Cumulative Physical Options/LRDP Assumed

UCSF Affiliate Approximate Drive-Alone Commute Vehicle Trip Reduction via Travel Demand Management Measures Exercise - DRAFT Four

Approximate Drive-Alone Commute Vehicle Trips	Campus		UCSF Shuttle *Shuttle Enhancements (wi-fi, Nextbus, etc.)*	Enhance Existing Car Share	More Robust Carpool Matching	Expand Vanpool Program	Flexible Work Schedules	Total Approx. Drive-Alone Commute Vehicle Trip Reduction	Total Approx. Drive-Alone Commute Vehicle Trip Percentage Reduction
	Mission Bay (4500)	4500	15	20	35	35	50	**155**	**-3%**

FEHR PEERS

Assumptions:

This exercise is for drive-alone commuters that travel during the AM and PM peak commute hours (7-9 AM, 4-6 PM) i.e., it is somewhat conservative as it doesn't look at other time periods

This exercise is for drive-alone commuters only, thus it doesn't include patients, visitors, vendors, etc.

This exercise is for drive-alone commuters, thus it does not take into account how carpoolers/ transit users may change their behavior if all/some of the proposed measures were implemented

The last-mile shuttle is assumed to run to the specified destinations with 20-minute headways

The park and ride is assumed to be a leased parking lot i.e. not on-street parking near a pick-up location

It is assumed there would be four shuttle buses from each park and ride lot. One each at 7 AM and 8 AM for Parnassus/Mount Zion…

...and one each at 7 AM and 8 AM for Mission Bay/Mission Center (vice versa during the PM peak period)

Enhance existing car share assumes additioanal paring spaces in UCSF garages and on-street

More robust carpool matchingg assumes preferential parking spaces

Expand vanpool program assumes purchase of additional vans and preferential parking

Flexible work schedule assumes limited working from home or commuting outside peak AM and PM peak periods e.g. 10 AM to 7 PM shift

This exercise assumes that 2012 and cumulative mode splits will be the same

This exercise assumes that 2012 and cumulative TDM efficacy will remain the same

This exercise assumes that 2012 and cumulative commuters will travel from the same regions by campus

This exercise assumes that the Project as identified in the Physical Options Study is in place at the Mission Bay campus

This exercise assumes that the Project (Options B1 or B3) as identified in the Physical Options Study is in place at the Mount Zion campus

This exercise assumes that the Project (No LPPI/Opth.) as identified in the Physical Options Study is in place at the Parnassus campus

This exercise assumes that the Project (Option A at 52 feet) as identified in the Physical Options Study is in place at the Mission Center campus

APPENDIX E: ANALYSIS METHODOLOGY

TABLE D1: SIGNALIZED INTERSECTION LOS CRITERIA		
Level of Service	**Description**	**Average Control Delay Per Vehicle (Seconds)**
A	Operations with very low delay occurring with favorable progression and/or short cycle length.	≤ 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	> 10.0 to 20.0
C	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	> 20.0 to 35.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	> 35.0 to 55.0
E	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	> 55.0 to 80.0
F	Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths.	> 80.0

Source: Highway Capacity Manual – Special Report 209 (Transportation Research Board, 2000).

TABLE D2: UNSIGNALIZED INTERSECTION LOS CRITERIA		
Level of Service	**Description**	**Average Control Delay Per Vehicle (Seconds)**
A	Little or no traffic delays	≤ 10.0
B	Short traffic delays	> 10.0 to 15.0
C	Average traffic delays	> 15.0 to 25.0
D	Long traffic delays	> 25.0 to 35.0
E	Very long traffic delays	> 35.0 to 50.0
F	Extreme traffic delays with intersection capacity exceeded	> 50.0

[c] Other travel modes include walk, bicycle, taxi and motorcycle.

[d] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

[e] Based on Parnassus Heights Transportation Surveys, 1992 and 1999, ITE Trip Generation 9th Edition (residential AM), and 2002 SF Guidelines (residential PM).

[c] Other travel modes include walk, bicycle, taxi and motorcycle.

[d] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

[e] Based on Parnassus Heights Transportation Surveys, 1992 and 1999, ITE Trip Generation 9th Edition (residential AM), and 2002 SF Guidelines (residential PM).

[c] Other travel modes include walk, bicycle, taxi and motorcycle.

[d] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

[e] Based on Parnassus Heights Transportation Surveys, 1992 and 1999, ITE Trip Generation 9th Edition (residential AM), and 2002 SF Guidelines (residential PM).

[c] Other travel modes include walk, bicycle, taxi and motorcycle.

[d] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

[e] Based on Parnassus Heights Transportation Surveys, 1992 and 1999, ITE Trip Generation 9th Edition (residential AM), and 2002 SF Guidelines (residential PM).

[c] Other travel modes include walk, bicycle, taxi and motorcycle.

[d] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

[e] Based on Parnassus Heights Transportation Surveys, 1992 and 1999, ITE Trip Generation 9th Edition (residential AM), and 2002 SF Guidelines (residential PM).

[c] Other travel modes include walk, bicycle, taxi and motorcycle.

[d] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

[e] Based on Mt Zion Transportation Surveys, 1992 and 1999.

[c] Other travel modes include walk, bicycle, taxi and motorcycle.

[d] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

[e] Based on Mt Zion Transportation Surveys, 1992 and 1999.

[c] Other travel modes include walk, bicycle, taxi and motorcycle.

[d] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

[e] Based on Parnassus Heights Transportation Surveys, 1992 and 1999.

[c] Other travel modes include walk, bicycle, taxi and motorcycle.

[d] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

[e] Based on Parnassus Heights Transportation Surveys, 1992 and 1999.

APPENDIX H

Water Supply Assessment for the UCSF Long Range Development Plan

This page intentionally left blank

AGENDA ITEM
Public Utilities Commission
City and County of San Francisco

DEPARTMENT Water Enterprise AGENDA NO. **9h**

MEETING DATE April 22, 2014

Approve Water Supply Assessment: Consent Calendar
Project Manager: Paula Kehoe

Approve, Water Supply Assessment for the UCSF Long Range Development Plan

Summary of Proposed Commission Action:	**Approve** the Water Supply Assessment (WSA) for the proposed University of California, San Francisco (UCSF) Long Range Development Plan, pursuant to the State of California Water Code Section 10910 *et seq.* and California Environmental Quality Act (CEQA) Section 21151.9 and CEQA Guidelines Section 15155.
Background:	Water Code Sections 10910-10915 provide a nexus between the regional land use planning process and the environmental review process. The law also reflects the growing awareness of the need to incorporate water supply and demand analysis at the earliest possible stage in the land use planning process. The core of this law is the requirement for a public water system to prepare a WSA of whether available water supplies are sufficient to serve the demand generated by projects of a specified size ("water demand projects"), as well as the reasonably foreseeable cumulative demand in the region over the next 20 years under a range of hydrologic conditions. The WSA is required within 90 days of the time the public water system receives a request for such assessment from the lead agency preparing an environmental impact report (EIR) or negative declaration under CEQA. The University of California, which is the lead agency under CEQA, is preparing an EIR for the proposed project and has identified the proposed project as a water demand project. The content of a WSA is specified by the Water Code and includes identification of any existing water supply entitlements or contracts, and detailed information about groundwater supplies. It assesses the adequacy of water supplies to serve the proposed project and cumulative demand. The WSA must be completed by the public water supplier that would serve the project and be approved by its governing body at a public meeting. Approval of a WSA is not approval of the development

APPROVAL: _____

COMMISSION SECRETARY Donna Hood

	project for which the WSA is prepared. A WSA is an informational document required to be prepared for use in the City's environmental review of a project under CEQA. The attached WSA prepared by San Francisco Public Utilities Commission (SFPUC) staff analyzes the sufficiency of long-term water supplies to serve the proposed project and cumulative development and concludes that there are adequate short-term and long-term water supplies to provide water service to the Project in compliance with the State Water Code requirements.
Result of Inaction:	A delay in approving this agenda item will result in the inability of the University of California to complete the environmental review for the proposed UCSF Long Range Development Plan. Under CEQA Guidelines Section 15155, the SFPUC may, within 90 days of the request for the WSA from the University of California, request a reasonable extension of time to complete the WSA.
Description of Action:	Approve the WSA for the proposed UCSF Long Range Development Plan**,** pursuant to the State of California Water Code 10910.
Environmental Review:	Under the Delegation Agreement with the San Francisco Planning Department, the Bureau of Environmental Management has determined that this action does not constitute a "project" under CEQA Guidelines Section 15378 because there would be no physical change to the environment.
Recommendation:	SFPUC staff recommends that the Commission adopt the attached resolution.
Attachments:	1. SFPUC Resolution 2. Water Supply Assessment for the UCSF Long Range Development Plan

PUBLIC UTILITIES COMMISSION

City and County of San Francisco

RESOLUTION NO. **14-0061**

WHEREAS, under the California Environmental Quality Act (CEQA) and State Water Code (Section 10910(g)(1)), the San Francisco Public Utilities Commission (SFPUC) is required to prepare and approve a Water Supply Assessment (WSA) for the University of California, San Francisco (UCSF) Long Range Development Plan's cumulative water demands; and

WHEREAS, a WSA is an informational document that assesses the adequacy of water supplies to serve a project and is required to be prepared as part of the CEQA environmental review process; and

WHEREAS, approval of the WSA does not constitute a project under CEQA Guidelines Section 15378 because it is not an approval of the UCSF Long Range Development Plan and is only an informational document which would not result in a physical change in the environment; and

WHEREAS, a WSA must be approved at a public meeting by the governing body of the public water supplier that would serve the project; and

WHEREAS; the SFPUC staff prepared a WSA for the UCSF Long Range Development Plan, which concluded that the SFPUC has adequate water supplies to meet the Project's water demands through 2035; now, therefore, be it

RESOLVED, this Commission approves the Water Supply Assessment for the UCSF Long Range Development Plan, pursuant to the State of California Water Code 10910(g).

I hereby certify that the foregoing resolution was adopted by the Public Utilities Commission at its meeting of April 22, 2014.

RE: Water Supply Assessment for the University of California, San Francisco 2014 Long Range Development Plan

---

1.0 Summary

1.1 Introduction

Under the Water Supply Assessment law (Sections 10910 through 10915 of the California Water Code), urban water suppliers like the San Francisco Public Utilities Commission (SFPUC) must furnish a Water Supply Assessment (WSA) to the city or county that has jurisdiction to approve the environmental documentation for certain qualifying projects (as defined in Water Code Section 10912 (a)) subject to the California Environmental Quality Act (CEQA). The WSA process typically relies on information contained in a water supplier's Urban Water Management Plan (UWMP), and involves answering specific questions related to the estimated water demand of the proposed project. While the University of California, San Francisco (UCSF) is neither a city nor a county and is not subject to the WSA law, as the lead agency for the 2014 Long Range Development Plan (LRDP), UCSF voluntarily requested preparation of a WSA as part of its cooperative planning with the City and County of San Francisco and to inform the environmental impact analysis. This memo serves as the WSA for the proposed UCSF 2014 LRDP, herein referred to as the "proposed project", for use in the preparation of an environmental impact report by UCSF.

1.1.1 The SFPUC's 2010 UWMP and 2013 Water Availability Study

The SFPUC's current UWMP was adopted in 2010. The UWMP incorporated 2009 Land Use Allocation (LUA 2009) projections from the San Francisco Planning Department. In 2012, the San Francisco Planning Department updated its LUA projections (LUA 2012), increasing the estimated number of new dwelling units and jobs over the previous LUA 2009 projections. As a result of the LUA 2012 projections, the SFPUC concluded that its 2010 UWMP no longer accounts for every project requiring a WSA (qualifying project) within San Francisco. Therefore, any qualifying project will require preparation of a WSA that documents the SFPUC's current and projected water supplies when compared to projected demands associated with the LUA 2012 projections. The LUA 2012 projections are provided in Section 3.1 of the 2013 Water Availability Study, discussed below.

Anson Moran
Commissioner

Art Torres
Commissioner

Harlan L. Kelly, Jr.
General Manager

The SFPUC will not be preparing an updated UWMP until 2015. During this interim period, the SFPUC developed a 2013 Water Availability Study to document the SFPUC's current and projected retail water supplies when compared to projected retail water demands associated with the LUA 2012 projections. The information in the Study is not project-specific and must be provided in the WSA of any qualifying project within San Francisco. ***The 2013 Water Availability Study is incorporated herein as Attachment A and referenced throughout this WSA with bold, italicized text***.

1.1.2 Basis for Requiring a WSA for the Proposed Project

The proposed project has not been the subject of a previous WSA, nor has it been part of a larger project for which a WSA was completed. The proposed project qualifies for preparation of a WSA under Water Code Section 10912(a)(2) because it is a mixed used development that includes more than 500 dwelling units. The proposed project also qualifies for preparation of a WSA because it would use more water than required by a 500 dwelling unit project (Water Code section 10912(a)(7)). The SFPUC previously determined that a 500 dwelling unit project would create retail water demand of 50,000 gallons per day (gpd) or 18.25 million gallons per year (gpy). The proposed project is characterized further in Section 1.2.

1.1.3 Conclusion of this WSA

In this WSA, the SFPUC concludes that there are adequate water supplies to serve the net new growth associated with the proposed project and cumulative retail water demands during normal years, single dry years, and multiple dry years over a 20-year planning horizon from 2015 through 2035. Additional information on supply sufficiency is provided in Section 4.2, Findings.

1.2 Proposed Project Description

The University of California, San Francisco (UCSF) is one of ten campuses in the University of California (UC) system, and is the only UC campus devoted solely to the health sciences. UCSF's mission is to advance health worldwide through innovative health sciences education, research and patient care. UCSF is a multi-site campus with locations throughout the City and County of San Francisco, encompassing approximately 8.04 million gross square feet (gsf). Its major academic and clinical sites are at Parnassus Heights, Mission Bay and Mount Zion, with a major presence at the City's San Francisco General Hospital site.

In support of its mission, UCSF is preparing a new Long Range Development Plan (LRDP) to guide future campus growth and development through the year 2035. UCSF currently occupies 6.99 million gsf in owned space and 1.05 million gsf in leased space in San Francisco. By 2035, UCSF's total owned and leased space will be about 12.37 million gsf, an increase of about 53 percent from existing conditions. The total space across all campus sites would increase by about 4.33 million gsf. Of the 4.33 million gsf, there is approximately 1.14 million gsf that is currently under construction at the Mission Bay campus site and is scheduled for completion in 2015. Housing across all campus sites would increase by about 667,600 gsf, or about 825 housing units. The remaining growth would be in instruction, research, clinical, and other academic and campus support use categories. For additional information on the existing and total projected square footages and population through the LRDP horizon of 2035, see the UCSF LRDP Demand Memo in Attachment B.

The total amount of space across all campus sites would increase by about 4.33 million gsf over the next 20 years. Of that 4.33 million gsf, about two-thirds or 2,845,700 gsf is already accounted for in the San Francisco Planning Department's LUA 2012 projections[1], while one-third or 1,482,800 gsf is growth not previously identified in the projections. The 1,482,800 gsf of new growth includes 991,800 gsf at the Mission Bay

[1] As noted in UCSF LRDP Demand Memo in Attachment B, the portion of UCSF growth that has already been accounted for were analyzed in the Mission Bay South Redevelopment Plan and the 1996 UCSF LRDP Environmental Impact Report.

campus site and 491,000 gsf distributed at the four other UCSF campus sites: Parnassus Heights, Mount Zion, San Francisco General Hospital, and the Mission Center Building at 1855 Folsom Street. The water demand associated with the 1,482,800 gsf of net new growth is the basis for this WSA.

2.0 Water Supply

This section reviews San Francisco's existing and planned water supplies.

2.1 Regional Water System

See ***Section 1.2 of the Water Availability Study*** (Attachment A) for descriptions of the Regional Water System (RWS), water rights held by City and County of San Francisco, the SFPUC Water Supply Improvement Program (WSIP), and the relationship between SFPUC's retail and wholesale customers.

2.2 Existing Retail Supplies

Retail water supplies from the RWS are described in ***Section 2.1.1 of the Water Availability Study***.

Local groundwater supplies, including the Westside Groundwater Basin, Central Groundwater Sub Basin, and Sunol Infiltration Gallery, are described in ***Section 2.1.2 of the Water Availability Study***.

Local recycled water supplies, including the Harding Park Recycled Water Project and Pacifica Recycled Water Project, are described in ***Section 2.1.3 of the Water Availability Study***.

2.3 Planned Retail Water Supply Sources

The San Francisco Groundwater Supply Project is described in ***Section 2.2.1 of the Water Availability Study***.

The proposed Westside and Eastside Recycled Water Projects are described in ***Section 2.2.2 of the Water Availability Study***.

2.4 Summary of Current and Future Retail Water Supplies

A breakdown of water supply sources for meeting SFPUC retail water demand through 2035 in normal years is provided in ***Section 2.3 of the Water Availability Study***.

2.5 Dry-Year Water Supplies

A description of dry-year supplies developed under WSIP, future options that SFPUC is exploring, and a breakdown of water supply sources for meeting SFPUC retail water demand through 2035 in multiple dry years are provided in ***Section 2.4 of the Water Availability Study***. For a single dry year, the retail RWS allocation and, thus, the breakdown of water supply sources would be the same as those in a normal year.

3.0 Water Demand

This section reviews the climatic and demographic factors that may affect San Francisco's water use, projected retail water demands, and the demand associated with the proposed project.

3.1 Climate

San Francisco has a Mediterranean climate. Summers are cool and winters are mild with infrequent rainfall. Temperatures in the San Francisco area average 57 degrees Fahrenheit annually, ranging from the mid-40s in winter to the upper 60s in late

summer. Strong onshore flow of wind in summer keeps the air cool, generating fog through September. The warmest temperatures generally occur in September and October. Rainfall in the San Francisco area averages about 22 inches per year and is generally confined to the "wet" season from late October to early May. Except for occasional light drizzles from thick marine stratus clouds, summers are nearly completely dry. A summary of the temperature and rainfall data for the City of San Francisco is included in Table 1.

Table 1: San Francisco Climate Summary

Month	Average Maximum Temperature (°F)	Average Minimum Temperature (°F)	Average Monthly Rainfall (inches)
January	58.0	45.7	4.36
February	60.3	47.3	4.41
March	61.4	48.1	2.98
April	62.3	49.1	1.38
May	63.2	50.9	0.68
June	64.8	52.7	0.18
July	65.6	54.3	0.02
August	66.6	55.3	0.06
September	68.1	55.0	0.19
October	67.8	53.3	1.04
November	61.2	48.1	2.85
December	58.3	45.9	4.33
Annual Average	**63.3**	**50.6**	**22.45**

Source: Western Regional Climate Center (www.wrcc.dri.edu), 1981-2010 data from two San Francisco monitoring stations (Mission Dolores/SF#047772 and Richmond/SF#047767).

3.2 Projected Growth

For a comparison of the 2009 and 2012 LUA projections for housing and employment through 2035, ***see Section 3.1 of the Water Availability Study***.

3.3 Projected Retail Water Demands

In-City retail water demands are estimated using the City's Retail Water Use Models, which were updated with the latest housing and employment projections from LUA 2012. ***See Section 3.2 of the Water Availability Study*** for tabulated retail water demand projections through 2035 and a description of the model methodology.

3.4 Proposed Project Water Demand

UCSF provided a memo describing the methods and assumptions used to estimate the water demands of the proposed project, along with the resulting demands (Attachment B). The SFPUC reviewed the memo to ensure that the methodology is appropriate for the types of proposed water uses, the assumptions are valid and thoroughly documented along with verifiable data sources, and a professional standard of care was used. The SFPUC concluded that the demand estimates provided by UCSF are reasonable.

As described in Section 1.2, approximately two-thirds of the growth associated with the proposed project has been accounted for in the San Francisco Planning Department's LUA 2012 projections, but about one-third of the proposed project growth (1,482,800 gsf) has not. Therefore, the demand that would be generated by this smaller portion of the proposed project is not encompassed within the San Francisco retail water demands that are presented in ***Section 3.2 of the Water Availability Study***, which considers retail water demand based on the LUA 2012 projections. Water demand associated with the proposed net new growth over the 20-year planning horizon is shown in the following table.

Table 2: Water Demand Based on Project Phasing

	2015	2020	2025	2030	2035
Total Demand of Proposed Net New Growth (mgd)	--	0.03	0.05	0.08	0.14

Note:
Construction of the proposed project, including the portion of net new growth, would occur throughout the period between 2015 and 2035. Occupancy of the proposed net new growth would begin in 2017 or 2018.

4.0 Conclusion

4.1 Comparison of Projected Supply and Demand

Section 4.0 of the Water Availability Study compares the SFPUC's retail water supplies and demands through 2035 during normal year, single dry-, and multiple dry-year periods. See Table 3, below, which is adapted from the Water Availability Study (Table 7, Attachment A) with the addition of water demand attributed to the net new growth that was not previously accounted for by the Water Availability Study. The water demands associated with the remainder of the proposed project are already captured in the retail demand projections presented in the Water Availability Study (e.g., the rows labeled "Total Retail Demand Excluding Proposed Net New Growth" in Table 3).

Considering the net new growth associated with the proposed project that was not accounted for by the Water Availability Study, total retail demand in 2035 is projected to be 84.3 mgd, which represents a 3.4 mgd, or 4 percent, increase over the 2035 projections in the 2010 UWMP. The ability to meet the demand of the retail customers is in large part due to development of 10 mgd of local WSIP supplies, including conservation, groundwater, and recycled water. These supplies are anticipated to be fully implemented over the next 10 years.

The proposed net new growth would slightly increase the shortfalls projected in deficit years by 0.2 percent or less (e.g., 2015 with existing and future supplies, 2035 with only existing supplies), but would not create additional years of water supply deficit. As described in the Table 3 notes and in ***Section 4.0 of the Water Availability Study***, deficits of this magnitude could be easily managed through voluntary conservation or rationing.

Table 3: Projected Supply and Demand Comparison with Proposed Net New Growth (mgd)

		Normal Year[1,2]	Single Dry Year[1,2]	Multiple Dry Years		
				Year 1[1,2]	Year 2[2,3]	Year 3[2,3]
2015	Total Retail Demand Excluding Proposed Net New Growth	83.7	83.7	83.7	83.7	83.7
	Demand of Proposed Net New Growth	--	--	--	--	--
	Total Retail Demand Including Proposed Net New Growth	83.7	83.7	83.7	83.7	83.7
	Total Retail Supply – Existing Supplies Only[4]	83.5	83.5	83.5	82.0	82.0

Notes:

1. Normal-year retail water supplies per ***Table 3 of the Water Availability Study***.
2. Retail water demands (excluding proposed net new growth) per ***Table 6 of the Water Availability Study***.
3. Year 2 and 3 of multiple dry years per ***Table 4 of the Water Availability Study***.
4. Existing and future supply sources per ***Table 3 (repeated in Table 4) of the Water Availability Study***.
5. The deficit shown for 2015 in a normal year with existing and future supplies represents less than a 0.25% shortfall and during a multiple dry-year drought event represents a 2.0% shortfall, which can be easily managed through voluntary conservation measures or rationing. Current retail demand in FY11/12 was 77.8 mgd. If retail demand exceeds the available water supply of 83.5 mgd, the Water Supply Agreement allows the SFPUC to import additional water from the RWS, with mitigation implemented by the SFPUC and potential environmental surcharges if RWS deliveries exceed the 265 mgd interim supply limitation. (Total RWS deliveries in FY11/12 were 219.4 mgd.)
6. The deficit shown for 2035 is projected if none of the local groundwater and recycled water projects are implemented as described in ***Section 2.2 of the Water Availability Study***.

If planned future water supply projects (i.e., San Francisco Groundwater Supply Project, Westside Recycled Water Project, and Eastside Recycled Water Project) are not implemented, normal-year supplies may not be enough to meet projected retail demands. To balance any water supply deficits during normal years, the SFPUC may import additional water from the RWS, with mitigation implemented by the SFPUC and potential environmental surcharges if RWS deliveries exceed the 265 mgd interim supply limitation.

If dry-year supply projects (i.e., Calaveras Dam Replacement Project, Lower Crystal Springs Dam Improvements Project, Upper Alameda Creek Filter Gallery Project, GSR Project, and water transfers) are not implemented, existing dry year supplies may not be enough to meet projected retail demands. To balance any water supply deficits during dry years, the SFPUC may reduce system deliveries and impose customer rationing.

The SFPUC remains committed to meeting the level of service goals and objectives outlined under WSIP. In addition, the SFPUC is currently exploring other future supplies, including:

- Development of additional conservation and recycling.
- Development of additional groundwater supplies.
- Securing of additional water transfer volumes.
- Increasing Tuolumne River supply.
- Revising the Upper Alameda Creek Filter Gallery Project capacity.
- Development of a desalination project.

4.2 Findings

Regarding the availability of water supplies to serve the proposed project beginning as soon as in 2017, the SFPUC finds, based on the entire record before it, as follows:

- During normal years, single dry years, and multiple dry years, the SFPUC has sufficient water supplies to serve the proposed project.
- With the addition of planned retail supplies, the SFPUC has sufficient water supplies available to serve its retail customers, including the demands of the proposed project, existing customers, and foreseeable future development.

Approval of this WSA by the Commission is not equivalent to approval of the development project for which the WSA is prepared. A WSA is an informational document required to be prepared for use in the lead agency's environmental review of a project under CEQA. The WSA assesses the adequacy of water supplies to serve the proposed project and cumulative demand.

If there are any questions or concerns, please contact Steve Ritchie at (415) 934-5736 or SRitchie@sfwater.org.

1.0 Introduction and Background

1.1 Purpose of this Study

Water Code Sections 10910-10915 require urban water suppliers to evaluate water supply availability to inform environmental review for qualifying projects ("water demand projects") defined in Water Code Section 10912(a). Water Code Section 10910 requires the preparation of a "water supply assessment" (WSA) for water demand projects that include a determination of whether available water supplies are sufficient to serve the demand generated by the project, as well as reasonably foreseeable cumulative demand over a 20 year period, including years of normal precipitation, single dry, and multiple dry years. If the water supplies needed by a water demand project were accounted for in the water supplier's most recent 5 year Urban Water Management Plan (UWMP), under Water Code Section 10910(c)(2), the water supplier may incorporate the requested information from the UWMP in preparing a WSA for a water demand project.

The SFPUC's most recent UWMP adopted in 2010 relied on the San Francisco Planning Department's (SF Planning) 2009 Land Use Allocation (LUA) projections of housing and employment growth in San Francisco to estimate future retail water demands. In summer 2012, SF Planning updated the 2009 LUA to incorporate the Association of Bay Area Government's (ABAG) Sustainable Community Strategy Jobs-Housing Connections Scenario as detailed in a memorandum from SF Planning to the SFPUC dated January 28, 2013 (Appendix A). SF Planning's 2012 LUA projects an additional 11,235 new dwelling units and 35,068 new jobs in San Francisco by 2035 over the previous 2009 LUA projections considered in the SFPUC's 2010 Urban Water Management Plan (UWMP).[1]

As a result of 2012 LUA projections, the SFPUC concluded that its 2010 UWMP no longer accounted for all projected retail water demands. The SFPUC will not be preparing an updated UWMP until 2015. Therefore, during this interim period, the SFPUC has developed this Water Availability Study (Study) to document the SFPUC's current and projected retail water supplies when compared to projected retail water demands associated with these projects and anticipated new growth in San Francisco under the 2012 LUA projections. This Study incorporates and utilizes the information in the 2010 UWMP, but includes the following:

- Updated retail demand projections based on the 2012 LUA housing and employment projections, and updates to the SF Retail Demand Model as detailed in a memorandum from the SFPUC dated February 22, 2013 (Appendix B).
- Updated project description and schedule for the San Francisco Groundwater Supply Project based on the SFPUC San Francisco Groundwater Supply Project Draft Environmental Impact Report (EIR) (March 2013).
- Updated schedule for the Eastside Recycled Water Project based on SFPUC planning efforts to date.
- Updated schedules for dry-year water supply projects.

[1] The projected increase in demand results largely from the incorporation of Senate Bill (SB) 375 in retail demand projections. SB 375 requires ABAG and the Metropolitan Transportation Commission to develop a Bay Area Sustainable Communities Strategy that 1) achieves a greenhouse gas emissions reduction target set by the California Air Resources Board by reducing vehicle travel through colocation of housing and mass transit, and 2) identifies a strategy to meet the Bay Area's entire housing need by income level within the Bay Area.

