, Folsom, and Harrison streets to the nearest BART Station at 16th and Mission streets, and Muni bus routes on Mission Street, Folsom Street, 16th Street, or 11th Street.

The TEP would discontinue the 12 Folsom/Pacific and replace it with the 27 Bryant adjacent to the campus site. The TEP does not propose any change to transit stop locations within the study area. The LRDP proposes to relocate the current UCSF shuttle stop from the parking lot to the north side of 15th Street midblock. This relocated shuttle stop, and the UCSF shuttle riders, is not expected to hinder pedestrian mobility on 15th Street as the 15 foot wide sidewalks could handle the expected pedestrian traffic. Existing pedestrian facilities surrounding the Mission Center campus site adequately accommodate existing pedestrian volumes and overcrowding is not expected to occur due to the LRDP.

The immediate area surrounding the Mission Center campus site includes robust pedestrian facilities that provide access to nearby neighborhoods, commercial uses, and transit stops. The LRDP would not create substantial conflicts between pedestrians and autos, bicyclists, or transit vehicles. Therefore, the LRDP's impact to pedestrian circulation and facilities at the Mission Center campus site would be **less than significant**.

4.5 BICYCLE IMPACTS

LRDP horizon bicycle trips were estimated based on existing travel surveys of UCSF staff and visitors as described in Chapter 3. Bicycle trips generated by the four UCSF campus sites would include trips to and from nearby residences and commercial uses. The sections below describes the estimated peak hour bicycle trips, proposed bicycle parking expansion, and potential conflicts to bicycle circulation associated with each campus site.

4.5.1 Parnassus Heights

As discussed in Chapter 2, the area around the Parnassus Heights campus site has a number of streets with bicycle lanes and streets designated as bicycle routes, including Parnassus Avenue, Kirkham Street, Sixth Avenue, and Seventh Avenue. In addition, there are several Class I bicycle paths and Class III routes in nearby Golden Gate Park. The Parnassus Heights campus site is within convenient bicycling distance of residential and commercial areas in the Sunset, Richmond, and Haight neighborhoods and many other neighborhoods to the east via the Golden Gate Park Panhandle and "Wiggle" bicycle route. Within the campus site, The *Parnassus Avenue Streetscape Plan* proposes to convert the current Class III bicycle lane to a Class II bicycle lane on steep portion of Parnassus Avenue, from Fifth Avenue to Third Avenue. The SF Bike Plan does not include any short- or long-term improvements in the study area.

The LRDP is expected to increase bicycle demand in the area by approximately 20 new trips during both the AM and PM peak hours. These trips would primarily occur on designated bicycle facilities in addition to other popular routes such as Irving and Carl streets, which connect to surrounding neighborhoods through the San Francisco Bike Route network. The increased bicycle demand would be accommodated at the campus site through additional bicycle parking provided as a part of UCSF's TDM program. In the near-term, UCSF plans to add one new bicycle cage and 20 new bicycle racks at the Parnassus Heights Campus Site. This would increase bicycle parking capacity and generally improve bicycle conditions on the campus site.

The expected increase in bicycle traffic would not represent a level that adversely affects bicycle facilities on the campus site, nor would the LRDP create substantial conflicts between bicyclists and pedestrians, autos, or transit vehicles. Thus, the LRDP's impact to bicycle facilities and circulation at the Parnassus Heights campus site would be considered ***less than significant***.

4.5.2 Mission Bay

As discussed in Chapter 2, the area around the Mission Bay campus site has a number of streets with bicycle lanes and streets designated as bicycle routes, including King Street, 16th Street, Mariposa Street, Fourth Street, and Seventh Street. The Mission Bay campus site is within convenient bicycling distance of residential and commercial areas in the Mission, Potrero Hill, Dogpatch, South of Market, and other downtown San Francisco neighborhoods. The LRDP does not propose changes to the bicycle circulation network surrounding the Mission Bay campus site. The Bike Plan includes a planned bikeway near/along Mission Creek between Fourth Street and Harrison Street, which is listed as a long-term project in the Bike Plan. In addition, an expansion of the Bay Area Bike Share program is currently being evaluated and could include a new station at Fourth Street near Rock Hall on the Mission Bay campus site. The proposed implementation of this expansion is the fall of 2014.

The LRDP is expected to increase bicycle demand in the area by 276 new trips during the AM peak hour and 214 new trips during the PM peak hour. These trips would primarily occur on the designated bicycle facilities connecting to the campus site, which connect to surrounding neighborhoods through the San Francisco Bike Route network. The increased bicycle demand would be accommodated through the existing on-campus site parking supply in additional to new bicycle parking locations in future buildings and the potential Bay Area Bike Share station. In the near-term, UCSF plans to add one additional bicycle cage and 10 bicycle racks at the Mission Bay Campus Site. This would increase bicycle parking capacity and generally improve bicycle conditions on the campus site.

The expected increase in bicycle traffic would not represent a level that adversely affects bicycle facilities on the campus site, nor would the LRDP create substantial conflicts between bicyclists and pedestrians, autos, or transit vehicles. Thus, the LRDP's impact to bicycle facilities and circulation at the Mission Bay campus site would be considered ***less than significant***.

4.5.2.1 LRDP Variant

Bicycle conditions associated with the LRDP Variant would be similar to those described above for the 2014 LRDP. Under the LRDP Variant, the Mission Bay campus site would generate slightly more bicycle trips than the 2014 LRDP. The increase in bicycle trips would be commensurate with the percentage increase in new peak hour vehicle trips generated by the 2014 LRDP plan for the Mission Bay campus site. The LRDP Variant does not propose changes to the bicycle environment compared to the LRDP. Similar to the 2014 LRDP, the expected increase in bicycle traffic would not represent a level that adversely affects bicycle facilities on the campus site, nor would the LRDP Variant create substantial conflicts between bicyclists and pedestrians, autos, or transit vehicles. Thus, the LRDP Variant's impact to bicycle facilities and circulation at the Mission Bay campus site would be considered ***less than significant***.

4.5.3 Mount Zion

As discussed in Chapter 2, the area around the Mount Zion campus site has several streets with bicycle lanes and streets designated as bicycle routes, including Post Street and Clay Street. The Mount Zion campus site is within convenient bicycling distance of residential and commercial areas in the Western Addition, Pacific Heights, and other downtown San Francisco neighborhoods. The LRDP does not propose changes to the bicycle circulation network surrounding the Mount Zion campus site. The SF Bike Plan does not include any short- or long-term improvements in the study area.

The LRDP is expected to slightly increase bicycle demand in the area, including approximately 20 new trips during the AM peak hour and 10 new trips during the PM peak hour. These trips would primarily occur on the designated bicycle facilities connecting to the campus site, which connect to surrounding neighborhoods through the San Francisco Bike Route network. The increased bicycle demand would be accommodated through the existing on-campus site parking supply in addition to new bicycle parking provided as a part of UCSF's TDM program. In the near-term, UCSF plans to add eight additional bicycle racks at the Mount Zion Campus Site. This would increase bicycle parking capacity and generally improve bicycle conditions on the campus site.

The expected increase in bicycle traffic would not represent a level that adversely affects bicycle facilities on the campus site, nor would the LRDP create substantial conflicts between bicyclists and pedestrians, autos, or transit vehicles. Thus, the LRDP's impact to bicycle facilities and circulation at the Mount Zion campus site would be considered ***less than significant***.

4.5.4 Mission Center

As discussed in Chapter 2, the area around the Mission Center campus site has a number of streets with bicycle lanes and streets designated as bicycle routes, including Folsom Street, Harrison Street, 17th Street, 14th Street, and 11th Street. The Mission Center campus site is within convenient bicycling distance of residential and shopping areas in the Mission, South of Market, and other downtown San Francisco neighborhoods. The LRDP does not propose changes to the bicycle circulation network surrounding the Mission Center campus site. The SF Bike Plan includes planned short-term improvements to add bicycle lanes from Ninth Street to 11th Street for Bicycle Route 25 on Howard Street.

As noted in Section 2.6.6, parcel delivery vehicles occasionally block the northbound bicycle lane on Folsom Street in front of the Mission Center campus site due to the lack of a curbside loading zone. Folsom Street is a popular bicycle route to Downtown San Francisco and bicyclists currently must pass the loading vehicles in the vehicle travel lane. While this is not considered a significant impact, the following Improvement Measure has been identified:

Improvement Measure IM-TR-2: Add Curbside Loading Zone on Folsom Street

UCSF could work with the SFMTA to add a curbside loading zone on Folsom Street, adjacent to the existing Mission Center building. A 50 foot loading zone would require the removal of approximately two parking spaces on Folsom Street. This loading zone will improve conditions for bicyclists whom may have their path currently blocked due to vehicles loading in the northbound bicycle lane.

The LRDP is expected to slightly increase bicycle demand in the area, including approximately 15 new trips during both the AM and PM peak hours. These trips would primarily occur on the designated bicycle facilities connecting to the campus site, which connect to surrounding neighborhoods through the San Francisco Bike Route network. The increased bicycle demand would be accommodated through the existing on-site bike parking supply in addition to any new bicycle parking provided as a part of UCSF's TDM program. In the near-term, UCSF plans to add four new bicycle racks at the Mission Center Campus Site. This would increase bicycle parking capacity and generally improve bicycle conditions on the campus site.

The LRDP proposes to reconfigure vehicle access to the campus site by designating the Harrison Street driveway to inbound only and the 15th Street driveway to outbound only. This reconfigured access, in addition to the increase in vehicle trips described in Section 4.2, would increase the number of conflicts between vehicles and bicycles using the Harrison Street Class II bicycle lanes. As noted Section 2.6.5, Harrison Street adjacent to the campus site is a popular bicycling route to and from Downtown San Francisco. While this is not considered a significant impact, the following Improvement Measure has been identified:

Improvement Measure IM-TR-3: Implement High-Visibility Bicycle Lanes on Harrison Street

UCSF could work with the SFMTA to implement measures to increase the visibility of southbound bicyclists for vehicles entering the Mission Center campus site from Harrison Street. This could include implement high-visibility green skip striping across the conflict zone in front of the Mission Center campus site driveway along Harrison Street.

The expected increase in bicycle traffic would not represent a level that adversely affects bicycle facilities in the area. With the proposed Improvement Measures in place, the LRDP would not create substantial conflicts between bicyclists and pedestrians, autos, or transit vehicles. Thus, the LRDP's impact to bicycle facilities and circulation at the Mission Center campus site would be considered ***less than significant***.

4.6 LOADING IMPACTS

4.6.1 Commercial Loading

The San Francisco Planning Code requires that land uses, such as medical offices and hospitals, provide off-street loading spaces according to the following schedule shown in **Table 4-15**.

TABLE 4-18: SAN FRANCISCO PLANNING CODE LOADING REQUIREMENTS

Use or Activity	Gross Floor Area of Structure or Use (sq. ft.)	Number of Off-Street Freight Loading Spaces Required
Retail stores, wholesaling, manufacturing, live/work units in newly constructed structures, and all other uses primarily engaged in the handling of goods.	0 - 10,000	0
	10,001 - 60,000	1
	60,001 - 100,000	2
	over 100,000	3 plus 1 for each additional 80,000 sq. ft.
Offices, hotels, apartments, live/work units not included above, and all other uses not included above	0 - 100,000	0
	100,001 - 200,000	1
	200,001 - 500,000	2
	over 500,000	3 plus 1 for each additional 400,000 sq. ft.

Source: San Francisco Planning Code Section 152.1, Fehr & Peers, 2014

Loading supply was estimated based on the criteria above. **Table 4-19** shows the existing and future loading requirements from Table 152 of the San Francisco Planning Code Article 1.5, Section 150 for the four UCSF campus sites. As shown, the existing and proposed loading supply exceeds the code at each of the campus sites.

While **Table 4-19** shows that the existing loading supply does not meet the LRDP horizon year required loading supply, it should be noted that the UCSF campus sites are unique, and their loading demands, and thus supply should be monitored over time to ensure that an appropriate amount of supply is provided at each campus site.

The demand for loading spaces through the LRDP horizon year was described in Chapter 3, and was calculated based on surveys from the Parnassus Heights campus site and methods described in the SF Guidelines. It is expected that the estimated LRDP supply should be adequate for the estimated demand, however, as mentioned above, the campus sites are unique and should be monitored over time. Commercial loading conditions for the 2014 LRDP and LRDP Variant is considered a ***less-than-significant impact*** if UCSF continues to monitor loading operations and provide appropriate supply.

TABLE 4-19: EXISTING AND FUTURE LOADING REQUIREMENTS – ALL CAMPUSES

Campus	Loading Spaces (Truck/ Freight)	Building Size (Goods Handling)[1]	Building Size (Other)[1]	Off-Street Loading Requirements			Total Required Minus Existing Supply
				Goods Handling	Other	Total	
Existing							
Parnassus Heights	11	36,700	3,265,100	1	10	11	0
Mission Bay	8	46,825	1,879,875	1	7	8	0
Mount Zion	3	4,325	771,875	0	4	4	-1
Mission Center	2	2,025	288,675	0	2	2	0
Subtotal	24	89,875	6,205,525	2	23	25	-1
Future							
Parnassus Heights	11	35,230	3,440,247	1	11	12	-1
Mission Bay	8	64,228	4,576,152	2	14	16	-8
Mount Zion	3	4,325	944,424	0	5	5	-2
Mission Center	2	5,775	384,925	0	2	2	0
Subtotal	24	***109,558***	***9,345,748***	***3***	***32***	***35***	***-11***

Notes:

1. Assumes 25% of Campus Community is considered "Goods Handling" per San Francisco Planning Code Section 152.1. Remaining GSF uses "Other" criteria.

Source: UCSF, Fehr & Peers, 2014

4.6.2 Passenger Loading/Unloading

This section describes the LRDP passenger loading impacts. As presented in Chapter 3, the LRDP would add approximately 310 and 250 total passenger loading trips during the AM and PM peak hours, respectively at the four campus sites. This represents an approximate growth of 50-percent during the peak hours. **Figure 4-5** through **Figure 4-8** show the LRDP proposed parking and loading locations.

The SF Guidelines methodology in which peak hour loading arrivals is converted into passenger car equivalents, then compared to supply was used in order to determine whether additional loading areas were recommended at each campus site with the LRDP in place. The analysis, as summarized in **Table 4-20** relies on passenger loading demand at each campus site from **Table 3-34** and the existing passenger loading supply at each campus site, as presented in Chapter 2.

Figure 4-5

Notes:

1. Demand presented in feet based on methodology presented in *SF Guidelines*, Vehicular Space Needs for Hotel Guest Loading/Unloading Activities, Appendix D and observations of existing passenger loading activity at the campus sites.
2. Negative values presented as zero.

Source: Fehr & Peers, 2014

4.6.2.1 Parnassus Heights

As shown in **Table 4-20**, there is an existing deficit of passenger loading supply to accommodate the existing peak hour demand at the Parnassus Heights campus site. This finding is supported by observations made of very active loading areas that on occasion generate queues of vehicles awaiting entry. It should be noted that this deficit appears to be exacerbated during peak times by some vehicles not adhering to all peak hour parking and loading regulations. As part of the LRDP, the Streetscape Plan, which seeks to alleviate parking and loading congestion among other goals will be implemented. In addition to the *Parnassus Avenue Streetscape Plan*, as part of the New Hospital Addition, a new passenger loading loop, larger than the current Moffitt Loop and sized to compensate for the existing deficit of passenger loading supply, will be designed in coordination with UCSF Transportation Services. The loop will be provided off of Parnassus Avenue in front of the New Hospital Addition.

The combination of the *Parnassus Avenue Streetscape Plan* and new passenger loading loop at the New Hospital Addition will be sufficient to accommodate the estimated LRDP demand, therefore the LRDP's impact to passenger loading is considered ***less than significant***.

4.6.2.2 Mission Bay

Table 4-20 shows that the existing passenger loading supply is sufficient for the estimated LRDP loading needs during the PM peak hour and in need of an additional five feet to be sufficient for the AM peak hour. As part of the LRDP, additional passenger loading supply will be implemented in the form of driveway loops in front of the Women's, Cancer, and Children's Hospital on the south side of campus, as shown on **Figure 4-6**. As shown on the figure, visitors and patrons may access the new northern passenger loading loop from Sixteenth Street and the new southern passenger loading loop from Mariposa Street. As described in Chapter 2, existing loading areas provide a sufficient amount of space for passenger and vehicle loading.

The combination of the new passenger loading loops at the Women's, Cancer, and Children's Hospital and adequate existing supply will be sufficient to accommodate the estimated LRDP demand, therefore the LRDP's impact to passenger loading is considered ***less than significant***.

4.6.2.2.1 LRDP Variant

Passenger loading conditions associated with the LRDP Variant would be similar to those described above for the 2014 LRDP. Under the LRDP Variant, the Mission Bay campus site would generate slightly more passenger loading trips than the 2014 LRDP. The increase in passenger loading trips would be commensurate with the percentage increase in new peak hour vehicle trips generated by the 2014 LRDP plan for the Mission Bay campus site. If the LRDP Variant at the Mission Bay campus site moves forward to the design phase, passenger loading will be designed to accommodate the loading demand in a similar manner to other zones on the Mission Bay campus site. This passenger loading zone would be subject to review and coordination between the UCSF Transportation Services and the SFMTA. Therefore the LRDP Variant's impact to passenger loading is considered ***less than significant***.

4.6.2.3 Mount Zion

Table 4-20 shows that the existing passenger loading supply is sufficient for the estimated LRDP loading needs during both the AM and PM peak hours. This is despite an expected increase in peak demand of approximately 60 feet during the AM peak hour and 30 feet during the PM peak hour. As noted in the Section 2.5.6, the loading area fronting the Scott Street facility appears to currently be at capacity, as multiple passenger vehicles were seen occupying metered parking spots. While this is not considered a significant impact, the following Improvement Measure has been identified:

> **Improvement Measure IM-TR-4: Add Passenger Loading to Scott Street**
>
> UCSF could work with the SFMTA to add a curbside passenger loading zone on Scott Street. An additional 50 foot loading zone would require the removal of approximately three metered parking spaces on Scott Street. This loading zone will reduce overflow for passenger loading on Scott Street.

As development of the LRDP proceeds at the campus site, UCSF may work with the SFMTA to further increase the amount of passenger loading supply by converting existing on-street parking meter spaces to passenger loading supply based on need and conditions at the time of development. The existing supply will be sufficient to accommodate the estimated LRDP demand, therefore the LRDP's impact to passenger loading is considered ***less than significant***.

4.6.2.4 Mission Center

Table 4-20 shows that the existing passenger loading supply is sufficient for the estimated LRDP loading needs during both the AM and PM peak hours. This is despite a marginal expected increase in peak demand of approximately five feet during the AM and PM peak hours.

The existing supply will be sufficient to accommodate the estimated LRDP demand, therefore the LRDP's impact to passenger loading is considered ***less than significant***.

4.7 PARKING ANALYSIS

The 2014 LRDP parking demand was estimated based on information about existing parking utilization and travel surveys of UCSF staff and visitors as described in Chapter 3. The sections below describe the changes in parking supply and parking utilization for each campus site under the 2014 LRDP buildout.

4.7.1 Changes in Parking Supply

The 2014 LRDP calls for additional parking to be provided on campus sites at Parnassus Heights, Mission Bay, Mount Zion, and Mission Center, as warranted by the proposed development. The precise quantity of any new parking would be determined as projects are proposed. The following list describes the currently proposed changes in parking supply; a quantitative summary is presented in **Table 4-21**. As shown in the table, the number of parking spaces owned by UCSF at the four campus sites would increase by approximately 4,150 spaces (about 83 percent) by year 2040. The majority of the new parking spaces (3,800) would be provided at the Mission Bay campus site.

Parnassus Heights

- Upon demolition of the Laboratory of Radiobiology building, the remaining surface pad may be improved, then used for approximately 30 contractor-only spaces sometime between 2014 and 2019.
- Upon demolition of the MR 4 building, the remaining lot may be graded and improved and used for approximately 30 contractor-only spaces sometime between 2014 and 2019.
- About 20 parking spaces at the Surge surface lot would be converted from permit holder to contractor-only parking sometime between 2014 and 2019.
- Upon demolition of the Koret Vision building, the remaining surface pad may be improved, then used for approximately 30 contractor-only spaces sometime between 2031 and 2035.

Mission Bay

- The 621-space 10-level garage structure at Owens Street, south of 16th Street, would open for service to the public in February 2015, as Phase One Medical Center becomes operational.
- A new 429-space surface parking lot adjacent to the new Owens Street garage would also be built, which would also open in conjunction with the Phase One Medical Center.
- Approximately 160 existing surface parking spaces located in the North Campus would be eliminated as the existing parking lots are replaced by new buildings.
- A new parking garage would be built on Block 18B in the North Campus containing approximately 1,540 parking spaces. The ground floor of the garage would be sized to accommodate about 60 UCSF shuttle buses.
- About 500 new spaces would be provided within Blocks 33 and 34, east of Third Street.

- An expansion of the Owens Street garage would be constructed as part of the Phase Two Medical Center, sometime after 2035, to replace the 429-space Phase One surface lot that would be replaced by new hospital buildings, and to accommodate the additional expected demand. The new structure would be built to the south of the Phase One garage and is planned to be the same size and have the same capacity of the Phase One garage of 621 independently accessible spaces. However, for purposes of a conservative analysis, it is assumed that up to 1,300 spaces could be developed in Phase Two, to account for the potential for valet parking in both the existing and proposed structures.

Mount Zion

- A 185-space garage would be constructed as part of a new clinical and/or research building to be located on Scott Street, on the east side of the main block. The parking could be provided in the building, underground, or off-site.

Mission Center

- A new UCSF building would be constructed at the existing surface parking lot to the east of the existing Mission Center building. A five-story, approximately 96,000-gsf parking structure would also be built between the existing and new buildings, with up to 294 parking spaces.