The information and conclusions of this Study, in concert with the background information provided in the 2010 UWMP that is incorporated into this Study, can be used in the development of water supply assessments for pending water demand projects.

1.2 Background

This section provides a broad overview of the Regional Water System (RWS); the SFPUC water rights; the Water System Improvement Program (WSIP); the relationship of the SFPUC's retail water customers to wholesale customers; and historic trends in retail and wholesale water demands.

1.2.1 The SFPUC Regional Water System[2]

The SFPUC, a department of the City and County of San Francisco, owns and operates the RWS. The RWS supplies water to both SFPUC wholesale customers and retail customers, the latter primarily in San Francisco. Historically, the RWS has supplied approximately 96% of the SFPUC's retail water demands. The remaining portion of the SFPUC's retail water supply comes from local groundwater and secondary treated recycled water. Groundwater in San Francisco is used primarily for irrigation at local parks and on highway medians. Recycled water is used mostly at municipal facilities for wastewater treatment process water, sewer box flushing, and similar wash down operations. These local supplies are discussed in greater detail in Section 2.1.

In 1934, San Francisco combined the Hetch Hetchy system and Spring Valley system to create the SFPUC RWS. The rights to store and divert water at Pilarcitos, San Andreas, Crystal Springs, and Calaveras Reservoirs were originally held by the Spring Valley Water Company, which was formed in 1862. San Francisco purchased Spring Valley in 1930.

The RWS currently delivers an annual average of approximately 219 million gallons per day (mgd) to 2.6 million users in Tuolumne, Alameda, Santa Clara, San Mateo, and San Francisco counties. The RWS is a complex system, shown in Figure 1, and supplies water from two primary sources:

- Tuolumne River through the Hetch Hetchy Reservoir, and
- Local runoff into Bay Area reservoirs in the Alameda and Peninsula watersheds.

Water from Hetch Hetchy Reservoir provides the majority of the water supply available to the SFPUC. On average, the Hetch Hetchy Project provides over 85% of the water delivered to the SFPUC's service area. The amount of water available to the SFPUC from the RWS is constrained by hydrology, physical facilities, and institutional parameters such as the 1913 Raker Act (38 Stat. 242) that allocate the water supply of the Tuolumne River between San Francisco and the Modesto and Turlock Irrigation Districts downstream. Due to these constraints, the SFPUC is very dependent on reservoir storage to maximize the reliability of its water supplies. During dry years, the SFPUC has a very small share of Tuolumne River runoff available and the local Bay Area watersheds produce very little water. Reservoir storage is critical during drought cycles because it enables the SFPUC to carry over water supply from wet years to dry years. During droughts the water received from the Hetch Hetchy system can amount to over 93% of the total water delivered. As explained in Section 1.2.3, the SFPUC is implementing a Water System Improvement Program ("WSIP") to assure the long-term adequacy of its water system. The SFPUC developed WSIP water supply objectives based on RWS supplies forecasted for a conservative "design drought" of 8.5 years.[3]

[2] For more detailed information on the RWS, see Section 2.1 of the SFPUC's 2010 UWMP.

[3] For more detailed information on use of the design drought, see Section 5.1.2 of the 2010 UWMP.

Bay Area reservoirs provide on average approximately 15% of the water delivered by the SFPUC RWS. The local watershed facilities are operated to conserve local runoff for delivery. On the San Francisco Peninsula, the SFPUC utilizes Crystal Springs Reservoir, San Andreas Reservoir, and Pilarcitos Reservoir to capture local watershed runoff. In the Alameda Creek watershed, the SFPUC constructed the Calaveras Reservoir and San Antonio Reservoir. In addition to capturing runoff, San Antonio, Crystal Springs, and San Andreas reservoirs also provide storage for Hetch Hetchy diversions. The local watershed facilities also serve as an emergency water supply in the event of an interruption to Hetch Hetchy diversions.

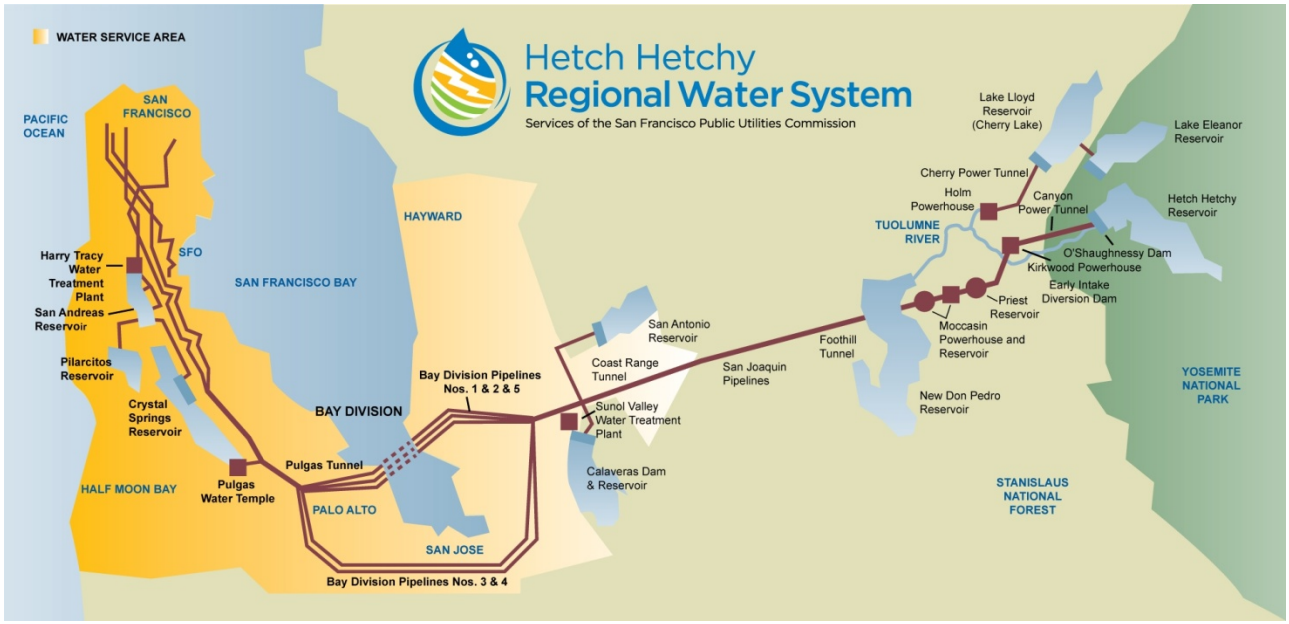

Figure 1: SFPUC Regional Water System

1.2.2 Water Rights

San Francisco owns "pre-1914" appropriative water rights to store and deliver water from Hetch Hetchy, Cherry and Eleanor Reservoirs in the Tuolumne River watershed and locally from the Alameda and Peninsula watersheds. The SFPUC also diverts and stores water in San Antonio Reservoir under an appropriative water right license granted by the State Water Resources Control Board (SWRCB) in 1976.

Appropriative water rights allow the holder to divert water from a source to a place of use not connected to the water source. These rights are based on seniority and use of water must be reasonable, beneficial, and not wasteful. In 1914, California established a formal water rights permit system, which is administered by the SWRCB. The SWRCB has sole authority to issue and administer post-1914 appropriative water rights, but has limited jurisdiction over pre-1914 appropriative water rights.

The 1912 Freeman Report identified the ultimate diversion rate from the Tuolumne River to the Bay Area as 400 mgd, and the City used this as the basis for designing the export capacity of the Hetch Hetchy project. The City has sufficient water rights for current diversions and the ultimate planned export of 400 mgd to the Bay Area.

In the 1913 Raker Act, the United States granted rights-of-way to the San Francisco over public land for purposes of constructing the Hetch Hetchy project. The Act recognizes the senior water rights of the Turlock and Modesto Irrigation Districts (TID and MID) to divert water from the Tuolumne River, and the City must bypass certain flows through its Tuolumne River reservoirs to TID and MID. By agreement, the City, TID, and MID have supplemented these Raker Act obligations to increase the TID and MID

entitlements to account for other senior Tuolumne River water rights and allow the City to "pre-pay" TID and MID their entitlement by storing water in the Don Pedro water bank. The City is required to bypass inflow to TID and MID totaling 2,416 cubic feet per second (cfs) or natural daily flow, whichever is less, at all times (as measured at La Grange), except for April 15 to June 13, when the requirement is 4,066 cfs or natural daily flow as measured at La Grange, whichever is less.

1.2.3 The Water System Improvement Program

To enhance the ability of the SFPUC water system to meet the service goals for water quality, seismic reliability, delivery reliability, and water supply, the SFPUC is undertaking the WSIP. The WSIP is a $4.6 billion, multi-year, capital program to upgrade the RWS. The program will deliver improvements that enhance the SFPUC's ability to provide reliable, affordable, high-quality drinking water to its wholesale customers and retail customers in an environmentally sustainable manner.[4]

As required under the California Environmental Quality Act (CEQA), SF Planning prepared a Program Environmental Impact Report (PEIR) for the WSIP. The PEIR analyzed the water supply effects of the WSIP at a project-level of detail and analyzed the WSIP facility improvement projects at a program-level of detail. The PEIR was certified by the San Francisco Planning Commission on October 30, 2008. On the same day, the SFPUC adopted the Phased WSIP Variant option in Resolution No. 08-200. The phased WSIP includes the following program elements:

- Full implementation of all WSIP facility improvement projects;
- Water supply delivery to RWS customers through 2018;
- Water supply sources (265 mgd average annual from SFPUC watersheds;10 mgd of conservation, recycled water, and groundwater in San Francisco; and 10 mgd of conservation, recycled water, and groundwater from the wholesale service area);
- Dry-year water transfers coupled with the Westside Groundwater Basin Conjunctive Use project to ensure drought reliability;
- Reevaluation of 2030 demand projections, RWS wholesale water purchase requests, and water supply options by 2018 and a separate SFPUC decision by 2018 regarding water deliveries after 2018; and
- Provision of financial incentives to limit water sales to an average annual 265 mgd "interim supply limitation" from the SFPUC watersheds through 2018.

The WSIP facility improvement projects approved by the SFPUC in 2008 included the implementation of groundwater, recycled water, and conservation projects in San Francisco. Since then, the SFPUC has been completing project-level review of projects requiring further environmental review, and proceeding to implement these projects. The WSIP identified that recycled water and groundwater projects would provide a total of approximately 6 mgd of additional water supply for retail customers, and another 4 mgd would be derived from active and passive conservation measures. The water supply goal in Resolution No. 08-200 was established to meet customer water needs in non-drought and drought periods. The water supply goal would be achieved under the following WSIP system performance objectives:

- Meet average annual water demand of 265 mgd (the interim supply limitation) from the SFPUC watersheds for retail and wholesale customers during non-drought years for system demands through 2018.

[4] For more information on the WSIP, see Sections 3.1.1 and 3.1.2 of the 2010 UWMP.

- Meet dry-year delivery needs through 2018 while limiting rationing to a maximum 20% system-wide reduction in water service during extended droughts.[5]
- Diversify water supply options during non-drought and drought periods.
- Improve use of new water sources and drought management, including groundwater, recycled water, conservation, and transfers.

Although the Phased WSIP Variant is designed to keep deliveries from exceeding an annual average target level of about 265 mgd, the SFPUC may deliver more than this interim supply limitation if necessary. In the event the SFPUC must deliver more than 265 mgd to its customers from its watersheds, the SFPUC must implement the WSIP PEIR mitigation measures associated with these impacts in proportion to the extent of the exceedance. In implementing the Phased WSIP Variant, the need could arise to temporarily increase deliveries from the watersheds over the 265 mgd interim supply limitation to meet customer water delivery needs in the near term, because of public health and safety considerations and because it might not be possible to implement all proposed local conservation, recycling, and groundwater projects and actions in time to meet unanticipated increases in customer demands. The mitigation measures identified in the PEIR to address potential impacts that could arise from RWS deliveries in excess of the interim supply limitation are:[6]

- Avoidance of flow changes in the lower Tuolumne River below La Grange dam by reducing demand for water from Don Pedro Reservoir (i.e., via a water transfer agreement with MID/TID and/or other water agencies such that the acquired water is developed through actions that result in reduction of demand on Don Pedro Reservoir and subsequently no change in the release pattern from La Grange dam)
- Fishery habitat enhancement
- Lower Tuolumne River Riparian Habitat Enhancement

As an incentive to keep RWS deliveries below the 265 mgd interim supply limitation, the SFPUC and its wholesale customers agreed to pay "environmental enhancement surcharges" for deliveries in excess of 265 mgd, as described in the next section.

1.2.4 Allocation of Water Between SFPUC Retail and Wholesale Customers[7]

The SFPUC provides water to both retail and wholesale customers. While this Study concerns water availability for retail customers, it is important to understand the contractual relationship between retail and wholesale customers to properly characterize the amount of water available to retail customers in normal and drought years. Approximately 2.6 million people within San Francisco, San Mateo, Santa Clara, Alameda, and Tuolumne Counties rely entirely or in part on the water supplied from the RWS by the SFPUC. Approximately one-third of RWS supplies are served directly to retail customers, primarily in San Francisco, and about two-thirds to wholesale customers outside San Francisco by contractual agreement. There are limited numbers of retail customers outside San Francisco.

The wholesale customers, except the cities of San Jose and Santa Clara, are collectively entitled to 184 mgd – the so called "Supply Assurance" – from the RWS under the terms of a 1984 contract and

[5] This 20% rationing level applies to retail and wholesale customers combined. No rationing level is specified for retail customers only.

[6] For a full description of these mitigation measures, see Section 6.4.2 of the WSIP PEIR, Measures 5.3.6-4a, 5.3.6-4b, and 5.3.7.-6.

[7] For more detailed information on the allocation of water, see Section 4.3.1 of the 2010 UWMP.

settlement agreement. The Supply Assurance represents a dedication of water supply by the City of San Francisco to the wholesale customer group. San Jose and Santa Clara are temporary, interruptible customers that are not included within the 184 mgd Supply Assurance. But for purposes of defining the interim supply limitation of 265 mgd, the total 184 mgd wholesale share of the interim supply limitation, while equal to the Supply Assurance, also includes a total of 9 mgd (4.5 mgd each) for San Jose and Santa Clara, who retain their temporary, interruptible status. One of the decisions deferred by the SFPUC in the adoption of the Phased WSIP Variant was whether or not to increase the Supply Assurance above 184 mgd. The 2009 wholesale Water Supply Agreement requires the SFPUC to make this decision by December 31, 2018, along with deciding whether or not to make San Jose and Santa Clara permanent customers.[8]

The SFPUC memorialized many of the WSIP commitments in the 2009 Water Supply Agreement with its 26 wholesale customers approved by the SFPUC in Resolution No. 08-0201 following adoption of the WSIP. The Supply Assurance continues to be in effect during the 25-year term of the 2009 Water Supply Agreement. In the wholesale Water Supply Agreement, the SFPUC agreed to:

- Meet average annual demand of 265 mgd (the interim supply limitation) from the SFPUC RWS for retail and wholesale customers during non-drought years for system demands through 2018;
- Achieve levels of service during extended droughts, including by implementing an agreed upon Water Shortage Allocation Plan (WSAP) for the allocation of water between wholesale and retail customers during shortages of up to 20%; and
- Allocate the 265 mgd interim supply limitation as follows: 81 mgd for San Francisco retail customers and 184 mgd for wholesale customers. If deliveries from the RWS exceed 265 mgd, San Francisco retail and wholesale customers would be charged volumetric environmental enhancement surcharges based on their respective amount(s) of excess use, i.e., retail customers would pay the surcharge if retail use exceeds 81 mgd, and individual wholesale customers would pay the surcharge if water deliveries exceed their allotted share (their individual "interim supply allocations") of the total 184 mgd wholesale interim supply limitation.

The wholesale Water Supply Agreement allows the SFPUC to temporarily reduce water deliveries to wholesale customers to a volume that is less than the Supply Assurance in response to emergencies, scheduled maintenance activities, and drought. During droughts, the WSAP outlines procedures for allocating water from the RWS to retail and wholesale customers during system-wide shortages of 20% or less (Tier 1 Plan).[9] Section 3.11.C of the Water Supply Agreement authorizes the wholesale customers to adopt a methodology for allocating the collective wholesale allocation among the individual wholesale customers (Tier 2 Plan). For shortages in excess of 20%, the SFPUC will meet with the wholesale customers to determine if modifications to the Tier 1 Plan can be agreed upon by the SFPUC and the wholesale customers. If they cannot agree, the SFPUC may allocate water in its discretion, subject to challenge by the wholesale customers, unless all of the wholesale customers direct that a particular Tier 2 allocation methodology be used.[10] The WSAP Tier 1 Plan allocates the available water supply between retail and wholesale customers as follows.

[8] See Section 4.06 of the wholesale Water Supply Agreement.

[9] Refer to the 2010 Urban Water Management Plan Appendix G for full text of the WSAP.

[10] Generally speaking, the differential allocation of water between retail and wholesale customers during droughts by the SFPUC must be reasonable and may include factors such as relative percentage of indoor/outdoor water use, per capita use, and other discretionary criteria.

Table 1: Retail/Wholesale Water Allocation during System-wide Water Shortage

Level of System-wide Reduction in Water Use Required	SFPUC Retail Share of Available Water	Wholesale Customer Share (Collectively)
5% or less	35.5%	64.5%
6% to 10%	36.0%	64.0%
11% to 15%	37.0%	63.0%
16% to 20%	37.5%	62.5%

Based on the WSAP allocations presented above in Table 1, Table 2 shows SFPUC RWS retail supply schedules during normal-, single dry-, and multiple dry-year periods. For the purposes of developing these allocations, the SFPUC assumed a delivery goal of 265 mgd. System-wide shortages were applied to a demand of 265 mgd and the subsequent allocations between retail and wholesale collectively.

Table 2: SFPUC Retail RWS Allocations in Normal, Dry, and Multiple Dry Years

Normal Year[1]		Single Dry Year[1]		Multiple Dry Years[1,2]					
				Year 1		Year 2		Year 3	
(mgd)	(%)	(mgd)	(%)	(mgd)	(%)	(mgd)	(%)	(mgd)	(%)
81.0	100	81.0	100	81.0	100	79.5	98.1	79.5	98.1

Notes:
1. The allocations presented are valid throughout the 20-year projection.
2. Under the WSAP, the SFPUC retail allocations at a 10% shortage are 85.86 mgd. However, due to the Phased WSIP Variant, only 81 mgd of RWS supply is shown.

The greater reductions in water supply that are required of wholesale customers, as shown in Table 1, reflect the fact that wholesale customers, to varying degrees, can conserve more water than retail customers in San Francisco due to much greater use of water for landscape irrigation in suburban areas. According to the WSAP allocations, the SFPUC's retail water supplies would decrease by 1.5 mgd, or 1.9%, to 79.5 mgd beginning in Year 2 of multiple dry-year periods. It is well within the ability of retail customers to collectively reduce their demand by this amount through voluntary conservation or rationing. In comparison, during the 1987-1992 drought in San Francisco, the SFPUC experienced system-wide shortages of 25 to nearly 45%. As the drought progressed, SFPUC retail customers were required to reduce total consumption by 14%, up to approximately 32%. A Retail Water Shortage Allocation Plan was adopted by the SFPUC in 2001 to formalize a three-stage program of action to be taken in San Francisco to reduce water use during a drought.[11] The first stage of action targets a reduction of 5-10% via voluntary measures. Table 2 shows water available to retail customers from the RWS over the next 20 years during Years 2 and 3 of multiple dry years, excluding existing and potentially available local water supplies such as groundwater.

The SFPUC remains committed to implementing conservation as an important component of its water supply portfolio. The retail water demands presented in this Study reflect passive and active conservation measures, including a total savings potential of up to 4 mgd by 2018 from active conservation, and 5 mgd by 2035. For more detailed information on the SFPUC's demand management programs, see Section 6 of the 2010 UWMP.

[11] For more detailed information on the Retail Water Shortage Allocation Plan, see Section 5.4.2 of the 2010 UWMP.

2.0 Retail Water Supply Analysis

This section reviews San Francisco's existing and projected retail water supplies.

2.1 Existing Retail Supplies

2.1.1 Retail Supplies from the Regional Water System

The SFPUC retail customer share of the 265 mgd interim supply limitation from the RWS is 81 mgd. While the RWS is physically capable of delivering more water than the 265 mgd interim supply limitation to wholesale and retail customers, the Phased WSIP Variant adopted by the SFPUC seeks to limit water sales to 265 mgd in order to allow the SFPUC and its wholesale customers to further evaluate locally available supplies prior to reaching a decision to increase diversions from the Tuolumne River within the SFPUC's established water rights. This Study assumes that the normal-year retail share of 81 mgd will continue to be available through the Study horizon of 2035. As described in Section 1.2, the SFPUC can increase deliveries from the RWS over 265 mgd to meet combined retail and wholesale needs during normal years. To do so, the SFPUC would need to implement mitigation measures required in the WSIP PEIR and impose the environmental enhancement surcharges described in Section 1.2.4.

2.1.2 Local Groundwater Supplies

San Francisco overlies all or part of seven un-adjudicated groundwater basins. These groundwater basins include the Westside, Lobos, Marina, Downtown, Islais Valley, South, and Visitation Valley basins. The Lobos, Marina, Downtown and South basins are located wholly within the City limits, while the remaining three extend south into San Mateo County. The portion of the Westside Basin aquifer located within San Francisco is referred to as the North Westside Basin. With the exception of the Westside and Lobos basins, all of the basins are generally inadequate to supply groundwater for municipal supply due to low yield, contamination, or potential subsidence concerns. There is currently no adopted groundwater management plan for the SFPUC's groundwater basins.

Early in its history, San Francisco made use of the local groundwater, springs, and spring-fed surface water, using between 6.0 mgd and 8.5 mgd prior to 1934. After imports of water from the Hetch Hetchy Reservoir began in October 1934, the municipal water supply system began to rely almost exclusively on surface water from the Alameda and Peninsula watersheds and from the Hetch Hetchy Water and Power Project. Local groundwater use, however, has continued in the City.

Westside Groundwater Basin – San Francisco[12]

With an area of about 45 square miles, the Westside Groundwater Basin is the largest in San Francisco and is currently used to meet retail water demands for some irrigation customers. The Westside Groundwater Basin is separated from the Lobos Basin to the north by a northwest-trending bedrock ridge through the northeastern part of Golden Gate Park. San Bruno Mountain and San Francisco Bay form the eastern boundary, and the San Andreas Fault and Pacific Ocean form the western boundary. The southern limit of the Westside Groundwater Basin is defined by an area of high bedrock that separates it from the San Mateo Plain Groundwater Basin. The basin opens to the Pacific Ocean on the northwest and San Francisco Bay on the southeast. Portions of the Westside Groundwater Basin, primarily from Lake Merced south, contain three aquifers known as the Shallow Aquifer, Primary Production Aquifer, and Deep Aquifer. The Shallow and Primary Production Aquifers also occur north of Lake Merced

[12] The primary source of information provided in this section is the SFPUC San Francisco Groundwater Supply Project Draft EIR (March 2013).

depending on the presence or absence of subsurface clay layers. The basin has not been adjudicated nor has it been identified by DWR as overdrafted, or as projected to be overdrafted in the future.

The Westside Groundwater Basin can be subdivided into northern and southern portions by the county line separating San Francisco and San Mateo counties. No geologic features restrict groundwater flow between the northern and southern parts of the groundwater basin. The 14-square-mile portion of the Westside Groundwater Basin north of the San Francisco/San Mateo County line is referred to as the North Westside Groundwater Basin, and the 31-square-mile portion of the Westside Groundwater Basin south of the San Francisco/San Mateo County line is referred to as the South Westside Groundwater Basin. Existing retail groundwater sources are pumped from the North Westside Groundwater Basin.

Since 1926, groundwater has been pumped from wells located in Golden Gate Park and the San Francisco Zoo in the North Westside Groundwater Basin. Based on flow meter data, about 1.5 mgd is produced by these wells.

The SFPUC has implemented a groundwater monitoring program to evaluate groundwater elevations and quality, along with water elevations at Lake Merced. The monitoring system includes a single well or clusters of two or more wells at 19 locations. Groundwater levels in each well are monitored continuously using pressure transducers or are measured quarterly by hand. Based on regular groundwater monitoring conducted in the North Westside Groundwater Basin since 2004, groundwater levels along the Pacific Coast and north of Lake Merced have generally remained above sea level in the Shallow and Primary Production Aquifers.

The SFPUC samples groundwater at five monitoring well locations semiannually to monitor general water quality in the groundwater basin, including four locations near Lake Merced and one at the West Sunset Playground. Three of the locations near Lake Merced include both a Shallow Aquifer and Primary Production Aquifer monitoring well. The monitored parameters include total alkalinity, calcium, magnesium, sodium, potassium, bicarbonate, hardness, chloride, nitrate, sulfate, TDS, pH, and specific conductance. In addition, some wells have been monitored for iron and manganese.

Central Groundwater Sub Basin – Livermore/Amador Valley

The SFPUC delivers about 0.4 mgd of groundwater to the Castlewood community in Pleasanton from a well field operated by the SFPUC. These deliveries are historic artifacts of Spring Valley Water Company groundwater exports to San Francisco in the early decades of the 20th century. This groundwater is drawn from the Central Groundwater Sub Basin in the Livermore/Amador Valley. DWR has not identified this basin as over-drafted, nor as projected to be over-drafted in the future. These wells are metered and have been in operation for several decades. The system serving Castlewood is not connected to the RWS.

Sunol Infiltration Gallery Subsurface Diversion – Sunol

The Sunol Infiltration Gallery (SIG) is located adjacent to Alameda Creek in Sunol, south of the SFPUC's Sunol Pump Station. The SIG is approximately 2,000 feet long and consists of a concrete box structure with 10-foot 8-inch height and a 6-foot width. The bottom of the box structure is open to allow infiltration. The SIG discharges into the Sunol Aqueduct at the Water Temple. About 0.3 mgd of groundwater is delivered to the Sunol Valley Golf Club from the SIG prior to any connection to the RWS.

2.1.3 Local Recycled Water Supplies

From 1932 to 1981, the City's McQueen Treatment Plant, using an activated sludge process, provided recycled water to Golden Gate Park for irrigation and flow augmentation of its streams and lakes. Due to changes in State regulations, the plant could no longer meet standards, and the City closed the McQueen plant and discontinued use of recycled water in Golden Gate Park.

Currently, recycled water use in San Francisco is limited, but the SFPUC is moving forward with expanding the use within the City. Disinfected secondary-treated recycled water from the SFPUC's Southeast Water Pollution Control Plant is used on a limited basis for wash-down operations, and is provided to construction contractors for soil compaction and dust control and other nonessential construction purposes. Current use of recycled water for these purposes does not materially contribute to reducing the retail demands.

The Harding Park Recycled Water Project uses available recycled water from the North San Mateo County Sanitation District (NSMCSD) located in Daly City, to irrigate Harding Park and Fleming Park golf courses in San Francisco. The SFPUC partnered with the NSMCSD for this project which completed construction and began using recycled water in October 2012. Average annual use of recycled water at Harding Park is estimated at 0.23 mgd.

The Pacifica Recycled Water Project will provide recycled water to irrigate the Sharp Park Golf Course in Pacifica (which is owned by the City) and other nearby areas. When completed, the project will save approximately 40 million gallons of drinking water each year. SFPUC has partnered with the North Coast County Water District on this project. Major project construction was completed in spring 2012 and customer retrofits are underway, with recycled water deliveries anticipated to begin in 2013.

2.2 Planned Retail Water Supply Sources

To reliably and sustainably meet the future water needs of its retail customers, the SFPUC has several WSIP facility projects in the planning stages for maintaining normal- and dry-year water supplies for both wholesale and retail customers, and is diversifying its water supply portfolio through the development of local water supplies such as increasing recycled water and groundwater production. These sources of supply were described and analyzed programmatically in the WSIP PEIR and in the 2010 UWMP. Projects related to these efforts are described below.