TABLE 4-21: EXISTING AND FUTURE UCSF-OWNED PARKING SUPPLY BY CAMPUS SITE

UCSF Parking Facilities	Existing Spaces (2012/2013)	New Spaces Proposed by 2015	Total Spaces by 2015	New Spaces Proposed between 2015 & 2040	Total Spaces by 2040
Parnassus Heights

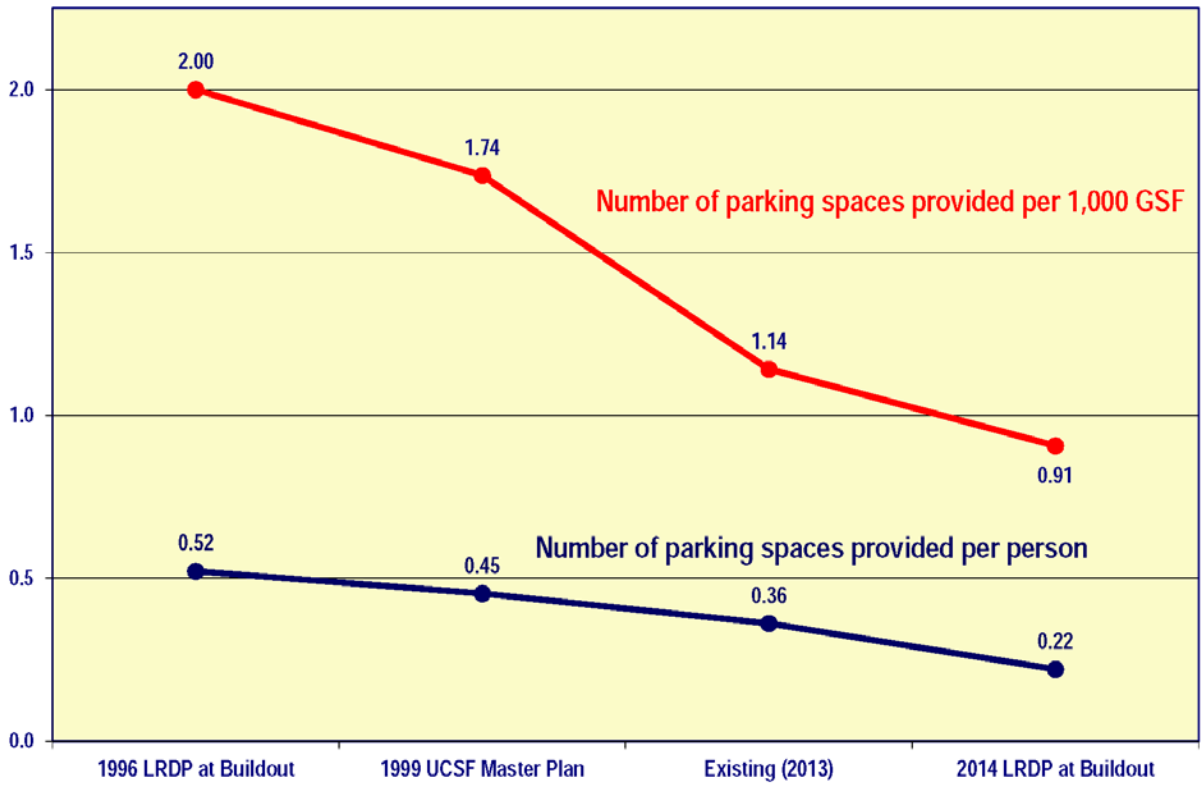
Source: UCSF, Adavant Consulting, 2014

As shown in **Table 4-21**, over 90 percent of the new parking spaces (3,800) to be provided as part of the 2014 LRDP by 2040 would be built at the Mission Bay campus site. This increase is directly related to the expected growth in staff, patients and visitors that would occur at that site. As previously described in **Table 3-1**, the weekday daily population through the LRDP horizon year/2040 at the Mission Bay campus

site would grow to approximately 22,840 people, over four times the current value. As indicated in **Table 4-21**, parking supply at the Mission Bay campus site is expected to grow at a lower rate than population, with overall future parking supply representing about 3.4 times the existing number of spaces currently provided on campus.

As shown in **Inset 4**, UCSF currently provides an average of 0.36 parking spaces per person or 1.14 parking spaces per 1,000 gross square feet of development. These values represent a reduction from previous plans such as the 1996 LRDP and the 1999 Mission Bay Campus Master Plan which called for higher parking supply ratios, based on the information about travel demand patterns that were available at the time. As shown in the figure, under the 2014 LRDP. UCSF would provide an average of 0.22 parking spaces per person or 0.91 parking spaces per 1,000 gross square feet of development, a 20 to 38 percent reduction over current values. These ratios are consistent with those presented in the Mission Bay South Design for Development plan, which calls for an average maximum parking supply ratio of approximately 1.3 spaces per 1,000 gross square feet of Commercial Industrial (including life sciences and biotechnology research) development.



Inset 4: UCSF Mission Bay Campus Site Average Parking Supply Ratios by Scenario

4.7.2 Year 2015 Parking Utilization at Mission Bay

Table 4-22 summarizes the existing and year 2015 off-street parking supply and occupancy at the UCSF parking facilities at the Mission Bay campus site.

TABLE 4-22: EXISTING AND 2015 OFF-STREET PARKING SUPPLY AND OCCUPANCY AT MISSION BAY

	Existing		LRDP Peak Parking Demand Growth (spaces) [3]	2015	
	Supply (spaces) [1]	Peak Parking Utilization [2]		Supply (spaces) [1]	Peak Parking Utilization [2]
Mission Bay	1,579	85%	1,059	2,629	91%

Notes:

1. Off-street parking spaces provided at UCSF garages and surface lots in Mission Bay.
2. Mid-morning to early afternoon, see **Table 2-18**.
3. Staff, patients and visitor demand.

Source: Adavant Consulting, 2014

As shown in **Table 4-22**, with the opening of Phase One Medical Center and the completion of the Mission Hall Building by 2015, the future parking utilization at the UCSF parking facilities would be below but close to of its maximum capacity, with a potential campus-wide surplus of about 230 spaces.

4.7.3 Year 2040 Parking Utilization

As described in the previous sections, the available on-street parking is well occupied at the four campus sites, and has therefore not been considered as a resource for the future parking utilization analysis, which has focused instead on the availability of off-street parking.

Table 4-23 summarizes the existing and future off-street parking supply and occupancy at the four major campus sites by 2040. The parking supply shown in the table represents the number of spaces managed by UCSF at each site, except for Mount Zion, where six privately owned public parking garages and surface lots nearby have also been added, as they have traditionally served the campus site's parking needs.

TABLE 4-23: EXISTING (20125/13) AND YEAR 2040 (FUTURE 2035/2040) OFF-STREET PARKING SUPPLY AND OCCUPANCY AT THE FOUR MAJOR CAMPUS SITES

Campus Site	Existing		LRDP Peak Parking Demand Growth (spaces) [3]	2040 [6]	
	Supply (spaces) [1]	Peak Parking Utilization [2]		Supply (spaces) [1]	Peak Parking Utilization [2]
Parnassus Heights	2,728	86%	225	2,818	99% [5]
Mission Bay	1,579	85%	4,471	5,379	108%
Mount Zion [4]	1,159	88%	309	1,344	99%
Mission Center	224	86%	206	294	135%
Total Four Campus Sites	**5,690**	**86%**	**5,211**	**9,835**	**104%**

Notes:

1. Off-street parking spaces provided at UCSF-owned facilities, except for the Mount Zion campus site as noted.
2. Mid-morning to early afternoon.
3. Staff, patients and visitor demand.
4. The parking supply and occupancy at the Mount Zion campus site includes approximately 700 spaces provided at six nearby public parking facilities, as shown in **Table 2-26**.
5. Reflects about 200 UCSF staff and faculty daily vehicles currently parking at the Kezar surface lot.
6. The data shown in this table reflects the future peak parking utilization for the LRDP horizon year (2035) for the Parnassus Heights, Mount Zion, and Mission Center campus sites and year 2040 for the Mission Bay campus site.

Source: Adavant Consulting, 2014

As shown in **Table 4-23** the future parking utilization at the Parnassus and Mount Zion campus sites would be at their physical capacity (99 percent utilization), while the utilization at the UCSF facilities at the Mission Bay and Mission Center campus sites would be above their maximum proposed physical capacity. The expected future parking demand (staff, patients and visitors, as applicable) at the Mission Bay and Mission Center campus sites would be approximately 430 and 100 spaces, above the future planned supply, respectively.

4.7.4 Parking Impacts

The parking demand at the Mission Bay and Mission Center campus sites by 2040 would result in a potential shortfall in parking supply of about 430 and 100 spaces, respectively. However, as part of the implementation of the 2014 LRDP or LRDP Variant at the Mission Bay campus site, UCSF would monitor parking demand at each phase of development and adjust parking supply as demand warrants. Should the demand for parking exceed on-site supply, priority for on-site parking where clinical activities occur would be given to patients, visitors and essential health care providers, and if necessary, UCSF could look to secure off-site parking to satisfy that demand. That additional parking supply could be provided on campus sites, if available, or elsewhere in the vicinity. All four campus sites are well served by the UCSF shuttle system and public transit. As the proposed 2014 LRDP projects develop, UCSF would continue to implement and improve its Travel Demand Management (TDM) program to educate faculty, staff, and students about alternative transportation and transit options in order to reduce auto usage and parking demand. Thus, the parking impacts under LRDP build-out would be ***less than significant***.

4.8 CONSTRUCTION IMPACTS

Implementation of the LRDP would occur using a coordinated, phased construction schedule that would preserve UCSF's operations during the construction period. The construction of LRDP projects will occur in phases beginning with the demolition of the Laboratory of Radiobiology at the Parnassus Heights campus site through to the construction of Phase Two Medical Center at the Mission Bay campus site.

The construction impact assessment for each campus site presented below is based on currently available information from UCSF, and professional knowledge of typical construction practices citywide. Prior to construction, as part of the construction application phase, UCSF and their construction contractor(s) would meet with the Department of Public Works ("DPW") and SFMTA staff to develop and review truck routing plans for demolition, disposal of excavated materials, materials delivery and storage, as well as staging for construction vehicles. For any work in the public right-of-way, the construction contractor would be required to meet the City of San Francisco's Regulations for Working in San Francisco Streets, (the Blue Book), including those regulations regarding sidewalk and lane closures, and would meet with SFMTA staff to determine if any special traffic permits would be required.[14] Prior to construction, the project contractor would coordinate with Muni's Street Operations and Special Events Office to coordinate construction activities and reduce any impacts to transit operations.

The sections below describe the estimated LRDP construction impacts by campus site.

4.8.1 Parnassus Heights

Construction of the LRDP projects at the Parnassus Heights campus site would occur in phases expected to begin in 2014 through the LRDP horizon year in 2035. The implementation of cushioning actions and demolition of the Laboratory of Radiobiology would begin in 2014. Much of the other demolition projects would occur between 2015 and 2017, then again between 2025 and 2034. The construction of additional housing on the Fifth Avenue and Parnassus Avenue site is expected to begin in 2017 and the construction of new housing on the Proctor site is anticipated to begin in 2031.

[14] The SFMTA Blue Book, 7th Edition, is available online through SFMTA (www.sfmta.com)

TABLE 4-24: PARNASSUS HEIGHTS PROPOSED CONSTRUCTION DATA			
Construction Project	**Construction Characteristics**		
	Gross Square Feet	**Housing Units**	**Housing Square Feet**
Projects Complete by 2020 (Construction 2015 through 2019)			
Demolish Medical Research 4 Building	12,100	--	--
Renovate/Reuse UC Hall- Phase One	--	105	74,000
Demolish Laboratory of Radiobiology	18,200	--	--
Build Housing on Fifth and Parnassus Site	--	45	48,400
Demolish the Woods Building	3,900	--	--
Demolish the Surge Building	11,400	--	--
Parnassus Avenue Streetscape Improvements - Phase One	--	--	--
Projects Complete by 2025 (Construction 2020 through 2024)			
Parnassus Avenue Streetscape Improvements - Phase Two	--	--	--
Projects Complete by 2031 (Construction 2025 through 2030)			
New Hospital Addition	308,000	--	--
Demolish the LPPI Building and Three Support Buildings	107,200	--	--
Projects Complete by 2036 (Construction 2031 through 2035)			
Demolish the Proctor Building	9,900	--	--
Build Housing on Proctor Site	--	32	30,400
Renovate Moffitt Hospital	--	--	--
Demolish the Koret Vision Research Building	--	--	43,100
Convert Millberry Union Towers to Housing	--	83	46,600
Renovate/Reuse UC Hall Phase Two	--	64	68,300
Demolish the Environmental Health and Safety Building	6,200	--	--

Source: UCSF, 2014

As discussed in Chapter 3 most construction projects will contribute 10 or less truck trips per workday. In some cases, a project will contribute 10 to 20 daily truck trips on average.

Some construction projects will result in a parking loss due to construction staging and/or restrictions and limit pedestrian access through the duration of construction; however project construction is temporary and will not result in a long term impact. The UC Hall renovation and construction of housing on Fifth and Parnassus avenues will require disrupting connectivity on the south side of Parnassus Avenue; therefore pedestrians will be directed to the north side of Parnassus Avenue to avoid conflicts with construction

work. The rest of the LRDP projects that require construction activities at the Parnassus Heights campus site will take place within the campus site and should not disrupt connectivity along Parnassus Avenue or other campus site perimeter streets.

It is anticipated that the addition of the worker-related vehicle- or transit-trips would not substantially affect transportation conditions, as impacts on local intersections or the transit network would be temporary in nature. Construction workers who drive to the construction sites and potential temporary parking restrictions along building frontages on Parnassus Avenue would cause a temporary increase in parking demand. Construction workers would park within nearby off-street parking facilities that currently have availability during the day (e.g., Kezar Stadium Parking Lot) or in satellite parking lots in which UCSF would temporary parking spaces. Additionally, the demolition of buildings accessed via Koret Way will increase the amount of contractor spaces at the campus site, as the building pads could be used as surface parking spaces.

UCSF would coordinate with various City departments such as SFMTA and DPW through the Transportation Advisory Staff Committee (TASC) to develop coordinated plans that would address construction-related vehicle routing and pedestrian movements adjacent to the construction area for the duration of construction. While construction of individual LRDP elements would by definition be temporary, the LRDP would require consideration of the effect of construction activities on existing and future transportation facilities (e.g. sidewalks, Muni service and facilities, roadways, bicycle routes, etc.) and existing and future adjacent land uses. Therefore, due to the need for on-going coordination and monitoring, the LRDP construction-related transportation impacts would be considered ***significant***.

Mitigation Measure TR-1a: Construction Coordination and Monitoring Measures

Traffic Control Plan for Construction – In order to reduce potential conflicts between construction activities and pedestrians, transit and autos during construction activities at the Parnassus Heights campus site, UCSF shall require construction contractor(s) to prepare a traffic control plan for major phases of project construction (e.g. demolition, construction, or renovation of individual buildings). UCSF and their construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations (e.g. Parnassus Avenue) and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction of the LRDP projects. For any work within the public right-of-way, the contractor would be required to comply with the City of San Francisco's Regulations for Working in San Francisco Streets, which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic.

In the event that the construction timeframes of the major phases and other development projects adjacent to the Parnassus Heights campus site overlap, UCSF should coordinate with City Agencies through the TASC and the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation impacts. UCSF, in conjunction with the adjacent developer, shall propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as staggering start and end times, coordinated material drop offs, collective worker parking and transit to job site and other measures.

Reduce SOV Mode Share for Construction Workers – In order to minimize parking demand and vehicle trips associated with construction workers, UCSF shall require the construction contractor to include in the Traffic Control Plan for Construction methods to encourage walking, bicycling, carpooling, and transit access to the campus sites by construction workers in the coordinated plan.

Project Construction Updates for Adjacent Residents and Businesses – In order to minimize construction impacts on access for nearby residences, institutions, and businesses, UCSF shall provide nearby residences and adjacent businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and lane closures via a newsletter and/or website.

Mitigation Measure TR-1a would reduce the LRDP's ***significant impacts*** related to construction-related transportation impacts to ***less-than-significant*** levels.

4.8.2 Mission Bay

Construction of the LRDP projects would occur in phases expected to begin in 2016 with development of Block 15 and the Surcharging Project on Block 14 and end with the construction of Phase Two Medical Center at Mission Bay beyond 2035.

TABLE 4-25: MISSION BAY PROPOSED CONSTRUCTION DATA

Construction Project	Construction Characteristics		
	Gross Square Feet	Housing Units	Housing Square Feet
Projects Complete in 2015			
Mission Hall (Block 25A)	264,800	--	--
Phase One Medical Center	869,000	--	--
Projects Complete by 2020 (Construction 2015 through 2019)			
Block 15 housing	418,200	523	398,700
Block 33	275,000	--	--
Block 33/34 Parking Garage	167,500	--	--
Cancer Outpatient	124,500	--	--
Surcharging - Blocks 15 & 18	42,700	--	--
Projects Complete by 2025 (Construction 2020 through 2024)			
Block 23A	232,200	--	--
Block 34	225,000	--	--
Block 18 Parking Garage-Phase One	271,000	--	--
Projects Complete by 2031 (Construction 2025 through 2030)			
Block 16	289,000	--	--
Block 25B	323,000	--	--
Projects Complete by 2036 (Construction 2031 through 2035)			
Block 18	193,000	--	--
Block 18 Parking Garage-Phase Two	271,000	--	--
Phase Two Medical Center	793,500	--	--

Source: UCSF, 2014

As discussed in Chapter 3, most construction projects will generate no more than 40 daily truck trips on average. The peak construction trip generation will be approximately 90 truck trips on average per workday during the construction of Phase Two Medical Center at Mission Bay. Most truck trips will enter/exit the campus site using Mission Bay Boulevard North, Nelson Rising Lane, Owens Street, and 16th Street, Fourth Street, and generally, construction projects will not result in a parking, vehicular (including transit), or pedestrian impact as locations are internal to the campus site and alternative connectivity routes will be provided.

It is anticipated that the addition of the worker-related vehicle- or transit-trips would not substantially affect transportation conditions, as impacts on local intersections or the transit network would be temporary in nature. Construction workers who drive to the site and potential temporary parking restrictions along frontages where construction and/or staging are occurring would cause a temporary increase in parking demand. Construction workers would park within nearby off-street parking facilities that currently have availability during the day (e.g., Third Street Garage, Owens Street Garage) or in temporary surface parking lots within undeveloped blocks.

It is anticipated that construction activity of the LRDP projects may overlap with the construction activity of other proposed and/or planned projects in the area, notably the proposed Golden State Warriors basketball arena north of 16th Street and east of Third Street (construction estimated to begin in 2016 for a 2018-2019 season opening) and the proposed mixed-used residential and office development at Seawall Lot 337, north of Mission Rock Street and east of Third Street (construction estimated to begin in 2016 and continue in phases through 2021).

The construction activities associated with these nearby projects would affect access, traffic operations and pedestrian movements on Third Street. It is anticipated that the construction manager for each project would be required to work with the various departments of the City to develop a detailed and coordinated plan that would address construction vehicle routing, traffic control and pedestrian movement adjacent to the construction area for the duration of the overlap in construction activity.

UCSF would coordinate with various City departments such as SFMTA and DPW through the TASC to develop coordinated plans that would address construction-related vehicle routing and pedestrian movements adjacent to the construction area for the duration of construction. While construction of individual LRDP elements would by definition be temporary, the LRDP would require consideration of the effect of construction activities on existing and future transportation facilities (e.g. sidewalks, Muni service and facilities, roadways, bicycle routes, etc.) and existing and future adjacent land uses. Therefore, due to the need for on-going coordination and monitoring, the LRDP construction-related transportation impacts would be considered ***significant***.

Mitigation Measure TR-1b: Construction Coordination and Monitoring Measures

Traffic Control Plan for Construction – In order to reduce potential conflicts between construction activities and pedestrians, transit and autos during construction activities at the Mission Bay campus site, UCSF shall require construction contractor(s) to prepare a traffic control plan for major phases of project construction (e.g. demolition, construction, or renovation of individual buildings). UCSF and their construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction of the LRDP projects. For any work within the public right-of-way, the contractor would be required to comply with the City of San Francisco's Regulations for Working in San Francisco Streets, which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic.

In the event that the construction timeframes of the major phases and other development projects adjacent to the Mission Bay campus site overlap, such as the adjacent proposed development at Mission Bay Blocks 29-32, UCSF should coordinate with City Agencies through

the TASC and the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation impacts. UCSF, in conjunction with the adjacent developer, shall propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as staggering start and end times, coordinated material drop offs, collective worker parking and transit to job site and other measures.

Reduce SOV Mode Share for Construction Workers – In order to minimize parking demand and vehicle trips associated with construction workers, UCSF shall require the construction contractor to include in the Traffic Control Plan for Construction methods to encourage walking, bicycling, carpooling, and transit access to the campus sites by construction workers in the coordinated plan.

Project Construction Updates for Adjacent Residents and Businesses – In order to minimize construction impacts on access for nearby residences, institutions, and businesses, UCSF shall provide nearby residences and adjacent businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and lane closures via a newsletter and/or website.

Mitigation Measure TR-1b would reduce the LRDP's ***significant impacts*** related to construction-related transportation impacts to ***less-than-significant*** levels.

4.8.2.1 LRDP Variant

Construction conditions associated with the LRDP Variant would be similar to those described above for the 2014 LRDP. UCSF would coordinate with various City departments such as SFMTA and DPW through the TASC to develop coordinated plans that would address construction-related vehicle routing and pedestrian movements adjacent to the construction area for the duration of construction. While construction of individual LRDP Variant elements would by definition be temporary, the LRDP Variant would require consideration of the effect of construction activities on existing and future transportation facilities (e.g. sidewalks, Muni service and facilities, roadways, bicycle routes, etc.) and existing and future adjacent land uses. Therefore, due to the need for on-going coordination and monitoring, the LRDP Variant construction-related transportation impacts would be considered ***significant***.

Mitigation Measure TR-1c: Construction Coordination and Monitoring Measures

Traffic Control Plan for Construction – In order to reduce potential conflicts between construction activities and pedestrians, transit and autos during construction activities at the Mission Bay campus site, UCSF shall require construction contractor(s) to prepare a traffic control plan for major phases of project construction (e.g. demolition, construction, or renovation of individual buildings). UCSF and their construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction of the LRDP projects. For any work within the public right-of-way, the contractor would be required to comply with the City of San Francisco's Regulations for Working in San Francisco Streets, which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic.

In the event that the construction timeframes of the major phases and other development projects adjacent to the Mission Bay campus site overlap, such as the adjacent proposed development at Mission Bay Blocks 29-32, UCSF should coordinate with City Agencies through the TASC and the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation impacts. UCSF, in conjunction with the adjacent developer, shall propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as staggering start and end times, coordinated material drop offs, collective worker parking and transit to job site and other measures.

Reduce SOV Mode Share for Construction Workers – In order to minimize parking demand and vehicle trips associated with construction workers, UCSF shall require the construction contractor to include in the Traffic Control Plan for Construction methods to encourage walking, bicycling, carpooling, and transit access to the campus sites by construction workers in the coordinated plan.

Project Construction Updates for Adjacent Residents and Businesses – In order to minimize construction impacts on access for nearby residences, institutions, and businesses, UCSF shall provide nearby residences and adjacent businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and lane closures via a newsletter and/or website.

Mitigation Measure TR-1c would reduce the LRDP Variant's ***significant impacts*** related to construction-related transportation impacts to ***less-than-significant*** levels.