2.2.1 San Francisco Groundwater Supply Project[13]

The San Francisco Groundwater Supply Project proposes two phases for the construction of up to six wells and associated facilities in the western part of San Francisco to extract up to 4 mgd of groundwater from the North Westside Groundwater Basin for potable use and distribution in the City. Phase 1 would include the construction and operation of four new well facilities to supply an annual average of approximately 2.5 to 3.0 mgd of groundwater. Phase 1 is anticipated to come online and begin water delivery in mid-2016. At initial startup, project well operation would be limited to a maximum combined capacity of 1 mgd as part of an adaptive management program. After one year of monitoring for possible seawater intrusion and adverse effects on Lake Merced, the SFPUC may increase annual pumping by 1 mgd each year, up to a total of 3 mgd during Phase 1 of the project and 4 mgd when Phase 2 is implemented.

Phase 2 would include the conversion of the two existing Golden Gate Park irrigation well facilities currently in use and the operation of the converted irrigation wells to provide an additional annual average of approximately 1.0 to 1.5 mgd of groundwater. Phase 2 of the project would only be implemented after the Westside Recycled Water Project is approved and constructed (anticipated 2018) to provide a new recycled water supply for irrigation uses at Golden Gate Park and nearby golf courses. The extracted groundwater, which would be used both for regular and emergency potable water supply purposes, would

[13] The primary source of information provided in this section is the SFPUC San Francisco Groundwater Supply Project Draft EIR (March 2013), which analyzes this project at a project-level of environmental review.

be disinfected and blended with imported surface water before entering the municipal drinking water system.

A distribution system (including pipelines and connection points) would connect five of the groundwater well facilities to Sunset Reservoir. The sixth well would connect to the Lake Merced Pump Station (which pumps water to both Sutro and Sunset Reservoirs). The groundwater would be blended with San Francisco's municipal water supply and distributed to local customers through the Sunset and Sutro Reservoirs. Figure 2 provides an overview schematic of the project and identifies the locations of all wells and the boundaries of the North Westside Groundwater Basin.

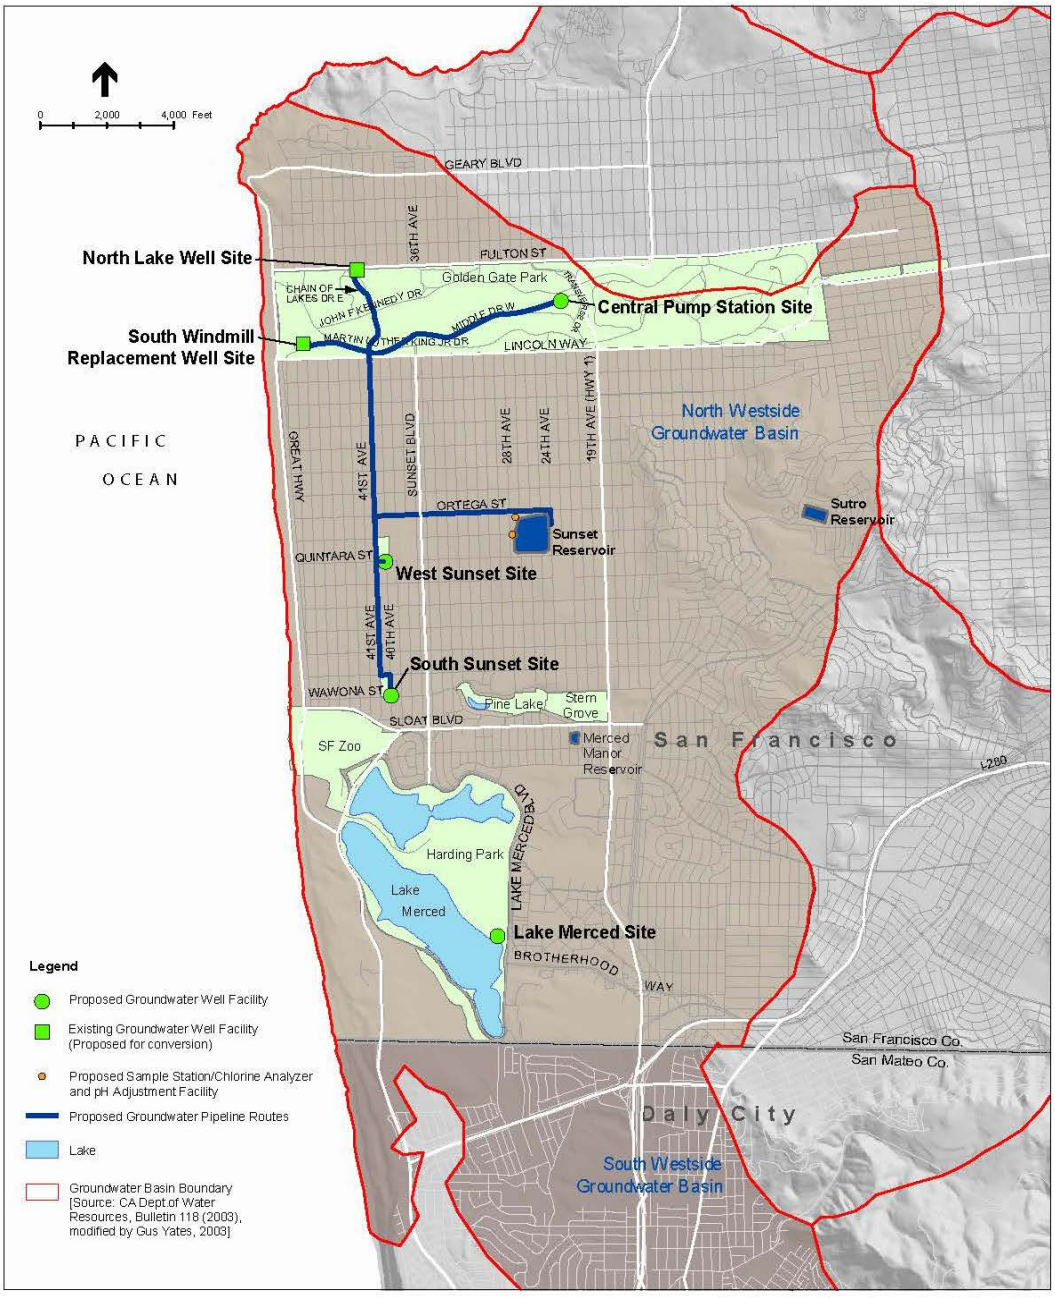

Figure 2: San Francisco Groundwater Supply Project

2.2.2 Future Recycled Water Supply Projects

The SFPUC also has plans to develop the proposed Westside and Eastside Recycled Water Projects in San Francisco (retail service area). These projects would provide up to 4 mgd of recycled water to a variety of users in San Francisco – primarily for landscape irrigation, toilet flushing, and industrial purposes – and are detailed below. Figure 3 shows areas on the western and eastern sides of the City that are designated for municipal recycled water use.

- The proposed Westside Project would construct a tertiary recycled water plant and associated pipelines to replace surface and groundwater currently used to irrigate Golden Gate Park, Lincoln Park and Golf Course, and the Presidio Golf Course. Additionally recycled water would be used for various non-potable uses in Golden Gate Park, including those at the California Academy of Sciences. The proposed treatment facility site was relocated to the SFPUC's Oceanside Plant in early 2012, and preliminary design for the new site is underway. The project-level environmental review for the new project is anticipated to begin in mid-2013.
- The SFPUC completed a recycled water demand assessment of potential customers on the eastern side of San Francisco, and identified a demand potential of up to 2 mgd to be served by the proposed Eastside Recycled Water Project. The planning of Eastside Recycled Water Project treatment and distribution facilities was initiated in late 2011, with the goal of identifying a preferred project in 2013. The WSIP contains funding for planning, design, and project-level environmental review for the proposed Eastside Recycled Water Project.

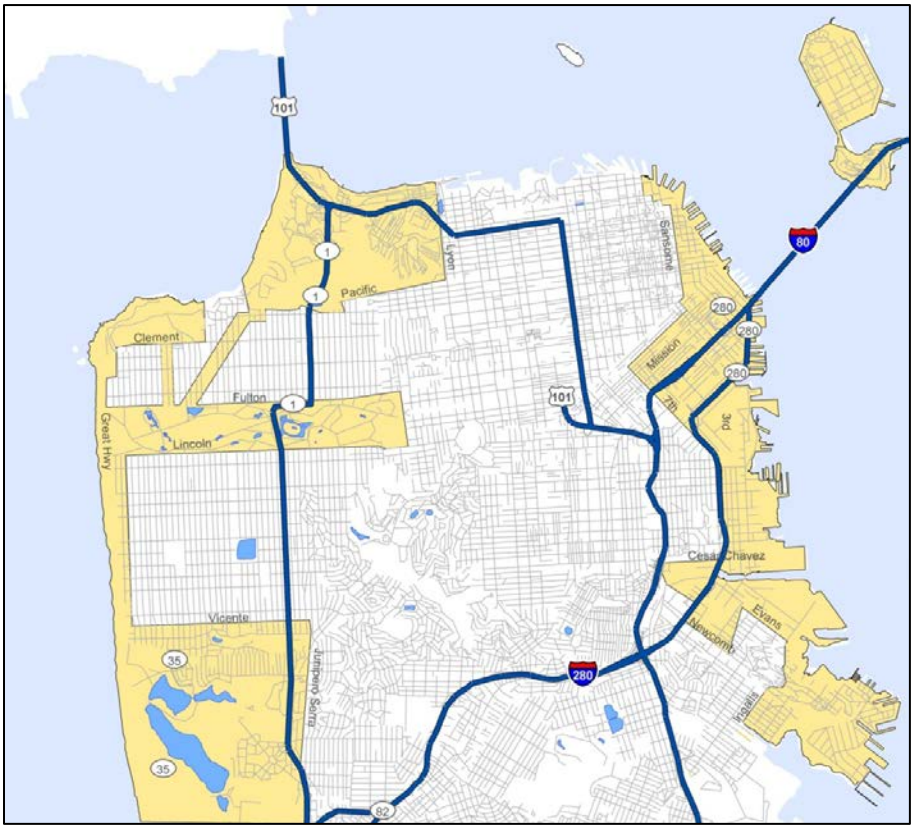

Figure 3: San Francisco's Designated Recycled Water Use Areas

2.3 Summary of Current and Future Retail Water Supplies

Table 3 provides a breakdown of current and projected water supply sources for meeting SFPUC retail water demand over the next 20 years.

Table 3: SFPUC Retail Water Supplies 2015-2035 in a Normal Year (mgd)

Water Supply Sources	2015	2020	2025	2030	2035
Existing Supply Sources					
RWS Watersheds - Retail Allocation	81.0	81.0	81.0	81.0	81.0
Suburban Groundwater & Subsurface Diversions[1]	0.7	0.7	0.7	0.7	0.7
North Westside Groundwater Basin[2]	1.5	1.5	1.5	1.5	1.5
Recycled Water - Harding Park & Sharp Park	0.3	0.3	0.3	0.3	0.3
Existing Supplies Subtotal	**83.5**	**83.5**	**83.5**	**83.5**	**83.5**
Future Supply Sources[3]					
Future North Westside Groundwater Basin Expansion[2]	0.0	2.8	2.8	2.8	2.8
Future Recycled Water Projects	0.0	2.0	4.0	4.0	4.0
Future Supplies Subtotal	**0.0**	**4.8**	**6.8**	**6.8**	**6.8**
TOTAL PROJECTED SUPPLIES	**83.5**	**88.3**	**90.3**	**90.3**	**90.3**

Notes:

1. These sources consist of groundwater use at Castlewood (not connected to RWS) of approximately 0.4 mgd, and subsurface diversions to Sunol Golf of approximately 0.3 mgd taken from the Sunol Infiltration Gallery.
2. The North Westside Groundwater Basin is currently used for irrigation. In-City groundwater use will be expanded for potable use with the San Francisco Groundwater Supply Project. Approximately 1.2 mgd of existing groundwater use will be converted to potable use (for a total of 4.0 mgd) once the Westside Recycled Water project is completed as a substitute irrigation water supply.
3. The implementation of proposed future supply sources is contingent on completion of necessary project-level environmental review and project approval. If these supplies are not available as planned, and if retail demand exceeds the available water supply, the Water Supply Agreement allows the SFPUC to import additional water from the RWS, with mitigation implemented by the SFPUC and potential environmental surcharges if RWS deliveries exceed the 265 mgd interim supply limitation. (Total RWS deliveries in FY11/12 were 219.4 mgd.)

2.4 Dry-Year Water Supplies

As an established major water supplier for the Bay Area region, the SFPUC is responsible for securing and managing its existing RWS supplies and planning for future needs, as well as securing its own retail supplies. During a drought, the SFPUC projects that retail and wholesale customers would experience a reduction in the amount of water received from the RWS. The WSIP water supply program includes development of the following dry-year supplies for the RWS:

- Restoration of Calaveras Reservoir capacity via the Calaveras Dam Replacement Project, which is currently under construction and anticipated to be completed in 2018;
- Restoration of Crystal Springs Reservoir capacity via the Lower Crystal Springs Dam Improvements Project, which was completed in 2013;

- Recapture of Calaveras Reservoir releases via the Upper Alameda Creek Filter Gallery Project[14], which is currently in the design phase and anticipated to be completed in 2019;
- Increase in groundwater storage volume and recapture via the Regional Groundwater Storage and Recovery (GSR) Project (a.k.a. Westside Basin Groundwater Conjunctive Use Project), for which the project-level Draft EIR was published on April 10, 2013, and construction is anticipated to be completed in 2016; and
- Water transfers, which are currently under negotiation.

The total available water supply during droughts would be allocated between wholesale and retail customers as described in Section 1.2.4.

Table 4 provides a breakdown of water supplies for meeting SFPUC retail demand over the next 20 years during Years 2 and 3 of multiple dry years. Local groundwater and recycled water supplies are assumed to remain constant regardless of a normal or dry year.

Table 4: SFPUC Retail Water Supplies 2015-2035 in Years 2 and 3 of Multiple Dry Years (mgd)

Water Supply Sources	2015	2020	2025	2030	2035
Existing Supply Sources					
RWS Watersheds - Retail Allocation	79.5	79.5	79.5	79.5	79.5
Groundwater & Subsurface Diversions[1]	0.7	0.7	0.7	0.7	0.7
North Westside Groundwater Basin[2]	1.5	1.5	1.5	1.5	1.5
Recycled Water - Harding Park & Sharp Park	0.3	0.3	0.3	0.3	0.3
Existing Supplies Subtotal	**82.0**	**82.0**	**82.0**	**82.0**	**82.0**
Future Supply Sources[3]					
Future North Westside Groundwater Basin Expansion[2]	0.0	2.8	2.8	2.8	2.8
Future Recycled Water Projects	0.0	2.0	4.0	4.0	4.0
Future Supplies Subtotal	**0.0**	**4.8**	**6.8**	**6.8**	**6.8**
TOTAL PROJECTED MULTIPLE DRY-YEAR SUPPLIES	**82.0**	**86.8**	**88.8**	**88.8**	**88.8**

Notes:
1. These sources consist of groundwater use at Castlewood (not connected to RWS) of approximately 0.4 mgd, and subsurface diversions to Sunol Golf of approximately 0.3 mgd taken from the Sunol Infiltration Gallery.
2. The North Westside Groundwater Basin is currently used for irrigation. In-City groundwater use will be expanded for potable use with the San Francisco Groundwater Supply Project. Approximately 1.2 mgd of existing groundwater use will be converted to potable use (for a total of 4.0 mgd) once the Westside Recycled Water project is completed as a substitute irrigation water supply.
3. The implementation of proposed future supply sources is contingent on completion of necessary project-level environmental review and project approval. These sources are intended to diversify normal-year supplies and meet dry-year needs as well.

[14] Although the Upper Alameda Creek Filter Gallery Project is not listed as a dry-year water supply project under WSIP, it is listed in this section because the infrastructure required to make the releases are included in the Calaveras Dam Replacement Project scope.

Continued progress on the dry-year supply projects is an important component of the SFPUC's dry-year water supply program. As part of the reservoir capacity projects, the SFPUC agreed to provide instream flow releases below Calaveras Dam and Lower Crystal Springs Dam, as well as bypass flows below Alameda Creek Diversion Dam, to obtain required federal and state resource agency permits for construction of those projects. The instream flow release requirements for Alameda Creek and San Mateo Creek represent a potential decrease in available annual average water supply of 3.9 mgd and 3.5 mgd, respectively, for a total shortfall of 7.4 mgd on an average annual basis. These instream flow releases could potentially create a shortfall in meeting the SFPUC system wide demands of 265 mgd and slightly increase the SFPUC's dry-year water supply needs. The effects of such a shortfall, if any, would occur upon completion of construction of both the Calaveras Dam Replacement Project and the Lower Crystal Springs Dam Improvements Project, at the time when the SFPUC will be required to provide the instream flow releases. The SFPUC is currently exploring other future supplies to offset the 7.4 mgd, including:

- Development of additional conservation and recycling.
- Development of additional groundwater supplies.
- Securing of additional water transfer volumes.
- Increasing Tuolumne River supply.
- Revising the Upper Alameda Creek Filter Gallery Project capacity.
- Development of a desalination project.

If multiple dry years occur before the planned dry-year supply projects are implemented, then the SFPUC may impose measures to ensure a balance of supplies and demands. These measures include reducing system deliveries and imposing customer rationing.

3.0 Retail Water Demand Analysis

Retail water demands for the SFPUC are separated into In-City customers and suburban customers. Suburban customers are retail customers outside of San Francisco that are billed and served directly by the SFPUC and not through a wholesale agency (including San Francisco County Jail, San Francisco International Airport, NASA Ames Research Center, residents in Sunol and other commercial and residential customers). Suburban retail customer demands have remained relatively constant over the last 20 years. The suburban retail customer demands are not generated by the SFPUC's Retail Water Use Models, but are instead based on historic water use.

3.1 Revised City of San Francisco Growth Projections

SF Planning used the updated growth projections to develop 2012 LUA projections, as detailed in Section 1.1 and in a memorandum from SF Planning to the SFPUC dated January 28, 2013 (Appendix A). This analysis results in a 2035 growth projection that differs from the 2010 UWMP. Table 5 compares the new 2012 LUA growth projections to those used in the 2010 UWMP in 5-year increments from 2015 to 2035.

Table 5: 2035 Growth Projections for Households and Employment

	2015	2020	2025	2030	2035
Housing Units Projections					
2009 LUA Projections (used in 2010 UWMP)	363,213	376,109	389,463	403,292	415,000
2012 LUA Projections	361,452	377,684	393,630	410,227	426,235
Net Change	**(1,761)**	**1,575**	**4,167**	**6,935**	**11,235**
Employment Projections					
2009 LUA Projections (used in 2010 UWMP)	569,720	599,060	631,790	665,030	698,790
2012 LUA Projections	621,722	677,531	691,342	706,848	733,858
Net Change	**52,002**	**78,471**	**59,552**	**41,818**	**35,068**

3.2 Projected Retail Water Demands

In-City retail water demands are estimated using the City's Retail Water Use Models. The models were first developed in 2004 and updated in 2010 and again in 2012, as detailed below. The models incorporate economic and demographic forecast data, including projections of population, housing stock and employment. For additional information in regards to the model methodology, please see Section 4.1.5 of the 2010 UWMP.

In late 2012, SFPUC staff compared the last four years of actual conservation measure savings through fiscal year 2012 with forecasted savings for 2013 to 2018. The comparison showed that some measures could fall short of future estimates (mainly multi-family coin operated washing machines and multi-family toilet direct installs). In response, the SFPUC adjusted forecasted production for these measures. In light of the new growth projections and the model updates, the SFPUC reran the demand model and developed new water demand projections for In-City uses, as detailed in a memo from SFPUC staff dated February 22, 2013 (Appendix B). A summary of all retail water demands for SFPUC is presented in Table 6.

Table 6: San Francisco Retail Water Demands (mgd)

Water Use Entity	2012[1]	2015	2020	2025	2030	2035
In-City Retail Customers						
Single-Family Residential[2]	16.1	16.7	15.5	14.8	14.4	14.3
Multi-Family Residential[2]	24.9	28.1	27.7	27.6	27.9	28.6
Non-Residential[2]	23.2	26.5	27.7	27.5	27.7	28.7
Other In-City Demands[4,7]	0.2	0.2	0.2	0.2	0.2	0.2
In-City Irrigation Uses[5,7]	1.5	1.5	1.5	1.5	1.5	1.5
Losses[2,3]	6.9	5.1	5.2	5.2	5.2	5.3
In-City Retail Subtotal	**72.8**	**78.1**	**77.8**	**76.8**	**76.9**	**78.6**
Suburban Retail Customers						
Single-Family Residential[7]	0.1	0.1	0.1	0.1	0.1	0.1
Non-Residential[7]	3.7	4.3	4.3	4.3	4.3	4.3
Hetch Hetchy Water & Power Customers[6,7]	1.2	1.2	1.2	1.2	1.2	1.2
Suburban Retail Subtotal	**5.0**	**5.6**	**5.6**	**5.6**	**5.6**	**5.6**
Total Retail Demand	**77.8**	**83.7**	**83.4**	**82.4**	**82.5**	**84.2**

Notes:

1. 2012 data are based on actual billing data.
2. 2015-2035 projections were generated using the SFPUC Retail Demand Model and include savings from passive and active conservation.
3. Losses reported for 2012 include meter under-registration. Losses for 2015-2035 exclude meter under-registration because they are included in the retail demand projections for residential and non-residential sectors. Meter under-registration losses are estimated at 2.2% of residential and 2.1% of non-residential sector demands. System losses excluding meter under-registration are estimated at 6.86% of sector demand.
4. Builders and Contractors, Docks and Ships.
5. Irrigation at Golden Gate Park, the Great Highway, and the San Francisco Zoo.
6. Hetch Hetchy Water & Power Customers include Lawrence Livermore National Laboratory, Groveland Community Services District and other incidental uses.
7. 2015-2035 projections are based on average historic consumption, which has remained relatively constant over the past 20 years.

4.0 Supply and Demand Comparison

This section compares the SFPUC's retail water supplies and demands through 2035 utilizing the information presented in Sections 2.0 and 3.0. Table 7 compares the SFPUC's retail supplies and demand during normal-year, single dry-, and multiple dry-year periods. Currently, San Francisco has access to an annual average 83.4 mgd from all existing water supply sources. Beginning in 2016, the SFPUC's retail water supplies are projected to increase if the local groundwater and recycled water projects are approved and implemented. The demands estimated in this Study show that the 2012 LUA projections from SF Planning result in an increase in City retail demand. By 2035, the retail demand is estimated at 84.2 mgd, as shown in the figures below. Figure 4 compares the demand to normal-year supplies (from on Table 3), and Figure 5 compares demand to dry-year supplies (from Table 4).

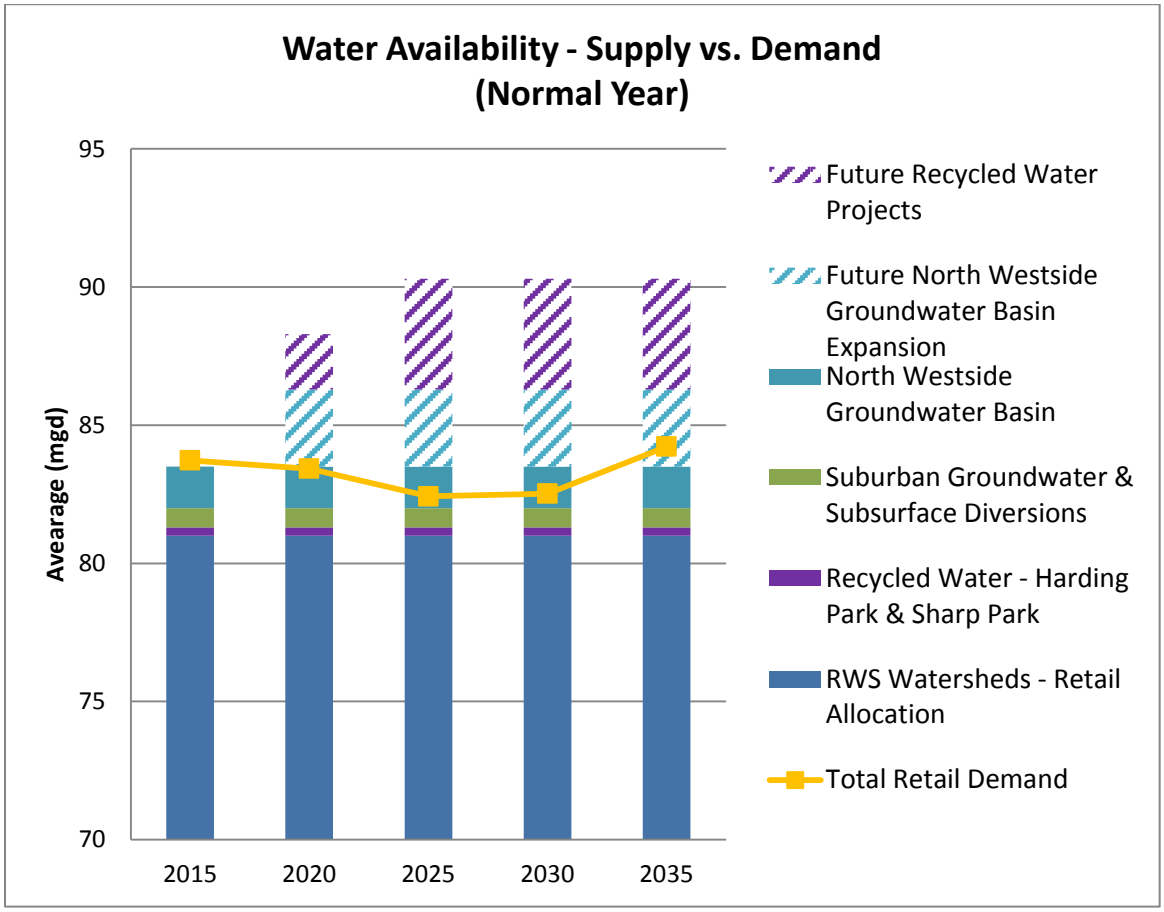

Figure 4: Normal-Year Supply and Demand Comparison

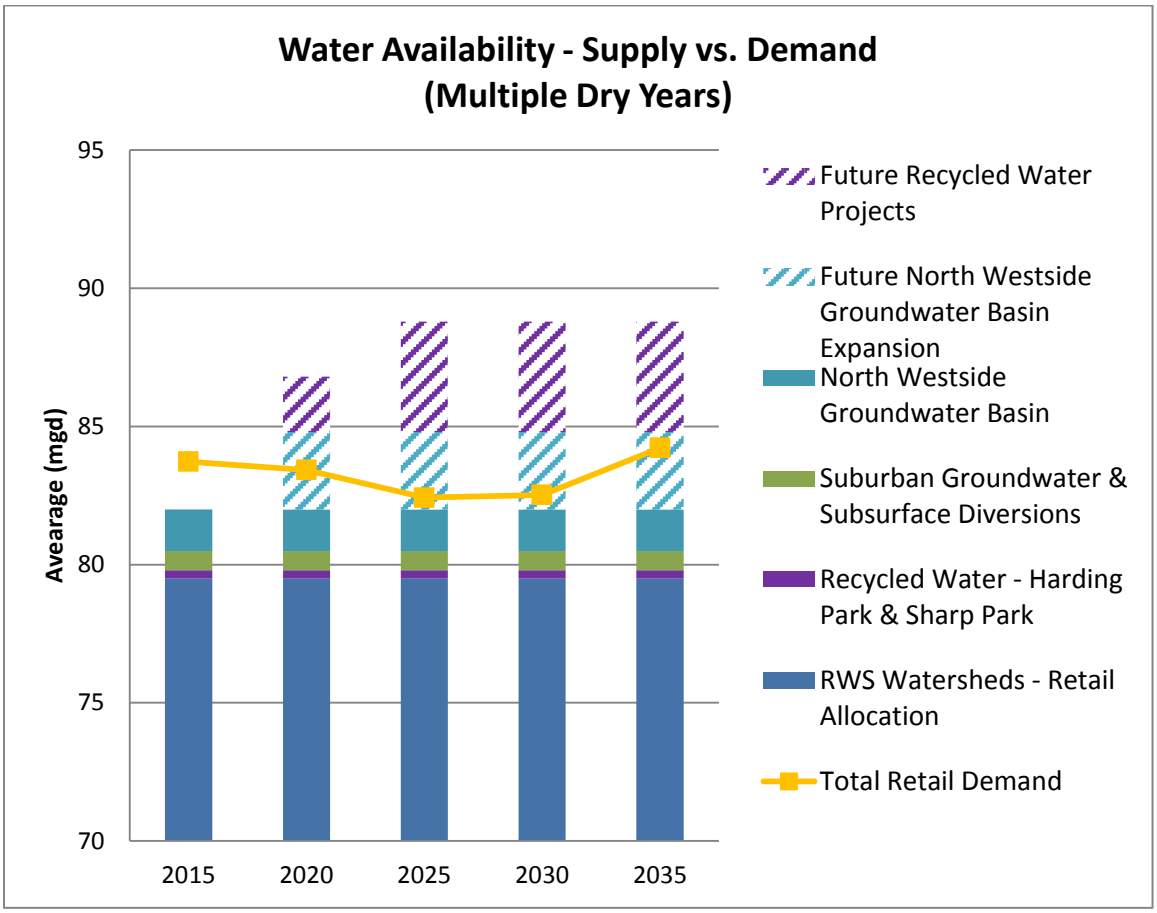

Figure 5: Multiple Dry-Year Supply and Demand Comparison

As shown in Table 7, the SFPUC, with its existing and future supplies, can meet the future demands of its retail customers in normal-, single dry-, and multiple dry-year events, with the exception of 2015. The deficit shown in 2015 can be attributed to a number of factors, including being within the margin of error and/or conservative assumptions of the demand model; propagated from aggressive near term employment and housing projections; and/or the result of demand increases prior to full implementation of the 10 mgd of new supplies under the Phased WSIP Variant. The deficit for 2015 in a normal year is 0.2 mgd, which represents less than a 0.25% shortfall. The deficit for 2015 in a multiple dry-year drought event is 1.7 mgd, which represents a 2.0% shortfall. These deficits could be easily managed through voluntary conservation measures or rationing. The SFPUC would have to declare a drought in 2014 to reach Year 2 of a multiple year event by 2015. As shown previously in Table 6, retail demand is currently lower than the 2015 projected demand (FY11/12 demand was 77.8 mgd). In the last 10 years, SFPUC's retail water demand has decreased by almost 10 mgd.

The other deficits shown in Table 7 are projected to occur if future supplies are not implemented as planned. The normal year deficits range from 0.2 to 0.7 mgd, which represent shortfalls of less than 1%. The multiply dry-year deficits range from 0.4 to 2.2 mgd, which represent shortfalls of up to 2.7%. These deficits are comparable to those described above for 2015 under normal-year conditions with future supplies, and could be easily managed through voluntary conservation measures or rationing.

Table 7: Projected Supply and Demand Comparison (mgd)

		Normal Year[1,2]	Single Dry Year[1,2]	Multiple Dry Years		
				Year 1[1,2]	Year 2[2,3]	Year 3[2,3]
2015	Total Retail Demand	83.7	83.7	83.7	83.7	83.7
	Total Retail Supply – Existing Supplies Only[4]	83.5	83.5	83.5	82.0	82.0
	Surplus/(Deficit)	(0.2)	(0.2)	(0.2)	(1.7)	(1.7)
	Total Retail Supply – Existing & Future Supplies[4]	83.5	83.5	83.5	82.0	82.0
	Surplus/(Deficit)[5]	(0.2)	(0.2)	(0.2)	(1.7)	(1.7)
2020	Total Retail Demand	83.4	83.4	83.4	83.4	83.4
	Total Retail Supply – Existing Supplies Only[4]	83.5	83.5	83.5	82.0	82.0
	Surplus/(Deficit)	0.1	0.1	0.1	(1.4)	(1.4)
	Total Retail Supply – Existing & Future Supplies[4]	88.3	88.3	88.3	86.8	86.8
	Surplus/(Deficit)	4.9	4.9	4.9	3.4	3.4
2025	Total Retail Demand	82.4	82.4	82.4	82.4	82.4
	Total Retail Supply – Existing Supplies Only[4]	83.5	83.5	83.5	82.0	82.0

	Surplus/(Deficit)	6.1	6.1	6.1	4.6	4.6

Notes:

1. Normal-year retail water supplies per Table 3.
2. Retail water demands per Table 6.
3. Year 2 and 3 of multiple dry years per Table 4.
4. Existing and future supply sources per Table 3 (repeated in Table 4).
5. The deficit shown for 2015 in a normal year with existing and future supplies represents less than a 0.25% shortfall and during a multiple dry-year drought event represents a 2.0% shortfall, which can be easily managed through voluntary conservation measures or rationing. Current retail demand in FY11/12 was 77.8 mgd. If retail demand exceeds the available water supply of 83.5 mgd, the Water Supply Agreement allows the SFPUC to import additional water from the RWS, with mitigation implemented by the SFPUC and potential environmental surcharges if RWS deliveries exceed the 265 mgd interim supply limitation. (Total RWS deliveries in FY11/12 were 219.4 mgd.)
6. The deficit shown for 2035 is projected if none of the local groundwater and recycled water projects are implemented as described in Section 2.2.

Whether or not future supplies are available, if the SFPUC determines in a particular year that projected total RWS storage is less than target storage levels devised in relation to the design drought, it may implement the terms of the WSAP to achieve a combined average reduction in wholesale and retail water use of up to 20 percent. In addition, the SFPUC currently serves approximately 1.0 mgd to retail irrigation lessees on an interruptible basis. It is anticipated that the San Francisco Groundwater Supply Project will provide an additional 1.0 mgd of water supplies beginning in mid-2016.

In addition, if retail demand exceeds the available water supply of 83.5 mgd in normal years, the Water Supply Agreement allows the SFPUC to import additional water from the RWS. If combined retail and wholesale RWS deliveries exceed the 265 mgd interim supply limitation, the SFPUC retail customers would be required to pay an environmental enhancement surcharge for RWS deliveries over 81 mgd as detailed previously in Section 1.2.4. In addition, the SFPUC would need to implement mitigation measures per the WSIP PEIR as described in Section 1.2.3. (Total RWS deliveries in FY11/12 were 219.4 mgd.)

4.1 Conclusion

The updated 2012 SF Planning projections result in a retail demand in 2035 of 84.2 mgd, which represents a 3.3 mgd, or 4%, increase over the 2035 demand projections estimated in the 2010 UWMP. The ability to meet the demand of the retail customers is in large part due to development of 10 mgd of local WSIP supplies, including conservation, groundwater, and recycled water. These supplies are anticipated to be fully implemented over the next 10 years.

If planned, future water supply projects (i.e., San Francisco Groundwater Supply Project [or Westside Groundwater Basin Expansion], Westside Recycled Water Project, and Eastside Recycled Water Project) are not implemented, normal-year supplies may not be enough to meet projected retail demands. To balance any water supply deficits during normal years, the SFPUC may import additional water from the RWS, with mitigation implemented by the SFPUC and potential environmental surcharges if RWS deliveries exceed the 265 mgd interim supply limitation.

If dry-year supply projects (i.e., Calaveras Dam Replacement Project, Lower Crystal Springs Dam Improvements Project, Upper Alameda Creek Filter Gallery Project, GSR Project, and water transfers) are not implemented, existing dry year supplies may not be enough to meet projected retail demands. To balance any water supply deficits during dry years, the SFPUC may reduce system deliveries and impose customer rationing.

The SFPUC remains committed to meeting the level of service goals and objectives outlined under WSIP. In addition, the SFPUC is currently exploring other future supplies, including:

- Development of additional conservation and recycling.
- Development of additional groundwater supplies.
- Securing of additional water transfer volumes.
- Increasing Tuolumne River supply.
- Revising the Upper Alameda Creek Filter Gallery Project capacity.
- Development of a desalination project.

January 28, 2013

Michael P. Carlin
Deputy General Manager, SFPUC
525 Golden Gate Street
San Francisco, CA 94102

Subject: Projections of growth 2015-2035

Dear Michael:

I am forwarding you the Department's current growth projections as requested by Paula Kehoe, Manager, Water Resources Planning, SFPUC. Table 1 shows the projections for the requested years 2015-2035 from the Planning Department's long range Land Use Allocation (LUA) 2012.

Table 1: Development Projections

	2015	2020	2025	2030	2035
Households	361,452	377,684	393,630	410,227	426,235
Jobs	621,772	677,531	691,342	706,848	733,858

Source: ABAG SCS 2012 (May). SF Planning, Land Use Allocation 2012.

The Planning Department routinely updates its long range LUA when ABAG updates their regional projections, typically, every two years. The Department uses the LUA for a variety of purposes, including analyzing impacts of plans and projects undergoing the environmental review process. This past summer, the Department updated its LUA for the recently released ABAG Sustainable Community Strategy Jobs-Housing Connections Scenario (ABAG SCS 2012).

In updating the LUA, the Department's method uses the best information available to allocate the growth to location. That information includes proposed and entitled projects (the "pipeline"), area plan development potential, and parcels with high development potential located outside area plan boundaries. The Planning Department assumed full buildout over the forecast period of the six large development projects at the beginning of their environmental review, namely Giants/Mission Rock (Sea Wall Lot 337 & Pier 48), Warriors Arena (Piers 30-32), Pier 70 Master Plan, 5M (901 Mission Street-Chronicle Building), Moscone Center Expansion, and the Central Corridor Plan.

If you or your staff have any questions, please contact Scott Edmondson, AICP, by email (Scott.Edmondson@sfgov.org) or telephone (415-575-6818).

Sincerely,

John Rahaim
Director of Planning

CC: Paula Kehoe (SFPUC), Scott Edmondson & Aksel Olsen (Planning Department)

MEMO

February 22, 2013

To: Steve Ritchie, Assistant General Manager, Water Enterprise

From: Paula Kehoe, Water Resources Director

Re: Updates to 2011 Retail Conservation Plan

This memo summarizes two areas of updated data that revise some conservation and demand estimates noted in the SFPUC's 2011 Retail Water Conservation Plan.

1) Updated Conservation Measure Production

The 2011 Retail Water Conservation Plan published in June 2011 notes a maximum conservation potential of 5 mgd demand reduction by 2018. The Plan also notes that the SFPUC regularly evaluates and reports on conservation activities. To that end, in late 2012, the SFPUC compared the last four years of actual conservation measure production through fiscal year 2012 with forecasted production for 2013 to 2018. The comparison showed that some measures could fall short of future estimates (mainly multi-family coin operated washing machines and multi-family toilet direct installs). In response, the SFPUC adjusted forecasted production for these measures, which resulted in a reduction of the overall estimated conservation potential to 4.1 mgd savings in 2018. The SFPUC intends to prepare a complete update of the Retail Water Conservation Plan every five years along with the Urban Water Management Plan. The next major update will be in 2015.

2) Updated Population and Employment Data

In January 2013, the San Francisco Planning Department provided the SFPUC updated population and employment projections for 2015 through 2035 from the Planning Department's long range Land Use Allocation (LUA) 2012. The Planning Department routinely updates its long range LUA when the Association of Bay Area Governments (ABAG) updates its regional projections, typically, every two years. These updated projections represent an increase in households in 2020 through 2035 and jobs in 2015 through 2035 used in the version of the SFPUC's forecast model that provided demand projections in the 2011 Retail Water Conservation Plan.

The attached, revised Tables 16 and 17 from the *SFPUC Retail Demand Model Update and Calibration Technical Memo* contained in Appendix A of the 2011 Retail Water Conservation Plan incorporate the updated conservation measure production, population and employment data noted in items 1 and 2 above.

RE: Water Supply Assessment Request for University of California, San Francisco (UCSF) 2014 Long Range Development Plan (LRDP)

The purpose of this memorandum is to request that the San Francisco Public Utilities Commission (SFPUC) prepare a Water Supply Assessment (WSA) for UCSF's 2014 LRDP.

Water Code 10910 and 14 CCR 15155 (entitled "City or County Consultation with Water Agencies") apply only to cities and counties. Water Code 10910(a) states "Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part."

Although these requirements do not specifically apply to the University of California, San Francisco, or the University of California, because it is not a city or county, UCSF is voluntarily requesting a WSA be prepared following the requirements of SB 610 for informational purposes for the net new development proposed as part of our LRDP, including the program level components. We are making this request as part of our cooperative planning with the City and County of San Francisco, and to inform the EIR analysis.

The memorandum dated March 13, 2013, from SFPUC requires Project Proponents to provide, a) a description of the Project, and b) the proposed project demand for all proposed water uses. The following sections discuss the required items in detail.

A. Project Description

The University of California, San Francisco (UC San Francisco or UCSF) is one of ten campuses in the University of California (UC) system, and is the only UC campus devoted solely to the health sciences. UCSF's mission is to advance health worldwide through innovative health sciences education, research and patient care. UCSF is a multi-site campus with locations throughout the City and County of San Francisco, encompassing approximately 8.04 million total gross square feet. Its major academic and clinical sites are at Parnassus Heights, Mission Bay and Mount Zion, with a major presence at the City's San Francisco General Hospital (SFGH) site.

In support of its mission, UCSF is preparing a new Long Range Development Plan (LRDP) to guide future campus growth and development through the year 2035. UCSF currently occupies 6.99 million gross square feet (gsf) in owned space and 1.05 million gsf in leased space in San Francisco. By 2035, UCSF's total owned and leased space will be about 12.37 million gsf, an increase of about 53% from existing conditions. The summary of existing

and total projected gsf at LRDP horizon in 2035 is shown below in **Table 1**. The total space across all campus sites would increase by about 4.33 million gsf. Of the 4.33 million gsf, there is approximately 1.14 million gsf that is currently under construction at the Mission Bay campus site and is scheduled for completion in 2015. Therefore, the projected campus growth under the LRDP by 2035 would be 3.19 million gsf.

TABLE 1
SUMMARY OF TOTAL UCSF EXISTING, LRDP HORIZON 2035 GSF AND NET CHANGE

Type of Space	Existing 2013[1,2] Total gsf	LRDP Horizon 2035 Total gsf	Change in gsf from existing (2013-2035)[3]
Instruction	608,000	711,800	103,800
Research	2,109,700	3,063,800	954,100
Clinical	1,926,700	3,783,500	1,856,800
Support			
Academic Support	417,900	573,000	155,100
Academic/Campus Admin	1,506,200	1,829,700	323,500
Campus Community	397,100	491,200	94,100
Logistics	400,000	560,400	160,400
Support Subtotal	2,721,200	3,454,300	733,100
Housing	638,500	1,306,100	667,600
Vacant/Alteration	36,700	50,000	13,300
Total	**8,040,800**	**12,369,300**	**4,328,500**

[1] Existing as of January 2014
[2] Excludes 1,618,100 gsf of structured parking (653,700 gsf at Parnassus Heights; 176,500 gsf at Mount Zion; 680,500 gsf at Mission Bay; and 107,400 gsf at Laurel Heights) .
[3] Total leased space is assumed to decrease from 1,050,000 sf in 2013 to 750,000sf in 2035.

B. Proposed Project Demand

As required as part of the project demand analysis, the LRDP's projected water demand is shown below in **Table 2**.

TABLE 2
WATER DEMAND BASED ON PROJECT PHASING

	2013	2015	2020	2025	2030	2035
Demand of total UCSF growth (MGD)	-	0.15	0.06	0.12	0.18	0.30
Demand of UCSF net new growth (MGD)	**-**	**-**	**0.03**	**0.05**	**0.08**	**0.14**

[1] 4.33 million gsf total UCSF growth

[2] 1.48 million gsf net new UCSF growth

[3]The 2013/2015 demand is based on actual current usage - 0.06 ccf/gsf. Future demand for 2020-2035 is based on a reduced 0.048 ccf/gsf rate, reflecting the conservation programs discussed below.

[4] Water Availability Study for the City and County of San Francisco, Appendix A - "SF Planning Memorandum" dated January 28, 2013, Prepared by the San Francisco Public Utilities Commission, May 2013.

As shown in **Table 1**, the total amount of space across all campus sites would increase by 4.33 million gsf over the next 20 years. Of that 4.33 million gsf, 2,845,700 gsf has been previously accounted for in

Planning Department growth projections; [1] and 1,482,800 gsf is growth not previously identified in the Planning Department 2035 growth projections. Net new growth is the additional space proposed under the 2014 UCSF Long Range Development Plan. In order to present the most conservative analysis possible, both the net new growth, 1.48 million gsf and the total water demand associated with all UCSF future growth, 4.33 million gsf, is accounted for in Table 2.

The 1,482,800 gsf of net new growth includes 991,800 gsf at the Mission Bay campus site. The additional 491,000 gsf of net new growth is distributed at the four other UCSF campus sites: Parnassus Heights, Mount Zion, SFGH, and the Mission Center Building at 1855 Folsom Street. The infrastructure effects of the growth at the Mission Bay campus site are discussed in the *LRDP Entitlement Increase Analyses Report for Public and Private Utilities*, Freyer & Laureta, May 2013. This report is attached and provided for reference.

As the City's second largest employer, UCSF currently consumes 0.85 MGD. As shown in **Table 2**, the net new growth represents an additional demand of 0.14 MGD or 0.15% of the total supply in 2035. The San Francisco Water Availability Study[2] estimates that supply could be reduced by 1.9% in the multiple dry year scenario. The project's water demand does not propose adjustments based on water year type. As the City's largest healthcare provider, short-term response to demand is relatively inelastic. In addition, UCSF participates in the voluntary conservation measures identified in the 2013 Water Availability Study[3] - 4.0 Supply and Demand Comparison– that are deemed to be sufficient to meet a multiple dry-year drought event.

UCSF has achieved a 20% reduction in water use per gsf from 1990 to 2010. UC policy sets a long-term goal of achieving 20% reduction per capita use of potable water by year 2020. UCSF has a funded program to assess Campus water conservation opportunities and to implement the identified improvements. http://sustainability.universityofcalifornia.edu/policy.html Therefore, UCSF does anticipate 20% per capita water use reductions over the long-term.

The UCSF Parnassus Heights campus is in the North Westside Groundwater Basin and UCSF does not draw any groundwater from the basin at Parnassus Heights campus site. The UCSF Mission Bay campus is in the Eastside Recycled Water Use Area. Future UCSF use of recycled water from the Eastside system is contingent upon completion of City constructed distribution.

As part of the submittal, we have also provided some additional background data regarding UCSF's water usage and the April 2013 Parnassus Campus Water Efficiency Survey. We believe the information provided meets the requirements for the preparation of a Water Supply Assessment by the SFPUC. Should you have additional questions, please contact me at Tchan@planning.ucsf.edu or 415.476.9627. Thank you.

[1] The remaining 2,845,700 gsf of UCSF growth, has been previously analyzed by the City in the Mission Bay South Redevelopment Plan, and, the 1996 UCSF LRDP EIR.

Notes:

1. Existing UCSF water use is 0.06 CCF per GSF or 10.4 CCF per capita . Future demand estimated at 0.06 CCF per GSF.
UCSF believes that 0.06 CCF per GSF factor is a conservative assumption. The factor was determined by using the actual SFPUC water bills averaged over a 3-year period (2007-2010) and the actual UCSF total space. UCSF has achieved a measured 20% reduction in water use per gsf in the 1990 to 2010 period. UCSF has a very accurate database of water use (CCF) and total space (GSF) associated with the campus. In addition UC Policy requires future new buildings to be both LEED silver and incorporate water savings design features. UC has a policy goal of achieving 20% reduction per capita of potable water use by 2020. http://sustainability.universityofcalifornia.edu/policy.html

2. Includes all UCSF owned occupied space in San Francisco/SFPUC served area. Excludes 1.5m gsf in existing parking structures. Includes housing.
Excludes UCSF owned space not in San Francisco/SFPUC served area. CAAN 3029 Fresno MERC 84,175 gsf
Excludes all leased space in San Francisco/SFPUC served area. Total leased space is not projected to change over life of plan.

3. Future UCSF growth at Mission Bay has been previously submitted to the City:
See "UCSF Long Range Development Plan Entitlement Increase Analyses - May 17, 2013"

4. Total Population - Residents of housing are also included in Student/ Faculty population.

UCSF Actual Purchased Water
20% Conservation Policy Baseline Data

Source : 654 Minnesota Finance Service Center Utilities Group
Data includes UCSF Medical Center
UCSF baseline data for reduction calculation is FY 07-08, 08-09, and 09- 10. (405,466 ccf)
http://www.swrcb.ca.gov/water_issues/hot_topics/20x2020/
The City's reclaimed water system does not currently extend to the UCSF campus sites.
A portion of future reductions in potable water is related to reclaimed water availability at Mission Bay.

Re: Long Range Development Plan Entitlement Increase Analyses
Public and Private Utilities - UCSF Mission Bay Campus, North of 16th

Dear Mr. Beauchamp:

As discussed, UCSF is currently preparing its next Long Range Development Plan (LRDP), which addresses future growth and will guide Campus development until 2035. Freyer & Laureta, Inc. (F&L) has been asked to perform a utility infrastructure capacity analysis based on a preferred development plan, north of 16th Street, provided to us by the University in order to continue due diligence for the LRDP. This letter reports our findings from our analyses.

In the *1999 Mission Bay Campus Master Plan*, the 43-acre research campus north of 16th Street was entitled for 2.65 million gross square feet (gsf). Upon completion of the academic building on Block 25A, approximately 465,200 gsf of entitlement would remain. The preferred plan proposes 3,641,800 gsf of total entitlement, an increase of 991,800 gsf. Programming for the additional building space includes Research, Office, Central Utilities Plant (CUP), and Student Housing, per the table below:

Table 1 – Development Plan/Programming

Building	Program	Building Size (gsf)
15a/b	Housing and Childcare	418,200
16a	Central Utility Plant	53,000
16b	Research	236,00
25b	Research/Office	323,250
23a	Research	232,200
18a	Office	192,850

This letter report summarizes our findings on the existing public utility infrastructure surrounding the UCSF Mission Bay Campus and projected improvements that may need to be constructed for each system to serve the additional entitlement desired by the University. This letter report also provides a sensitivity analysis for infrastructure that may be affected by both UCSF and current planned development projects in Mission Bay. For this study,

F&L performed the Domestic Water, Reclaimed Water, Fire Sprinkler, Storm Drain and Sanitary Sewer analyses, John Lambert from Client First Consulting Group provided analyses for Telecom/Data and Alarms and John VanNoord & Associates provided analyses for Electrical and Natural Gas analyses.

UTILITY LOAD ESTIMATION

The University previously estimated building utility loads in 1999, based on anticipated building programming at the time. Since then, buildings have been constructed on Blocks 17, 19, 20, 21, 23B, and 24. Construction is currently underway on Block 25A, with a slightly larger program than previously envisioned. In order to estimate utility capacity needs for the study area, we estimated building utility loads for both the constructed buildings and the future buildings on Blocks 15, 16, 18, 23A and 25B, based on anticipated programming for these future buildings. The following factors/methods were used to calculate building loads:

Sanitary Sewer

Sewer Demand Factors established in the "Mission Bay Separated Sanitary Sewer Analysis" prepared by Olivia Chen Consultants dated December 26, 2000, were used in our analyses. For programming not defined in this Analysis, sewer factors from Metcalf and Eddy were used. A peaking factor of 3 was used to calculate peak flows.

From Mission Bay Separated Sanitary Sewer Analysis (average flows):

Mission Bay Campus	0.174 gpd/gsf
Housing	170 gpd/unit

From Metcalf and Eddy:

Childcare Center	20 gpd/person
Hospital Bed	165 gpd/bed
Visitors and Hospital Employees	15 gpd/person

Domestic Water

In the 1999 Building Load Estimates, Domestic Water loads were estimated to be equal to Sanitary Sewer loads. In this analysis, Sanitary Sewer flows are estimated to be 90% of Domestic Water loads. A majority, but not necessarily all, water use within buildings drain into the Sanitary Sewer system.

Natural Gas

The following factors were used in Natural Gas Building Load Estimation:

Housing	0.12 scfh/gsf	(scfh – standard cu ft/hr)

Research	0.10 scfh/gsf
Office	0.12 scfh/gsf
Childcare	0.15 scfh/gsf
Research and Office	0.10 scfh/gsf

These factors have been successfully used in estimating gas demand for project sites in Mission Bay. Gas loads for the CUP were obtained from reports provided by the University.

Electrical

The following factors were used in Electrical Building Load Estimation:

Housing	18 va/gsf	(va – volt-amps)
Research	30 va/gsf	
Office	10 va/gsf	
Childcare	12 va/gsf	
Research and Office	30 va/gsf	
Central Utilities Plant	460 va/gsf	

These factors have also been successfully used in estimating electrical demand for project sites in Mission Bay.

Telecom/Data/Alarms

Each Campus Building has two physically separate data cable entrances, connected to the University owned Telecom/Network infrastructure of vaults on University property. The information listed on the Utility Load table for Telephone, Data and Alarms are based on known infrastructure required for each building.

Reclaimed Water

Reclaimed water is used for irrigation and other non-potable uses, such as toilet flushing. In the past, the University has not used Reclaimed Water, but provisions are being made to have main lines fronting all Campus Development Blocks to allow the option to connect.

Fire Protection

For Fire Protection, the California Fire Code 2007 was used to calculate flow requirements. Type 1A construction was assumed for each building for fire flow estimates. If buildings are sprinklered, the Fire Code allows for a 75% reduction of the fire flow requirement. We assumed this 75% reduction would be allowed in our analyses. If the 75% reduction resulted in required fire flow less than the minimum 1,500 gpm, we listed 1,500 gpm in the Table.

Please see Table 2 – UCSF Long Range Development Plan Estimated Utility Loads for estimated utility demands for each building, used in our analyses.

Estimated Building Utility Loads

Total Building SF 3,641,800

Assumptions:
- Building loads are based on current Master Planning information and subject to change.
- Subtotals and Programs Total loads assume 100% diversity.
- All individual building loads assume each building has its own mechanical room, with no central Utility Plant.
- All loads are approximate, actual design of the buildings are not known at this time.

Notes:
1. Utility Plant includes all practical loads necessary to supply steam and chilled water to all UCSF Buildings. The phase of construction and location of a Utility Plant, if at all, is not known at this time. Individual building loads will reduce once a Central Plant is constructed.
2. Natural Gas 45 - 60 psig minimum at street.
3. Reclaimed water demand estimated for irrigation purposes only, no reclaimed water needed for building use.
4. Total building fire-protection water to be specified by Fire Marshall. Fire flow determination was per the 2007 California Fire Code.
5. The Total Gas Load shown does not include loads from the CUP (neither demand nor generation).

Abbreviations:

SCFH- st. cubic feet per hour
KVA - kilovolt-amps
pairs - telephone
GSF - gross square feet

EXISITING CAMPUS AND PUBLIC UTILITY ANALYSES

At this time, a majority of public utility infrastructure is constructed surrounding the Campus. Only the utilities adjacent to Block 25 in 16th and Third Streets and the Joint Trench in Mission Bay Blvd South between Sixth and Fourth Streets remains to be constructed. Also, public utility infrastructure is completed in Fourth Street traversing the Campus. In our analyses, we reviewed the capacities of the public utility infrastructure surrounding and traversing the Campus and our findings and estimations are listed below. They are also depicted in Exhibits 1 through 9, found in Appendix A – Utility Exhibits.

Storm Drain

The storm drain piping in the public streets surrounding and traversing the Campus is of sufficient size to collect planned 5-yr storm runoff from the Campus. The increase in building square footage does not increase planned drainage volumes from development blocks. Campus storm drainage piping, per the UCSF Mission Bay Civil Master Plan and as shown on Exhibit 1 – Storm Drainage Exhibit, is required to be constructed to drain the development parcels.

Based on understanding of the Mission Bay Storm Drainage Master Plan and Campus Storm Drain Piping, we conclude there is no need to replace/upsize City and University storm drainage conveyance piping already constructed.

Separated Sanitary Sewer Pipeline Conveyance

The increase of entitlement increases peak sewer flow from the study area from 1,087 gpm (gallons per minute), per the Mission Bay Separated Sanitary Sewer Analysis, to 1,385 gpm, an increase of 298 gpm. Of this increased flow, 159 gpm drains through piping in Owens Street, Mission Bay Blvd South, Fourth Street and Third Street that flows toward the Sanitary Sewer Pump Station on Mission Bay Park P15 and the remaining 139 gpm drains toward the sewer piping in 16th Street and Illinois Street, which ultimately flows to the Mariposa Pump Station.