4.8.3 Mount Zion

Construction of the LRDP projects would occur in phases expected to begin in 2015 with the renovation and reuse of the existing hospital.

TABLE 4-26: MOUNT ZION PROPOSED CONSTRUCTION DATA

Construction Project	Construction Characteristics		
	Gross Square Feet	Housing Units	Housing Square Feet
Projects Complete by 2020 (Construction 2015 through 2019)			
Main Hospital - Renovation	--	--	--
Demo 3 buildings	85,000	--	--
Construct additional parking	78,000		
New office/research building	257,000	--	--
Demolish or retrofit the "N" building (2255 Post Street)	7,500		

Source: UCSF, 2014

As discussed in Chapter 3, construction projects will generate no more than 30 daily truck trips on average. Most truck trips will enter/exit the campus site using Sutter Street, Post Street, and Scott Street.

Some construction projects will result in a parking loss due to construction staging and/or restrictions and limit pedestrian access through the duration of construction; however project construction is temporary and will not result in a long term impact. The demolition of the Hellman, Harold Brunn Institute, and the Dialysis Center buildings, construction of a new medical office and/or research building and additional parking, and renovation/reuse of the existing hospital on the block north of Post Street and west of Scott Street require disrupting connectivity on the south side of Sutter Street, the north side of Post Street, and/or the west side of Scott Street; therefore pedestrians will be directed to the north side of Sutter Street, the south side of Post Street, and/or the east side of Scott Street to avoid conflicts with construction work. Construction work that affects the frontage of Post Street may require that a portion of the existing Class II bicycle lane between Scott and Divisadero streets be converted temporarily to a Class III bicycle route for the duration of construction activities in the vicinity.

It is anticipated that the addition of the worker-related vehicle- or transit-trips would not substantially affect transportation conditions, as impacts on local intersections or the transit network would be temporary in nature. Construction workers who drive to the construction sites and potential temporary parking restrictions along building frontages on Sutter Street, Post Street, and Scott Street would cause a temporary increase in parking demand. Construction workers would park within nearby off-street parking facilities that currently have availability during the day (e.g., 2300 Sutter Street Garage, 2186 and 2120 Geary Boulevard surface lots).

It is anticipated that construction activity of the LRDP projects may overlap with the construction activity of other proposed and/or planned projects in the area, notably the proposed Geary Boulevard BRT project, as described in Chapter Two. The construction activity of the LRDP projects and the Geary

Boulevard BRT project within the vicinity of the campus site should be coordinated, specifically with regard to construction worker parking and staging, although it is unlikely that they will have an effect on each other due to the distance between the campus site and Geary Boulevard, and to the comparative lack of disruption to the transportation network infrastructure required by the BRT project when compared to other major transportation projects.

UCSF would coordinate with various City departments such as SFMTA and DPW through the TASC to develop coordinated plans that would address construction-related vehicle routing and pedestrian movements adjacent to the construction area for the duration of construction. While construction of individual LRDP elements would by definition be temporary, the LRDP would require consideration of the effect of construction activities on existing and future transportation facilities (e.g. sidewalks, Muni service and facilities, roadways, bicycle routes, etc.) and existing and future adjacent land uses. Therefore, due to the need for on-going coordination and monitoring, the LRDP construction-related transportation impacts would be considered ***significant***.

Mitigation Measure TR-1d: Construction Coordination and Monitoring Measures

Traffic Control Plan for Construction – In order to reduce potential conflicts between construction activities and pedestrians, transit and autos during construction activities at the Mount Zion campus site, UCSF shall require construction contractor(s) to prepare a traffic control plan for major phases of project construction (e.g. demolition, construction, or renovation of individual buildings). UCSF and their construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations (e.g. Sutter Street), and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction of the LRDP projects. For any work within the public right-of-way, the contractor would be required to comply with the City of San Francisco's Regulations for Working in San Francisco Streets, which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic.

In the event that the construction timeframes of the major phases and other development projects adjacent to the Mount Zion campus site overlap, UCSF should coordinate with City Agencies through the TASC and the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation impacts. UCSF, in conjunction with the adjacent developer, shall propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as staggering start and end times, coordinated material drop offs, collective worker parking and transit to job site and other measures.

Reduce SOV Mode Share for Construction Workers – In order to minimize parking demand and vehicle trips associated with construction workers, UCSF shall require the construction contractor to include in the Traffic Control Plan for Construction methods to encourage walking, bicycling, carpooling, and transit access to the campus sites by construction workers in the coordinated plan.

Project Construction Updates for Adjacent Residents and Businesses – In order to minimize construction impacts on access for nearby residences, institutions, and businesses, UCSF shall provide nearby residences and adjacent businesses with regularly-updated information regarding

project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and lane closures via a newsletter and/or website.

Mitigation Measure TR-1d would reduce the LRDP's ***significant impacts*** related to construction-related transportation impacts to ***less-than-significant*** levels.

4.8.4 Mission Center

Construction of the LRDP projects would occur in phases expected to begin in 2022 with the construction of a new parking garage in what is currently surface parking on the eastern portion of the campus site block.

TABLE 4-27: MISSION CENTER PROPOSED CONSTRUCTION DATA

Construction Project	Construction Characteristics		
	Gross Square Feet	Housing Units	Housing Square Feet
Projects Complete by 2025 (Construction 2020 through 2024)			
New Mission Center Building	100,000	--	--
Mission Center Parking Garage	96,000	--	--

Source: UCSF, 2014

As discussed in Chapter 3, construction projects will generate no more than 15 daily truck trips on average. Most truck trips will enter/exit the campus site using 15th Street and/or Harrison Street and generally, construction projects will not result in a parking, vehicular (including transit), or pedestrian impact as construction and staging will occur on the campus site. Additionally, it is not expected that access to or operations of the SF Muni Maintenance Yard (H. Welton Flynn Motor Coach Division) directly south of the campus site will be affected as its main vehicle access point is on Harrison Street, facing away from the campus site. The construction of the new parking garage would result in the temporary displacement of approximately 224 existing employee parking spaces. UCSF will investigate temporary additional off-site parking supply in advance of construction of the new parking garage.

It is anticipated that the addition of the worker-related vehicle- or transit-trips would not substantially affect transportation conditions, as impacts on local intersections or the transit network would be temporary in nature. Construction workers who drive to the construction sites and potential temporary parking restrictions along frontages where construction and/or staging are occurring would cause a temporary increase in parking demand. Construction workers would park within nearby off-street parking facilities that currently have availability during the day (e.g., 3111 17th Street surface lot) or in satellite parking lots in which UCSF would provide temporary parking spaces.

UCSF would coordinate with various City departments such as SFMTA and DPW through the TASC to develop coordinated plans that would address construction-related vehicle routing and pedestrian movements adjacent to the construction area for the duration of construction. While construction of individual LRDP elements would by definition be temporary, the LRDP would require consideration of the effect of construction activities on existing and future transportation facilities (e.g. sidewalks, Muni service and facilities, roadways, bicycle routes, etc.) and existing and future adjacent land uses. Therefore, due to

the need for on-going coordination and monitoring, the LRDP construction-related transportation impacts would be considered ***significant***.

Mitigation Measure TR-1e: Construction Coordination and Monitoring Measures

Traffic Control Plan for Construction – In order to reduce potential conflicts between construction activities and pedestrians, transit and autos during construction activities at the Mission Center campus site, UCSF shall require construction contractor(s) to prepare a traffic control plan for major phases of project construction (e.g. demolition, construction, or renovation of individual buildings). UCSF and their construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations, and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction of the LRDP projects. For any work within the public right-of-way, the contractor would be required to comply with the City of San Francisco's Regulations for Working in San Francisco Streets, which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic.

In the event that the construction timeframes of the major phases and other development projects adjacent to the Mission Center campus site overlap, UCSF should coordinate with City Agencies through the TASC and the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation impacts. UCSF, in conjunction with the adjacent developer, shall propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as staggering start and end times, coordinated material drop offs, collective worker parking and transit to job site and other measures.

Reduce SOV Mode Share for Construction Workers – In order to minimize parking demand and vehicle trips associated with construction workers, UCSF shall require the construction contractor to include in the Traffic Control Plan for Construction methods to encourage walking, bicycling, carpooling, and transit access to the campus sites by construction workers in the coordinated plan.

Project Construction Updates for Adjacent Residents and Businesses – In order to minimize construction impacts on access for nearby residences, institutions, and businesses, UCSF shall provide nearby residences and adjacent businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and lane closures via a newsletter and/or website.

Mitigation Measure TR-1e would reduce the LRDP's ***significant impacts*** related to construction-related transportation impacts to ***less-than-significant*** levels.

5 CUMULATIVE CONDITIONS

This chapter presents the transportation impact analysis of the LRDP under Year 2015 conditions for the Mission Bay Campus Site and Year 2040 conditions for all four study campus sites. Year 2015 conditions describe the anticipated operating conditions of the transportation network once Phase One Medical Center at Mission Bay and Mission Hall are operational. Year 2040 conditions assess the long-term impacts of the LRDP, whose horizon year is 2035, in combination with projected development within San Francisco and the rest of the Bay Area, as well as implementation of planned transportation infrastructure projects.

The geographic context for the analysis of Year 2040 transportation impacts includes the local roadway and transit network in the vicinity of four UCSF campus sites included in this study. The discussion of 2040 transportation impacts assesses the degree to which the LRDP would affect the transportation network in conjunction with other reasonably foreseeable projects.

5.1 FORESEEABLE NEARBY DEVELOPMENT PROJECTS AND TRANSPORTATION NETWORK CHANGES

5.1.1 Approach

Year 2040 conditions traffic volumes were estimated based on cumulative development and growth identified by the SFCTA SF-CHAMP travel demand model, using model output that represents Existing conditions and model output for Year 2040 conditions. The Year 2040 traffic volumes include the additional vehicle-trips generated by the LRDP. Year 2015 traffic volumes were estimated based on the addition of traffic generated by foreseeable nearby development projects to the existing transportation network in addition to Phase One Medical Center at Mission Bay and Mission Hall traffic volumes. The foreseeable nearby development projects and transportation network changes included in each scenario are described below.

5.1.2 Year 2015 Conditions

The following development projects and infrastructure projects are included in the Year 2015 conditions Mission Bay campus site analysis.

5.1.2.1 Foreseeable Nearby Development Projects

Reasonably foreseeable development projects that were considered in the Year 2015 conditions analysis include planned development projects in the Eastern Neighborhoods and ongoing construction and new planned development in the Mission Bay Plan Areas, as incorporated into the SF-CHAMP travel demand model. It also includes the opening of the Phase One Medical Center and Mission Hall at the Mission Bay campus site.

5.1.2.2 Transportation Network Changes

The Mission Bay Redevelopment Plan calls for changes to the existing roadway network in the study area which would be in place by 2015. These changes are described under Mission Bay Existing Plus LRDP conditions, Section 4.2.2.

5.1.3 Year 2040 Conditions

The Year 2040 traffic impact analysis takes into consideration the following foreseeable development projects and transportation improvements.

5.1.3.1 Foreseeable Development Projects

Examples of reasonably foreseeable development projects that were considered in the Year 2040 analysis include the following:

- Candlestick Point-Hunters Point Shipyard Development Plan (Approved – Case No. 2007.0946E)
- Treasure Island and Yerba Buena Island Redevelopment Plan (Approved – Case No. 2007.0903E)
- California Pacific Medical Center Long Range Development Plan (Approved – Case No. 2005.0555E)
- Mission Bay Redevelopment Plan (Approved – Case No. 96.771E)
- Development associated with neighborhoods plans including the Eastern Neighborhoods Plan (Approved – Case No. 2004.0160E), Western SoMa Plan (Approved – Case No. 2008.0877E), Market-Octavia Plan (Approved – Case No. 2003.0347E), and Rincon Hill Plan (Approved – Case No. 2000.1081E)
- Central SoMa Plan (Case No. 2011.1356E)
- Seawall Lot 337 and Pier 48 Mixed-Use Project (Pending approval – Case No. 2013.0208E)
- Pier 70 Mixed-Use Project (Pending approval – Case No. Not yet assigned)

In addition to the above projects, the Golden State Warriors Project at Mission Bay Blocks 29-32 is in the early stages of environmental review. The details for this project were not available at the time of this study and are therefore discussed qualitatively in the Year 2040 traffic analysis section found in Section 5.2.3.

5.1.3.2 Transportation Network Changes

In addition to the transportation network changes described for Year 2015 conditions, the following transportation network changes are also incorporated into the Year 2040 analysis:

- **Transit Effectiveness Project (TEP**) (Approved) – The TEP is aimed at improving reliability, reducing travel times, providing more frequent service, and updating Muni bus routes and rail lines to better match current travel patterns. TEP recommendations include new routes and route realignments, more service on busy routes, and elimination or consolidation of certain routes or route segments with low ridership. The TEP recommendations were unanimously endorsed by the

SFMTA Board of Directors in October 2008, and the EIR was certified by the San Francisco Planning Comission in March 2014. The TEP Implementation Strategy anticipates that many of the improvements would be implemented sometime between Fiscal Year 2014 and Fiscal Year 2019, subject to funding sources and resource availability. A description of the TEP improvements that relate to each campus site are included in Chapter 2.

- **San Francisco Bicycle Plan** (Approved) – The San Francisco Bicycle Plan aims to expand the City's bicycle network through the addition of 34 miles of Class II bicycle lanes, 75 miles of on-street Class III bicycle routes, improved bicycle parking, and a variety of programs to improve biycle access and safety. A desccription of the improvements that relate to each campus site are included in Chapter 2.

  Van Ness BRT Project (Approved) – Similar to the Geary BRT, this project proposes to increase bus service frequency by giving buses a dedicated travel lane and create high-quality bus stations along Van Ness Avenue between Mission Street and Lombard Street. The SFCTA and the SFMTA Boards approved a Locally Preferred Alternative for the Van Ness BRT project in May and June 2012. The Locally Preferred Alternative includes dedicated center-running bus lanes separated from traffic from Mission to Lombard Streets, which will be used by Muni Routes 49 and 47, and by Golden Gate Transit. This configuration will eliminate most left turns, include transit signal priority optimization to reduce travel times, and provide new pedestrian and streetscape improvements throughout the corridor. The Federal Transit Administration issued a Record of Decision in December 2013 determining that environmental review requirements have been met. BRT construction is expected to begin as early as 2015 with BRT service beginning on the corridor in 2018.

- **Central Subway Project** (Approved) - The Central Subway Project is the second phase of the Third Street light rail line (i.e., T Third), which opened in 2007. Construction of the underground segment from Bryant to Clay Street is currently underway, and the Central Subway will extend the T Third line northward from its current terminus at Fourth and King streets to a surface station south of Bryant Street and go underground at a portal under I-80. From there it will continue north to stations at Moscone Center, Union Square where it will provide passenger connections to the Powell Street Station and BART— and in Chinatown, where the line will terminate at Stockton and Clay streets. Construction of the Central Subway is scheduled to be completed in 2017, and revenue service is scheduled for 2019. This project would improve transit service between the Mission Bay campus site and Downtown.

- **Transit Center District Plan** (Approved) **-** Adopted in summer 2012, the Transit Center District Plan (TCDP) builds on the City's 1985 Downtown Plan to create new land use, urban form, building design, and public realm improvements in and around the new Transbay Transit Center that is currently under construction. The TCDP includes changes to the transportation network, including conversions of one-way streets to two-way traffic (i.e., Howard and Folsom streets), reductions in travel lanes, provision of new transit-only lanes, sidewalk widening, bulb-out installations, creation of new multi-use paths, and other improvements.

- **Geary BRT Project** (Pending Approval) – This project proposes to increase bus service frequency by giving buses a dedicated travel lane and create high-quality bus stations along Geary

Boulevard from Downtown to the Outer Richmond. The staff-recommended alternative prepared in January 2014 includes side-running bus lanes seperated from traffic from Gough Street to Palm Street in the Richmond District and center-running bus lanes from Palm Street to 27th Avenue. This configuration, along with elimination of most left turns, transit signal priority and traffic signal optimization will help reduce travel time on the corridor, and new pedestrian and streetscape improvements will be implemented throughout the corridor. The Geary Boulevard BRT is slated to be completed by 2018. This project would improve transit service to the Mount Zion Campus Site while reducing vehicle traffic lanes adjacent to the Campus Site from three lanes in each direction to two lanes in each direction.**Caltrain Electrification Program** (Pending Approval) - Caltrain will be implementing a Modernization Program that will electrify the railway to provide upgraded performance and allow more efficient operations and a higher capacity. The Program is scheduled to be complete by 2019. Currently Caltrain crosses 16th Street at grade at the intersection of 16th Street/Seventh/Mississippi streets. There are currently ten trains per hour during peak periods and the Modernization Program will allow the number of trains to increase to 12 trains per hour. Additionally, Caltrain is anticipating a "blended system" which will see California High Speed Rail trains running alongside Caltrain on the same tracks. However, the future of the High Speed Rail system is currently unknown due to legal and funding challenges. If the blended system is built, it may require a grade separation at 16th/Seventh/Mississippi Street. Electrification of Caltrain (and the associated improved travel times and frequencies) as well as the introduction of High Speed Rail may improve transit access for the UCSF Mission Bay Campus Site.

- **Central SoMa Plan** (Pending Approval) – The San Francisco Planning Department is in the process of developing an integrated community vision for the southern portion of the Central Subway rail corridor, in an area located generally between Townsend and Market streets along Fourth Street, between Second and Sixth streets. The plan's goal is to integrate transportation improvements for pedestrians, bicycles, and transit to intesified land uses in the corridor.
- **Second Street Improvement Project** (Pending Approval) – The San Francisco DPW, SFMTA, and the Planning Department have been working with community members on design improvements on Second Street between Market and King streets. The preferred concept would reduce the number of travel lanes from two to one travel lane in each direction, limit general parking, and relocate some commercial loading spaces and passenger loading/unloading zones.

5.2 YEAR 2040 TRAFFIC IMPACTS

This section presents the traffic analysis for Year 2040 conditions for each of the four campus sites. Year 2015 traffic conditions are presented for the Mission Bay campus site only. Consistent with the significance criteria presented in Section 4.1, the LRDP was determined to have a significant impact at an intersection if LRDP-generated trips would contribute considerably to the deterioration of intersection conditions (LOS E or F) under future year conditions.

5.2.1 Parnassus Heights

The weekday AM and PM peak hour Year 2040 traffic volumes and travel lane configurations at the study intersections are presented on **Figures 5-1A** and **5-1B. Table 5-1** presents the Existing and Year 2040 Plus LRDP intersection operating conditions for the weekday AM and PM peak hours. Under Year 2040 Plus LRDP conditions, 8 of the 23 study intersections are projected to operate at LOS E or LOS F conditions (as compared to 5 of the 23 study intersections operating at LOS E or LOS F under Existing conditions). The LRDP's contributions to the 2040 traffic volumes at the critical movements operating poorly (i.e., at LOS E or LOS F) for the 8 intersections operating at LOS E or LOS F under Year 2040 conditions were calculated to determine whether the LRDP's contributions to the LOS E or LOS F operating conditions under Year 2040 conditions would be considered significant.

TABLE 5-1: PEAK HOUR INTERSECTION LEVEL OF SERVICE COMPARISON - PARNASSUS HEIGHTS

Intersection	Traffic Control[1]	Peak Hour	Existing		Year 2040 Plus LRDP

Notes:

1. AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
2. Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersection, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach.
3. For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
4. **Bold** indicates LOS E or F operations.

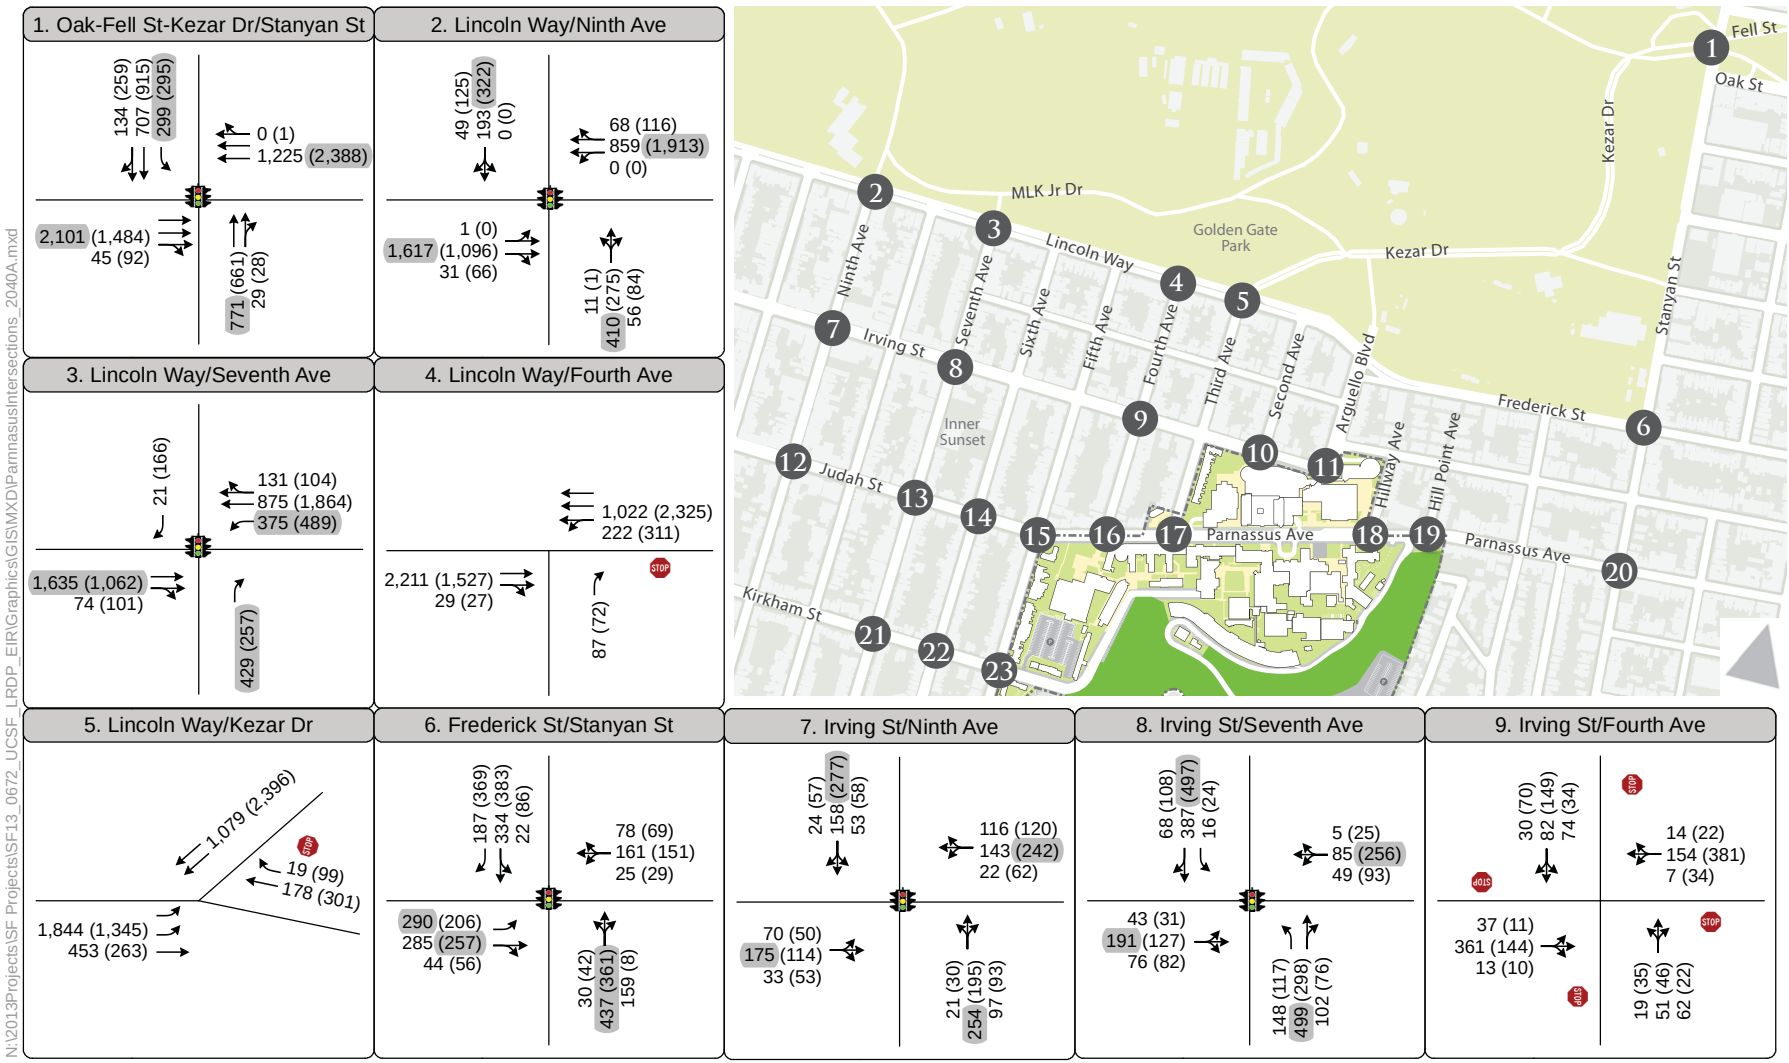

Figure 5-1A

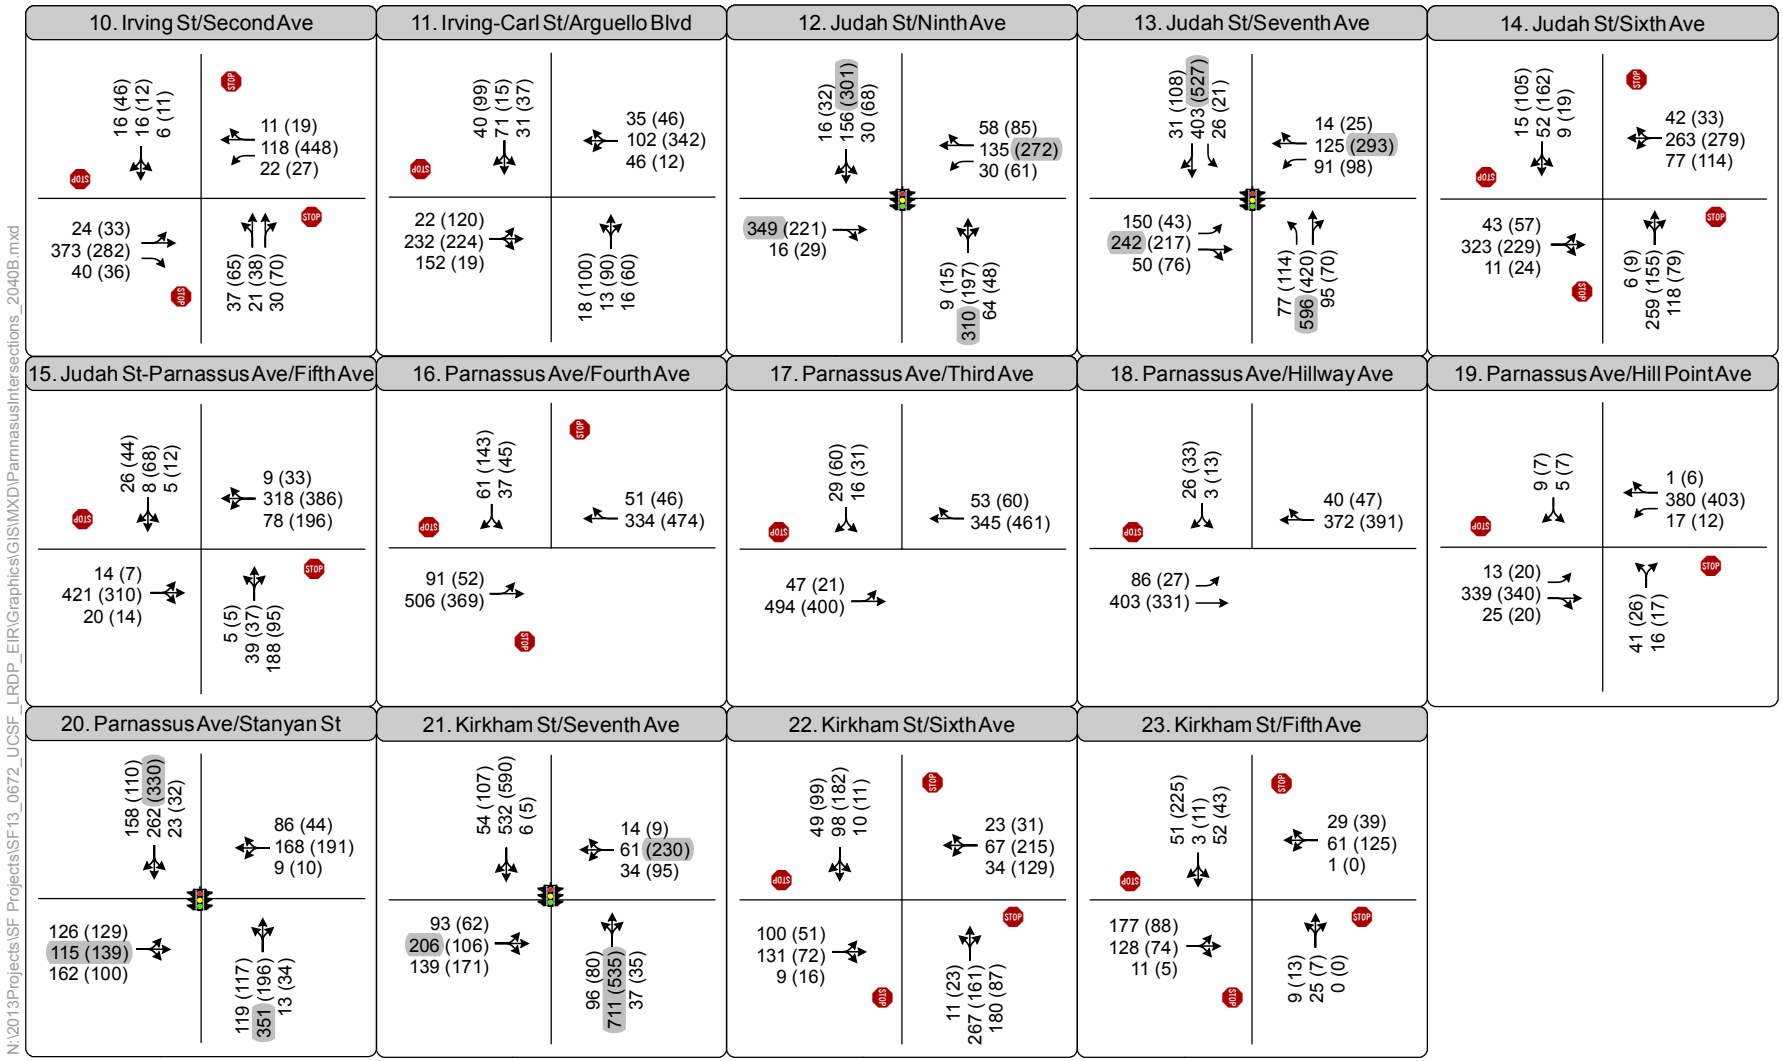
Cumulative (2040) Intersection Lane Configurations, Traffic Control, and Volumes-Parnassus Heights



N:\2013Projects\SF Projects\SF13_0672_UCSF_LRDP_EIR\Graphics\GIS\MXD\ParnassusIntersections_2040B.mxd

Figure 5-1B

Cumulative (2040) Intersection Lane Configurations, Traffic Control, and Volumes- Parnassus Heights

The Oak Street – Fell Street – Kezar Drive/Stanyan Street (Intersection #1) signalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions. The critical southbound left turn movement operates at LOS F during the PM peak. The LRDP would add zero vehicle trips to the critical southbound left turn movement, which represents no increase from Year 2040 conditions. While this movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – the westbound through – is expected to operate at LOS F and the LRDP would add six vehicle trips, which represents less than one percent increase from Year 2040 conditions. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Lincoln Way/Ninth Avenue (Intersection #2) signalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions. The critical southbound through movement operates at LOS F during the PM peak. The LRDP would add three vehicle trips to this critical movement, which represents a one percent increase from Year 2040 conditions. The other critical movement at the intersection – the westbound through – is expected to operate at LOS F and the LRDP would add nine vehicle trips, which represents less than one percent increase from Existing conditions. While these movements are expected to operate unacceptably under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Lincoln Way/Fourth Avenue (Intersection #4) unsignalized intersection operates at LOS F in the AM peak hour under Year 2040 Plus LRDP conditions. The westbound left turn movement operates at LOS F during the AM peak. The LRDP would add three vehicle trips to this critical movement, which represents a one percent increase from Year 2040 conditions. While the westbound left turn is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. In addition, the increase in traffic does not warrant a signal according to the Caltrans signal warrant for unsignalized intersections in urban areas (Warrant 3). Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Lincoln Way/Fourth Avenue (Intersection #4) unsignalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions. The westbound left turn movement operates at LOS E during the PM peak. The LRDP would add three vehicle trips to this critical movement, which represents a one percent increase from Year 2040 conditions. While the westbound left turn is expected to operate at LOS E under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. In addition, the increase in traffic does not warrant a signal according to the Caltrans signal warrant for unsignalized intersections in urban areas (Warrant 3). Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Irving Street/Second Avenue (Intersection #10) unsignalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions. The westbound shared through/right turn movement operates at LOS E during the PM peak. The LRDP would add eight vehicle trips to this movement, which represents a two percent increase from Year 2040 conditions. While the westbound shared through/right turn movement is expected to operate at LOS E under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. In addition, the increase in traffic does not warrant a signal according to the Caltrans signal warrant for unsignalized intersections in urban areas (Warrant 3). Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Irving Street/Arguello Boulevard (Intersection #11) unsignalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions. The northbound approach operates at LOS F during the PM peak. The LRDP would add a total of 17 vehicle trips to this movement, which represents a seven percent increase from Year 2040 conditions. Since the northbound approach is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would be significantly considerable. However, the increase in traffic does not warrant a signal according to the Caltrans signal warrant for unsignalized intersections in urban areas (Warrant 3). Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Judah Street-Parnassus Avenue/Fifth Avenue (Intersection #15) unsignalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions. The northbound approach operates at LOS F during the PM peak. The LRDP would add a total of two vehicle trips to this approach, which represents a one percent increase from Year 2040 conditions. While the northbound approach is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. In addition, the increase in traffic does not warrant a signal according to the Caltrans signal warrant for unsignalized intersections in urban areas (Warrant 3). Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Parnassus Avenue/Stanyan Street (Intersection #20) signalized intersection operates at LOS E in the AM peak hour under Year 2040 Plus LRDP conditions. The critical northbound through movement operates at LOS F during the PM peak. The LRDP would add three vehicle trips to the critical northbound through movement, which represents a one percent increase from Year 2040 conditions. While this movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – the eastbound through – is expected to operate at LOS F and the LRDP would add no vehicle trips. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Kirkham Street/Seventh Avenue (Intersection #21) signalized intersection operates at LOS F in the AM peak hour under Year 2040 Plus LRDP conditions. The critical northbound through movement operates at LOS F during the PM peak. The LRDP would add 12 vehicle trips to the critical northbound through movement, which represents a two percent increase from Year 2040 conditions. While this movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – the eastbound through – is expected to operate at LOS F and the LRDP would add one vehicle trip, which is an increase of less than one percent from Year 2040 conditions. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

UCSF already implements a robust campus-wide TDM program and proposes to expand its TDM program under the 2014 LRDP. The proposed expanded TDM strategies, described in the Project Description (Section 1.2.5) and listed again below, were developed as part of an internal planning process that resulted in identifying feasible TDM measures that UCSF could implement that could reasonably result in a reduction in single-occupant vehicle (SOV) trips. In order to accomplish these goals, UCSF would implement some or all of the following:

- Expand UCSF Vanpool Program (add new vanpools and subsidize costs to attract new riders);
- Develop more robust UCSF Carpool Matching and convert additional parking spaces to carpool only;

- Enhance existing City CarShare pods on campus sites and participate in the city's new Medical Center Rideshare program;
- Increase supply and access to bicycle parking and showers/lockers;
- Enhance shuttle system with Wifi and Next Bus;
- Limit parking for non-faculty tenants in new housing;
- Gradually increase cost of employee parking, over time; and
- Promote flexible work schedules, as possible.

Additional TDM strategies that were considered, but rejected as infeasible include the following:

- Extending UCSF shuttle service to new Park-and-Ride locations in the North Bay, South Bay, and East Bay;
- Expanding and/or extending UCSF shuttle service to the Fourth and King Caltrain Station, the Embarcadero BART/Ferry, and Civic Center BART; and
- Free or discounted Muni passes for students, staff, and faculty.

Although the LRDP is not projected to cause any new significant impacts to traffic circulation at the Parnassus Heights Campus Site, the improvement measure below could be implemented to lessen the effect of SOV vehicles in the project vicinity.

Improvement Measure IM-TR-5a: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips to the Parnassus Heights Campus Site

- UCSF shall continue to investigate and implement TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

5.2.2 Mission Bay (Year 2015)

The weekday AM and PM peak hour Year 2015 Plus Phase One Medical Center and Mission Hall (Phase One MC and MH) traffic volumes and travel lane configuration at the study intersections are presented on **Figures 5-2A** and **5-2B. Table 5-2** presents the Year 2015 and Year 2015 Plus Phase One MC and Mission Hall intersection operating conditions for the weekday AM and PM peak hours. With the exception of Mission Bay Boulevard / Seventh Street, 16th Street / Vermont Avenue, Mariposa Street / Fourth Street, and Mariposa Street / I-280 Northbound Ramps, all intersections under Year 2015 conditions are expected to operate at the same level of service as under Existing conditions.

TABLE 5-2: PEAK HOUR INTERSECTION LEVEL OF SERVICE COMPARISON - MISSION BAY

Intersection	Traffic Control[1]	Peak Hour	Year 2015		Year 2015 Plus Phase One MC and MH	
			Vehicle Delay[2] (seconds)	LOS[3]	Vehicle Delay[2] (seconds)	LOS[3]

Notes:
1. AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
2. Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersection, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach.
3. For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For an unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
4. **Bold** indicates LOS E or F operations
5. Intersection is signalized under Year 2015 Plus Phase One MC and Mission Hall condition

Source: Fehr & Peers, 2014.

Under Year 2015 Plus Phase One MC and Mission Hall conditions, one of the 21 study intersections are projected to operate at LOS E or LOS F conditions (as compared to three of the 21 study intersections operating at LOS E or LOS F under Existing conditions). The Phase One MC and Mission Hall contributions to the Year 2015 traffic volumes at the critical movements operating poorly (i.e., at LOS E or LOS F) for the one intersection operating at LOS E or LOS F under Year 2015 conditions was calculated to determine whether the Phase One MC and Mission Hall contributions to the LOS E or LOS F operating conditions under Year 2015 conditions would be considered significant.

The King Street/Third Street (Intersection #24) signalized intersection operates at LOS E in the PM peak hour under Year 2015 Plus Phase One MC and Mission Hall conditions. The critical eastbound left turn movement operates at LOS F during the PM peak. The Phase One MC and Mission Hall would add 17 vehicle trips to the critical eastbound left turn movement, which represents a two percent increase from Year 2015 conditions. The other critical movements at this intersection – northbound through and westbound through – operate at LOS C and E, respectively, during the PM peak. Since the northbound through movement is expected to operate at LOS C, the Phase One MC and MH's contribution would not be considered significant. The Phase One MC and Mission Hall would add no vehicle trips to the westbound through movement. While the eastbound left critical movement is expected to operate at LOS F under Year 2015 Plus Phase One MC and Mission Hall conditions, the Phase One MC and MH's contribution would not be considered significant. Therefore, the Phase One MC and MH's impact at this intersection would be considered ***less than significant***.

5.2.3 Mission Bay (Year 2040)

As presented in Section 2.4.3, the SFMTA has proposed two transit enhancement treatment visions for 16th Street. The treatments are referred to as the Moderate and Expanded Alternatives in the TEP EIR. The Moderate Alternative proposes a number of physical changes to the portion of the rerouted 22 Fillmore in the vicinity of the Mission Bay campus site including new and relocated transit stops, transit bulbs, and new traffic signals at Connecticut and Missouri streets. The Expanded Alternative includes these features as well as the conversion of a lane of mixed-flow lane of traffic to a transit-only lane along 16th Street in both directions through the campus site. The Expanded Alternative also includes the prohibition of left

turns at Bryant, Potrero (westbound only), Utah, San Bruno, Kansas, Rhode Island, De Haro, Carolina, Wisconsin, Arkansas, Connecticut, and Missouri streets. The Mission Bay Year 2040 traffic analysis includes both the Moderate Alternative and Expanded Alternative.

The weekday AM and PM peak hour Year 2040 traffic volumes and travel lane configuration at the study intersections are presented on **Figures 5-3A** and **5-3B. Table 5-3** presents the Existing and Year 2040 Plus LRDP intersection operating conditions for the weekday AM and PM peak hours. Under Year 2040 Plus LRDP conditions with the Moderate Alternative, four of the 21 study intersections are projected to operate at LOS E or LOS F conditions (as compared to four of the 21 study intersections operating at LOS E or LOS F under Existing conditions). The Expanded Alternative would cause an additional three intersections to operate at LOS E or F conditions due to the conversion of a mixed-flow travel lane in both directions to transit-only lanes. The LRDP's contributions to the 2040 traffic volumes at the critical movements operating poorly (i.e., at LOS E or LOS F) for the intersections operating at LOS E or LOS F under Year 2040 conditions were calculated to determine whether the LRDP's contributions to the LOS E or LOS F operating conditions under Year 2040 conditions would be considered significant. Year 2040 Plus LRDP conditions with the Moderate and Expanded Alternatives are described below, including a discussion of the LRDP Variant. This section also includes a qualitative discussion of the potential effects of the development of a Golden State Warriors event center at Mission Bay Blocks 29-32.

Source: Fehr & Peers, 2014.

The King Street/Third Street (Intersection #24) signalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate and Expanded Alternatives. The critical eastbound left turn movement operates at LOS F during the PM peak. The LRDP would add 36 vehicle trips to the critical eastbound left turn movement, which represents a four percent increase from Year 2040 conditions. The other critical movements at this intersection – northbound left turn and westbound through – operate at LOS C and F, respectively, during the PM peak. Since the northbound left turn movement is expected to operate at LOS C, the LRDP's contribution would not be considered significant. The LRDP would add two vehicle trips to the westbound through, which is an increase of less than one percent from Year 2040 conditions. While this critical movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The King Street/Fourth Street (Intersection #25) signalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate and Expanded Alternatives. The critical eastbound left turn movement operates at LOS F during the PM peak. The LRDP would add no vehicle trips to the critical eastbound left turn movement. The other critical movements at this intersection – southbound through and westbound through – operate at LOS D and E, respectively, during the PM peak. Since the southbound through movement is expected to operate at LOS D, the LRDP's contribution would not be considered significant. The LRDP would add no vehicle trips to the westbound through movement. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The Brannan Street/Seventh Street (Intersection #26) signalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate and Expanded Alternatives. The critical northbound through movement operates at LOS F during the PM peak. The LRDP would add 163 vehicle trips to the critical northbound through movement, which represents 54 percent of the increase to Year 2040 conditions. Therefore, the LRDP's impact at this intersection would be considered ***significant***. The other critical movement at this intersection – the eastbound left turn – operates at LOS F during the PM peak. The LRDP would add no vehicle trips to the eastbound left turn. While this critical movement is

expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution to these movements would not be considered **significant**.

A mitigation measure (E-29), whose responsibility for implementation falls to the City was identified as part of the Mission Bay FSEIR. As part of the mitigation measure, the City would monitor the potential impact at this intersection, with the ultimate aim to re-stripe the northbound approach to provide three travel lanes, once needed. This mitigation measure would require removal of on-street parking on Seventh Street for approximately 300 feet approaching the intersection, shifting the northbound bike lane to the curb for the same distance to ensure the Class II bicycle facility on this street is not interrupted by this measure, and aligning the northbound through lanes through the intersection. The implementation of this measure by the City would improve traffic operations from LOS F to LOS C in the PM peak hour and reduce the impacts to ***less-than-significant*** levels.

The 16th Street/Fourth Street (Intersection #35) signalized intersection operates at LOS E in the AM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical westbound through and eastbound left turn movements operate at LOS E and LOS F, respectively, during the AM peak hour. The LRDP would add 198 vehicle trips to the westbound through movement, which represents an increase of 65 percent from Year 2040 conditions. The LRDP would add 184 vehicle trips to the critical eastbound left turn movement, which represents a 188 percent increase from Year 2040 conditions. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***significant***. The other critical movement at this intersection – southbound through – operates at LOS D during the AM peak. Since the southbound through movement is expected to operate at LOS D, the LRDP's contribution to this movement would not be considered significant.