We calculated pipeline capacities for the sanitary sewer conveyance system and results are shown below. In our analyses, we compared these capacities to the increased flow rates.

Table 3 – Sanitary Sewer Piping to SSPS on P15

Street	Pipe Diameter (inches)	Tributary Blocks	Estimated Peak Demand (gpm)	Pipe Capacity (gpm)
Owens Street (Section 1)	12	18, 21, portion of 41, 42, 43	394	875
Mission Bay Blvd South (Section 2)	18	Section 1 + 12, 14, 15, 19a and portion of 16	729	2,580

Mission Bay Blvd South (Section 3)	21	Section 2 + portion of 16	815	3,895
Fourth Street (Section 4)	8	23a and 19b	146	475
Fourth Street (Section 5)	10	Section 4 + 20a, 17a/b	282	843
Third Street (Section 6)	15	23b, 20b, and areas east of Third	414	1,535

These results exclude increased, planned gross square footage for future development blocks in Mission Bay. Additional results can be seen on Exhibit 2, Sanitary Sewer Exhibit.

For the piping leading to the Mariposa Pump Station, we not only estimated increased sewer flows from Blocks 24 and 25, but also the Hospital site. Blocks X3 and 36-39, on which the Hospital site is situated, had a projected peak flow rate of 412 gpm in the Mission Bay Separated Sanitary Sewer Analysis. Information from the Final Environmental Impact Report, UCSF Medical Center at Mission Bay, Certified by The Regents of the University of California, September 17, 2008, included the Hospital site ultimately having 550 hospital beds and 9,119 staff members, interns, students, visitors and vendors, constructed in two phases. Phase 1 is currently under construction and Phase 2 is anticipated to begin construction after 2030. Using the sewer unit factors listed in a previous section, we projected a peak flow of 474 gpm from the hospital site, an increase of 62 gpm.

This projected increased flows from the Hospital site and Blocks 24 and 25 were used in our piping analyses tributary to the Mariposa Pump Station. Our findings are below:

Table 4 – Sanitary Sewer Piping to Mariposa Pump Station

Street	**Pipe Diameter (inches)**	**Tributary Blocks**	**Estimated Peak Demand (gpm)**	**Pipe Capacity (gpm)**
Owens Street (Section 1)	8	24a/b and portion of 41	140	628
16th Street (Section 2)	12	Section 1 + P26 and 40	322	1,822
16th Street (Section 3)	18	Section 2 + Hospital site and 25	1,065	5,376
16th Street (Section 4)	18	Section 3 + 31	1,182	1,885
Illinois Street (Section 5)	24	Section 4 + 32, 33, 34, and X4	1,445	4,542

Based on our analysis, we conclude it is not necessary to replace/upsize City and University sanitary sewer conveyance piping already constructed in order to serve the proposed increase in Campus gross square footage. However, sanitary sewer piping will need to be constructed on Campus to serve future development parcels, as shown on Exhibit 2. This does not deviate from the UCSF Mission Bay Civil Master Plan.

Sanitary Sewer Pump Station on P15

The capacity of the pump station was designed to meet the flow rate defined in the "Mission Bay Separated Sanitary Sewer Analysis" prepared by Olivia Chen Consultants dated December 26, 2000, revised August 13, 2001, February 25, 2002, February 10, 2004 (for the UCSF Blocks 20A/B Project), and per the updated sanitary sewer analyses prepared by Winzler & Kelly dated July 2005. The pump station was design to collect and pump a projected peak flow rate of 6.4 MGD. To meet this demand, the pump station was designed with four variable speed, 25-horsepower (hp), Flygt NP3171-435 submersible pumps. Three pumps were designed to handle projected peak flow rates and one was for stand-by.

Prior to project acceptance, the Engineer of Record, Winzler & Kelly prepared an Engineer's Evaluation of Pump Performance, found in Appendix B of this report. In that evaluation, in-situ pump performance testing was performed, with the results showing that three pumps operating together discharge at a rate of 4,686.8 gpm (6.7 MGD). This in 0.3 MGD higher than the projected peak flow at the time the pump station was designed.

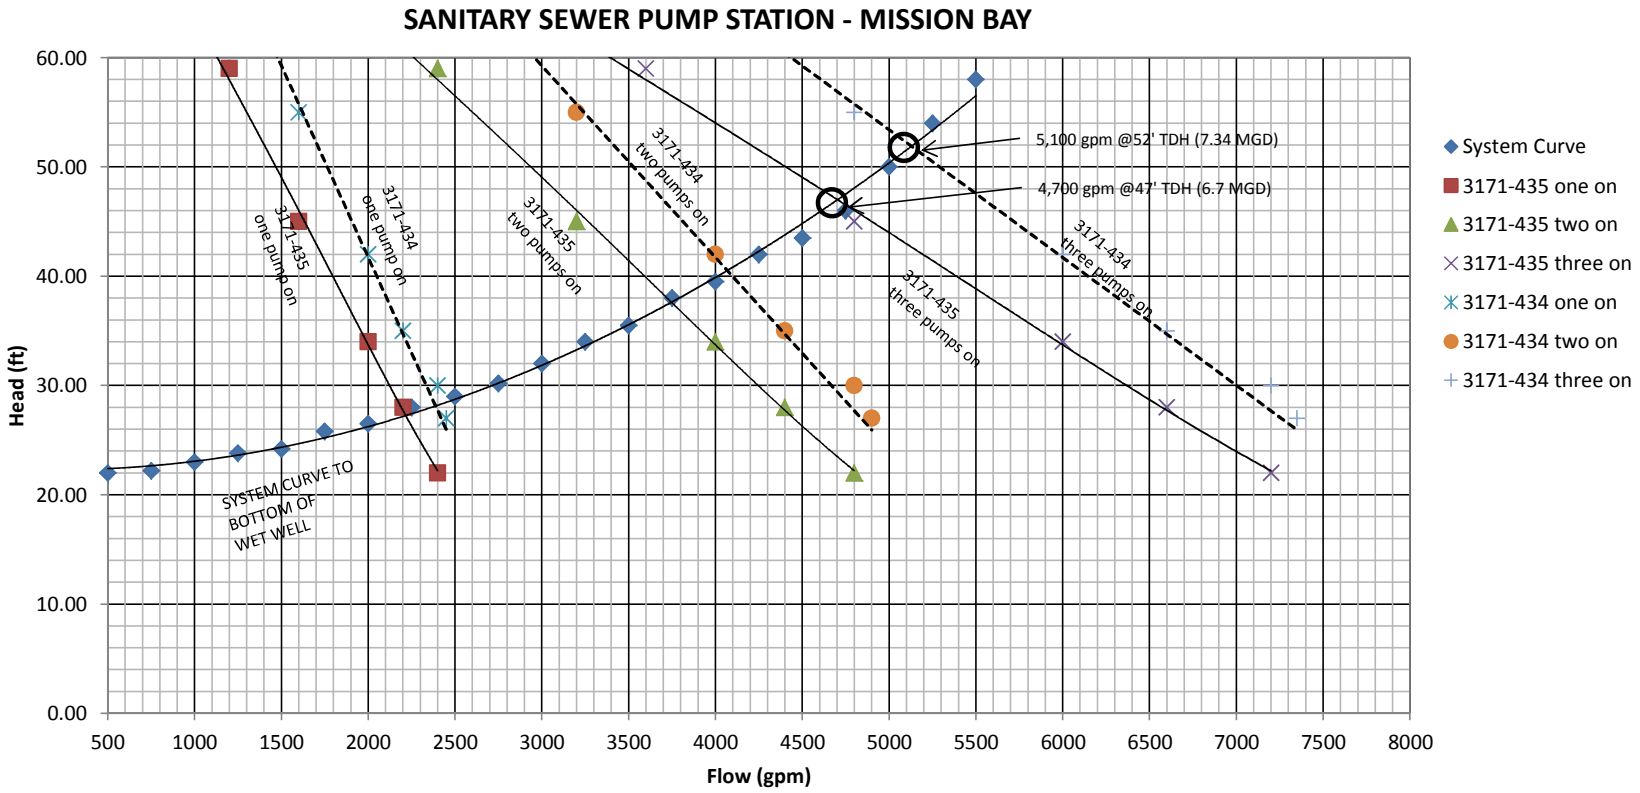
As reported in the previous section, the estimated peak flow increase to the pump station on P15 due to the University's planned entitlement increase is 159 gpm (0.23 MGD), resulting in the need for pump station capacity of 6.63 MGD. This is below the pumping capacity of the pump station, however it potentially may leave the pump station with insufficient excess capacity desired by the City.

To provide extra pump station capacity, the pump station can be modified without structural or piping modifications. The existing NP3171-435, 25hp pumps can be replaced with NP-3171-434, 30hp pumps which are physically the same size and can easily connect to existing discharge piping. This will increase the pump station capacity to 5,100 gpm (7.34 MGD), as shown on Chart 1 – SSPS Pump Upgrade.

Existing conductors from the panel can be re-used to serve these new pumps, however four circuit breaker switches, one per pump, will need to be replaced from 70 amp breakers to 80 amp breakers.

There is a potential need to increase capacity at this pump station to increase excess capacity. Four existing 25 horsepower, Flygt NP 3171 435 pumps will need to be replaced with four 30 horsepower, Flygt NP 3171 434 pumps. Also, four breaker switches will need to be replaced from 70 amps to 80 amps. This will increase pump station capacity without structural or piping modifications at the pump station.

Chart 1 - SSPS Pump Upgrade



Mariposa Pump Station

The Mariposa Pump Station is a combined (sewer and storm) system pump station. Approximately 1,456 gpm peak sanitary sewer flows to this pump station from the Campus (including the Hospital Site) and tributary Mission Bay Blocks.

Per the "Revised Summary Drainage Study for the South of Channel Water Shed" prepared by Santina and Thompson dated December 2000, a storm drain pump station will be constructed in Park P23 that will collect and discharge into the Bay stormwater at a rate of 72 cfs (32,314 gpm). This volume of stormwater will be diverted from the Mariposa Pump Station post storm drain pump station construction. The new storm drain pump station will drastically reduce the volume of water to the Mariposa Pump Station, allowing it to more than adequately handle the projected increased water.

Based on understanding of the Mission Bay Drainage Study and on the estimated tributary sewer flows being less than the capacity of the stormwater pump station being constructed in P23, we conclude there is no need to increase capacity at the Mariposa Pump Station.

Fire Protection Water

The UCSF private fire protection water supply system consists of 12-inch high density polyethylene (HDPE) underground piping. There are three points of connection between the City low pressure water system and the UCSF private fire system: 1) Owens Street & Gene Friend Way, 2) Owens Street & Campus Way, and 3) Fourth Street & Nelson Rising Lane. The first two connections constitute the "southern system, and the third constitutes the "northern system". This system supplies water to hydrants throughout the Campus and to building fire sprinkler systems. The fire protection pipe network feeding from the Fourth Street/Nelson Rising Lane was recently connected to the other two pipe systems as part of the "Mission Bay Civil and CUP Utilities and Surface Improvements in Support of 19A – M8448" Project. Therefore, all three points of connection feed piping that interconnect, creating a looped fire protection water supply system.

As part of the above mentioned M8448 Project, a Fire Protection Water Supply Study was performed for Building 19A by CSW / Stuber Stroeh with support from Cosco Fire Protection, who performed fire flow tests on both the northern and southern systems (prior to connection). This study can be found in Appendix C. For our analysis, we remodeled the Campus' Fire Protection Water Supply system using the information from the CSW/Stuber Stroeh study. For demand, we assumed the 75% reduction factor previously mentioned would be allowed in our analyses by the University's Fire Marshal. The fire flow demand for each building is 1,500 gpm with a residual pressure of 20 psi. Also, our analysis assumes that only one building is drawing from the University's Fire Protection Water Supply system an any given time. Results of our analysis can be found in the following table:

Table 5 – Fire Protection Results

Building	Fire Flow Demand (gpm)	Pressure at Fire Flow Demand (psi)	Fire Flow at 20 psi
15a/b	1,500	43.93	2,450
16a	1,500	44.02	2,450
16b	1,500	44.19	2,480
18a	1,500	43.87	2,450
23a	1,500	43.27	2,400
25b	1,500	42.41	2,320

Based on our analysis, there is sufficient capacity in the Fire Protection Water Supply System to meet fire flow requirements (granted the 75% reduction factor) for each proposed building. Additional campus fire protection water supply piping will need to be installed per Exhibit 4, Low Pressure Water Exhibit, per the UCSF Mission Bay Civil Master Plan adjacent to development blocks to serve future buildings. Results can be found in Appendix D.

Domestic Water

For this analyses, we collected data from various low pressure water system reports written for Mission Bay Development by Winzler & Kelly, the latest being a study performed for Fifth & King Intersection titled “Computer Modeling and Analysis of the Low Pressure Water System, Fifth and King Intersection” dated September 25, 2004, which modeled the Mission Bay low pressure water pipe network for both north and south of Channel, incorporating the domestic demand for each block per the entitlements at the time of the study and fire flow for one development block North of Channel, near the intersection of Fifth and King.

The following domestic water demands and calculated residual pipe pressures from this study for piping around the study area are listed in Table 5- Water System Pressures from Original Water Model. Again, this assumes a development block North of Channel is drawing fire flow from the pipe system. The table shows an average of 60 psi around the Campus, with the domestic demand included.

Table 6 – Water System Pressures from Original Water Model

Node Location	Demand (gpm)	Pipe Pressure (psi)
Mission Bay Circle	164.8	60.34
MBBS at Fifth	33.6	60.35
MBBS at Fourth	8	63.84

MBBS at Third	46.4	60.73
Owens at Nelson Rising	46.4	58.95
Owens at Gene Friend	44.8	58.81
Owens at Campus Way	51.2	59.25
Owens at 16th	56	59.38
16th at Fourth	11.2	59.22
16th at Third	116	58.52
4th at Nelson Rising	33.6	60.42
4th at Gene Friend	32	60.49
4th at Campus Way	30.4	60.16
Third at South Street	65	59.19
Third at MBBS	46.4	60.73

As mentioned in the Separated Sanitary Sewer Pipeline Conveyance Analysis section of the report, an additional 298 gpm of wastewater is estimated to be generated from the additional square footage planned by the University. With the estimation that wastewater is 90% of domestic water demand, 331 gpm of additional domestic water demand is estimated for the additional square footage planned by the University.

We distributed this additional water demand across the future development blocks based on the calculated percentage of each block's estimated wastewater flow against the total additional wastewater flow. Calculated percentages are listed below:

Table 7 – Percentage of Additional Wastewater Demand

Development Block	**Distribution Percentage**	**Additional Water Demand (gpm)**
Block 15	34	113.04
Block 16	18	60.72
Block 18	12	40.52
Block 23a	15	48.79
Block 25c	21	67.92
Total	100	331

For our analysis we remodeled the pipe network surrounding the study area, incorporating the fire flow data as mentioned in the Fire Protection section of this report to model water supply, and injecting the additional water demand at nodes adjacent to the future development blocks, in order to determine the pipe pressure reduction caused by additional water demand. The reduction in pressure was found to be 2.65 psi for piping surrounding the

study area. This pressure was then subtracted from the pressure values from the W&K study, with results listed below:

Table 8 – Water System Pressures with added Entitlement

Node Location	**Demand (gpm)**	**Pipe Pressure (psi)**
Mission Bay Circle	164.8	57.69
MBBS at Sixth	*113.04*	57.7
MBBS at Fifth	*94.32*	57.7
MBBS at Fourth	8	61.19
MBBS at Third	46.4	58.08
Owens at Nelson Rising	*86.92*	56.3
Owens at Gene Friend	44.8	56.16
Owens at Campus Way	51.2	56.6
Owens at 16th	56	56.73
16th at Fourth	11.2	56.57
16th at Third	*183.92*	55.87
4th at Nelson Rising	33.6	57.77
4th at Gene Friend	32	57.84
4th at Campus Way	*79.19*	57.51
Third at South Street	65	56.54
Third at MBBS	46.4	58.08

Note: Italicized figures represent demands increased to incorporate demand from future development blocks.

Based on our analysis, we conclude it is not necessary to replace/upsize City low pressure piping already constructed, as there is sufficient capacity in the pipe system to supply increased water demand to the development parcels. In order to obtain required pressures within the buildings, water pumps may need to be installed. This will be determined at the time buildings are designed.

Reclaimed Water

Currently, the University does not draw water from the City's Reclaimed Water Line, which currently is charged with domestic water, as there is no existing source for reclaimed water. There are reclaimed water mains fronting Blocks 18, 23a, and 23b, however not yet fronting Blocks 15 and 16.

To provide the option for the University to connect Blocks 15 and 16 to the Reclaimed Water System, a main line will be installed in Merrimac and Mission Bay Blvd South by the Mission Bay Development Group. This can be seen on Exhibit 5 – Reclaimed Water.

Telecom/Data/Alarms

UCSF Mission Bay campus Buildings are interconnected to network and telephone services through a University owned and operated infrastructure that resides on UCSF property with ROW crossings at three points along 4th street and connections to the public infrastructure on 3rd Street, 16th Street, Owens Street and Mission Bay Blvd South. There are (2) Main Distribution Centers (MDCs) on the campus and (1) Building Distribution Facility (BDF) in each building. Each BDF has two fiber optic cable connections to the MDCs. Each BDF has one copper cable connection to the campus infrastructure. As of January 2013 Mission Bay campus buildings are provided with telephone service through AT&T Centrex with a few exceptions. The Neuroscience building that came on line in 2012 is utilizing a Voice over IP (VoIP) system for telephone service and it is interconnected to the public infrastructure through the campus data network. The campus housing complex on block 20 does not utilize campus dial tone to service the residential living units. The residential units are treated like most apartments in San Francisco and the residence purchase telephone services directly from AT&T.

Two Buildings on the campus have been provided with Comcast cable television service. The Rutter Center and the campus housing on Block 20. Comcast enters the campus at Gene Friend Way and 3rds Street and routes its broadband cable through campus conduits and innerduct to service these two properties. The Rutter Center is serviced with hard-line coax and the campus housing with single mode fiber both connected to the Comcast infrastructure in the Mission Bay area. We anticipate that new campus housing will be supported in the same manner through the Universities telecom conduits and vaults.

The foundation of the campus telecom infrastructure is a grid of 4 inch conduits grouped in duct banks and routed between precast concrete underground vaults, building distribution facilities and main distribution centers on the Mission Bay Campus. The conduits utilized are manufactured of fiberglass reinforced epoxy, FRE. FRE conduit can withstand the soil settlement found in Mission Bay area better than PVC. At least two thirds of the conduits are lined with HDPE innerducts to support multiple placements of fiber optic cable sheaths over the years of building construction on the campus. The conduits and vaults form a basic grid with 16th street, Gene Friend Way (14th) and Nelson rising Lane (13th) forming the east west routes while Owens Street, 5th Street, and an area between 4th and 3rd streets provide the north south routes. Each campus building is interconnected to this grid through two physically diverse connections separated by a minimum of 90 degrees and in many cases 180 degrees. The Phase 1 campus utility project implemented this grid from Owens to 3rd Street and 16th to Gene Friend Way. Phase 2 extended the grid northeast to block 17 and the corner of Mission Bay Blvd South and 3rds streets. In 2012 the grid was extended northwest to the corner of 5th street and Nelson Rising Lane. The areas of the campus north of Gene Friend Way and west of 5th street, blocks 15 and 18, will be supported by existing TMH-D8 and TMH-E8 in the intersection of 5th Street and

Nelson Rising Lane as well as existing TMH-H4 and H7 in Gene Friend Way north of the Rutter Center. Blocks 15 and 18 do not have telecommunications conduit or vaults and will require them to support buildings on these blocks. Block 16 has six conduit stubs from the existing vaults in Nelson Rising Lane but will require some additional connections to TMH-D12 in Nelson Rising Lane North of Rock Hall. Existing TMH-H16 and L16 will be utilized to support a building on lot 23A. Existing TMH-L17 and existing conduit stubs on lot 25A will be utilized to support a new building on lot 25B.

Single mode fiber optic cabling has been utilized on the Mission Bay campus to provide CAN connectivity between the MDCs and the BDFs. In the past 10 years buildings have been provided with Campus Area Network (CAN) service using multiple 1 Gigabit Ethernet circuits or groupings of 10 Gigabit Ethernet circuits depending on the availability of technology, the project budget and the projected network load for the building. UCSF ITS will transition primarily to 10 Gigabit Ethernet as it replaces network switches that are coming off of manufacturer support in 2013. When the first campus building outside of Genentech Hall was connected to MDC1, 10 Gigabit Ethernet was not yet available. Multiple Gigabit Ethernet circuits were used. One 10 Gigabit circuit requires (2) strands of single mode fiber. (10) Gigabit circuits require (20) strands of single mode fiber. The single mode glass that has been utilized is manufactured by Corning and is referred to as SMF28e and SMF28e+. This glass will support 10 Gigabit Ethernet in standard transmit and receive format using two fibers and it will support Wave Division Multiplexing (WDM) that will support 10 Gigabit Ethernet on a single strand of fiber using two wave lengths to support transmit and receive. This single mode will also support bandwidths greater than 10 Gigabit Ethernet as they become economically feasible to utilize.

The design of the two existing MDCs did take into consideration a complete campus build-out of all buildings shown on the campus master plan including new buildings in Blocks 15, 16, 18, 23A and 25. The existing fiber frame in MDC2 will require no additional components. The existing fiber distribution frame in MDC1 can support four additional buildings before it will require additional splice and termination shelves.

The standard fiber optic strand count to each campus building is 36 strands primary to MDC1 and 36 strands secondary to MDC2. These fiber optic strands support the campus data network in addition to a sub group of these strands being dedicated to the Parking Services network and the Physical Plant networks.

The UCSF Mission Bay Campus as of January 2013 utilizes AT&T Centrex for telephone service in all campus buildings except the Neuroscience building on block 19A. AT&T Centrex is supported by AT&T hardware located in the MPOE area of MDC1 and MDC2. Two existing 1800 pair copper feeder cables extend from MDC1 to Cross Box CB-H9 on Gene Friend Way south of 19A and on Nelson Rising Lane North of Campus Housing. One existing 1800 pair feeder extends from MDC2 to CB-D9 on the corner of 5th Street and Nelson Rising Lane. New campus buildings on blocks 16, 18, 23A and 25B will utilize VoIP to support telephone services instead of AT&T Centrex. Block 15 campus housing will require a copper cable to support AT&T phone service to the residential units.

The VoIP system will be supported on the campus fiber optic cabling over the campus network. Some Telephone Services such as services to life safety devices will be supported over the copper telephone cabling. Blocks 15, 16 and 18 will be supported from the existing cross box CB-D9. New distribution copper will be required between the new building BDFs and CB-D9 at the corner of 5th Street and Nelson Rising Lane. Block 23A will be connected to existing Cross Box CB-H9 on Gene Friend Way at the south side of Neuroscience. New Buildings on Block 25 will be connected to existing CB-E16 on Nelson Rising Lane north of Block 20 campus housing.

Twenty-four gauge outside plant copper cabling is shown on Exhibit 6, Telecommunications Exhibit, to provide telephone service between the MPOEs and the BDFs. Large count 1800 pair and 1200 pair feeder cables are shown on the drawings routing from the MPOEs to above-ground cross-connection boxes. Distribution cables are routed between the cross-connection boxes and the BDFs. The cross-connection boxes maximize utilization of distribution and feeder cables by allowing the telephone circuits to be redirected to buildings depending on usage density.

The backbone system on the Campus is well set. Each future Campus Building must have two physically separate telecom conduit entrances, as depicted in Exhibit 6, Telecommunications Exhibit, that build off the Campus backbone.

Electrical

Mission Bay obtains electrical power from two substations; 1) The Mission Substation at Folsom and Fremont and 2) The Potrero Substation at Illinois and 22nd St. Without considering construction of the CUP, PG&E has or soon will have sufficient infrastructure, (i.e., conduits and substructures), in Mission Bay Blvd. South, Owens St. 16th St and 3rd St. to supply the projected electric loads for the future development buildings. Conduit is of sufficient size and it is PG&E's obligation to provide the cables required for service to the buildings.

If a CUP is constructed, based on the loads on the CUP Reports provided to us for review by the University and our team's experience with PG&E, there is a high probability that PG&E will require additional conduit (2-6" conduits) from their main utility vault at the intersection of Seventh and Mission Bay Drive, in Mission Bay Drive, through the Circle, and in Mission Bay Blvd South to Block 16a for a standby feed. This will need to be determined by PG&E.

Please see Exhibit 7, Joint Trench Exhibit, for joint trench sections front the study area. The additional conduit that may be required by PG&E for the CUP is not shown on this Exhibit.

Natural Gas

Gas infrastructure in and around the campus include a PG&E 16" distribution main in 16th Street on the south side of the campus between 3rd and Owens Streets, an 8" line fed by the

16" line on the west side of 3rd from 16th to China Basin and a 6" line in 4th St. from 16th Street to Channel, and a 6" line in Owens from 16th Street to the Mission Bay Circle. The pressure within these gas mains is approximately 45 to 60 psi, depending on weather. The lines north of the campus all (or will soon) interconnect to provide fully adequate service to UCSF's total campus after complete build out without the construction of a CUP.

If a CUP is constructed, gas loads could range between 56,000 to 146,000 Standard Cubic Feet/Hr (SCFH) to Block 16a. There is insufficient capacity to serve the upper range of gas loading, thus it is probable that PG&E will require an extension from their Potrero Station near the intersection of Illinois and 22nds Street to serve a CUP with higher gas demands.

High Pressure Water

Although the University does not tap into the City's High Pressure water system, we have prepared Exhibit 9, High Pressure Water, to depict the location of the High Pressure Water System in relation to the Study Area.

ANTICIPATED INFRASTRUCTURE UPGRADES SUMMARY AND ANTICIPATED COST SCHEDULE

Below is a summary of findings for infrastructure to serve the additional entitlement desired by the University:

Table 9 – Summary of Findings

Utility	Findings	Potential Upgrades
Storm Drain	Stormwater runoff will not increase due to increased building square footage.	No upgrades required to existing infrastructure. Will require installation of new on-site piping to serve future development blocks.
Separated Sanitary Sewer	Increase flow rate from additional development does not exceed capacity of public infrastructure.	No upsizing required for public infrastructure. Private piping to be installed to serve future development blocks.
Sewer Pump Station on P15	Additional flow from the Campus does not exceed capacity of pump station, however the City may require additional capacity as a safety factor.	Potentially replace four existing NP-3171-435 25hp pumps with NP-3171-434 30hp pumps and replace four 70 amp breaker switches with 80 amp breakers.
Mariposa Pump Station	Future sanitary sewer flows are far less than the stormwater that will be diverted to the future SDPS in P23.	No upgrades required.

Fire Protection	The Campus Fire Protection Pipe System has capacity to provide required fire flow demand for new buildings, assuming 75% reduction factor for sprinklered buildings is allowed by the Fire Marshal.	No upgrades required to existing backbone. Will require the installation of new piping to serve future development blocks.
Domestic Water	The existing public water piping surrounding the study area has sufficient capacity to serve future buildings.	No upgrades required to existing infrastructure. Booster pumps may be required in buildings to increase water pressure, to be determined.
Reclaimed Water	Campus currently does not connect to the City's Reclaimed Water Pipe System.	MBDG to install piping in Merrimac and MBBS to serve Blocks 15 and 16.
Telecom/Data/Alarms	Campus has well planned Telecom system on-site.	No public improvements required. Will need to extend Campus ductbanks to serve future development blocks.
Electrical	PG&E has, or soon will install infrastructure surrounding the study area that will provide sufficient infrastructure to serve the development blocks minus the CUP.	No additional upgrades required except for CUP. Possible conduit and cable extension for the CUP from Seventh to Block 16a.
Natural Gas	PG&E has, or soon will install infrastructure surrounding the study area that will provide sufficient infrastructure to serve the development blocks minus the CUP.	No additional upgrades required except for CUP. Possible extension for the CUP from PG&E's Potrero Station near Illinois and 22nd Street.

Below is a table with anticipated costs for the potential upgrades to the public utilities. These costs are anticipated construction costs only and based on project planning and information available at the time the Cost Schedule was prepared. Possible additional electrical and gas infrastructure for the CUP is not included in this estimate.

Table 10 – Potential Public Utility Upgrades – Anticipated Construction Cost Schedule

Description	Quantity	Unit	Unit Cost	Total
SSPS on P15 Replace Flygt 3171-435 pumps with 3171-434 pumps	4	EA	$50,000	$200,000
Replace 70amp breaker switches with 80 amp breaker switches	4	EA	$2,500	$10,000

SENSITIVITY ANALYSIS

This section analyzes the effect on utility infrastructure for the University's preferred plan for entitlement increase combined with increased development planned in Mission Bay. The assumptions for increased development in Mission Bay used for the infrastructure analysis are consistent with the assumptions being used in the traffic analysis being prepared by Adavant Consulting. This sensitivity analysis was performed for only the utilities that the University's plan affects. Planned developments used in this analysis include:

Table 11 – Planned Developments

Block #	Residential	Retail	Office	Hotel	R&D	Large Retail
1	350	50,000		250		
2	315	10,000

Results of our analyses are listed below:

Natural Gas

The pressure in the gas mains in Mission Bay range between 45 and 60 psi, depending on weather. Based on initial communication with PG&E, there appears to be sufficient capacity in the main lines to serve the development blocks. PG&E however reserves the right to re-analyze when actual loads are available. Their analysis does not include the possibility of elevated pressure requests.

Electrical

Based on initial communication with PG&E, there are a sufficient number and size of conduits to serve the development blocks. Wiring will need to be installed by PG&E to provide service to the development blocks, but the need for new conduits is not anticipated. Similar to gas, PG&E however reserves the right to re-analyze when actual loads are available.

Telecom/Data/Alarms

The University's proposed entitlement increase does not affect the communications infrastructure in Mission Bay, as the Campus has its own backbone communications network.

Storm Drain

This University's proposed entitlement increase does not affect the stormwater discharge volume anticipated for the Campus. Therefore, the entitlement increase does not affect the capability of adjacent development projects to discharge stormwater.

Separated Sanitary Sewer Pipeline Conveyance

Table 12 includes the sewer flows from development blocks that share sewer mains with the University. As shown in the table, the SWL337 block will discharge less wastewater than planned in the "Mission Bay Separated Sanitary Sewer Analysis".

Table 12 – Sewer Flows

Block #	Peak Sanitary Sewer Flow (gpm)	Peak Master Plan Flow (gpm)	Net Difference (gpm)
8	70	13	57
9	41	43	-2
9A	26	27	-1
10	119	85	34

Block #	Peak Sanitary Sewer Flow (gpm)	Peak Master Plan Flow (gpm)	Net Difference (gpm)
10A	35	44	-9
12W+12E	152	143	9
13W+13E	152	123	29

Pier 48	60	118	-58

The net differences, applied to our pipeline capacity calculations show that the existing pipelines are adequate to convey wastewater from the University as well as programmed development projects that share sanitary sewer pipelines with the University.

Sanitary Sewer Pump Station on P15

As previously reported the pump station can be upgraded to have a peak pumping capacity of 7.34 MGD and that the calculated increased flow from the University combined with flows defined in the Mission Bay Separated Sanitary Sewer Analysis is approximately 6.63 MGD. The net difference in peak flow from non-UCSF development blocks that drains to this pump station is negligible. The decreased peak discharge from SWL337 is approximately equal to

the increased discharge from other development blocks in Mission Bay that drains to this pump station. Therefore the proposed pump station upgrade will handle UCSF's entitlement increase and anticipated flows from blocks tributary to this pump station.

Domestic Water

GHD (formerly Winzler & Kelly), ran the Mission Bay Water Model with the proposed UCSF increased entitlement and the proposed developments throughout Mission Bay. The results show that the planned water system is sufficient to serve the University's increased entitlement and the proposed development blocks in Mission Bay, provided a water main is installed through the SWL 337 Block, connecting the water main in Third Street to water main in Terry Francois. The model and calculations can be found in the Appendix F – GHD Water System Model.

Thank you for the opportunity to present this information to you. If you have any questions, please feel free to contact me.

Sincerely,
FREYER & LAURETA, INC.

Richard J. Laureta, P.E.
President

APPENDIX B – MISSION BAY SANITARY SEWER PUMP STATION, ENGINEER'S EVALUATION OF PUMP PERFORMANCE

WINZLER & KELLY

RECEIVED
NOV 19 2010
TMI

Ref: Project No. 0334005041

November 17, 2010

Sent via E-mail and US Mail

Mr. J.T. Matarangas
Mission Bay Development Group
255 Channel St
San Francisco, CA 94158

Subject: Mission Bay Sanitary Sewer Pump Station
505 Mission Bay Boulevard North
Engineer's Evaluation of Pump Performance

Dear Mr. Matarangas:

Reference is made to: (i) the Mission Bay Consulting Agreement dated January 1, 2004 and Change Order W&K 200609-05 dated March 16, 2009, between Mission Bay Development Group ("Company") and Winzler & Kelly ("Engineer"). Per the "South of Channel Separated Sanitary Sewer Report" by Olivia Chen Consultants dated December 26, 2000 and revised August 13, 2001, and per the updated sanitary sewer analysis by Winzler & Kelly dated July 2005, the projected sanitary sewer inflow to the Mission Bay Sanitary Sewer Pump Station (MB SSPS) is 2.1 million gallons per day (MGD) average dry weather flow and 6.4 MGD peak wet weather flow.

Per the construction documents prepared by Winzler & Kelly titled "Mission Bay Sanitary Sewer Pump Station, 505 Mission Bay Boulevard North" dated November 11, 2008, the pump station contains four submersible pumps. In this configuration, three pumps operate during the peak design flow and one pump is available as standby. In-situ pump performance testing completed by the Contractor dated May 12, 2010 indicate that the approximate discharge rate for three pumps operating together is 4686.8 GPM or 6.7 MGD.

To the best of my knowledge, information and belief, regarding the improvements contemplated by the Plans and Specifications (the "Improvements") for the "Mission Bay Sanitary Sewer Pump Station, 505 Mission Bay Boulevard North", I hereby state the following:

> Based on the pump test data provided to me from the in-situ pumping tests performed on May 12, 2010, by JMB Construction with TMI as witness, the pumps perform as intended.

Sincerely,
WINZLER & KELLY

Jacobs Project No. R1W29601

Dear Mr. Martin:

Attached is a letter report dated September 24, 2010 from CSW / Stuber Stroeh regarding the fire protection water supply to Building 19A. This report was prepared in response to your request. Mark Salvucci requested that I send this report to you.

Please contact me at (503) 624-3214 or Kerry Ettinger at CSW / Stuber Stroeh at (415) 883-9850 with any questions.

Sincerely,

James P. Miller
Senior Project Manager

RE: FIRE PROTECTION WATER SUPPLY AT BUILDING 19A UCSF MISSION BAY, SAN FRANCISCO (PROJECT M8448)

Dear Jim:

CSW/Stuber-Stroeh Engineering Group, Inc. (CSW|ST2) has prepared this report at the request of the University Fire Marshall to investigate the anticipated fire protection water supply at Building 19A on the UCSF Mission Bay Campus and to determine if the anticipated flow will meet the requirements of the California Fire Code. CSW|ST2 analyzed the system, including the proposed 12-inch fire line connection between the north and south system, which will be installed as part of the UCSF Project No. M8448 (Mission Bay Civil & CUP Utilities, Surface Improvements in Support of 19A).

Existing Conditions: The UCSF fire protection water supply system consists of 12-inch high density polyethylene (HDPE) underground piping, 6-inch ductile iron hydrant taps, fire hydrants and automatic sprinkler systems (from the Record Drawings titled "UCSF Mission Bay – Utilities & Civil Work/Infrastructure" dated October 1, 2004, prepared by MACTEC Engineering and Consulting, Inc.). The 12-inch HDPE piping has an interior diameter of 10.3-inches.

There are three points of connection between the City water distribution system and the UCSF private fire system: Owens Street & 15th Street and Owens Street & 14th Street serve the south system, and 4th Street & Nelson Rising Lane serve the north system.

A temporary 12-inch ductile iron pipe has recently been installed to connect the northern and southern systems. However, to more accurately model the proposed improvements, the data which pre-dates the temporary fire installation was used in this analysis. This allows for a more accurate accounting of potential flows feeding the Building 19A site.

Fire Hydrant Test Data: Several fire hydrant flow tests have been performed on the UCSF fire protection water supply, for both the north and south system. This data was used to build a model of the UCSF fire protection water supply system. For the north system, the Cosco Fire Protection (Cosco) fire flow data dated August 24, 2010 was used. Hydrant flow test number one (#1) was used for this analysis. For the south system, the Cosco fire flow data from the report titled "Fire Protection Backflow Preventer and Meter Flow Tests," dated June 30, 2010 was used. Test number nine (#9) was used for this analysis. At the time of testing,

the north and south system were not connected. No improvements to either system were implemented in the intervening time between tests.

See Exhibit A – Existing Fire Protection Water Supply for fire flow test hydrant locations.

Proposed Conditions: The M8448 project (Mission Bay Civil & CUP Utilities, Surface Improvements in Support of 19A) includes installation of a 12-inch HDPE water main to connect the north and south portions of the UCSF fire protection water supply system. Several new fire hydrants, including two (2) surrounding Building 19A, will be installed as part of the project. The project also includes an 8-inch HDPE fire service off the proposed 12-inch HDPE water main to serve the Building 19A fire service system.

See Exhibit B - On-Site Hydrants and POC at Building 19A for proposed fire protection water supply system layout.

Required Fire Flows: Given the size of Building 19A (234,825 square feet), the type of construction (type 1A), and the California Fire Code 2007 (see Attachments), the minimum fire flow for Building 19A is 5,250 gallons per minute (gpm) at a residual pressure of 20 pounds per square inch (psi). Should a 75% reduction due to the presence of automatic sprinkler system be approved, the required fire flow for Building 19 A would be 1,312.5 gpm. However, since this value is less than the minimum fire-flow of 1,500 gpm, the minimum required fire flows of 1,500 gpm at a residual pressure of 20 psi would be required. The building 19A team requires a minimum of 1,029 gpm at the 8-inch sprinkler connection with a 20 psi residual pressure to run the building's internal fire suppression system.

Fire Flow Model: Combining the existing and proposed conditions, a hydraulic model of the UCSF fire protection water supply system was created using WaterCAD XMV8. The fire hydrant flow test data was used to model the flow available to the UCSF fire protection water supply system and estimate the available fire water supply at Building 19A.

The flow data from Cosco's hydrant flow tests were modeled in WaterCAD as pump curves. The pump curve was developed by entering the static and residual pressures with their respective flow rates and then calculating a third point on the curve using the Three-Point Pump Curve Equation provided by Bentley (see attached flow data and sample calculation). The WaterCAD Model was built using the following design criteria called out in Table 1.

Table 1: Design Criteria For WaterCAD Model	
Existing On-Site Hydrant #1	Existing Grade (EG) @ Hydrant = 102.34' (from field survey dated June 14, 2010); static pressure, residual pressure, and available flow from Cosco's Hydrant Flow Report dated August 24, 2010.[1]
Existing On-Site Hydrant #2	EG @ Hydrant = 103.61'(from field survey dated June 14, 2010); static pressure, residual pressure, and available flow from Cosco's Hydrant Flow Report dated June 30, 2010.[2]

Table 1: Design Criteria For WaterCAD Model - Continued	
Existing Pipe Diameters and Materials, C-factor, and lengths	Existing Pipe Lengths, Diameters, and materials per plans entitled "UCSF Mission Bay – Utilities & Civil Work / Infrastructure," dated October 1 2004. All HDPE used a C-factor of 140, and Ductile Iron Pipe (DIP) used a C-factor of 130.
Proposed Pipe Diameters and Materials, C-factor, and lengths	Proposed Pipe Lengths, Diameters, and materials per the M8448 project. All HDPE used a C-factor of 140, and DIP used a C-factor of 130.
Proposed Fire Hydrants and POC at Building 19A	Elevations for the proposed fire hydrants and POC at Building 19A per UCSF Project No. M8448.

[1]See Attachment for Cosco Fire Protection Hydrant Flow Report dated August 24, 2010.
[2]See Attachment for Cosco Fire Protection Hydrant Flow Report dated June 30, 2010.

Fire Flow Model Results: The following flows, depicted in Table 2, are available at the following points of interest (see Exhibit B - On-Site Hydrants and POC at Building 19A for node locations):

Table 2: Points of Interest Vs. Available Flows			
Points of Interest (Name of Node(s) that were flowed[1])	**Description**	**Flow(s) (gpm)**	**Residual Pressure(s) (psi)**
H-5 only	8" HDPE Point of Connection to Building 19A (8" POC) flowed only	2,498	20
H-2, H-3, and H-4 flowed simultaneously	Hydrants at Gene Friend Way, Future Fifth Street, and Nelson Rising Lane flowed simultaneously	H-2 = 813 H-3 = 813 H-4 = 813 Total = 2,439	H-2 = 20.0 H-3 = 21.2 H-4 = 21.2
H-5 held @ 1,029gpm while H-2, H-3, and H-4 flowed simultaneously	8" POC held @ 1,029gpm while hydrants at Gene Friend Way, Future Fifth Street, and Nelson Rising Lane flowed simultaneously	H-2 = 476 H-3 = 476 H-4 = 476 H-5 = 1,029 Total = 2,457	H-2 = 20.0 H-3 = 21.0 H-4 = 20.6 H-5 = 22.2

Conclusion: In the first scenario, only the 8" POC to Building 19A was modeled as flowing. The calculated flow was 2,498 gpm at a residual pressure of 20psi. This meets and exceeds the fire flow requirements for Building 19A's fire protection system.

The second scenario where the three hydrants on Gene Friend Way, Future Fifth Street, and Nelson Rising Lane were modeled as flowing simultaneously, the calculated flow at each hydrant was 813 gpm at residual pressures of 20 psi, 21.2 psi, and 21.2 psi, respectively. The cumulative available fire flows to the site is 2,439 gpm, which meets and exceeds the fire flow requirements for the site, should a reduction be granted due to the presence of a building sprinkler system.

The third scenario where the 8" POC was held at 1,029 gpm and the three hydrants on Gene Friend Way, Future Fifth Street, and Nelson Rising Lane were modeled as flowing simultaneously, the calculated flow at each hydrant was 476 gpm at residual pressures of 20psi, 21.0 psi, and 20.6 psi, respectively. The cumulative available fire flows to the site is 2,457 gpm, which meets and exceeds the fire flow requirements for the site, should a reduction be granted due to the presence of a building sprinkler system.

The calculated flows assume that there are no additional hydrants or fire sprinkler systems drawing on the fire protection water supply.

We trust this provides you with the information required at this time. If you require further information, please call us at (415) 883-9850.

Sincerely,

CSW/STUBER-STROEH ENGINEERING GROUP, INC.

Re: Fire Protection Backflow Preventer and Meter Flow Tests
Nelson Rising Lane
UCSF Mission Bay Campus
San Francisco, CA
R&S PCO #9110

Dear Mr. Duran,

Cosco Fire Protection has completed its review and testing of the Fire Mains in Nelson Rising Way. Please refer to the following Data:

Purpose: The purpose of this investigation was to determine the source of the low water flow and pressure loss for the fire main on Nelson Rising Lane. On June 29, 2010 flow testing was done for the backflow preventer and three (3) water meters on 4th Street. This report cover this test.

Flow Test Data: See Sheet #2

Analysis:

June 29, 2010:

1. Test #1: A single City Fire Hydrant on 4th St. was flowed at the NW corner of the CVRB to verify a starting point for available flow and pressure being supplied to the Fire Main. The result was a flow of 830 GPM, Static Pressure of 71 PSI and a Residual Pressure of 68 PSI from a single 3" hydrant outlet. Cosco utilized a 3 x 2 ½" reducer, a 2 ½" meter and 20' of 2 ½" fire hose to a Hose Monster diverter.

2. Test #2: A second test was performed 30 minutes later on the same City Hydrant. This test was performed to verify the consistency or the original test results. The second result was a flow of 820 GPM, Static Pressure of 71 PSI and a Residual Pressure of 69 PSI from a single 3" hydrant outlet. The City water main was delivering consistent flow and pressure.

3. Test #3: A flow test was taken at the discharge flange of the Backflow Preventer (BFP) utilizing a 10" blind flange tapped 3" IPT with a 3" nipple to a 3" gate valve, and a 3" x 2 ½" bell reducer to a 2 ½" nipple. A 2 ½" test meter was connected and

Hydrant Flow Tests

Location: UCSF Mission Bay - 10" BFP & Meters, 4th St. @ Nelson Rising Lane

Test #	Hydrant or Device	Flow Test	Flow GPM	Static PSI	Residual PSI	Pressure Location
1	#1 City Hyd	(1) 3"	830	71	68	#2 City Hyd
2	#1 City Hyd	(1) 3"	820	71	69	#2 City Hyd
3	(3) Mtr w/ BFP	(1) 3"	580	61 (70)	45	Test Va BFP
4	(3) Mtr w/ BFP	(1) 3"	610	61 (70)	46 (56)	Test Va BFP
5	(3) Mtrs w/o BFP	(1) 3"	700	70	64	Test Va BFP
6	S Mtr w/ BFP	(1) 3"	580	61 (70)	42	Test Va BFP
7	Mid Mtr w/ BFP	(1) 3"	580	61 (70)	44	Test Va BFP
8	N Mtr w/ BFP	(1) 3"	600	61 (70)	45	Test Va BFP
9	S Hyd Rock Hall	(1) 3"	580	58	41	SW Hyd Rock H

discharged into 20' of 2 ½" fire hose to a Hose Monster diverter. Pressures were read on the down stream side of the BFP check valves at the ¾" test cock. All three water meters were open. The observed flow was 580 GPM, Static Pressure of 61 PSI and a Residual Pressure of 45 PSI. 2 PSI is added to the BFP pressure readings to account for the elevation difference between the City hydrant and the BFP. Corrected readings are (63) PSI Static and (47) PSI Residual.

4. Test #4: Test #3 was repeated. Results were a flow of 610 GPM, 61 (63) PSI Static, 46 (48) PSI Residual.

5. Test #5: Three Meters were tested simultaneously without the BFP. The 10" BFP was removed without the 10" supply side OS&Y Gate Valve. The 10" flanged test valve assembly described in Test #3 was transferred to the discharge of the 10"

OS&Y Gate Valve. Pressure readings were taken from the ¾" test cock on the valve. Results were a flow of 700 GPM, 70 (72) PSI static, 64 (66) PSI Residual.

6. Test #6: The discharge valves for the Mid Meter and N Meter were closed and a flow test was performed with the backflow preventer and the S Meter. The same test valve assembly and pressure reading source were used as described in Test #3. Results were a flow of 580 GPM, 61 PSI Static and 42 PSI Residual.

7. Test #7: Same as Test #6 except only the Mid Meter was used for supply. Results were a flow of 580 GPM, 61 PSI Static, 44 PSI Residual.

8. Test #8: Same as Test #6 except only the N Meter was used for supply. Results were a flow of 600 GPM, 61 PSI Static and 45 PSI Residual.

9. Test #9: Frank Fasano suggested testing a hydrant on the South side of Rock Hall to see the flow available from the Owens Fire Main supply. Pressures were recorded from the South/West Hydrant at Rock Hall. Results were a flow of 580 GPM, 58 PSI Static and 41 PSI Residual. It appears that this section of the fire main has similar flow restrictions as does Nelson Rising Lane. Frank Fasano and Cosco inspected the South Connection on Owens and found a 10" BFP supplied by two meters. We did a visual inspection of one meter and it appears to be 4". We suggest an additional study with flow tests be made on this part of the Fire Main system.

Attachments:

1. Fire Service Schematic
2. Neptune Meter Product Data
3. Watts Backflow Preventer Data

Conclusions:

1. Backflow Preventer: Before we can analyze the recorded data, corrections to the static pressure on the discharge side of the Reduced Pressure Backflow Preventer must be made. These corrections are shown on the chart as (xx). The device automatically reduces the downstream static pressure by 10 PSI +- below the inlet pressure to protect the City Main from contamination. When the BFP check valves open under flow, this 10PSI reduction is lost and then becomes a 10PSI friction loss due to the flow characteristics of the device. The static 10 PSI reduction and the 10 PSI friction loss under a flow condition are not additive. Therefore, when comparing the flows taken for the outlet of the BFP, 10 PSI must be added to the static reading for a true pressure differential comparison to the residual pressure under flow conditions. However, if we do this correction, the valve is showing a 20 PSI +- residual pressure loss, 10 psi higher than the charts indicate. We know our basis for the 10 PSI increase to the static pressure is correct as verified in Test #5 at the inlet of the BFP. Test #5, measured flow through the three (3) meters without the BFP and resulted in 20 PSI +- higher residual pressure, which would account for the removed BFP. The BFP should not loose 20 PSI. Further investigation of this device should be made.

Recommendation: Contact Watts engineering and resolve the problem. Consider replacing the Backflow Preventer with an Ames with better flow characteristics.

2. Additional study is recommended to verify the sufficiency of the pipe size from the city main, through the 3 meters and to the supply side of the BFP. Calculations must take into account the actual inside diameters of the HDPE piping. Nominal pipe sizes cannot be used and will result in overly optimistic results. As shown on our Fire Service Schematic, 12" HDPE has an inside diameter of 10.293", 8" HDPE has an inside diameter of 6.963 inches, and 6" HDPE has an inside diameter of 5.348".

   Recommendations: Increase the pipe size from the meters to the header to 8" HDPE. Replace the existing variable pipe size header with a continuous 12" HDPE header.

3. Consideration should be taken to reconnect the Nelson Rising Way leg of the Fire Main system to the portion of the system supplied by the Owens connections.

4. The Owens connections should undergo a study for improvement with the addition of adequately sized meters.

5. Additional fire flow calculations are recommended. Based upon the use of HDPE, the fire mains are actually 10" in lieu of the 12" shown. We have seen calculations based upon the use of nominal diameters and not actual inside diameters. Fire flow calculations using the Hazen Williams formula require actual inside diameters.

The above information is based upon observed flows taken from hydrants and devices as shown on the attached Fire Service Schematic on June 29, 2010. Time of flow testing was 8:00 AM to 12:00 PM.

Respectfully submitted
Cosco Fire Protection

APPENDIX B
FIRE-FLOW REQUIREMENTS FOR BUILDINGS

SECTION B101
GENERAL

B101.1 Scope. The procedure for determining fire-flow requirements for buildings or portions of buildings hereafter constructed shall be in accordance with this appendix. This appendix does not apply to structures other than buildings.

SECTION B102
DEFINITIONS

B102.1 Definitions. For the purpose of this appendix, certain terms are defined as follows:

FIRE-FLOW. The flow rate of a water supply, measured at 20 pounds per square inch (psi) (138 kPa) residual pressure, that is available for fire fighting.

FIRE-FLOW CALCULATION AREA. The floor area, in square feet (m^2), used to determine the required fire flow.

SECTION B103
MODIFICATIONS

B103.1 Decreases. The fire chief is authorized to reduce the fire-flow requirements for isolated buildings or a group of buildings in rural areas or small communities where the development of full fire-flow requirements is impractical.

B103.2 Increases. The fire chief is authorized to increase the fire-flow requirements where conditions indicate an unusual susceptibility to group fires or conflagrations. An increase shall not be more than twice that required for the building under consideration.

B103.3 Areas without water supply systems. For information regarding water supplies for fire-fighting purposes in rural and suburban areas in which adequate and reliable water supply systems do not exist, the fire code official is authorized to utilize NFPA 1142 or the *International Wildland-Urban Interface Code.*

SECTION B104
FIRE-FLOW CALCULATION AREA

B104.1 General. The fire-flow calculation area shall be the total floor area of all floor levels within the exterior walls, and under the horizontal projections of the roof of a building, except as modified in Section B104.3.

B104.2 Area separation. Portions of buildings which are separated by fire walls without openings, constructed in accordance with the *California Building Code,* are allowed to be considered as separate fire-flow calculation areas.

B104.3 Type IA and Type IB construction. The fire-flow calculation area of buildings constructed of Type IA and Type IB construction shall be the area of the three largest successive floors.

Exception: Fire-flow calculation area for open parking garages shall be determined by the area of the largest floor.

SECTION B105
FIRE-FLOW REQUIREMENTS FOR BUILDINGS

B105.1 One- and two-family dwellings. The minimum fire-flow requirements for one- and two-family dwellings having a fire-flow calculation area which does not exceed 3,600 square feet (344.5 m^2) shall be 1,000 gallons per minute (3785.4 L/min). Fire-flow and flow duration for dwellings having a fire-flow calculation area in excess of 3,600 square feet (344.5 m^2) shall not be less than that specified in Table B105.1.

Exception: A reduction in required fire flow of 50 percent, as approved, is allowed when the building is provided with an approved automatic sprinkler system.

B105.2 Buildings other than one- and two-family dwellings. The minimum fire-flow and flow duration for buildings other than one- and two-family dwellings shall be as specified in Table B105.1.

Exception: A reduction in required fire-flow of up to 75 percent, as approved, is allowed when the building is provided with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2. The resulting fire-flow shall not be less than 1,500 gallons per minute (5678 L/min) for the prescribed duration as specified in Table B105.1.

—	—	179,401-191,400	129,601-138,300	79,801-85,100	7,750	
—	—	191,401-Greater	138,301-Greater	85,101-Greater	8,000	

For SI: 1 square foot = 0.0929 m^2, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. The minimum required fire flow shall be allowed to be reduced by 25 percent for Group R.

b. Types of construction are based on the *California Building Code*.

c. Measured at 20 psi.

Pressure start in this analysis was 61 psi. The additional flows resulted in a pressure drop of 2.65 psi.

APPENDIX F – GHD WATER MODEL

Technical Memorandum

April 1, 2013

To:	Rich Laureta, Freyer & Laureta, Inc.		
Cc:			
From:	Tony Petroccitto, Robert Le		
Subject:	Mission Bay Water Model Update – Interim Condition – Increased Domestic Demand	Job no.:	8410513

INTRODUCTION

Freyer & Laureta, Inc. (F&L) retained GHD Inc. (GHD) to perform a hydraulic analysis of the low-pressure water distribution system serving the Mission Bay Development area. A computerized hydraulic model was used to identify deficiencies, and develop necessary improvements, if any, to the existing Mission Bay low-pressure water system to maintain the minimum required pressure during fire flow scenarios with the increased domestic demand. Eleven fire flow scenarios were analyzed.

This technical memorandum (TM) describes the computer model and results, and the recommended infrastructure improvements.

DESCRIPTION OF COMPUTER PROGRAM

The hydraulic analysis was prepared using the computer program WaterCAD V8i Select Series 3, by Bentley Systems, Inc. The program computes the head loss through system pipes and the pressures in system nodes for a given scenario. A scenario is a pipe network with specified demands at the nodes.

EXISTING CONDITIONS & MODEL UPDATE

The model was originally developed by GHD (formerly Winzler & Kelly) in May of 2000 and the initial results were published in the report titled “Computer Modeling and Analysis of the Low Pressure Water System, Mission Bay Development, San Francisco, California” (Winzler & Kelly MB LPW Report). The pipe network system developed by GHD, for the Blocks 8, 9, 9A site-specific analysis in August of 2011, was used as the existing pipe network system for this analysis. This version of the model is the most accurate and current representation of the existing Mission Bay low-pressure water system.

Freyer & Laureta provided updated sanitary sewer flows for the blocks in the South of Channel (SOC) area of Mission Bay Development. These sanitary sewer flows were used to estimate the current 2013

water demands. This was done by dividing the sanitary sewer flow (in total gallons per day) by a factor of 0.9 to obtain the water average-day-demand. This factor of 0.9 is consistent with previous modeling effort performed for Mission Bay. Using the F&L data, it was estimated that the water demand in the SOC increased roughly 10 - 15%. With this in consideration, all node demands in the model (NOC & SOC) were increased by 15%.

As a check to locate blocks with significant increases in demand, a demand comparison was made between the data from 1999 and 2013. The 1999 demands were estimated using land-use data from a Memo developed by Hawk Engineers, dated January 14, 1999 (see references). The water demands were calculated using this land-use data along with flow factors as listed in the Winzler & Kelly MB LPW Report.