> **Mitigation Measure TR-2a: Implement the Moderate Alternative of the TEP 16th Street Proposal**
>
> Two mixed-flow travel lanes in each direction would be required to improve operations at 16th Street/Fourth Street to acceptable levels of service in the AM peak hour. As such, this mitigation measure would require that the Moderate Alternative of the TEP 16th Street proposal be implemented in order to maintain the requisite traffic carrying capacity of 16th Street for the forecasted traffic demand with the LRDP in place. The implementation of this measure would improve traffic operations from LOS E to LOS D in the AM peak hour and reduce the impacts to less-than-significant levels. The implementation of this mitigation measure will require further study and coordination with other agencies for approval and is outside the jurisdiction of UCSF. Therefore, this impact is considered ***significant and unavoidable***.

Should the City of San Francisco implement the Expanded Alternative of the TEP, thereby resulting in a significant unavoidable cumulative impact on traffic conditions along 16th Street[15] to which the proposed

[15] The TEP EIR, which included the expansion of the Mission Bay campus (including Phase One of the Medical Center and up to 2.65 Million gsf in the North campus), identified both project and cumulative significant and unavoidable impacts at numerous study intersections along 16th Street under the TEP's Expanded Alternative. Source: San Francisco Planning Department. 2014. *TEP Final EIR*, March 27, 2014, Available online at http://tepeir.sfplanning.org. Accessed April 3, 2014. Case No. 2011.0558E. The document and supporting information may also be viewed at the Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA in case file 2011.0558E.

2014 LRDP would make a considerable contribution, UCSF shall implement the following mitigation measures:

Mitigation Measure TR-3a: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips

- UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

- UCSF will monitor traffic conditions within and immediately surrounding the Mission Bay Campus Site as presented in Section 1.2.6. Should traffic conditions approach unacceptable levels, (LOS E or F), and should UCSF's contribution to this cumulative impact be significant, UCSF shall implement additional TDM strategies that it investigates (beyond those identified in its existing TDM program presented in **Table 2-1** and beyond those proposed in the 2014 LRDP) and finds could reasonably result in a reduction in SOV trips. The additional TDM strategies shall target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods.

The implementation of this mitigation measure could improve traffic operations along 16th Street by reducing SOV trips to and from the Mission Bay Campus Site by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. Therefore, any combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

Mitigation Measure TR-4a: Manage Parking Supply

UCSF will continue to monitor the parking supply at the Mission Bay Campus Site so as not to oversupply parking at this campus site. As presented in Section 4.7, the trend in providing total parking supply at the Mission Bay Campus Site is negative as parking supply is expected to grow at a lower rate than total population. Monitoring the total parking supply per population at the Mission Bay Campus Site and revising the rate downward, if necessary, would improve traffic operations along 16th Street by reducing vehicular trips to and from the Mission Bay Campus Site. However, similar to Mitigation Measure TR-3a, any combination of reduced parking at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

The 16th Street/Owens Street (Intersection #36) signalized intersection operates at LOS F in the AM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical eastbound through movement operates at LOS F during the AM peak. The LRDP would add 283 vehicle trips to the critical eastbound through movement, which represents a 92 percent increase from Year 2040 conditions. The other critical movements at this intersection – northbound through and westbound left turn – operate

at LOS B and F, respectively, during the AM peak. Since the northbound through movement is expected to operate at LOS B, the LRDP's contribution would not be considered significant. The LRDP would add 121 vehicle trips to the westbound left turn movement, which represents an increase of 1,344 percent from Year 2040 conditions. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***significant***.

The 16th Street/Owens Street (Intersection #36) signalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical northbound left turn movement operates at LOS F during the PM peak. The LRDP would add 84 vehicle trips to the critical eastbound through movement, which represents a 156 percent increase from Year 2040 conditions. The other critical movements at this intersection – eastbound through and westbound through – both operate at LOS F during the PM peak. The LRDP would add 30 vehicle trips to the eastbound through movement, which represents an increase of 11 percent from Year 2040 conditions. The LRDP would add 233 vehicle trips to the westbound through movement, which represents an increase of 47 percent from Year 2040 conditions. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***significant***.

Mitigation Measure TR-2b: Implement the Moderate Alternative of the TEP 16th Street Proposal

Two mixed-flow travel lanes in each direction would be required to improve operations at 16th Street/Owens Street to acceptable levels of service in the AM and PM peak hours. As such, this mitigation measure would require that the Moderate Alternative of the TEP 16th Street proposal be implemented in order to maintain the requisite traffic carrying capacity of 16th Street for the forecasted traffic demand with the LRDP in place. The implementation of this measure would improve traffic operations from LOS F to LOS D in the AM and PM peak hours and reduce the impacts to less-than-significant levels. The implementation of this mitigation measure will require further study and coordination with other agencies for approval and is outside the jurisdiction of UCSF. Therefore, this impact is considered ***significant and unavoidable***.

Mitigation Measure TR-3b: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips

- UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

- UCSF will monitor traffic conditions within and immediately surrounding the Mission Bay Campus Site as presented in Section 1.2.6. Should traffic conditions approach unacceptable levels, (LOS E or F), and should UCSF's contribution to this cumulative impact be significant, UCSF shall implement additional TDM strategies that it investigates (beyond those identified in its existing TDM program presented in **Table 2-1** and beyond those proposed in the 2014 LRDP) and finds could reasonably result in a reduction in SOV trips. The additional TDM strategies shall target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods.

The implementation of this mitigation measure would improve traffic operations along 16th Street by reducing SOV trips to and from the Mission Bay Campus Site by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. Therefore, any combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

Mitigation Measure TR-4b: Manage Parking Supply

UCSF will continue to monitor the parking supply at the Mission Bay Campus Site so as not to oversupply parking at this campus site. As presented in Section 4.7, the trend in providing total parking supply at the Mission Bay Campus Site is negative as parking supply is expected to grow at a lower rate than total population. Monitoring the total parking supply per population at the Mission Bay Campus Site and revising the rate downward, if necessary, would improve traffic operations along 16th Street by reducing vehicular trips to and from the Mission Bay Campus Site. However, similar to Mitigation Measure TR-3a, any combination of reduced parking at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

The 16th Street/Seventh Street (Intersection #37) signalized intersection operates at LOS F in the AM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical southbound left turn movement operates at LOS F during the AM peak. The LRDP would add 162 vehicle trips to the critical southbound left turn movement, which represents a 130 percent increase from Year 2040 conditions. The other critical movements at this intersection – northbound through and eastbound through – both operate at LOS F during the AM peak. The LRDP would add no vehicle trips to the northbound through movement. The LRDP would add 412 vehicle trips to the eastbound through movement, which represents an increase of 143 percent from Year 2040 conditions. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***significant***.

The 16th Street/Seventh Street (Intersection #37) signalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical southbound right turn movement operates at LOS F during the PM peak. The LRDP would add 55 vehicle trips to the critical southbound left turn movement, which represents a 72 percent increase from Year 2040 conditions. The other critical movements at this intersection – northbound through and westbound through – operate at LOS E and F, respectively, during the PM peak. The LRDP would add no vehicle trips to the northbound through movement. The LRDP would add 176 vehicle trips to the westbound through movement, which represents an increase of 48 percent from Year 2040 conditions. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***significant***.

Mitigation Measure TR-2c: Implement the Moderate Alternative of the TEP 16th Street Proposal

Two mixed-flow travel lanes in each direction would be required to improve operations at 16th Street/Seventh Street to acceptable levels of service in the AM and PM peak hours. As such, this mitigation measure would require that the Moderate Alternative of the TEP 16th Street proposal be implemented in order to maintain the requisite traffic carrying capacity of 16th Street for the forecasted traffic demand with the LRDP in place. The implementation of this measure would improve traffic operations from LOS F to LOS D in the AM and PM peak hours and reduce the impacts to less-than-significant levels. The implementation of this mitigation measure will require further study and coordination with other agencies for approval and is outside the jurisdiction of UCSF. Therefore, this impact is considered ***significant and unavoidable***.

Mitigation Measure TR-3c: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips

- UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

- UCSF will monitor traffic conditions within and immediately surrounding the Mission Bay Campus Site as presented in Section 1.2.6. Should traffic conditions approach unacceptable levels, (LOS E or F), and should UCSF's contribution to this cumulative impact be significant, UCSF shall implement additional TDM strategies that it investigates (beyond those identified in its existing TDM program presented in **Table 2-1** and beyond those proposed in the 2014 LRDP) and finds could reasonably result in a reduction in SOV trips. The additional TDM strategies shall target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods.

The implementation of this mitigation measure would improve traffic operations along 16th Street by reducing SOV trips to and from the Mission Bay Campus Site by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. Therefore, any combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

Mitigation Measure TR-4c: Manage Parking Supply

UCSF will continue to monitor the parking supply at the Mission Bay Campus Site so as not to oversupply parking at this campus site. As presented in Section 4.7, the trend in providing total parking supply at the Mission Bay Campus Site is negative as parking supply is expected to grow at a lower rate than total population. Monitoring the total parking supply per population at the Mission Bay Campus Site and revising the rate downward, if necessary, would improve traffic operations along 16th Street by reducing vehicular trips to and from the Mission Bay Campus Site. However, similar to Mitigation Measure TR-3a, any combination of reduced parking at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative.

Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

The 16th Street/Potrero Avenue (Intersection #40) signalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate Alternative. The critical northbound left turn movement operates at LOS F during the PM peak. The LRDP would add no vehicle trips to the critical northbound left turn movement. The other critical movement at this intersection – westbound through – operates at LOS C during the PM peak. Since the westbound through movement is expected to operate at LOS C, the LRDP's contribution would not be considered significant. Therefore, the LRDP's impact at this intersection with the TEP Moderate Alternative proposal for 16th Street would be considered ***less than significant***.

The 16th Street/Potrero Avenue (Intersection #40) signalized intersection operates at LOS F in the AM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical southbound left turn movement operates at LOS F during the AM peak. The LRDP would add 19 vehicle trips to the critical southbound left turn movement, which represents a 12 percent increase from Year 2040 conditions. The other critical movement at this intersection – eastbound through – operates at LOS F during the AM peak. The LRDP would add 130 vehicle trips to the eastbound through movement, which represents an increase of 38 percent from Year 2040 conditions. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***significant***.

The 16th Street/Potrero Avenue (Intersection #40) signalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical westbound through movement operates at LOS F during the PM peak. The LRDP would add 102 vehicle trips to the critical westbound through movement, which represents a 17 percent increase from Year 2040 conditions. The other critical movement at this intersection – northbound left turn – operates at LOS F during the PM peak. However, the LRDP would add no vehicle trips to the northbound left turn movement. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***significant***.

Mitigation Measure TR-2d: Implement the Moderate Alternative of the TEP 16th Street Proposal

Two mixed-flow travel lanes in each direction would be required to improve operations at 16th Street/Potrero Avenue to acceptable levels of service in the AM peak hour. As such, this mitigation measure would require that the Moderate Alternative of the TEP 16th Street proposal be implemented in order to maintain the requisite traffic carrying capacity of 16th Street for the forecasted traffic demand with the LRDP in place. The implementation of this measure would improve traffic operations from LOS F to LOS D in the AM peak hour and reduce the impacts to less-than-significant levels. However, the traffic operations would remain at LOS F in the PM peak hour. The implementation of this mitigation measure will require further study and coordination with other agencies for approval and is outside the jurisdiction of UCSF. Therefore, this impact is considered ***significant and unavoidable***.

Mitigation Measure TR-3d: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips

- UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and

has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

- UCSF will monitor traffic conditions within and immediately surrounding the Mission Bay Campus Site as presented in Section 1.2.6. Should traffic conditions approach unacceptable levels, (LOS E or F), and should UCSF's contribution to this cumulative impact be significant, UCSF shall implement additional TDM strategies that it investigates (beyond those identified in its existing TDM program presented in **Table 2-1** and beyond those proposed in the 2014 LRDP) and finds could reasonably result in a reduction in SOV trips. The additional TDM strategies shall target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods.

The implementation of this mitigation measure would improve traffic operations along 16th Street by reducing SOV trips to and from the Mission Bay Campus Site by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. Therefore, any combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

Mitigation Measure TR-4d: Manage Parking Supply

UCSF will continue to monitor the parking supply at the Mission Bay Campus Site so as not to oversupply parking at this campus site. As presented in Section 4.7, the trend in providing total parking supply at the Mission Bay Campus Site is negative as parking supply is expected to grow at a lower rate than total population. Monitoring the total parking supply per population at the Mission Bay Campus Site and revising the rate downward, if necessary, would improve traffic operations along 16th Street by reducing vehicular trips to and from the Mission Bay Campus Site. However, similar to Mitigation Measure TR-3a, any combination of reduced parking at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

5.2.3.1 LRDP Variant

Traffic conditions associated with the LRDP Variant would be similar to those described for the LRDP. **Table 5-4** presents the Existing and Year 2040 Plus LRDP Variant intersection operating conditions for the weekday AM and PM peak hours. Under Year 2040 Plus LRDP conditions with the Moderate Alternative, six of the 21 study intersections are projected to operate at LOS E or LOS F conditions (as compared to four of the 21 study intersections operating at LOS E or LOS F under Existing conditions). The Expanded Alternative would cause an additional two intersections to operate at LOS E or F conditions due to the conversion of a mixed-flow travel lane in both directions to transit-only lanes (as compared to three of the 21 study intersections operating at LOS E or LOS F under Existing conditions).. Per Section 3.6.2, the LRDP Variant's contributions to the 2040 traffic volumes at the critical movements operating poorly (i.e., at LOS E or LOS F) for the intersections operating at LOS E or LOS F under Year 2040 conditions would be approximately two percent higher to those calculated for the LRDP.

TABLE 5-4: PEAK HOUR INTERSECTION LEVEL OF SERVICE COMPARISON - MISSION BAY

Intersection	Traffic Control[1]	Peak Hour	Existing		Year 2040 Plus LRDP Variant (Moderate Alternative)		Year 2040 Plus LRDP Variant (Expanded Alternative)[6]	
			Vehicle Delay[2] (sec)	LOS[3]	Vehicle Delay[2] (sec)	LOS[3]	Vehicle Delay[2] (sec)	LOS[3]
44. Mariposa Street / I-280 Southbound Ramp	SSS[5]	AM PM	**>50** **>50**	**F** **F**	<10 13	A B		

Notes:
1. AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
2. Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersection, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach.
3. For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For an unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
4. **Bold** indicates unacceptable operations per UCSF LOS standards
5. Intersection is signalized under Existing Plus LRDP condition

Source: Fehr & Peers, 2014.

In general, the addition of LRDP Variant-generated traffic would result in similar changes in the average delay per vehicle at most study intersections to the LRDP. Most of the study intersections would continue to operate at the same service levels as under 2040 Plus LRDP conditions, with the exceptions being 16th Street/Seventh Street which would operate at LOS E during the AM peak hour under the Moderate Alternative and Mariposa Street / Third Street which would operate at LOS E during the AM peak hour under both the Moderate Alternative and the Expanded Alternative.

The LRDP Variant would contribute considerably to the operations at several intersections which are expected to operate at LOS E or F under the TEP Moderate and / or Expanded Alternative, including the following previously identified intersections:

- Brannan Street / Seventh Street (PM peak hour, Moderate and Expanded Alternatives). A mitigation measure (E-29), whose responsibility for implementation falls to the master developer of Mission Bay, FOCIL, was identified as part of the Mission Bay FSEIR. As part of the mitigation measure, the City would monitor the potential impact at this intersection, with the ultimate aim to re-stripe the northbound approach to provide three travel lanes, once needed. This mitigation measure would require removal of on-street parking on Seventh Street for approximately 300 feet approaching the intersection, shifting the northbound bike lane to the curb for the same distance to ensure the Class II bicycle facility on this street is not interrupted by this measure, and aligning the northbound through lanes through the intersection. The implementation of this measure by the City would improve traffic operations from LOS F to LOS C in the PM peak hour and reduce the impacts to ***less-than-significant*** levels.

- 16th Street/Fourth Street (AM peak hour, Expanded Alterative) The LRDP' Variant's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered

significant. The implementation of Mitigation Measure TR-2a would improve traffic operations from LOS E to LOS D in the AM peak hour and reduce the impacts to less-than-significant levels. The implementation of this mitigation measure will require further study and coordination with other agencies for approval and is outside the jurisdiction of UCSF. Additionally, should the City of San Francisco implement the Expanded Alternative of the TEP, thereby resulting in a significant unavoidable cumulative impact on traffic conditions along 16th Street to which the LRDP Variant would make a considerable contribution, UCSF shall implement Mitigation Measures TR-3a and TR-4a. Any combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site, as identified in MM TR- 3a, and combination of reduced parking at the Mission Bay Campus Site, as identified in MM TR- 4a, could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of these mitigation measures, this impact under the LRDP Variant would still be considered ***significant and unavoidable***.

- 16th Street/Owens Street (AM and PM peak hours, Expanded Alterative) The LRDP' Variant's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***significant***. The implementation of Mitigation Measure TR-2b would improve traffic operations from LOS F to LOS D in the AM and PM peak hours and reduce the impacts to less-than-significant levels. The implementation of this mitigation measure will require further study and coordination with other agencies for approval and is outside the jurisdiction of UCSF. Additionally, should the City of San Francisco implement the Expanded Alternative of the TEP, thereby resulting in a significant unavoidable cumulative impact on traffic conditions along 16th Street to which the LRDP Variant would make a considerable contribution, UCSF shall implement Mitigation Measures TR-3b and TR-4b. Any combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site, as identified in MM TR- 3a, and combination of reduced parking at the Mission Bay Campus Site, as identified in MM TR- 4b, could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of these mitigation measures, this impact under the LRDP Variant would still be considered ***significant and unavoidable***.

- 16th Street/Seventh Street (AM and PM peak hours, Expanded Alterative) The LRDP' Variant's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***significant***. The implementation of Mitigation Measure TR-2a would improve traffic operations from LOS F to LOS D in the AM and PM peak hours and reduce the impacts to less-than-significant levels. The implementation of this mitigation measure will require further study and coordination with other agencies for approval and is outside the jurisdiction of UCSF. Additionally, should the City of San Francisco implement the Expanded Alternative of the TEP, thereby resulting in a significant unavoidable cumulative impact on traffic conditions along 16th Street to which the LRDP Variant would make a considerable contribution, UCSF shall implement Mitigation Measures TR-3c and TR-4c. Any combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site, as identified in MM TR- 3c, and combination of reduced parking at the Mission Bay Campus Site, as identified in MM TR- 4c, could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of these mitigation measures, this impact under the LRDP Variant would still be considered ***significant and unavoidable***.

- 16th Street/Potrero Avenue (AM and PM peak hours, Expanded Alterative) The LRDP' Variant's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***significant***. The implementation of Mitigation Measure TR-2d would improve traffic operations from LOS F to LOS D in the AM peak hour and reduce the impacts to less-than-significant levels. However, the traffic operations would remain at LOS F in the PM peak hour. The implementation of this mitigation measure will require further study and coordination with other agencies for approval and is outside the jurisdiction of UCSF. Additionally, should the City of San Francisco implement the Expanded Alternative of the TEP, thereby resulting in a significant unavoidable cumulative impact on traffic conditions along 16th Street to which the LRDP Variant would make a considerable contribution, UCSF shall implement Mitigation Measures TR-3d and TR-4d. Any combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site, as identified in MM TR- 3d, and combination of reduced parking at the Mission Bay Campus Site, as identified in MM TR- 4d, could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of these mitigation measures, this impact under the LRDP Variant would still be considered ***significant and unavoidable***.

The LRDP Variant would contribute considerably to the operations at two intersections which are expected to operate at LOS E or F under the TEP Moderate and / or Expanded Alternative, which were not previously identified under the LRDP scenario:

- 16th Street/Seventh Street (AM peak hour, Moderate Alterative) The LRDP' Variant's impact at this intersection with the TEP Moderate Alternative proposal for 16th Street would be considered **significant**. To mitigate the poor operating condition of the intersection, additional travel lane capacity would be needed at the eastbound and westbound approaches to the intersection. The provision of additional travel lane capacity would require the narrowing of sidewalks and/or removal of the Class II bicycle facility on 16th Street. Narrowing of sidewalks and removal of bicycle lanes would be inconsistent with the transit and pedestrian environment encouraged by the City's Transit First Policy by removing space dedicated to pedestrians and increasing the distances required for pedestrians to cross streets. Additionally, the presence of the I-280 freeway support structures prohibit further widening of the 16th Street right-of-way. For the reasons described above, there are no feasible geometric mitigation measures to improve conditions to a less-than-significant level.

  Mitigation Measure TR-3e: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips

  - UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

  - UCSF will monitor traffic conditions within and immediately surrounding the Mission Bay Campus Site as presented in Section 1.2.6. Should traffic conditions approach unacceptable levels, (LOS E or F), and should UCSF's contribution to this cumulative impact be significant, UCSF shall implement additional TDM strategies that it investigates (beyond those identified in its existing TDM program presented in **Table 2-1** and beyond those proposed in the 2014 LRDP) and finds could reasonably result in a reduction in SOV

trips. The additional TDM strategies shall target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods.

The implementation of this mitigation measure and the inclusion of the additional TDM strategies presented in Section 1.2.5 would improve traffic operations at the intersection of Mariposa Street/Third Street in the AM peak hour under the Moderate Alternative. The TDM strategies presented in Section 1.2.5 were recently proposed by UCSF and hence were not assumed in the travel demand calculations presented in Chapter 3. These TDM strategies would reduce SOV trips by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. The implementation of this measure by UCSF and the associated reduction in vehicle trips to the Mission Bay campus site would improve traffic operations at 16th Street/Seventh Street from LOS E to LOS D in the AM peak hour and reduce the impacts to ***less-than-significant*** levels.

- Mariposa Street/Third Street (AM peak hour, Moderate Alterative) The LRDP Variant's impact at this intersection with the TEP Moderate Alternative proposal for 16th Street would be considered **significant**. To mitigate the poor operating condition of the intersection, additional travel lane capacity would be needed at the eastbound approach to the intersection. The provision of additional travel lane capacity would require the narrowing of sidewalks on Mariposa Street. Narrowing of sidewalks would be inconsistent with the transit and pedestrian environment encouraged by the City's Transit First Policy by removing space dedicated to pedestrians and increasing the distances required for pedestrians to cross streets. For the reasons described above, there are no feasible geometric mitigation measures to improve conditions to a less-than-significant level.

  Mitigation Measure TR-3f: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips

  - UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

  - UCSF will monitor traffic conditions within and immediately surrounding the Mission Bay Campus Site as presented in Section 1.2.6. Should traffic conditions approach unacceptable levels, (LOS E or F), and should UCSF's contribution to this cumulative impact be significant, UCSF shall implement additional TDM strategies that it investigates (beyond those identified in its existing TDM program presented in **Table 2-1** and beyond those proposed in the 2014 LRDP) and finds could reasonably result in a reduction in SOV trips. The additional TDM strategies shall target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods.

  The implementation of this mitigation measure and the inclusion of the additional TDM strategies presented in Section 1.2.5 would improve traffic operations at the intersection of Mariposa Street/Third Street in the AM peak hour under the Moderate Alternative. The TDM strategies presented in Section 1.2.5 were recently proposed by UCSF and hence were not assumed in the

travel demand calculations presented in Chapter 3. These TDM strategies would reduce SOV trips by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. The implementation of this measure by UCSF and the associated reduction in vehicle trips to the Mission Bay campus site would improve traffic operations at Mariposa Street/Third Street from LOS E to LOS D in the AM peak hour and reduce the impacts to ***less-than-significant*** levels.

- Mariposa Street/Third Street (AM peak hour, Expanded Alterative) The LRDP' Variant's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered **significant**. To mitigate the poor operating condition of the intersection, additional travel lane capacity would be needed at the eastbound approach to the intersection. The provision of additional travel lane capacity would require the narrowing of sidewalks on Mariposa Street. Narrowing of sidewalks would be inconsistent with the transit and pedestrian environment encouraged by the City's Transit First Policy by removing space dedicated to pedestrians and increasing the distances required for pedestrians to cross streets. For the reasons described above, there are no feasible geometric mitigation measures to improve conditions to a less-than-significant level.

  Mitigation Measure TR-3g: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips

  - UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

  - UCSF will monitor traffic conditions within and immediately surrounding the Mission Bay Campus Site as presented in Section 1.2.6. Should traffic conditions approach unacceptable levels, (LOS E or F), and should UCSF's contribution to this cumulative impact be significant, UCSF shall implement additional TDM strategies that it investigates (beyond those identified in its existing TDM program presented in **Table 2-1** and beyond those proposed in the 2014 LRDP) and finds could reasonably result in a reduction in SOV trips. The additional TDM strategies shall target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods.

  The implementation of this mitigation measure and the inclusion of the additional TDM strategies presented in Section 1.2.5 would improve traffic operations at the intersection of Mariposa Street/Third Street in the AM peak hour under the Expanded Alternative. The TDM strategies presented in Section 1.2.5 were recently proposed by UCSF and hence were not assumed in the travel demand calculations presented in Chapter 3. These TDM strategies would reduce SOV trips by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. The implementation of this measure by UCSF and the associated reduction in vehicle trips to the Mission Bay campus site would improve traffic operations at Mariposa Street/Third Street from LOS E to LOS D in the AM peak hour and reduce the impacts to ***less-than-significant*** levels.

5.2.3.2 Proposed Golden State Warriors Event Center at Mission Bay

In April 2014, the Golden State Warriors (GS Warriors) announced the purchase of 12 acres of land from Salesforce.com in the Mission Bay South Redevelopment Project Area where the team intends to build a new sports and entertainment center. Previously, the Warriors were exploring constructing the arena and associated uses on Piers 30 and 32 and Seawall Lot 330 to the north of Mission Bay, along The Embarcadero.

The proposed event center would be built on four adjacent city blocks (Development Blocks 29 through 32) bounded by Third Street to the west, South Street to the north, Terry François Boulevard to the east, and 16th Street to the South. The four blocks are currently undeveloped, with a portion of Blocks 29 and 30 adjacent to South Street being used as a temporary surface parking lot.

The GS Warriors have just started the planning and design for the new site, so the division of the approximately one million square feet of development allowed for the site among the 18,000-seat arena, office, and retail uses has not yet been established. Based on previous designs for Piers 30 and 32, the new arena is likely to occupy 500,000 to 600,000 square feet of development, with the remaining space (400,000 to 500,000 square feet) available for office and retail uses.

The SF-CHAMP travel demand forecasting model developed in 2013 by the SFCTA and the SF Planning Department and used in this study to estimate future cumulative transportation conditions assumes approximately one million square feet of office/R&D with ground floor retail to occur by the year 2040 within Blocks 29 through 32. As such, the traffic and transit data derived from the SF-CHAMP model and used in the analysis of cumulative transportation impacts of the 2014 LRDP can be deemed as a conservative and valid representation of a typical day when no events take place at the proposed arena.

`The transportation effects of an event at the new arena are not yet known, as the GS Warriors have just started the necessary project development and environmental studies. Based on modal split and vehicle occupancy data taken from surveys of SF Giants game attendees, spectators at a sellout game at the new arena could be expected to generate about 3,200 vehicle trips and 8,300 transit trips.[16] Based on previous data for Piers 30 and 32, the event vehicle and transit demand would be inbound during the evening (starting around 6 PM) and outbound late at night (after 10 or 10:30 PM) since most games and concerts would start around 7:30 and last for 2 ½ or 3 hours.

The exact contribution of the new arena to the PM peak hour cumulative traffic and transit conditions is not known as this time, as the project analysis have just started. In addition the GS Warriors are in the process of developing as part of the project a Transportation Management Program (TMP) to address potential transportation project impacts.

Several key intersections in the Mission Bay South Area, such as 16th Street/Third Street, 16th Street/Seventh/Mississippi Street, Mariposa Street/Third Street, and Seventh Street/Mission Bay Drive, would be expected to operate at a high LOS D by year 2040 during the PM peak hour, as shown in **Table**

[16] Based on a modal split of 44% auto, 46% transit and 10% other travel modes, and an average vehicle occupancy of 2.6 people per vehicle. Source: Appendix A (p. A-8), Travel and Parking Demand Estimates for the Proposed Event Center and Mixed Use Development at Piers 30-32 and Seawall Lot 330, Draft 3 Technical Memorandum, Adavant Consulting, February 28, 2014. This document is available for review at the SF Planning Department, 1650 Mission Street, Suite 400, San Francisco, California 94103.

5-3. Thus, it is possible that an increase in inbound traffic due to an arena event causes these intersections to operate at LOS E or F instead of LOS D. If inbound arena event traffic causes significant traffic impacts at these intersections, the contribution of LRDP traffic to the cumulative conditions at these intersections would be substantial and the LRDP's impact to cumulative traffic impacts therefore would be considered ***significant.*** The significant impact may not be able to be mitigated to a less than significant level; therefore rendering the cumulative impacts potentially significant and unavoidable.

Mitigation Measure TR-3h: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips

- UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

- UCSF will monitor traffic conditions within and immediately surrounding the Mission Bay Campus Site as presented in Section 1.2.6. Should traffic conditions approach unacceptable levels, (LOS E or F), and should UCSF's contribution to this cumulative impact be significant, UCSF shall implement additional TDM strategies that it investigates (beyond those identified in its existing TDM program presented in **Table 2-1** and beyond those proposed in the 2014 LRDP) and finds could reasonably result in a reduction in SOV trips. The additional TDM strategies shall target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods.

The implementation of this mitigation measure would improve traffic operations along 16th Street by reducing SOV trips to and from the Mission Bay Campus Site by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. Therefore, any combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

Similar to under the LRDP scenario, several key intersections in the Mission Bay South Area, such as 16th Street/Third Street, 16th Street/Seventh/Mississippi Street, and Seventh Street/Mission Bay Drive, would be expected to operate at a high LOS D by year 2040 during the PM peak hour under the LRDP Variant, as shown in **Table 5-4**. Thus, it is possible that an increase in inbound traffic due to an arena event causes these intersections to operate at LOS E or F instead of LOS D. If inbound arena event traffic causes significant traffic impacts at these intersections, the contribution of LRDP Variant traffic to the cumulative conditions at these intersections would be substantial and the LRDP Variant's impact to cumulative traffic impacts therefore would be considered ***significant.*** The significant impact may not be able to be mitigated to a less than significant level; therefore rendering the cumulative impacts potentially significant and unavoidable.

As identified above, Mitigation Measure TR-3g would improve traffic operations along 16th Street by reducing SOV trips to and from the Mission Bay Campus Site by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. Any

combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of these mitigation measures, this impact under the LRDP Variant would still be considered ***significant and unavoidable***.

5.2.4 Mount Zion

The weekday AM and PM peak hour Year 2040 traffic volumes and travel lane configuration at the study intersections are presented on **Figures 5-4A** and **5-4B**. **Table 5-5** presents the Existing and Year 2040 Plus LRDP intersection operating conditions for the weekday AM and PM peak hours. Under Year 2040 conditions none of the 16 study intersections are projected to operate at LOS E or LOS F conditions, similar to under Existing conditions).

60. Geary Boulevard / Scott Street	Signal	AM	21	C	27	C
		PM	20	B	30	C

Notes:

1. AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
2. Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersection, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach.
3. For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For an unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
4. **Bold** indicates LOS E or F operations

Source: Fehr & Peers, 2014.

During the AM and PM peak hours, all 16 of the study intersections would continue to operate at acceptable levels of service (LOS D or better) under Year 2040 Plus LRDP conditions. Therefore, the LRDP would have a ***less-than-significant impact*** at these intersections.

Although the LRDP is not projected to cause any new significant impacts to traffic circulation at the Mount Zion Campus Site, the improvement measure below could be implemented to lessen the effect of SOV vehicles in the project vicinity.

Improvement Measure IM-TR-5b: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips to the Mount Zion Campus Site

- UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

5.2.5 Mission Center

As presented in Section 5.2.4, the SFMTA has proposed two transit enhancement treatment visions for 16th Street as a part of the TEP. Through the Mission Center study area, the Moderate Alternative would maintain four-lanes on 16th Street and the Expanded Alternative would convert the westbound mixed-flow lane of traffic to a transit-only lane while maintaining the two eastbound mixed-flow traffic lanes (note: further to the east in the Mission Bay campus site, the Expanded Alternative of the TEP proposes transit-only lanes in both directions – the eastbound transit-only lane is proposed to begin at Bryant Street). Therefore, the Mission Center Year 2040 traffic analysis includes both the Moderate and Expanded Alternatives.

Year 2040 Plus LRDP conditions peak hour turning movement volumes for the Mission Center Campus Site are shown on **Figures 5-5A** and **5-5B**. **Table 5-6** presents intersection levels of service and delay for the AM and PM peak hours for the Existing and Year 2040 Plus LRDP scenarios. Under Year 2040 Plus LRDP conditions with the Moderate Alternative, six of the 15 study intersections are projected to operate at LOS E or LOS F conditions (as compared to one of the 15 study intersections operating at LOS E or LOS F under Existing conditions). The Expanded Alternative would cause an additional four intersections to operate at LOS E or F conditions due to the conversion of a mixed-flow westbound travel lane to transit-only lane. The LRDP's contributions to the Year 2040 traffic volumes at the critical movements operating poorly (i.e., at LOS E or LOS F) for the intersections operating at LOS E or LOS F under Year 2040 conditions were calculated to determine whether the LRDP's contributions to the LOS E or LOS F operating conditions under Year 2040 conditions would be considered significant. Year 2040 Plus LRDP conditions with the Moderate and Expanded Alternatives are described below.

4. **Bold** indicates LOS E or F operations
5. Intersections with grayed cells in the Expanded Alternative columns operate at the same delay and LOS as in the Moderate Alternative columns.

Source: Fehr & Peers, 2014.

The 13th Street/South Van Ness Avenue (Intersection #61) signalized intersection operates at LOS F in the AM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate and Expanded Alternatives. The critical southbound through movement operates at LOS F during the AM peak. The LRDP would add 14 vehicle trips to the critical southbound through movement, which represents a one percent increase from Year 2040 conditions. While the southbound through movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movements at the intersection – eastbound right turn and westbound left turn – are not expected to receive an increase in vehicular traffic due to the LRDP. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The 13th Street/South Van Ness Avenue (Intersection #61) signalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate and Expanded Alternatives. The critical southbound through movement operates at LOS E during the PM peak. The LRDP would add one vehicle trip to the critical southbound through movement, which represents a less than one percent increase from Year 2040 conditions. While the southbound through movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – westbound through – is not expected to receive an increase in vehicular traffic due to the LRDP. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The 13th Street/Folsom Street (Intersection #62) signalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate and Expanded Alternatives. The critical southbound through movement operates at LOS F during the PM peak. The LRDP would add no vehicle trips to the critical southbound through movement. While the southbound through movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movements at the intersection – eastbound left turn and westbound through – both operate at LOS F during the PM peak. The LRDP would add no vehicle trips to the eastbound left turn and 12 vehicle trips to the westbound through, which represents an increase of less than one percent. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The 13th Street/Harrison Street (Intersection #63) signalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate and Expanded Alternatives. The critical southbound through movement operates at LOS F during the PM peak. The LRDP would add one vehicle trip to the critical southbound through movement, which represents an increase of less than one percent from Year 2040 conditions. While the southbound through movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – westbound through – operates at LOS F during the PM peak. The LRDP would add no vehicle trips to the westbound through. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The 14th Street/South Van Ness Avenue (Intersection #65) signalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate and Expanded Alternatives. The critical southbound through movement operates at LOS F during the PM peak. The LRDP would add no vehicle trips to the critical southbound through movement. While the southbound through movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – eastbound through – operates

at LOS F during the PM peak. The LRDP would add no vehicle trips to the eastbound through. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The 14th Street/Harrison Street (Intersection #67) unsignalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate and Expanded Alternatives. The LRDP would add a total of 55 vehicle trips to the intersection, which represents a three percent increase from Year 2040 conditions. Therefore, the LRDP's contribution would not be considered significant. While the increase in traffic does warrant a signal according to the Caltrans signal warrant for unsignalized intersections in urban areas (Warrant 3), the LRDP's impact at this intersection would be considered ***less than significant***.

The 15th Street/South Van Ness Avenue (Intersection #68) signalized intersection operates at LOS E in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Moderate and Expanded Alternatives. The critical westbound right turn movement operates at LOS F during the PM peak. Since the westbound right is a shared movement with the westbound through and left turn movements, the LRDP's contributions to all three movements were summed to determine the total LRDP contribution to the westbound approach. The LRDP would add a total of 10 vehicle trips to the westbound approach, which represents an increase of two percent from Year 2040 conditions. Therefore, the LRDP's contribution to the approach would not be considered significant. The other critical movement at the intersection – southbound through – operates at LOS D during the PM peak, so the LRDP's contribution would not be significant. Therefore, the LRDP's impact at this intersection would be considered ***less than significant***.

The 16th Street/South Van Ness Avenue (Intersection #72) signalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical southbound through movement operates at LOS F during the PM peak. The LRDP would add two vehicle trips to the critical southbound through movement, which represents a less than one percent increase from Year 2040 conditions. While the southbound through movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – westbound through – operates at LOS F during the PM peak. The LRDP would add ten vehicle trips to the westbound through movement, which represents an increase of two percent from Year 2040 conditions. While the westbound through movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***less than significant***.

The 16th Street/Folsom Street (Intersection #73) signalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical southbound through movement operates at LOS F during the PM peak. The LRDP would add four vehicle trips to the critical southbound through movement, which represents a less than one percent increase from Year 2040 conditions. While the southbound through movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – westbound through – operates at LOS F during the PM peak. The LRDP would add two vehicle trips to the westbound through movement, which represents an increase of less than one percent from Year 2040 conditions. While the westbound through movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***less than significant***.

The 16th Street/Harrison Street (Intersection #74) signalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical northbound through movement operates at LOS F during the PM peak. The LRDP would add no vehicle trips to the critical northbound through movement. Therefore, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – westbound through – operates at LOS F during the PM peak. The LRDP would add no vehicle trips to the westbound through movement. Therefore, the LRDP's contribution would not be considered significant. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***less than significant***.

The 16th Street/Bryant Street (Intersection #75) signalized intersection operates at LOS F in the PM peak hour under Year 2040 Plus LRDP conditions with the TEP Expanded Alternative. The critical westbound through movement operates at LOS F during the PM peak. The LRDP would add two vehicle trips to the critical westbound through movement. While the westbound through movement is expected to operate at LOS F under Year 2040 Plus LRDP conditions, the LRDP's contribution would not be considered significant. The other critical movement at the intersection – northbound through – operates at LOS F during the PM peak. The LRDP would add no vehicle trips to the northbound through movement. Therefore, the LRDP's contribution would not be considered significant. Therefore, the LRDP's impact at this intersection with the TEP Expanded Alternative proposal for 16th Street would be considered ***less than significant***.

Although the LRDP is not projected to cause any new significant impacts to traffic circulation at the Mission Center Campus Site, the improvement measure below could be implemented to lessen the effect of SOV vehicles in the project vicinity.

Improvement Measure IM-TR-5c: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips to the Mission Center Campus Site

- UCSF shall continue to investigate and implement TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

5.3 YEAR 2040 TRANSIT IMPACTS

This section presents a discussion of transit conditions in Year 2040 for each of the four campus sites. LRDP-generated transit trips under Year 2040 conditions are presented Section 3.6 and Section 4.3 describes the estimated peak hour transit trip assignments.

5.3.1 SF Muni

As described in Section 5.1.3, the TEP is estimated to be fully implemented by Year 2040. The TEP will improve Muni's reliability, reduce travel times and provide frequent service. Descriptions of TEP improvements that relate to each campus site are included in Chapter 2.

There is an anticipated increase in background Muni riders between Existing Plus Project and Year 2040 Conditions at all four campus sites. Future transit improvements including the TEP, Geary BRT, and Central Subway project would increase transit capacity to the four campus sites in anticipation of this background growth. While there would be a general increase in ridership that is expected through the Year 2040, the LRDP would not create excess demand for public transit that would require the development or expansion of mass transit facilities, the development of which would cause significant environmental impacts.

As described in Section 1.2.6, as a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP or LRDP Variant, would continue to do so in particular at the four UCSF campus sites where development is proposed. As the campus sites develop, UCSF would monitor vehicle traffic conditions, transit operations, and shuttle ridership within and surrounding the campus sites. This monitoring program would be informed by the annual UCSF Employee Transportation Survey, the existing UCSF shuttle program monitoring[17], UCSF staff, students, and patients and visitors, and campus site observations by Transportation Services staff, and ongoing coordination with SFMTA staff.

The results of the various monitoring efforts would be used to inform when and whether UCSF would:

- Implement additional TDM strategies that seek to minimize the number of single occupancy vehicle trips (SOV) generated by the LRDP;
- Revise UCSF Shuttle system operations; and/or
- Introduce or enhance campus-wide or specific measures to reduce conflicts with Muni service.

Should the need for additional shuttle service be triggered by increased ridership due to shifts in travel mode or demand generated by the 2014 LRDP or LRDP Variant, UCSF Transportation Services would first review that the additional service would not negatively affect Muni operations. Once implemented, the additional service would be monitored to the same standard as that identified above. Further, should conflicts between shuttle service and Muni service arise, UCSF Transportation Services would coordinate with SFMTA staff to resolve these conflicts and ensure UCSF shuttles do not negatively affect Muni operations.

As described in Chapter 2, the SFMTA plans to add new transit vehicles to increase capacity on many Muni routes that serve the four UCSF campus sites. These improvements are designed to increase service reliability and accommodate a forecasted increase in transit ridership due to projected development throughout San Francisco. These additional transit vehicles would require expanded storage and maintenance facilities to accommodate the fleet growth. The SFMTA conducted a needs assessment study[18] in 2013 to review the existing facilities and determine what facilities would be required to accommodate this projected growth. This study determined that many of the Muni's storage,

[17] UCSF monitors its shuttle ridership demand by conducting monthly audits to capture boarding data, and the data is used to continually adjust shuttle operations to meet peak ridership demand. The monthly audits are conducted for one entire week (five business days) on all routes, throughout the entire day. In addition, UCSF conducts an annual UCSF Transportation Survey that is distributed to all members of our community. The data is used to measure and benchmark the efficacy of the existing TDM programs, and assist in designing new programs.

[18] *The SFMTA's Real Estate and Facilities Vision for the 21st Century* (SFMTA and Parsons Brinckerhoff, January 2013).The environmental review for this study is expected to begin in the second half of 2014.

maintenance, and operations facilities are at maximum capacity and not seismically safe and therefore Muni will need to upgrade existing facilities and build new facilities to accommodate the anticipated fleet growth. While the 2014 LRDP and LRDP Variant would increase ridership on the Muni routes serving the four campus sites, this increase in ridership would not exceed the existing or planned capacity of routes serving the campus. As described in Section 1.2.6, UCSF Transportation Services performs monthly auditing. Should they find that public transit to and from UCSF campuses does not meet demand, they will adjust shuttle operations (which may include providing additional shuttle service) where necessary to meet demand, Therefore, the 2014 LRDP or LRDP Variant would not require the expansion or replacement of public transit facilities. For the above reasons, the 2014 LRDP or LRDP Variant, in combination with past, present and reasonably foreseeable development in San Francisco, would have ***less than significant*** Year 2040 SF Muni transit impacts.

5.3.2 Regional Transit Service

UCSF staff, patrons and students are anticipated to continue to use BART, AC Transit, Caltrain, SamTrans, and Golden Gate Transit for regional transit service through Year 2040. Regional service stations are likely to remain at existing locations, over half a mile away, and can be accessed by other transit modes such as SF Muni and the UCSF shuttle.

As presented in Chapter 2, Caltrain is proposing to implement a Modernization Program that will electrify the railway to provide upgraded performance and allow more efficient operations and a higher capacity. It is assumed that in the cumulative transit scenario that this program has been implemented. There are currently 10 trains per hour during peak periods and the Modernization Program will allow the number of trains to increase to 12 trains per hour. Additionally, Caltrain is anticipating a "blended system" which will see California High Speed Rail trains running alongside Caltrain on the same tracks. Electrification of Caltrain (and the associated improved travel times and frequencies) as well as the introduction of High Speed Rail may improve transit access for the Mission Bay campus site.

While there would be a general increase in regional transit ridership that is expected through the Year 2040, the 2014 LRDP or LRDP Variant would not create excess demand for public transit that would require the development or expansion of mass transit facilities, the development of which would cause significant environmental impacts. For the above reasons, the 2014 LRDP or LRDP Variant, in combination with past, present and reasonably foreseeable development in San Francisco, would have ***less than significant*** Year 2040 regional transit service impacts.

5.3.3 UCSF Shuttle Service

UCSF shuttle service operations, as summarized in Chapter, 2 will continue to serve the four campus sites through Year 2040. As the 2014 LRDP or LRDP Variant moves forward, additional shuttle stops will likely be constructed fronting the new facilities depending on future shuttle ridership demand. The 2014 LRDP or LRDP Variant do not propose specific changes to shuttle service headways, although UCSF Transportation Services regularly monitors system wide shuttle ridership and may change headways or routes based on shifting demand as LRDP projects are constructed and occupied at each respective campus site.