The flow factors used are as follows:

Residential Housing:	180 gal/unit/day
Entertainment:	0.20 gal/s.f./day
Hotel:	150 gal/room/day
Commercial, Industrial:	0.23 gal/s.f./day

See calculations in Appendix A. The 2013 demands are based on the provided F&L data previously described. Seawall Lot 337 is a notable lot with significant demand increase. The F&L data shows a demand increase of 507 gallons per minute (gpm) for Seawall Lot 337. The 507 gpm was equally distributed to five nodes surrounding Seawall 337: J-31, J-33, J-37, J-38, and J-39.

MODELING CRITERIA

The modeling criterion is to achieve a minimum residual pressure of 20 pounds per square inch (psi), as required by the City and County of San Francisco (CCSF), for all nodes in the Mission Bay system during a fire flow scenario.

The design demand is typically based on the maximum hourly demand (MHD) or the maximum daily demand plus the fire flow requirements (MDD+FF), whichever is greater (see Table 1 for comparison).

Table 1 - Comparison of Demand Conditions

Demand	Flow (gpm)
MDD	4,147
MHD	4,976
MDD + FF	12,147

The Maximum Hourly Demand (MHD) is the Average Daily Demand (ADD) multiplied by a factor of 2.4. The peaking factor of 2.4 was used based on recommendations by the CCSF Water Department (CCSFWD) as stated in the Winzler & Kelly MB LPW Report.

The Maximum Daily Demand (MDD) is the Average Daily Demand (ADD) multiplied by a factor of 2.0.

The peaking factor of 2.0 was used for this localized analysis as recommended by CCSFWD. (It should be noted that the peaking factor to determine MDD for the entire Mission Bay system, and in fact, the entire CCSF water distribution system, is 1.6. However, when studying a localized, site-specific design demand, it was agreed with CCSFWD that a slightly higher peaking factor would be appropriate, and so a factor of 2.0 was adopted.)

The Fire Flow (FF) requirement is 8,000 gpm for any given block in Mission Bay. This was established in the Winzler & Kelly MB LPW Report.

For this analysis, the MDD+FF is greater than the MHD; therefore, the design demand is MDD+FF.

Design Demand = 2.0 (Peaking Factor) x Average Daily Demand + Fire Flow of 8,000 gpm

The 8,000 gpm fire flow was distributed to the nodes at the corners of the designated block. See Appendix A for the fire flow distribution for each scenario.

MODEL RESULTS

The design demand was used to model the following 11 scenarios:

Scenario 1:

Scenario 1 represents the existing system with a fire flow demand at Blocks 8, 9, 9A. The maximum day demand plus fire flow can be met with the existing low-pressure water infrastructure. A minimum pressure of 27 psi was achieved (see WaterCAD output in Appendix C). This meets the modeling criterion for a minimum system pressure of 20 psig.

Scenario 2:

Scenario 2 represents the existing system with a fire flow demand at Blocks 26-28. The maximum day demand plus fire flow can be met with the existing low-pressure water infrastructure. A minimum pressure of 31 psi was achieved (see WaterCAD output in Appendix C). This meets the modeling criterion for a minimum system pressure of 20 psig.

Scenario 3:

Scenario 3 represents the existing system with a fire flow demand at Blocks 36-39, X-3. The maximum day demand plus fire flow can be met with the existing low-pressure water infrastructure. A minimum pressure of 34 psi was achieved (see WaterCAD output in Appendix C). This meets the modeling criterion for a minimum system pressure of 20 psig.

Scenario 4:

Scenario 4 represents the existing system with a fire flow demand at Blocks 41-43. The maximum day demand plus fire flow can be met with the existing low-pressure water infrastructure. A minimum pressure of 35 psi was achieved (see WaterCAD output in Appendix C). This meets the modeling

criterion for a minimum system pressure of 20 psig.

Scenario 5:

Scenario 5 represents the existing system with a fire flow demand at Blocks 2-7, 11, 13. The maximum day demand plus fire flow can be met with the existing low-pressure water infrastructure. A minimum pressure of 24 psi was achieved (see WaterCAD output in Appendix C). This meets the modeling criterion for a minimum system pressure of 20 psig.

Scenario 6:

Scenario 6 represents the existing system with a fire flow demand at Block 1. The maximum day demand plus fire flow can be met with the existing low-pressure water infrastructure. A minimum pressure of 21 psi was achieved (see WaterCAD output in Appendix C). This meets the modeling criterion for a minimum system pressure of 20 psig.

Scenario 7:

Scenario 7 represents the existing system with a fire flow demand at Fourth Street, north of Sixteenth Street. The maximum day demand plus fire flow can be met with the existing low-pressure water infrastructure. A minimum pressure of 30 psi was achieved (see WaterCAD output in Appendix C). This meets the modeling criterion for a minimum system pressure of 20 psig.

Scenario 8:

Scenario 8 represents the existing system with a fire flow demand at Blocks 17, 20, 23. The maximum day demand plus fire flow can be met with the existing low-pressure water infrastructure. A minimum pressure of 35 psi was achieved (see WaterCAD output in Appendix C). This meets the modeling criterion for a minimum system pressure of 20 psig.

Scenario 9:

Scenario 9 represents the existing system with a fire flow demand at Seawall Lot 337. The additional 507 gpm that represents the development at Seawall Lot 337 is not included. The maximum day demand plus fire flow can be met with the existing low-pressure water infrastructure. A minimum pressure of 22 psi was achieved (see WaterCAD output in Appendix C). This meets the modeling criterion for a minimum system pressure of 20 psig.

Scenario 10:

Scenario 10 represents the existing system plus the additional 507 gpm, representing development at Seawall Lot 337, and a fire flow demand at Seawall Lot 337. The maximum day demand plus fire flow cannot be met with the existing low-pressure water infrastructure. A minimum pressure of 19 psi was observed (see WaterCAD output in Appendix C). This violates the modeling criterion for a minimum system pressure of 20 psig. Node J-38 exhibits a pressure of 19 psi; Node J-163, a pressure of 19 psi; and Node J-39, a pressure of 19 psi.

Scenario 11:

Scenario 11 represents the Scenario 10 system with a proposed 1,200 ft. long, 8-inch diameter water main running north-south through Seawall Lot 337. The purpose of the new main is to increase flow and hydraulic head to the nodes with lowest pressure. The maximum day demand plus fire flow can be met with the infrastructure in this scenario. A minimum pressure of 20 psi was achieved (see WaterCAD output in Appendix C). This meets the modeling criterion for a minimum system pressure of 20 psig.

WATER EFFICIENCY SURVEY OF
UCSF PARNASSUS CAMPUS, SAN FRANCISCO, CA

1.0 EXECUTIVE SUMMARY

1.1 Project Summary

Maddaus Water Management Inc. (MWM) was retained in September 2011 by the UCSF Parnassus Campus to perform a water efficiency survey (survey) of the medical school and make water conservation recommendations for uses throughout the campus. This water survey focused on the administrative, educational and research facilities of the UCSF Parnassus Campus. There are a total of twenty-five buildings on the Parnassus campus, fifteen of which were surveyed for this report.

Based on review of the UCSF Parnassus Campus's historical billing data provided by the UCSF Facilities Management staff, the campus used an average of 515,000 gallons per day (gpd) of potable water in the year 2011, all of which is purchased from San Francisco Public Utilities Commission (SFPUC). This amounted to about 188 million gallons per year (MGY). This includes the hospitals, clinic and power plant water use. The buildings surveyed use a little less than half of this amount. The campus water use is almost entirely indoor use (e.g., laboratories, restrooms and kitchens). There is very little outdoor use for landscape irrigation. Based on the campus's water and sewer billing data, the entire UCSF Parnassus Campus currently spends approximately $3.2 million annually on its water and sewer bills.

Implementation of the recommended water conservation projects is estimated to result in a 20% savings in the annual water use (approximately 17.4 million gallons per year) of the fifteen buildings surveyed. These projects would save approximately $266,000 per year after all the recommended projects are completed as a result of lower water, sewer, and energy bills (using 2011 price rates). MWM estimates that the UCSF Parnassus Campus's payback from implementation of the recommended water conservation projects will occur in approximately one year.

1.2 Recommended Water Conservation Program

From November 2011 to February 2012, MWM and UCSF Parnassus Campus staff conducted a detailed survey of the administrative, educational, and research facilities involving fifteen of the UCSF Parnassus Campus buildings to identify uses of water and potential water conservation options. MWM and UCSF staff measured over 2,000 fixtures including faucet and shower flow rates, toilet flush volumes, looked for leaks, checked for missing faucet aerators and inspected the kitchens and characterized water use for over 2.6 million square feet of buildings which included laboratories, restrooms, exam rooms, kitchens, cooling tower and gymnasium. This data was placed in an electronic database and was used for the analysis of this report. The database was provided to staff for future implementation and reference purposes. The summary results of the fixtures included in this survey are presented below.

Table 1 - Summary UCSF Parnassus Campus Main Campus Surveyed Water Using Areas

Fixture	Number Surveyed
Buildings Surveyed	15
Rooms Surveyed	919
Restrooms Surveyed	168
Showers	28
Kitchens Surveyed	108
Cooling Towers Surveyed	1
Swimming Pools (Indoor) Surveyed	1
Cold Rooms	22
Laboratory Steam Sterilizers	47
Laboratories Surveyed	486

Following the campus survey, MWM estimated the water savings, costs, and paybacks associated with implementation of various water conservation projects. Based on MWM's analysis, the following water conservation projects were identified to provide significant water savings and a quick payback for the UCSF Parnassus Campus.

For payback analysis, we are using the average water and sewer rates for 2011. The average water and sewer rate for the campus as of January 1, 2012 is $13.34 per 1,000 gallons. If the rates continue to increase faster than inflation after 2011, the water conservation projects evaluated in this report will become even more attractive.

The recommended water conservation projects are shown in

Table 2 below.

Table 2 shows the estimated annual cost and estimated annual savings for each project.

Table 2 also shows the payback period for each project. The payback period is the annual project cost divided by the annual project savings. The payback period calculation yields the number of years it takes for the initial project costs to be recouperated from lower water bills. The recommended projects shown below all have an expected payback period of a few months to less than three years. All of the projects together have an average payback period of one year.

Table 2 - Recommended Conservation Projects for UCSF Parnassus Campus

	Measure	Estimated Project Cost, $/Year	Estimated Project Savings, $/Year	Payback Years
1	Reduce pressure on all laboratory distilled faucets	$4,798	$3,445	1.4
2	Install low flow faucet aerators in all industrial faucets (2.2 gpm)	$1,815	$631	2.9
3	Install low flow faucet aerators in all exam room faucets (1.5 gpm)	$7,260	$12,182	0.6
4	Install low flow aerators in all laboratory faucets (2.2 gpm)	$11,160	$42,992	0.3
5	Install low flow shower heads in locker rooms	$400	$2,210	0.2
6	Install low flow faucet aerators in all bathroom faucets (0.5 gpm)	$5,535	$33,452	0.2
7	Retrofit older low use urinals with DualFlush handles	$7,455	$2,844	2.6
8	Retrofit older toilet handles with DualFlush handles	$27,510	$18,890	1.5
9	Replace diaphragm in 1.6 gpf toilets in public restrooms	$3,850	$10,971	0.4
10	Employee Training	$3,000	$44,916	0.1
11	Cold room solenoid valves	$11,000	$12,010	0.9
12	Public outreach to detect leaks	N/A	N/A	N/A
13	Pursue LEED building certification	N/A	N/A	N/A
14	Maintain 1.6gpd toilet valve	N/A	N/A	N/A
15	Install water efficient fixtures in new construction projects	N/A	N/A	N/A
16	Install water mizers on autoclaves	$132,343	$55,995	2.4
17	Replace high use older urinals with low water use urinals	$9,375	$4,209	2.2
18	Replace all high use older toilets in public restrooms with 1.28 gpf type toilets	$28,000	$20,835	1.3
	Total Recommended Projects	**$253,501**	**$265,582**	**1.0**

Note: The payback calculations are simple paybacks and by definition do not take time of actual implementation into account.

Each of the above listed projects is described in the Conservation Opportunities Section 5.

UCSF Parnassus Campus has completed several projects in previous years to improve water efficiency including replacing about one-third of 3.5 or 5.0 gallon per flush toilets with 1.6 gallon per flush toilets, installing waterless urinals and installing 0.5 gpm faucets in renovated restrooms. In addition to these changes, MWM recommends the above list of water conservation projects be considered for implementation.

Implementation of the recommended water conservation projects is estimated to result in a 20 percent savings in total medical school water use and a savings of approximately $266,000 per year (2011 rates). Savings will be higher when utility rates increase.

2.0 INTRODUCTION

2.1 Project Objectives

Maddaus Water Management Inc. was retained in September 2011 by the UCSF Parnassus Campus to perform a water efficiency survey (survey) and make water conservation recommendations for uses throughout the campus. The survey described in this report was conducted at the UCSF Parnassus Campus located in San Francisco, California. The water conservation recommendations included in this report are based on a payback analysis that identified the most cost-effective water conservation projects for UCSF Parnassus Campus.

2.2 Scope of the Investigation

MWM worked closely with the campus staff to complete the water efficiency study of fifteen of the buildings on the UCSF Parnassus campus. The project including the following steps:

1. Gather background data on the fifteen buildings.
2. Assess the efficiency of plumbing fixtures in campus facilities, existing conservation efforts, and the campus distilled water system.
3. Identify options to reduce water consumption including operations and retrofits.
4. Conduct an analysis of cost effectiveness for the various water conservation measures.
5. Develop a prioritization of potential options for implementation over the next 5 years.

The water survey was conducted on a total of fifteen buildings that are mainly used for medical research, administration, dining and teaching. These buildings where selected by UCSF staff as offering the best opportunities to save water. The buildings that were not surveyed included the medical clinic building, hospitals, and the power plant. The list of buildings surveyed is shown below in

Table 3. The Ambulatory Care Center (ACC) was made available for a walkthrough, however, extensive measurements of the water using fixtures was not possible due to the nature of the center's work with its patients.

Table 3 - List of Buildings Surveyed

	Building Name	Average Annual Water Use (gpd)	Square Feet (sq.ft.)	Average gpd per sq.ft.	Building Use
1	Clinical Sciences	1,475	107,647	0.01	L, A, C

	Total	**242,145**	**2,664,370**	**0.09**	

Abbreviations: L = LAB; A = ADMINISTRATIVE; C = CLASSROOM; H = HOSPITAL/MEDICAL; O = OTHER

During the site survey, MWM and campus staff identified all significant uses of water in the buildings surveyed. They measured the flow rates and volumes of representative fixtures. MWM interviewed staff responsible for each significant end use. Based on this information, MWM prepared a breakdown of daily water use at the UCSF Parnassus campus into major categories and identified potential water conservation projects for payback evaluation. As described in detail below, water conservation project recommendations were developed and prioritized based on the estimated payback from each water conservation project, the total cost and amount of effort involved in completing the conservation project.

MWM identified and focused water conservation efforts on the major uses of potable water, listed below, at the surveyed buildings on UCSF Parnassus campus:

Potable Water

- Domestic (sanitary) use by students and employees
  - Toilets
  - Urinals
  - Faucets
  - Showers
- Laboratories
  - Faucets
  - Steam Sterilizers
  - Ice Machines
  - Bottle Washers
  - Cage Washers
- Kitchen / Restaurant
  - Faucets
  - Dishwashers

    - Spray valves
    - Ice machines
- Other
    - Cooling Towers
    - Swimming Pools
    - Cold Rooms

2.3 Goals and Objectives for the UCSF Parnassus Water Efficiency Survey

During a meeting with UCSF and Maddaus Water Management Inc. on October 26, 2011, a list of goals and objectives for the water efficiency survey were identified.

The goals of the study were:

- Identify improvements that could be made to campus facilities and operations to reduce campus water consumption.
- Analyze the cost-effectiveness of these potential improvements (when possible).
- Create a fixture database so UCSF staff can benefit from a detailed building fixture list.
- Recommend top priority water conservation measures to be carried out within the next few years.
- Create a detailed list of water using fixtures in the Kalamanovitz Library and School of Nursing to help with the LEED certification for these buildings.

3.0 DESCRIPTION OF EXISTING UCSF PARNASSUS CAMPUS

The first building of the University of California San Francisco Parnassus Campus was constructed in the mid-1890s and was first occupied in 1898 as an addition to the existing UCSF facilities in Berkeley. It was constructed to help alleviate the problem of the teaching facilities being scattered throughout the city. The Parnassus Campus has grown over the years adding a medical center, and ambulatory care center, academic and support buildings that include kitchens, a fitness center with an indoor swimming pool, cooling towers, and many laboratories which are used by about 3,000 students, 14,000 staff and faculty, 1,600 residents and 1,000 postdoctoral scholars. There are a total of twenty-five buildings on the Parnassus campus, only fifteen of which were surveyed for this report.

3.1 Description of Existing Campus Water Systems

Currently, the UCSF Parnassus Campus uses three types of water: potable (tap), distilled and industrial (reclaimed). The potable water is obtained from the San Francisco Public Utility Commission through multiple meters spread through the campus. SFPUC also handles all waste water generated by the campus. The campus maintains and monitors submeters for each building on campus. An analysis of the historical domestic water use is shown in section 4 below.

Most of the buildings surveyed use distilled water in their research laboratories. The distilled water is mainly created at the power plant and pumped around campus to other buildings as needed. Distilled water is mainly used to clean laboratory glassware and for use in experiments. The campus also supports an industrial water system where water is reclaimed from boiler blowdown and is pumped into the Health Sciences East and West buildings for use in cleaning of laboratory glassware and experiments.

Domestic (Sanitary) Use

Approximately 168 restrooms (for public, student and employee use) are maintained around campus. Approximately 257 toilets, 384 restroom sinks and 65 urinals were surveyed in those restrooms throughout the UCSF Parnassus Campus. The number of fixtures shown in Table 4, represent only the number of fixtures that were physically surveyed which is only a portion of the total number on campus. Although this was a very comprehensive survey, it did not include the hospital facilities, Ambulatory Care Center (ACC), power plant, irrigated areas or areas that do not use any water. In summary, Table 4 lists only the items that were physically surveyed. A brief discussion of findings from the UCSF Parnassus Campus survey is presented below:

- 257 flush valve toilets tested at an average of 3.11 gpf.
- Majority of campus had low flow shower heads, with an average flow rate of 1.54 gallons per minute (gpm).
- Measured flow rates of faucets as follows:
  - Restrooms: 2.58 gpm
  - Laboratories: 3.66 gpm
- All of the kitchen spray rinse valves were low flow valves and had an average of 1.27 gpm.

Table 4 - Summary UCSF Parnassus Campus Main Campus Surveyed Water Fixtures

Fixture	Number Surveyed
Buildings Surveyed	15
Restrooms Surveyed	168
Restroom Faucets Surveyed	384
Toilets Surveyed	268
Urinals – Flush	98
Urinals – Waterless	23
Showers	28
Kitchen Faucets	108
Kitchen Spray Valves	4
Kitchen Ice Machines	5
Cooling Towers	1
Cold Rooms	22
Swimming Pools (Indoor)	1
Laboratory Steam Sterilizers	47
Laboratory Faucets	923
Laboratory Cage Washer	5
Laboratory Spray Valves	8
Laboratory Ice Machines	46
Total Fixtures Surveyed	**2,154**

Laboratories

MWM conducted a water survey of many of the laboratories. The main use of water in the laboratories was for washing and sterilization of laboratory equipment. Most of the laboratories had distilled water (DI) faucets. The campus has a main distilled water (DI) system originating at the power plant and smaller systems in several buildings around campus. The power plant has the

largest DI system, which is maintained by the campus Facilities Management department. The DI faucets where tested in each of the laboratories in each building.

MWM identified the following major water using equipment:

- 5 Cage washers for animal research area
- 42 Wall mounted steam sterilizers used to clean and sterilize glassware
- 12 Kitchen spray valves to pre-rinse glassware
- 51 Ice machines
- Water cooled vacuum pumps and compressors

Kitchen / Restaurants

The UCSF Parnassus Campus has multiple dining areas on campus, but only those at the Millberry Union were surveyed as part of this project. The main cafeteria was not surveyed as it was located in the hospital which was not included in the survey. The restaurants in the Millberry Union building are independently owned and operated. The Millberry Union restaurants are open for breakfast, lunch and dinner. The number of meals served will greatly fluctuate depending on the UCSF Parnassus Campus occupancy which is lower in the summer and during school holiday breaks. The summer term does continue to have dining services for summer school attendees and employees. During food preparation and cleanup the kitchens use a variety of water-using equipment including dishwashers, spray valves, ice machines, and kitchen faucets.

During cleanup, typically the dishes are sprayed with a spray rinse valves, washed in small dishwashers or cleaned with kitchen faucets. Dishwashers use a large volume of water to wash dishes. Therefore, MWM recommends that the dishwashers be loaded as efficiently as possible as determined by the manufacturer (e.g., running full racks instead of partially full racks) to avoid any unnecessary water use.

Spray rinse valves are used in commercial kitchens to rinse dishes before they are placed in the dishwasher. Conventional spray valves use about two to three gallons per minute or more and new low flow models required by the current plumbing regulations only use about 1.6 gallons/minute at 80 psi, or 1.0 gallons/minute at 60 psi. There are even lower flow models available that function well and flow at rates of 1.15 gpm. Valves rated at lower than 1.15 gpm have been showing difficulty in the field with generally unacceptable cleaning performance. Low flow models can save on energy, water and sewer as the fixtures typically use hot water.

The flow rates of the 12 spray rinse valves located at USCF that were measured during the survey had an average flow rate of 1.27 gpm. These are all high efficiency valves so no other action is required. However, it is recommended that new spray valves that are installed be the low flow models as they are used frequently by kitchen staff.

Information about these pre-rinse spray valves and savings can be found at: http://www.fishnick.com/equipment/sprayvalves/.

Other

UCSF Parnassus Campus has 51 air-cooled ice machines for laboratory and kitchen use. The ice machines are made by a variety of manufactures including Manitowoc,

Hoshizaki and Scotsman. Air-cooled ice machines are more water efficient than water-cooled machines. Air-cooled machines typically use less than 18 gallons per 100 pounds of ice. Water-cooled machines typically use 150 to 200 gallons per 100 pounds of ice produced.

It is recommended that when it is time for new installations or replacements, UCSF should select air cooled machines and look for possible rebates. Air cooled machines can be more efficient (for both energy and water) but do not typically cost any more than water cooled machines.

For more information and an example of possible future rebates see the following website:

http://www.energystar.gov/index.cfm?fuseaction=CFSrebate.CFSrebate_locator

Cleaning (Custodial)

The UCSF Parnassus Campus has a custodial staff that cleans different parts of campus daily. The staff is responsible for cleaning the sinks, toilets, faucets, and showers. It is recommended that the staff be trained in water and chemical efficiency to ensure that water is not wasted.

Cooling Tower

UCSF Parnassus Campus has multiple evaporative (water) cooling towers however this survey only covers the cooling tower on the roof of the library building. The library cooling tower has 320 tons of cooling capacity that is used for air conditioning in the library. The cooling tower is separately metered and is well maintained. The cooling tower runs as needed. During the site visit and testing of total dissolved solids (TDS) shown in Table 5, the tower was not running but would have been running at approximately 13 cycles when last in operation. For water efficiency the goal is a minimum of 5 cycles.

Table 5 - Cooling Tower Description

Cooling Tower	Cooling Tower Manufacturer and Type	Tonnage	Read Date	TDS Incoming Water	TDS Measured in Tower	Approx .# of Cycles
Library	Ceramic Towers Inc.	320	Nov 9, 2011	43	550	12.79

Swimming Pool

The UCSF Parnassus Campus has one large indoor swimming pool in the fitness club in the Millberry Union building. The pool is approximately 65 feet by 50 feet in size with a depth range of 3.5 to 10 feet deep. The approximate volume of the pool is 163,000 gallons and is in use all year. The staff did not know how often the pool filters are backwashed but typically this is done once per month.

Cold Rooms

There are 22 cold rooms on the medical school campus used for low temperature laboratory experiments. Currently existing water cooled cold rooms rely on a pressure controlled valve which determines flow rate. Total water use of each cold room is estimated by Mr. Bruce Shapiro

to be 133,736 gallons per year. Of this use, 40,880 gallons per year is flow during the period when the unit is supposed to be cycled off. This use occurs because the control valve is adjustable and can drift from its setting and allow water to flow needlessly. A solenoid valve installation would ensure zero water flow when the system is cycled off. Several water conservation projects based on the above listed items are evaluated in the Conservation Opportunities Section 5.0.

4.0 HISTORICAL WATER USE AT UCSF PARNASSUS CAMPUS

SFPUC reads the city owned UCSF Parnassus Campus water meters every month for billing purposes. Figure 1 indicates that overall annual water use at the UCSF Parnassus Campus has been decreasing over the last three years. This trend of decreased water use is a common trend in the Bay Area and all throughout California recently due to the irregular economy (in a campus environment the change in the economy can impact things such as number of employees and total hours worked on campus, student enrollment, research funds for experiments, etc.). The peak water usage occurs during the school year when students are on campus for classes. Figure 2 shows a declining trend in monthly data on the order of 10-15 percent since 2007.

Water usage at the fifteen buildings evaluated varies seasonally (see Figure 3). This seasonal variance is due to the increase of water use while school is in session and generally drops off as students leave for the summer. In this report, water usage is reported in gallons per day (GPD). The following water use characteristics were derived based on review of the UCSF Parnassus Campus's water sub meter data as provided by the campus Facilities Management department:

- The highest water use occurs during the school months of June and November.
- The average total daily usage in 2010 of the fifteen buildings is approximately 242,000 gallons per day (GPD).