The *UCSF Shuttle Operations Study Final Report*[19] analyzed cumulative demand on the shuttle program. Population growth projections were made for the cumulative year and population group mode splits, by campus site, and trip rates were used to calculate the number of new daily shuttle trips created by new populations on a campus-by-campus basis. Shuttle growth projections per line were calculated based upon the proportionate increases in population at campuses served by each line. The analysis found that four lines would experience ridership growth of more than ten percent (Gold: 50 percent, Blue: 50 percent, Grey: 45 percent, and Red: 35 percent (all figures approx.)). Recommendations for increasing the capacity of these four lines to adequately address these cumulative demand increases were included in the report. These recommendations include increasing peak period shuttle capacity by introducing additional vehicles and reassigning different capacity vehicles to specific lines.

As described in Section 1.2.6, UCSF Transportation Services monitor shuttle performance through a monthly auditing process and implement operational adjustments (which may include additional service) where necessary to meet demand. Therefore, the 2014 LRDP or LRDP Variant would not create excess demand for transit that would require the development or expansion of mass transit facilities. Either of these findings would cause significant environmental impacts. Thus, peak hour Year 2040 UCSF shuttle trips would result in a ***less-than-significant impact***.

5.4 YEAR 2040 PEDESTRIAN IMPACTS

Pedestrian circulation impacts by their nature are site-specific and generally do not contribute to impacts from other development projects. As indicated in Section 4.4, the 2014 LRDP or LRDP Variant would not result in overcrowding of sidewalks or create new potentially hazardous conditions for pedestrians under existing conditions.

While the neighborhoods surrounding the Parnassus Heights, Mount Zion, and Mission Center campus sites are unlikely to change dramatically in the future, the Mission Bay campus site is in the middle of a fast growing new neighborhood that will include many new residential, office, and entertainment land uses in the future. Future land uses associated with the Mission Bay Development Plan, Eastern Neighborhoods Community Plan, and the proposed Warriors arena will change the character surrounding the Mission Bay campus site to a dense urban environment. As developments are proposed, improved sidewalks and pedestrian facilities would be required for new developments to accommodate growth in pedestrian trips in the surrounding neighborhood.

For all four campus sites, pedestrian trips throughout the City may increase under the Year 2040 scenario due to general growth. Existing and proposed pedestrian facilities at each of the campus sites are designed to facilitate safe and easy pedestrian paths of travel. Walk trips may increase between the completion of the LRDP and the Year 2040 conditions due to increasing effectiveness of TDM measures in reducing vehicle trips. Because transit users would walk between the transit stops and the four campus sites, TDM measures such as promoting effective use of transit could over time increase the number of pedestrians accessing the four campus sites from surrounding neighborhoods.

As described in Section 1.2.6, as a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP or LRDP Variant,

[19] Nelson\Nygaard. 2014. Shuttle Operations Study Final Report, January, 2014

would continue to do so in particular at the four UCSF campus sites where development is proposed. As the campus sites develop, UCSF will continue to monitor pedestrian conditions to ensure increased pedestrian volumes due to the 2014 LRDP or LRDP Variant do not cause overcrowding of sidewalks under the Year 2040 Conditions. This monitoring program would be informed by the annual UCSF Employee Transportation Survey, the existing UCSF shuttle program monitoring, UCSF staff, students, and patients and visitors, and campus site observations by Transportation Services staff, and ongoing coordination with SFMTA staff.

There is an anticipated increase in background automobile traffic between Existing Plus Project and Year 2040 Conditions at all four campus sites, as shown in the Year 2040 traffic forecasts. This will result in an increase in automobile-pedestrian conflicts at intersections and driveways in the study area. While there would be a general increase in vehicle traffic that is expected through the future scenario, UCSF would continue to monitor pedestrian conditions to ensure the LRDP would not create substantial conflicts between pedestrians and autos, bicyclists, or transit vehicles. For the above reasons, the 2014 LRDP or LRDP Variant, in combination with past, present and reasonably foreseeable development in San Francisco, would have ***less than significant*** Year 2040 pedestrian impacts.

5.5 YEAR 2040 BICYCLE IMPACTS

Bicycle circulation and facility impacts by their nature are site-specific and generally do not contribute to impacts from other development projects. Similar to the pedestrian conditions, bicycling conditions would change the most surrounding the Mission Bay campus site as it is in the middle of a fast growing new neighborhood. As developments are proposed, improved bicycle facilities would be required for new developments to accommodate growth in bicycle trips in the surrounding neighborhood. For all four campus sites, bicycle trips throughout the City may increase under the Year 2040 scenario due to general growth.

As described in Section 1.2.6, as a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP or LRDP Variant, would continue to do so in particular at the four UCSF campus sites where development is proposed. As the campus sites develop, UCSF will continue to monitor bicycle conditions and improve facilities if needed to ensure the growth due to the 2014 LRDP or LRDP Variant remains compatible with bicycling to prevent overcrowding of bicycle facilities (bicycle routes). In addition, UCSF will monitor bicycle parking to ensure the supply accommodates future demand at the four campus sites.

This monitoring program would be informed by the annual UCSF Employee Transportation Survey, the existing UCSF shuttle program monitoring, UCSF staff, students, and patients and visitors, and campus site observations by Transportation Services staff, and ongoing coordination with SFMTA staff.

There is an anticipated increase in background automobile traffic between Existing Plus Project and Year 2040 Conditions at all four campus sites, as shown in the Year 2040 traffic forecasts. This will result in an increase in automobile-bicycle conflicts at intersections and driveways in the study area. While there would be a general increase in vehicle traffic that is expected through the future Year 2040 scenario, UCSF would continue to monitor bicycle conditions to ensure the LRDP would not create substantial conflicts between bicyclists and autos, pedestrians, or transit vehicles. For the above reasons, the 2014 LRDP or LRDP Variant, in combination with past, present and reasonably foreseeable development in San Francisco, would have ***less than significant*** Year 2040 bicycle impacts.

5.6 YEAR 2040 LOADING IMPACTS

Loading impacts, similar to pedestrian and bicycle impacts, are by their nature localized and site-specific, and would not contribute to impacts from other development projects near the four campus sites. Parnassus Heights, Mount Zion and Mission Center campus sites will likely experience little to no change in loading activity in the Year 2040 since the uses that make up the campus sites are generally the same. The development of the Mission Bay campus site should result in a further shift in the land uses surrounding the campus site from a neighborhood whose primary land uses are residential, warehousing, and light industrial neighborhood to a mixed-use neighborhood. This would likely result in a decrease in vehicle loading activities associated with warehouses and production and an increase in passenger loading and residential or commercial delivery services. Providing adequate loading facilities for the 2014 LRDP or LRDP Variant as described in **Section 4.6.** would ensure that future changes to loading activity adjacent to the campus sites would not create potential loading conflicts under Year 2040 Conditions.

As described in Section 1.2.6, as a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP or LRDP Variant, would continue to do so in particular at the four UCSF campus sites where development is proposed. As the campus sites develop, UCSF will continue to monitor loading conditions to ensure they are sufficient to accommodate the 2014 LRDP or LRDP Variant loading demand and do not create potentially hazardous conditions or significant delays affecting traffic, transit, bicycles, or pedestrians. This monitoring program would be informed by the annual UCSF Employee Transportation Survey, the existing UCSF shuttle program monitoring, UCSF staff, students, and patients and visitors, and campus site observations by Transportation Services staff, and ongoing coordination with SFMTA staff.

There is an anticipated increase in background automobile traffic between Existing Plus Project and Year 2040 Conditions at all four campus sites, as shown in the Year 2040 traffic forecasts. This will result in an increase in loading conflicts at intersections and driveways in the campus sites. While there would be a general increase in vehicle traffic that is expected through the future Year 2040 scenario, the 2014 LRDP or LRDP Variant would not create potentially hazardous conditions or significant delays affecting traffic, transit, bicycles, or pedestrians, or otherwise interfere with loading access to the campus sites and adjoining areas. For the above reasons, the 2014 LRDP or LRDP Variant, in combination with past, present and reasonably foreseeable development in San Francisco, would have ***less-than-significant*** Year 2040 loading impacts.

5.7 YEAR 2040 PARKING IMPACTS

While the neighborhoods surrounding the Parnassus Heights, Mount Zion, and Mission Center campus sites are unlikely to change dramatically in the future, the Mission Bay campus site is in the middle of a fast growing new neighborhood that will include many new residential, office, and entertainment land uses in the future. Future land uses associated with the Mission Bay Development Plan, Eastern Neighborhoods Community Plan, and the proposed Warriors arena will change the character surrounding the Mission Bay campus site to a dense urban environment.

As described in Section 1.2.6, as a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP or LRDP Variant,

would continue to do so in particular at the four UCSF campus sites where development is proposed. As developments are proposed, UCSF would UCSF would monitor parking demand at each phase of development and adjust parking supply as demand warrants. Parking facilities would be required for new developments to accommodate growth in parking demand in the surrounding neighborhood. Improvements to the transit network as described in Chapter 2 and off-street parking for the new developments would ensure that future changes to parking demand adjacent to the campus sites would not exceed the parking supply under Year 2040 Conditions. Should the demand for parking exceed on-site supply, priority for on-site parking would be given to patients and visitors and essential health-care providers at the major clinical sites, and if necessary, UCSF would look to secure off-site parking to satisfy demand. That additional parking supply could be provided on campus sites, if available, or elsewhere in the vicinity. As the sites develop, UCSF (through its Campus Transportation Services Offices) will make efforts to educate faculty, staff, and students about transit options in order to reduce auto usage and parking demand. Thus, the parking impacts under 2014 LRDP or LRDP Variant build-out would be ***less than significant***.

5.8 YEAR 2040 CONSTRUCTION IMPACTS

Construction impacts are localized and site-specific, and would not contribute to impacts from other development projects near the four campus sites. The assessment of construction activity at each campus site may change between the completion of the 2014 LRDP or LRDP Variant and the Year 2040 scenario due to additional non-LRDP projects on the campus sites and the surrounding area and due to timing of implementation of all aspects of the LRDP. Year 2040 impacts of nearby construction projects should not be considered as the construction would be temporary and the project sponsor would coordinate with various City departments such as SFMTA and DPW through the TASC to develop coordinated plans that would address construction-related issues. For the above reasons, the 2014 LRDP or LRDP Variant, in combination with past, present and reasonably foreseeable development in San Francisco, would have ***less than significant*** Year 2040 construction impacts.

6 SUMMARY OF TRANSPORTATION MITIGATION AND IMPROVEMENT MEASURES

This chapter presents the transportation mitigation measures that would be required to reduce the significant impacts of the LRDP. In some cases, no significant impact was identified; however, an improvement measure was noted that would improve conditions. These mitigation and improvement measures were developed for the Existing plus Project and Year 2040 conditions, as appropriate.

6.1 MITIGATION MEASURES

Mitigation Measure TR-1a: Construction Coordination and Monitoring Measures

Traffic Control Plan for Construction – In order to reduce potential conflicts between construction activities and pedestrians, transit and autos during construction activities at the Parnassus Heights campus site, UCSF shall require construction contractor(s) to prepare a traffic control plan for major phases of project construction (e.g. demolition, construction, or renovation of individual buildings). UCSF and their construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations (e.g. Parnassus Avenue) and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction of the LRDP projects. For any work within the public right-of-way, the contractor would be required to comply with the City of San Francisco's Regulations for Working in San Francisco Streets, which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic.

In the event that the construction timeframes of the major phases and other development projects adjacent to UCSF overlap, UCSF should coordinate with City Agencies through the TASC and the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation impacts. UCSF, in conjunction with the adjacent developer, shall propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as staggering start and end times, coordinated material drop offs, collective worker parking and transit to job site and other measures.

Reduce SOV Mode Share for Construction Workers – In order to minimize parking demand and vehicle trips associated with construction workers, UCSF shall require the construction contractor to include in the Traffic Control Plan for Construction methods to encourage walking, bicycling, carpooling, and transit access to the campus sites by construction workers in the coordinated plan.

Project Construction Updates for Adjacent Residents and Businesses – In order to minimize construction impacts on access for nearby residences, institutions, and businesses, UCSF shall provide nearby residences and adjacent businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and lane closures via a newsletter and/or website.

Mitigation Measures TR-1b through 2e would result in similar findings for the remaining significant construction impacts at the Mission Bay, Mount Zion, and Mission Center campus sites.

Mitigation Measure TR-2a: Implement the Moderate Alternative of the TEP 16th Street Proposal

Two mixed-flow travel lanes in each direction would be required to improve operations at 16th Street/Fourth Street to acceptable levels of service in the AM peak hour. As such, this mitigation measure would require that the Moderate Alternative of the TEP 16th Street proposal be implemented in order to maintain the requisite traffic carrying capacity of 16th Street for the forecasted traffic demand with the LRDP in place. The implementation of this measure would improve traffic operations from LOS E to LOS D in the AM peak hour and reduce the impacts to less-than-significant levels. The implementation of this mitigation measure will require further study and coordination with other agencies for approval and is outside the jurisdiction of UCSF. Therefore, this impact is considered ***significant and unavoidable***.

Mitigation Measures TR-2b through 2d would result in similar findings for the remaining significant intersection impacts at the Mission Bay Campus Site.

Mitigation Measure TR-3a: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips

- UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

- UCSF will monitor traffic conditions within and immediately surrounding the Mission Bay Campus Site as presented in Section 1.2.6. Should traffic conditions approach unacceptable levels, (LOS E or F), and should UCSF's contribution to this cumulative impact be significant, UCSF shall implement additional TDM strategies that it investigates (beyond those identified in its existing TDM program presented in **Table 2-1** and beyond those proposed in the 2014 LRDP) and finds could reasonably result in a reduction in SOV trips. The additional TDM strategies shall target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods.

The implementation of this mitigation measure would improve traffic operations along 16th Street by reducing SOV trips to and from the Mission Bay Campus Site by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. Therefore, any combination of or increase in expenditure to TDM strategies at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

Mitigation Measures TR-3b through 3d and TR-3h would result in similar findings for the remaining significant intersection impacts at the Mission Bay Campus Site.

The implementation of this Mitigation Measures TR-3e through TR-3g and the inclusion of the additional TDM strategies presented in Section 1.2.5 would improve traffic operations surrounding and within the Mission Bay campus site. The TDM strategies presented in Section 1.2.5 were recently proposed by UCSF and hence were not assumed in the travel demand calculations presented in Chapter 3. These TDM strategies would reduce SOV trips by approximately three percent, which would represent a three percent reduction in the overall vehicle trips generated by the campus site. The implementation of this measure by UCSF and the associated reduction in vehicle trips to the Mission Bay campus site would improve traffic operations at 16th Street/Seventh Street (Moderate Alternative) and Mariposa Street/Third Street (Moderate and Expanded Alternatives) from LOS E to LOS D in the AM peak hour and reduce these impacts to ***less-than-significant*** levels.

Mitigation Measure TR-4a: Manage Parking Supply

UCSF will continue to monitor the parking supply at the Mission Bay Campus Site so as not to oversupply parking at this campus site. As presented in Section 4.7, the currently there is a downward trend in parking supply at the Mission Bay Campus Site as it is expected to grow at a lower rate than total population. Monitoring and reducing the future parking supply per person at the Mission Bay Campus Site would improve traffic operations along 16th Street by reducing SOV trips to and from the Mission Bay Campus Site. However, similar to Mitigation Measure TR-3a, any combination of reduced parking at the Mission Bay Campus Site could not reduce vehicular trips by the 90 to 95 percent that would be required to sufficiently lessen the impacts identified along 16th Street under the TEP Expanded Alternative. Therefore, even with the implementation of this mitigation measure, this impact would still be considered ***significant and unavoidable***.

Mitigation Measures TR-4b through 4d would result in similar findings for the remaining significant intersection impacts at the Mission Bay Campus Site.

6.2 IMPROVEMENT MEASURES

Improvement Measure IM-TR-1: Study and Implement Uses to Minimize Transit Trips on the Muni T Third Street Line

- Development of clinical uses on Blocks 33/34 is considered a "secondary use" under the Mission Bay South Redevelopment Plan, which requires findings by the Office of Community Investment and Infrastructure that the use is consistent with the Mission Bay South Redevelopment Plan. UCSF would continue to study the amount of clinical space proposed under the LRDP Variant, and would refine the proposal before bringing it forth to the City for approval. In refining the LRDP Variant, UCSF would consider reducing the size of the clinical facilities at Blocks 33/34 to a level that will reduce the transit ridership on the T Third Street to less than the Muni's capacity utilization of 85 percent.

Improvement Measure TR-2: Add Curbside Loading Zone on Folsom Street

UCSF could work with the SFMTA to add a curbside loading zone on Folsom Street, adjacent to the existing Mission Center building. A 50 foot loading zone would require the removal of approximately two parking spaces on Folsom Street. This loading zone will improve conditions for bicyclists whom may have their path currently blocked due to vehicles loading in the northbound bicycle lane.

Improvement Measure IM-TR-3: Implement High-Visibility Bicycle Lanes on Harrison Street

UCSF could work with the SFMTA to implement measures to increase the visibility of southbound bicyclists for vehicles entering the Mission Center campus site from Harrison Street. This could include implement high-visibility green skip striping across the conflict zone in front of the Mission Center campus site driveway along Harrison Street.

Improvement Measure IM-TR-4: Add Passenger Loading to Scott Street

UCSF could work with the SFMTA to add a curbside passenger loading zone on Scott Street. An additional 50 foot loading zone would require the removal of approximately two metered parking spaces on Scott Street. This loading zone will reduce overflow for passenger loading on Scott Street.

Improvement Measure IM-TR-5a: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips to the Parnassus Heights Campus Site

- UCSF shall continue to investigate and implement TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20 year-horizon of the LRDP.

Improvement Measures IM-TR-5b and 5c would result in similar findings at the Mount Zion and Mission Center Campus Sites.

APPENDICES

Appendix A: Approved Scope of Work

Appendix B: Roadway Network Classifications (From SF General Plan)

Appendix C: Intersection Level of Service Calculations

Appendix D: Traffic Volume and Intersection Turning Movement Counts

Appendix E: Analysis Assumptions

Appendix F: Travel Demand Calculations

APPENDIX A: APPROVED SCOPE OF WORK

University of California San Francisco:
Long-Range Development Plan Environmental Impact Report

Draft Transportation Scope of Work – July 10, 2013

This document presents the draft scope of work for the transportation component for the University of California San Francisco (UCSF) Long-Range Development Plan (LRDP) Environmental Impact Report (EIR). Fehr & Peers and Adavant Consulting, collectively the "transportation team," will complete stand-alone transportation impact studies that include technical analysis to support the environmental documentation being prepared for the LRDP for the Parnassus Heights, Mount Zion, Mission Bay, and Mission Center campus sites, as well as San Francisco General Hospital. As noted in the RFP, long-term changes at the University's Laurel Heights Campus are being considered separately from the LRDP at this time; therefore, this scope of work excludes transportation planning work on the Laurel Heights site.

Task 1 – Project Scoping and Coordination

Although not required, UCSF has traditionally provided the City of San Francisco Planning Department the opportunity to review and comment on proposed transportation analysis work scopes. Thus, prior to beginning work on this study, we will work with UCSF Campus Planning staff and City staff to refine our scope of work. We anticipate that this will include providing the Environmental Planning ("EP") Section of the Planning Department a chance to review this proposed scope of work, as well communicating with the San Francisco Municipal Transportation Agency ("SFMTA") and the Successor Agency to the San Francisco Redevelopment Authority (for Mission Bay). This initial collaboration will help minimize potential issues which might arise during later phases of the analysis and the Draft EIR public comment period, such as methodology, assumptions and data collection needs. Comments received during this task will be included in a revised scope of work provided to UCSF and the EIR team. The discussion will focus on items such as:

- Additional data collection (locations, time periods, type of data, adequacy of data, etc.);
- Review of assumptions (study area, land use types, cumulative growth, etc.);
- Methodology (LOS methodology, trip generation methodology and appropriate sources, travel forecasts, etc.); and
- Deliverables (report organization, draft reports, final report).

The transportation team anticipates the need to regularly meet with and discuss the status and issues of the LRDP EIR over the course of the study. This scope of work assumes that this will involve one study team meeting with UCSF staff every two weeks, the EIR team, and local agency staff and stakeholders.

As part of this coordination, the transportation team will confirm the description of the proposed LRDP development plans. The team will include a comparison to the existing uses on the campuses in the Project Description section of the transportation impact study. This section will include a brief description of each of the proposed development plans, including location, type of land uses proposed, their size by population/user type, and proposed time frame for implementation. A map included in the report will indicate the location of the elements of the development plan in relation to the rest of the campus site, as well as other LRDP plans at other sites.

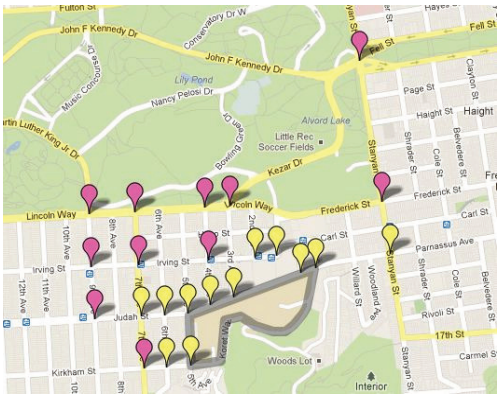
Task 2 – Data Collection

The transportation team has recently collected transportation data for areas around the Parnassus Heights Campus and Mission Bay sites. Additional data will be collected to supplement existing data for those sites, including new intersection turning movement counts and on-street parking occupancy surveys. New data will be collected around the Mission Center Building and Mount Zion sites. We propose to collect the following data:

Field Visit –

As part of the data collection task, the transportation team will visit each of the four campus sites to confirm existing transportation conditions and collect information about traffic and transit operations, bicycle and pedestrian activity, and parking and loading areas. For some of our work, institutional knowledge of key issues and constraints will make these observations more valuable. Therefore, as part of the data collection effort, the transportation team will coordinate with UCSF staff to conduct walking tours at each campus site. During these tours, the team will observe existing conditions, visit areas of concern, and identify potential constraints that should be considered in the analyses.

Traffic –



Parnassus Heights: This scope of work assumes that a total of 23 study intersections (see left and noted below) would be analyzed in the transportation impact study during the weekday AM and PM peak hour periods. Of these, 12 intersections (yellow) were evaluated as part of the UC Hall Options Study analysis, for which PM peak period counts were collected in 2011. New AM peak period counts will be collected at all study intersections and new PM peak period counts will be collected at the remaining 11 study intersections (violet).

1. 7th/Kirkham
2. 6th/Kirkham
3. 5th/Kirkham
4. 9th/Judah
5. 7th/Judah
6. 6th/Judah

6.	14th/Folsom	14.	16th/Bryant
7.	15th/Folsom	15.	16th/Mission
8.	16th/Folsom		

Transit –

The transportation team will compile local and regional public transit information on those lines providing service to the four campus sites, using already available data from the local and regional transit operators. The transit description will include the general hours of operation, approximate frequency of service, and major destinations served.

The transportation team will request and summarize UCSF shuttle origins and destinations, operational characteristics and ridership information as provided by UCSF Transportation staff.

Pedestrian/Bicycle –

The transportation team will collect the pedestrian counts during the midday period, and bicycle counts during the AM and PM peak periods.

Parnassus Heights: The transportation team assumes that pedestrian and bicycle counts conducted in 2007 and 2011 are sufficient for use in this analysis because conditions have not substantially changed.

Mission Bay: The transportation team will collect new pedestrian and bicycle counts at up to four intersections or sidewalk locations in or adjacent to the site.

Mount Zion and Mission Center: New pedestrian and bicycle counts will be collected at up to four locations at each site.

Parking –

The transportation team will collect new weekday midday and evening (10:00 AM to 2:00 PM; 6:00 to 8:00 PM) on-street parking occupancy surveys within approximately ¼ mile of each campus site:

Parnassus Heights: Parnassus Avenue, Stanyan Street, Waller Bicycle Learning Area-Kezar Drive, Lincoln Way, 10th Avenue, Kirkham Street

Mission Bay: Mariposa Street, 7th Street-Mississippi Street, Channel Street, Terry Francois Boulevard (Note: On-street parking is generally restricted on most streets within this area, making the amount of data to be collected smaller).

Mount Zion: California Street, Lyon Street-O'Farrell Street, Geary Blvd, Steiner Street

Mission Center: 17th Street, Mission Street, Bryant Street, 12th Street (Note: This data might already be available from the SFMTA, which will be confirmed as part of the initial study coordination.)

General information about current on-street parking regulations (time limits, neighborhood parking areas, meters, etc.) within the parking study area adjacent to each site will also be collected.

Utilization at public off-street parking lots and garages within the study area near the four sites will also be surveyed during the same time periods, as necessary to supplement existing data. Current information regarding hours of operation, and parking rates will also be gathered.

To fully assess the effect of the LRDP development proposals on each site- and/or neighborhood-wide conditions, the transportation team will also request on-campus parking garage usage data from UCSF staff. The team will use this information to document the relative effect that the LRDP will have to on-campus parking demand and supply, as well as affects to neighborhood parking conditions. This scope does not include parking turn-over or parking occupancy by vehicle type for spaces along Parnassus Avenue; however, the 2007 data can be updated as an optional task.

Loading –

The transportation team will confirm the existing loading space quantity, location, and type with staff and field review at each campus. These areas could be assessed during the campus site walking tours.

Construction –

The transportation team will request potential construction phasing information for elements of the LRDP development proposals, including duration, proposed construction management plans, worker parking plans, truck routing, etc.

Task 3 – Document Existing Conditions

The transportation team will document existing street traffic, circulation, parking, pedestrian, bicycle, and transit conditions in the vicinity of each campus site, including:

- A base map for each study area describing the street designations, street names, number of lanes, and traffic flow directions.
- Existing vehicular circulation conditions, especially relative to pedestrian and bicycle conditions
- Intersection level-of-service (LOS) conditions for the AM and PM peak hours, as determined by the 2000 Highway Capacity Manual Operations Methodology
- Figures indicating the AM and PM peak hour traffic volumes at the study intersections, including the critical lane groups (the lane groups that have the highest flow ratio for a given green signal phase)
- A map and discussion of existing public transit routes and stops, including capacity utilization for the transit lines providing access to each campus site
- A map and discussion of existing UCSF shuttle service, including operational activities, routes, and stops, hours of service, peak period headways, and type of vehicle shuttle
- A map and discussion of bicycle routes to/from each site and any changes to the bicycle network being proposed by the SF Bicycle Plan
- A discussion of pedestrian facilities on and near each campus site, with particular emphasis on pedestrian routes to transit stops
- Overall pedestrian and bicycle conditions at each campus site
- Detailed site plans where available as provided by UCSF to illustrate vehicular and pedestrian access locations and parking/loading facilities for specific buildings.
- A map and table presenting the off-street parking supply and midday and evening conditions
- A map and discussion of on-street parking conditions for midday and evening conditions
- A description of existing service loading operations, including the location and number of access points and loading spaces
- Description of existing TDM programs at each UCSF campus site

Task 4 – Determine Project Travel Demand

Subtask 4.1 Patient/Visitor Transportation Survey

As noted in the RFP, UCSF conducts regular transportation surveys of its faculty, staff and students to monitor its performance related to sustainability objectives and transportation demand management; however, the most recent comprehensive travel survey of the various campus sites that included patients and visitors was prepared in the 1990s. Since that time, UCSF and the transportation system with San Francisco have changed dramatically, including the construction of the Mission Bay site (as well as the Mission Bay neighborhood) and changes to Muni public transportation service throughout the City. This task includes the administration and documentation of a transportation survey to update this data.

Survey Development

Through coordination with UCSF, the transportation team will develop a patient/visitor transportation survey in order to collect information about travel patterns and behavior for each site. The survey will include a brief introduction providing a summary of the intent of the survey and encouraging participation. The transportation team will provide a draft survey to UCSF prior to its administration. We will incorporate one round of comments. The following questions could be included in the survey:

- Where do you live? (city, zip code, cross streets)
- How did you get here today? (auto, transit, bike, walk, etc.)
- If you drove today, where did you park? (on-street/off-street, distance)
- How much will you pay for parking?
- Where did you travel from before you came here? (home, work, school, other; location)
- Where will you be going afterwards? (home, work, school, other; location)
- What was the purpose of your visit to UCSF today? (patient, visit a patient, other)

Survey Distribution

We will conduct the survey on two consecutive weekdays (preferably a Tuesday/Wednesday at each campus site or Wednesday/Thursday) in order to get a representative sample of patients/visitors. We propose two survey delivery options:

Option 1: UCSF Distributes Survey

We prefer that UCSF distribute the surveys, which will reduce patient and visitor disruption and will likely result in a higher response rate. We will work with UCSF to select a representative selection of departments. Once the survey dates are selected, the chosen departments will hand out surveys to all patients and visitors when they check in. They will be told that the survey is voluntary but will be asked to return completed surveys to the receptionist. We expect a high response rate from this distribution method because patients will have time to fill out the survey as they wait for their appointment. Additionally, they will understand that UCSF supports the data collection effort.

To supplement the surveys distributed by UCSF, the transportation team will also set up several tables/kiosks at several locations within the surveyed campuses on the two survey dates and will provide information about the survey intent and will also distribute additional surveys.

Option 2: Transportation Team Conducts Entire Survey

A second option is that the transportation team could undertake is to conduct an intercept survey. This will involve placing surveyors at key locations on each campus site that would stop persons entering the facility and ask whether they are a patient or visitor. Patients and visitors would be asked to complete the survey on the spot before entering the facility. However, this has the potential to create more disruption to campus activities since patients and visitors would be delayed in getting to their appointments, potentially resulting in a higher refusal rate than with Option 1. Option 2 would require a higher budget than Option 1 due to additional labor hours required to administer the survey.

UCSF will provide estimates on the approximate total number of staff, patients and visitors seen during the survey days at each site as well as average annual patient and visitor rates. This information will be used to determine the survey response rate and develop the appropriate survey coefficients.

Survey Analysis

The transportation team will use the survey results to estimate the mode split of patients and visitors for each facility. This data will be used to monitor UCSF's performance related to sustainability objectives and transportation demand management goals. The information can also assist in obtaining a peak patient/visitor parking demand per facility and in trip generation and trip distribution estimates. The survey results will be compiled in a memorandum and provided to UCSF. We will incorporate one round of revisions to the memo.

Subtask 4.2 Travel Demand

The transportation team will estimate the total number of net new person- and vehicle-trips generated by the LRDP development proposals on a typical weekday and during the weekday AM and PM peak hours for each campus site. The travel demand will be based on the expected increase in campus population by type (i.e., faculty, staff, students, etc.) as provided by UCSF. Individual trip generation rates by population type will be taken from the data developed in Task 4.1, information presented in the UCSF's Journey-to-Campus data, LRDP Amendment #3 FEIR (2005), recent analyses for UCSF's Mission Bay Medical Center FEIR (2008), the UC Hall Options Study (2011), Osher Center FEIR (2005 and 2007), and Mount Zion Garage Project FEIR (2011).

Trip Distribution / Modal Split – The trip distribution and modal split allocations will be estimated for each population group based on previously developed factors used in other UCSF studies and the travel surveys conducted as a part of this scope of work. Average vehicle occupancy factors derived from the same sources will then be applied to the auto person-trips to calculate the vehicle-trips.

Parking/Commercial Loading Demand **–** Peak daily parking demand will be estimated by data collected in Tasks 2 and 4.1, individual peak factors by population type taken from the data presented in the LRDP Amendment #3 FEIR (2005), and most recently used in the analysis of UCSF's Mission Bay Medical Center FEIR (2008). Commercial loading demand will be based on campus specific data to be provided by UCSF for the proposed uses, and supplemented with the information presented the City's Transportation Impact Analysis Guidelines (2002).

As described in Task 8 – Documentation, the transportation team will prepare a technical memorandum describing the assumptions and methodology to be used to determine the travel demand at each of the campus sites. The technical memorandum will also summarize the travel demand estimates for patients, visitors and employees for each campus by land use type, mode of travel and place of origin. This will also be submitted to UCSF staff for their review and final approval prior to performing the transportation impact analyses (Task 5).

Task 5 – Transportation Impact Analysis

The transportation team will identify potential transportation impacts associated with LRDP proposals at each campus, including impacts on the study intersections, plus impacts on transit, pedestrian and bicycle circulation. Potential impacts associated with the LRDP parking supply and demand, as well as passenger and freight loading supply and demand conditions will also be identified. The methodology used will be consistent with UCSF criteria for identifying significant impacts. The construction of new medical facilities and the demolition and renovation of some of the existing buildings being proposed as part of the LRDP will take place at different horizon years. Thus, transportation impacts will be evaluated under both existing and future year conditions.

Traffic –

The transportation team will estimate AM and PM peak hour turning movement volumes at the study intersections identified in Task 2 for each campus site, and will perform intersection level of service analysis using the HCM 2000 methodology. The following scenarios will be analyzed:

- Existing (four campus sites)
- Existing plus LRDP (four campus sites)

- Interim Year (±2020) plus LRDP (Mission Bay campus site only)
- 2040 Cumulative, including LRDP (four campus sites)

Interim and future year traffic conditions will be estimated from the most recent AM and PM peak hour highway assignments obtained from City of San Francisco travel demand forecasting model for the appropriate years (2020 and 2040) as developed by the SF County Transportation Authority (SFCTA). The model results will be adjusted, if necessary, to properly reflect the latest information available about major development projects being planned in the vicinity of some campus sites, such as Mission Bay.

Transit –

The transportation team will use the forecasted increase in weekday peak hour transit trips to generally discuss transit conditions with the additional LRDP-generated transit trips. The discussion will also include a qualitative analysis of transit access walk trips from the each campus site to transit, such as inadequate sidewalks, unsafe pedestrian crossings or other related improvements affecting adequate access to transit service. Increased shuttle ridership on UCSF shuttles will also be discussed.

Bicycle/Pedestrian –

The transportation team will qualitatively assess pedestrian and bicycle conditions in the vicinity of each campus site as a result of the LRDP proposals. Potential conflicts between LRDP-generated vehicle traffic and pedestrian and bicycle circulation will be qualitatively assessed, and conflict areas will be identified.

Parking
The transportation team will use the parking information collected to document how parking demand associated with the LRDP proposals could affect on-campus or off-campus parking supply. If the analysis shows that parking demand may exceed supply, the transportation team will work with UCSF to identify potential strategies to reduce parking demand or manage on-street supply to reduce potential consequences overflow parking. We will qualitatively assess the potential for parking to spill over to adjacent neighborhoods.

Loading –

The transportation team will use the loading demand calculated in Task 4 to conduct an overall loading supply/demand evaluation at each campus site. This analysis will also include a discussion of potential transportation-related issues associated with relocating or consolidating loading activities to certain areas of the site.

Based on the travel demand forecasts, the transportation team will qualitatively discuss potential passenger loading issues and activities at each campus site. Passenger loading and unloading operations planned to occur at each site will be identified. The potential for conflicts of these passenger activities with traffic, transit, pedestrian and bicycle flows will be discussed.

Construction –

The transportation team will qualitatively evaluate potential short-term construction impacts that could be created by the LRDP proposals. Construction impact evaluation will address the duration of construction activity, possible truck routings, and estimated daily truck volumes

Task 6 – Develop and Evaluate Potential Mitigation Measures, TDM Measures and Identify Improvements

Based on the results of impact analysis, the transportation team will work with UCSF staff to identify potential measures, if necessary, to mitigate any significant transportation impacts to a non-significant level. The analysis will include an assessment of additional TDM measures that could be implemented to reduce the number of single-occupant vehicles and increase the number of carpoolers and transit riders on campus, including a reduction in the parking supply ratios, increased parking rates, additional transit incentives, etc. The effectiveness of the specific TDM measures will be estimated based on past experiences at the UCSF campuses, similar plans being proposed for other locations in San Francisco, and best practices at other institutional locations as reported in the literature.

The transportation team will also work with UCSF to identify and assess potential transportation improvements (e.g., provision of bicycle racks, additional TDM measures, etc.) that although not necessary to mitigate transportation impacts, would facilitate and improve travel to/from the campus sites by means other than single occupant automobile.

Task 7 – Transportation Study Report

The transportation team's first deliverable will be a technical memorandum summarizing the transportation survey methodology, implementation and results, and the travel demand forecast estimates for each campus site, as described in Task 4. The transportation team will respond to one round of comments from UCSF and will submit a final draft technical memorandum to UCSF for inclusion in the transportation study reports.

The transportation team will prepare a Draft One Transportation Study Report for each campus site, incorporating data, analyses, and conclusions from the previous tasks. These reports will be submitted to UCSF staff for review. The transportation team will respond to one round of comments from UCSF and will submit a Draft Two report for each campus site to UCSF. The transportation team will incorporate the final comments from UCSF, and prepare a Final Transportation Study Report for each campus site.

Task 8 – Environmental Impact Report

The transportation team will coordinate with UCSF staff and Environmental Science Associates (ESA) on the preparation of the transportation section for the Administrative Draft document of the UCSF LRDP EIR to be written by ESA. We assume for budgeting purposes 50 hours for coordination and that no new technical analysis will be necessary.

After Draft EIR circulation, we will review relevant public comments with UCSF Staff and ESA on the transportation section to help provide recommended responses. We assume for budgeting purposes 24 hours for the preparation of the response to public comments and that no new technical analysis will be necessary.

APPENDIX B: ROADWAY NETWORK CLASSIFICATIONS (FROM SF GENERAL PLAN)

Roadway Classifications

The San Francisco Planning Department has developed a street hierarchy system for the City and County of San Francisco, in which the function and design of each street are consistent with the character and use of adjacent land. The major classifications in the Vehicle Circulation Plan of the San Francisco *General Plan* are:

- **Freeways:** Limited access, very high capacity facilities; primary function is to carry intercity traffic; they may, as a result of route location, also serve the secondary function of providing for travel between distant sections in the city.
- **Major Arterials:** Cross-town thoroughfares whose primary function is to link districts within the city and to distribute traffic from and to the freeways; these are routes generally of citywide significance; of varying capacity depending on the travel demand for the specific direction and adjacent land uses.
- **Transit Conflict Streets:** Streets with a primary transit function which are not classified as major arterials but experience significant conflicts with automobile traffic.
- **Secondary Arterials:** Primarily intra-district routes of varying capacity serving as collectors for the major thoroughfares; in some cases supplemental to the major arterial system.
- **Recreational Streets:** A special category of street whose major function is to provide for slow pleasure drives and cyclist and pedestrian use; more highly valued for recreational use than for traffic movement. The order of priority for these streets should be to accommodate: 1) pedestrians, hiking trails or wilderness routes, as appropriate; 2) cyclists; 3) equestrians; 4) automobile scenic driving. This should be slow and consistent with the topography and nature of the area.
- **Collector Streets:** Relatively low-capacity streets serving local distribution functions primarily in large, low-density areas, connecting to major and secondary arterials.
- **Local Streets:** All other streets intended for access to abutting residential and other land uses, rather than for through traffic; generally of lowest capacity.

In addition to the San Francisco Planning Department's roadway classifications, the freeways, major arterials, and transit conflict streets are included in the Congestion Management Program (CMP) Network and Metropolitan Transportation System (MTS) Network (see below).

Transit Preferential Streets

The Transit Preferential Street network classification system takes into consideration all transportation functions, and identifies the major transit routes where general traffic should be routed away from. There are two classifications of transit preferential streets: Primary Transit Streets, which are either transit-oriented or transit-important; and Secondary Transit Streets.

- **Primary Transit Street – Transit-Oriented:** Not major arterials, with either high transit ridership, a high frequency of service, or surface rail. Along these streets, the emphasis should be on moving transit vehicles, and impacts on automobile traffic should be of secondary concern.

- **Primary Transit Street – Transit-Important:** Major arterials, with either high transit ridership, high frequency of service, or surface rail. Along these streets, the goal is to improve the balance between modes of transportation, and the emphasis should be on moving people and goods, rather than on moving vehicles.
- **Secondary Transit Street:** Medium transit ridership and low-to-medium frequency of service, or medium frequency of service and low-to-medium transit ridership, or connects two or more major destinations.

In general, it is City policy that transit preferential treatments should be concentrated on the most important transit streets, and the treatments applied should respond to all transportation needs of the street. For example, on streets that are major arterials for transit and not for automobile traffic, treatments should emphasize transit priority; on streets that are major arterials for both transit and automobiles, treatments should emphasize a balance between the modes. It is also City policy that automobile facility features (such as driveways and loading docks) should be reduced, relocated or prohibited on transit preferential streets in order to avoid traffic conflicts and automobile congestion.

Citywide Pedestrian Network

The Citywide Pedestrian Network is a classification of streets throughout the City used to identify streets devoted to or primarily oriented to pedestrian use. The main classifications are:

- **Citywide Pedestrian Network Street:** An inter-neighborhood connection with "citywide significance" includes both exclusive pedestrian and pedestrian-oriented vehicular streets. These streets include the Bay, Ridge, and Coast trails, are used by commuters, tourists, general public and recreaters, and connect major institutions with transit facilities.
- **Neighborhood Network Street:** A neighborhood commercial, residential or transit street that serves pedestrians from the general vicinity. Some streets may be part of the Citywide network, but are generally oriented towards neighborhood-serving uses. Types include exclusive pedestrian and pedestrian-oriented vehicular streets. As part of the Neighborhood Network Street network, streets are classified as **Neighborhood Commercial Streets**, which are streets that are predominately commercial use with parking and loading conflicts, or **Neighborhood Network Connection Streets**, which are intra-neighborhood connection streets that connect neighborhood destinations.

In general, it is City policy that sufficient pedestrian movement space should be provided to minimize pedestrian congestion, sidewalks should be widened where intensive commercial, recreational or institutional activity is present, and efforts should be made to ensure convenient and safe pedestrian crossings at intersections.

Congestion Management Program (CMP) Network

The CMP Network is the network of freeways, state highways, major arterials and transit conflict streets (see Roadway Classifications, above) established in accordance with state Congestion Management legislation. As part of the CMP, the San Francisco County Transportation Authority is required to determine the level of service (LOS) for the CMP Network streets every two years. The LOS is based on the average travel speed for each

- **Primary Transit Street – Transit-Important:** Major arterials, with either high transit ridership, high frequency of service, or surface rail. Along these streets, the goal is to improve the balance between modes of transportation, and the emphasis should be on moving people and goods, rather than on moving vehicles.
- **Secondary Transit Street:** Medium transit ridership and low-to-medium frequency of service, or medium frequency of service and low-to-medium transit ridership, or connects two or more major destinations.

In general, it is City policy that transit preferential treatments should be concentrated on the most important transit streets, and the treatments applied should respond to all transportation needs of the street. For example, on streets that are major arterials for transit and not for automobile traffic, treatments should emphasize transit priority; on streets that are major arterials for both transit and automobiles, treatments should emphasize a balance between the modes. It is also City policy that automobile facility features (such as driveways and loading docks) should be reduced, relocated or prohibited on transit preferential streets in order to avoid traffic conflicts and automobile congestion.

Citywide Pedestrian Network

The Citywide Pedestrian Network is a classification of streets throughout the City used to identify streets devoted to or primarily oriented to pedestrian use. The main classifications are:

- **Citywide Pedestrian Network Street:** An inter-neighborhood connection with "citywide significance" includes both exclusive pedestrian and pedestrian-oriented vehicular streets. These streets include the Bay, Ridge, and Coast trails, are used by commuters, tourists, general public and recreaters, and connect major institutions with transit facilities.
- **Neighborhood Network Street:** A neighborhood commercial, residential or transit street that serves pedestrians from the general vicinity. Some streets may be part of the Citywide network, but are generally oriented towards neighborhood-serving uses. Types include exclusive pedestrian and pedestrian-oriented vehicular streets. As part of the Neighborhood Network Street network, streets are classified as **Neighborhood Commercial Streets**, which are streets that are predominately commercial use with parking and loading conflicts, or **Neighborhood Network Connection Streets**, which are intra-neighborhood connection streets that connect neighborhood destinations.

In general, it is City policy that sufficient pedestrian movement space should be provided to minimize pedestrian congestion, sidewalks should be widened where intensive commercial, recreational or institutional activity is present, and efforts should be made to ensure convenient and safe pedestrian crossings at intersections.

Congestion Management Program (CMP) Network

The CMP Network is the network of freeways, state highways, major arterials and transit conflict streets (see Roadway Classifications, above) established in accordance with state Congestion Management legislation. As part of the CMP, the San Francisco County Transportation Authority is required to determine the level of service (LOS) for the CMP Network streets every two years. The LOS is based on the average travel speed for each

roadway segment during both the AM and PM peak periods. The level of service standard is LOS E, except for roadway segments that operated at LOS F in 1991 (when the first study was performed). The CMP requires development of "Deficiency Plans" for any CMP-designated roadway that operate at LOS F. These plans include an analysis of the causes of the deficiency, a list of improvements that would have to be made to prevent the deficiency from occurring (including cost estimates), a list of improvements proposed as part of the plan, and an action plan for implementation of the improvements (including an implementation schedule).

Metropolitan Transportation System (MTS) Network

The MTS Network is defined by Metropolitan Transportation Commission (MTC) as part of its Regional Transportation Plan. The MTS is a regional network of roadways, transit corridors and transfer points, identified by the MTC on the basis of specific criteria. The criteria identified facilities that provide relief to congested corridors, improve connectivity, accommodate travel demand and serve a regional transportation function. The State highways and major thoroughfares designated in San Francisco's CMP roadway network are all included in the regional MTS network. There are a few instances in which the local CMP network is not identical to the MTS network due to differences in the criteria used to define each network.