Figure 1 - Annual Water Consumption History for the entire UCSF Parnassus Campus

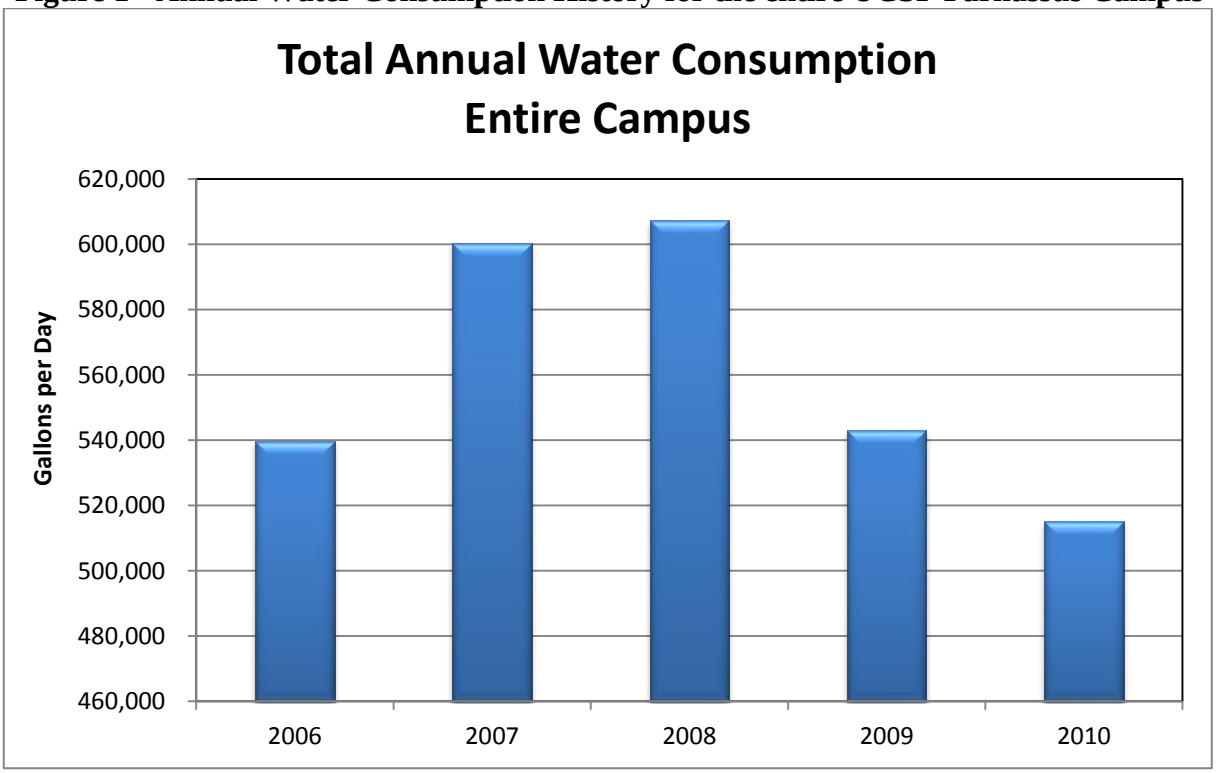

Figure 2 - Monthly Water Consumption History for the entire UCSF Parnassus Campus

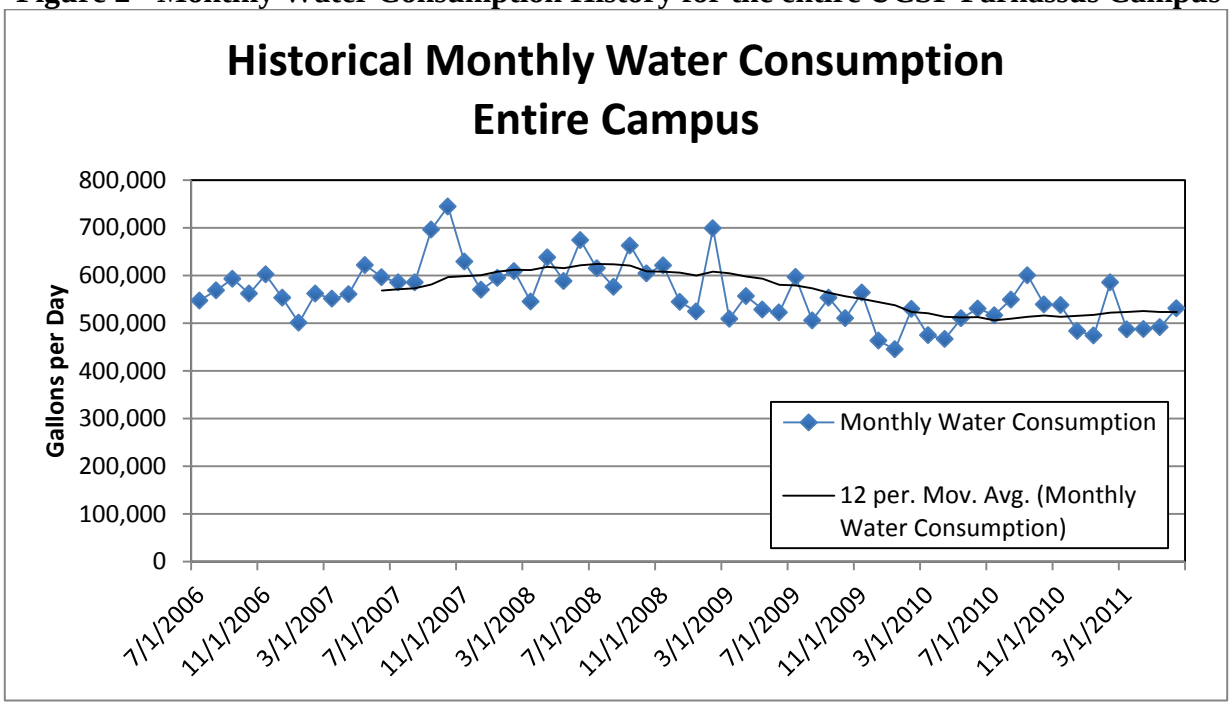

Figure 3 - Monthly Water Consumption History for the fifteen buildings surveyed

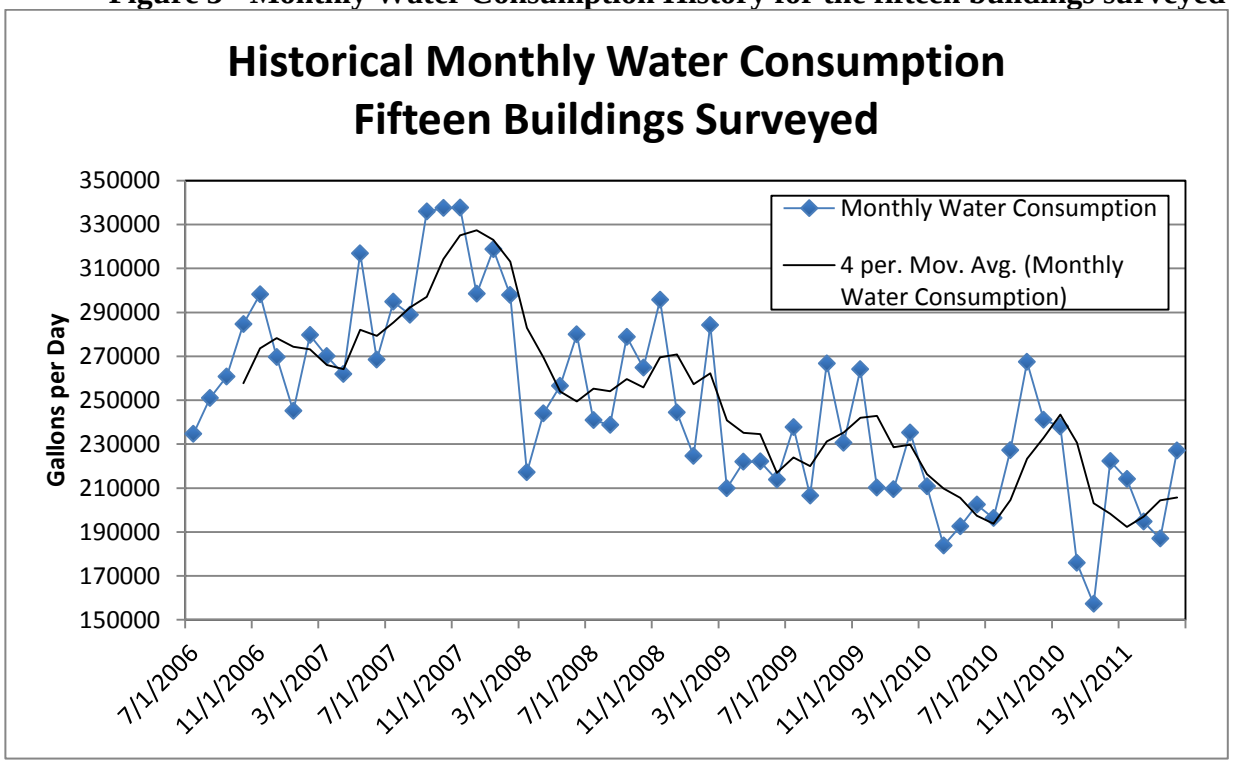

4.1 Water Use Composition

In order to accurately account for water conservation benefits from water conservation program savings, it is necessary to establish a baseline water use from historical data. The evaluation of

historical water consumption for UCSF Parnassus Campus involved the analysis of available submetering data between 2005 and 2011. Data shows that the 12-month moving average from 2005 to 2011 for the submetered system is decreasing slightly and was at approximately 515,000 gallons per day for calendar year 2010. This submeter total does not include water system loss or unmetered areas. This report focuses specifically on water conservation for the domestic water supply system and the distilled water system. The historical water use was further broken down into a water system profile to establish water demands for the major categories.

The respective percent of total annual average domestic water demand based on 5 years of metered data for each use category in the medical school is illustrated in Figure 4. This does not include system losses.

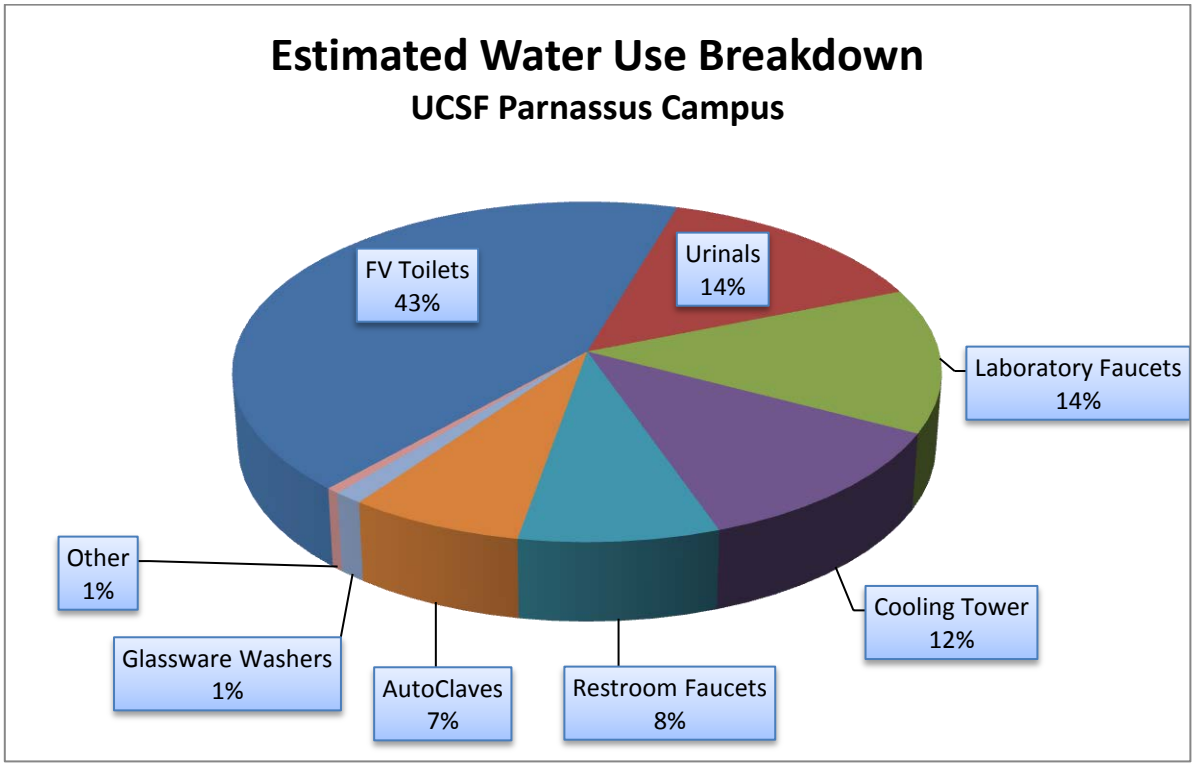

Figure 4 - Estimated Water Use Breakdown

MWM recommends that the focus for water conservation efforts should target the larger end uses of water so as to provide the most cost effective conservation investment returns.

4.2 Billing Rates for the UCSF Parnassus Campus

The current average cost of water and sewer (as of January 1, 2012) for UCSF Parnassus Campus is $13.34 per 1000 gallons for the main building meter. The total combined sewer and water bill for UCSF Parnassus Campus is approximately $3.2 million annually as of 2011. The campus (educational, research and administrative) portion would be a little less than half of this amount. In accordance with the City's policies, the water and sewer rates are revised every year. Historically, water rates change on January 1 and Sewer rates change on July 1 every year. A rate of $0.74/therm (2007 natural gas rate) was used to estimate energy savings from lower hot water use.

UCSF Parnassus Campus does not have a separate meter or separate bill for irrigation use as the irrigation use is very small. All the water used on campus for domestic, irrigation or other type of use is charged the same at a uniform rate. Indoor uses thus get billed both for water and sewer charges (including cooling tower drain down water), while outdoor use also gets charged for the sewer but the amount of landscaping is nominal and does not warrant the installation of a separate meter.

Water rates have increased steadily over the past few years for the campus and if water rates continue to increase faster than inflation after 2011, the water conservation projects evaluated in this report will become even more attractive.

4.3 Historical Water Conservation Efforts UCSF Parnassus Campus

The UCSF Parnassus Campus has a long tradition of trying to be resource efficient. This attitude toward sustainable resource management was seen on multiple occasions when talking to staff around campus that water and energy efficiency is very important in their project planning and daily operation procedures. All across campus MWM discovered water and energy efficiency practices including:

- Use of reclaimed industrial water
- LEED certification of buildings
- Submeters installed per building
- Installation of water efficient fixtures as older fixtures break including waterless urinals and low water use toilets
- Dual flush toilet handles

5.0 WATER CONSERVATION OPPORTUNITIES

5.1 Water Conservation Project Descriptions

The following table provides a description of the projects that were identified during the UCSF Campus water efficiency survey.

Table 6 - UCSF Parnassus Campus Water Efficiency Project Descriptions

Project Number	Name	Description
1	Reduce waste of DI water due to high pressure at DI water faucets.	Reduce the pressure in distilled water system where water was seen to be splashing in the laboratory faucets. Reduce the pressure at the faucet shut off valve or with a pressure reducer for each floor.
2	Install low flow faucet aerators in all industrial faucets. (2.2 gpm)	Reduce flow rate for industrial faucets by installing lower-water-use aerators.
3	Install low flow faucet aerators in all exam room faucets. (1.5 gpm)	Reduce flow rate for exam room faucets by installing lower-water-use aerators.
4	Install low flow faucet aerators in all laboratory faucets (2.2 gpm)	Reduce flow rate for laboratory faucets by installing lower-water-use aerators.

Project Number	Name	Description
5	Replace older, inefficient showerheads with newer, more efficient models.	Remove old high flow showerheads and replace them with efficient models using 1.5 gpm or less.
6	Install low flow faucet aerators in all bathroom faucets. (0.5 gpm)	Reduce flow rate for restroom faucets by installing lower-water-use aerators. The campus seems to be installing 0.5 gpm aerators on some new faucets but these were only found in a few buildings.
7	Retrofit low traffic restroom urinals with Dual Flush handles.	In all restrooms with low traffic and high water use urinals retrofit each urinal handle with the Dual Flush handle to help save water without incurring the high cost of installing the entire fixture.
8	Retrofit low traffic restroom toilet handles with Dual Flush handles.	In all restrooms with low traffic and 3.5 gpf type toilets retrofit each toilet handle with a Dual Flush handle to help save water without incurring the high cost of replacing the entire fixture.
9	Retrofit 1.6 gpf toilet flush valves in public restrooms where a flush indicates more than 1.6 gpf is being used.	Replace existing 1.6 gpf flush valve toilet diaphragms with new ones to improve performance of existing efficient toilets.
10	Employee Water Education Training and Increase water conservation awareness among students.	Conduct training for employees and educational campaign for students arriving on campus in September.
11	Retrofit all water cooled cold rooms with a solenoid valve to prevent continuous flow when unit is cycled off	Install a solenoid valve on the cooling water line that closes when unit is cycled off. Currently (2013) a pilot project is being conducted on campus at one cold room to measure savings.
12	Public outreach to help detect and repair leaks more quickly.	Post signs in restrooms encouraging people to report leaks.
13	Continue to pursue water efficiency when doing LEED building certifications.	Install the most water efficient fixtures possible during LEED certifications.
14	Maintain 1.6 gpf toilet models so that they function as designed.	Monitor and replace existing 1.6 gpf flush valve toilets by installing new 1.6 gpf flush valves as needed.
15	Install more water-efficient fixtures in existing buildings as they are remodeled.	Update water efficiency requirements for remodels in campus standards. This may include toilets, showers, faucets, urinals, dishwashers, steam sterilizers and more.
16	Increase water efficiency of autoclaves (steam sterilizers).	Add Water Mizer or solenoid sensors to all steam sterilizers. This will create a significant water use reduction.

Project Number	Name	Description
17	Replace all older urinals with high efficiency quart or pint urinals.	Remove older urinals in high use bathrooms and replace them with high efficiency urinals. The urinal selected should be found on the SFPUC rebate list in order to help offset the cost of the fixture.
18	Replace all older 3.5 gpf toilets in public restrooms with 1.28 gpf type toilets.	Remove older toilets and replace with high efficiency 1.28 gpf toilets. The toilet selected should be found on the SFPUC rebate list in order to help offset the cost of the fixture.

5.1 Rebate Opportunities from SFPUC

SFPUC is currently offering commercial rebate programs to customers which UCSF can utilize to offset the costs of installing water efficient fixtures. MWM contacted Julie Ortiz JNOrtiz@sfwater.org who answered our questions and would be a good contact for UCSF to discuss rebate opportunities with.

Three of SFPUC's commercial programs could currently be used by UCSF Parnassus Campus. The first program is the Commercial High-Efficiency Toilet Rebate program which contains a $300 rebate for each 1.28 gpf toilet that is installed and replaces an existing 3.5 gpf type toilet. The second program is the Commercial High Efficiency Urinal Rebate program which contains a $300 rebate for each 1.5 gpf urinal that is replaced with a 0.5 gpf or less use urinal. The last program is the Grant Assistance for Water Efficient Retrofits which can cover medical steam sterilizers, commercial laundry machines, x-ray film processors, ice machines, connectionless food steamers, dry vacuum pumps, and cooling tower pH controllers. The efficient retrofit program has a variable rebate about of 50% of the equipment costs with limits as shown in Table 7 below.

Table 7 - Eligible Projects for the Grant Assistance for Water Efficient Retrofits Program

Equipment Type	Estimated Annual Water Savings (1 ccf = 748 gallons)	Grant Amount
Cooling Tower pH Controllers	1,734 ccf	50% of the equipment cost, up to $8,000
X-Ray Film Processor Retrofits	1,119 ccf	50% of the equipment cost, up to $5,000
Medical Equipment Steam Sterilizers	670 ccf	50% of the equipment cost, up to $2,500
Water Efficient Ice Machines	364 ccf	50% of the equipment cost, up to $1,800
Commercial Laundry Retrofits	344 ccf	50% of the equipment cost, up to $1,700
Dry Vacuum Pumps	279 ccf	50% of the equipment cost, up to $1,000
Connectionless Food Steamers	109 ccf per compartment	50% of the equipment cost, up to $545 per compartment

5.2 Recommended Fixtures

Urinals

Table 8 below shows a list of recommended urinals for installation. These fixtures have been recommended by other universities that have tested and installed these fixtures and have knowledge of their use. These recommendations do not guarantee that the fixtures will work well at UCSF. Therefore, it is strongly recommended that UCSF test each fixture conducting a pilot test of each fixture by installing a few of the devices and testing that they are functioning as expected and that water savings are occurring. Then after the pilot test, the fixtures should be ready for a full installation).

There are multiple approaches that can be taken to improve the efficiency of the existing urinals. The options are for the urinal to either be replaced with a new one pint flush fixture or retrofitted with the Dual Flush handle as shown in Table 8 below. This type of handle is designed to be up for full flush and down for a reduced flush, causing the user to act differently to get a full flush. In order to obtain the best benefit to cost ratio MWM recommends that the decision to replace versus retrofit a urinal be decided on whether the restroom is in a high or lower traffic area. If the restroom is a high traffic restroom then replace the urinal with one from Table 8 below. If the restroom is in a low traffic area then it is recommended to retrofit the urinal handle with the Dual Flush handle to save water. As SFPUC is currently offering a $300 rebate on the installation of one pint urinals, a rebate form will need to be submitted to the SFPUC for all of the urinals installed. The form can be found at:
http://www.sfwater.org/modules/showdocument.aspx?documentid=223
The SFPUC may want to inspect the newly installed urinals to verify proper installation.

Table 8 - Recommended Urinals

Manufacturer	Model Number	Flush Valve Type	Flush Volume	SFPUC $300 Rebate	Notes
Zurn	Z5798	Automatic Battery	1 pint	Yes	This model was recommended by multiple other California universities and the only comment was that the model Z5738 was noted to have a better wash-down than this mode.
Zurn	Z5758	Automatic Battery	1 pint	Yes	Works well. No issues noted. Recommend model (Z5738) "small pint" for better wash-down.
Zurn	Z5738 (Small Pint)	Automatic Battery or Automatic Hardwired	1 pint	Yes	This model was noted to work well. It was also noted that in the battery life of the automatic flush valve depended on the amount of use. It was recommended, if possible, to get the hard-wired model (Z5738.206.0).
Kohler	4904-ET (bowl) and K-13520-YY (flush valve)	Manual	1 pint	Yes	This model bowl was noted to work well.

Toilets

Table 9 below shows a list of recommended toilets for installation. These fixtures have been recommended by other universities that have tested and installed these fixtures and have knowledge of their use. These recommendations do not guarantee that the fixtures will work well at UCSF. Therefore it is strongly recommended that UCSF test each fixture conducting a pilot test of each fixture by installing a few of the devices and testing that they are functioning as expected and that water savings are occurring. Then after the pilot test the fixtures should be ready for a full installation.

The toilet flush valve and bowl selected should be high efficiency using 1.28 gpf and used to replace an older 3.5 gpf toilet in order to qualify for the SFPUC rebate. MWM is recommending a similar strategy to that used with urinals, that all of the high traffic toilets be replaced with 1.28 gpf toilets selected from Table 9 below. If a restroom is in a high traffic area it should be considered higher priority for replacement. If the bathroom is in a lower use area, it is recommended to install the Dual Flush handle to help save water without the large cost of a new fixture.

It should be noted, when selecting a flush valve, multiple studies have shown that automatic flush valves use more water than manual flush valves. This appears to be due to unnecessary flushes triggered by false sensor readings that a flush is necessary. Based on the industry research and direct field observations MWM recommends that when appropriate that manual flush valves be chosen for installation.

The SFPUC rebate form for these toilets can be found at:
http://www.sfwater.org/modules/showdocument.aspx?documentid=1103

Table 9 - Recommended Toilets

Manufacturer	Model Number	Flush Volume	MAP Score	Type	SFPUC Rebate	Notes
Zurn	Z5615 (bowl) and AquaSense AV ZER6000AV-HET-CPM (flush valve)	1.28 gpf	800	Wall Mount, Automatic, Battery Powered	Yes	Tested in dual-flush, sensor, and single flush models. Toilet works well, but must be sure the valve is adjusted correctly to avoid double flushing or spitting.
Toto	CT705ELN (bowl) and Toto TET 1LN-32	1.28 gpf	1000	Floor Mount,	Yes	
American Standard	Madera 3461.001 (bowl) and 6065121.002 (flush valve)	1.28 gpf	1000	Floor Mount, Automatic, Battery Powered	Yes	

Urinal and Toilet Handle Retrofit

If a high water use toilet or urinal is in a less visited restroom, then the toilet should be retrofitted with a Dual Flush handle in order to save water without incurring the cost of a new toilet. Dual Flush handles are simple to install, only requiring a few minutes for a plumber to unscrew the old handle and then screw in this new one. By simply replacing the handle, the toilet or urinal can be used as a dual flush device where pressing down uses a reduced flush while pressing up will use a full flush of water. This device manufactured by AMTC and can save up to 30% per flush. Signage is also sent with the handle to be mounted near the toilet or urinal so as to

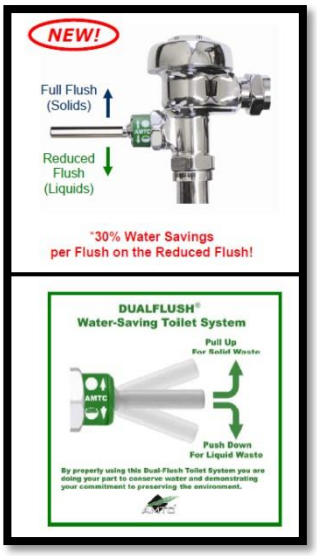

Table 10 - Recommended Retrofit Dual Flush Handles for High Use Urinals and Toilets

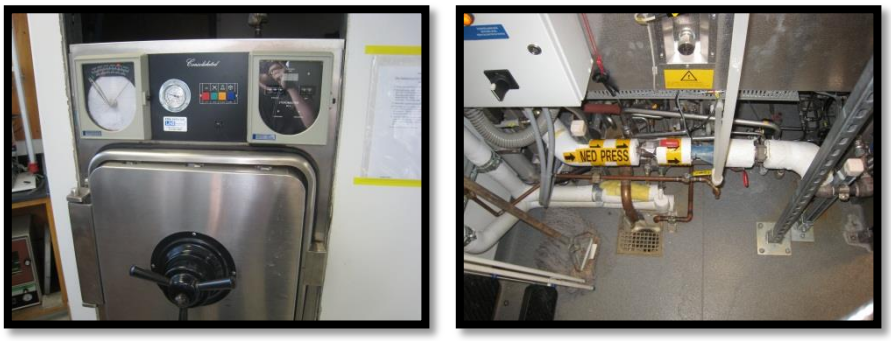
Manufacturer	Retrofitted Fixture	Model Number	Flush Volume (gpf)
AMTC	1.6 gpf toilet	ADH-100-16	1.5/1.2
AMTC	3.5 gpf toilet	ADH-100-35	3.5/1.75
AMTC	Urinal	ADH-101	0.5

Steam Sterilizers (Autoclaves)



There are a total of 42 large sterilizers that were surveyed. These large wall mounted sterilizer units are used to sterilize equipment and glassware for experiment and research purposes that need high temperature sterilization. The hot water discharge must be cooled before discharging to the building drain to prevent damage to the plumbing.

MWM is recommending installing Water Mizers on the 42 large sterilizers on campus when the sterilizer appears to be in regular use and water is being discharged continuously (even when the sterilizer is not in use). The Water Mizers have a solenoid valve which senses when the machine needs cool water (only while in use and during the very end of the clean cycle) instead of running a large volume of water down the drain 24 hours a day (often with potable water). Since these facilities are mainly focused on research, it assumed

Figure 5 - Water Mizer

there can be a very large overall savings potential. Other local Bay Area campuses have installed Water Mizers successfully and showed very significant savings.

The campus departments that have sterilizers should decide whether to replace existing units with new units equipped to save water or install water mizers depending upon criteria including:

- Age of unit
- Relative water efficiency of existing unit
- Frequency of repair
- Consequences of a unit being down for repairs
- Estimated remaining useful life
- Availability of SFPUC rebates
- Cost analysis of Water Mizer vs. Replace Unit vs. Doing nothing

The following table shows information to consider when purchasing a new machine. The water efficient options do cost more when the unit is purchased, but can save significant water and sewer costs for many years.

Table 11 - Water Efficient Features of Steam Sterilizers

Unit	Option	Cost $	Peak Water usage (gpm)	Water usage full (gal/cycle)	Water savings (gals/cycle)	Water saving %
Steris Lab 250	Standard Unit with water ejector	-	6	126	-	-
Steris Lab 250	Vacuum pump upgrade	$1,500	3	48	78	62%
Century	Standard Unit with vacuum pump	-	15	94	-	-
Century	Chilled water vacuum & drain	$3,500	0.5	1.4	93	99%
Getinge 733LS	Standard Unit with water ejector	-	11	340	-	-
Getinge 733LS	Vacuum pump	$5,500		70	270	71%
Getinge 733LS	Chilled loop Chilled water (vac & drain)					
Getinge 733LS	MP-129 (Stand-alone unit)	$15,000		110	230	68%

There are additional small bench top sterilizer units which are thought to be used infrequently based on discussion with UCSF personnel. These units are often manually filled by the user. Based on the infrequency of use and type of unit it is not recommended to install Water Mizers for these units.

Faucet Aerators

There is a large potential for water savings on the Parnassus Campus from water faucets in restrooms, laboratories, kitchens and exam rooms. During the survey many faucets where found to have broken or missing aerators. Replacing an aerator is a quick and cheap fix that will help save money for the campus. For this reason we are recommending the following types of aerators be installed and regularly checked in the following areas.

Room Type	Recommended Aerator Flow Rate
Restrooms	0.5 gpm
Laboratories	2.2 gpm
Kitchens	2.2 gpm
Exam Rooms	1.5 gpm

Aerators can get clogged over time with sought from the water lines and this can cause faucet users to get frustrated if water pressure isn't sufficient. This can lead to aerator removal and a loss of water savings. It is recommended to periodically check and cleaning the aerator screens as needed to prevent problems.

Distilled Water System Improvements

Updates to the distilled water system could be made in one of two ways to help improve efficiency. MWM observed relatively high pressure in all instances. Steps should be taken to reduce pressure and save water. MWM can suggest three possible methods:

(1) One way to address the issue of high pressure would be to install pressure reducers on each floor.
(2) The second method would be to check the pressure at each distilled faucet and lower the pressure at the sink by adjusting the valves under the sink so as to obtain a decent flow rate of water without excessive splashing.
(3) The third approach would be to install 1.5 gpm aerators on each of the faucets that do not have a nozzle to ensure that water is not being wasted.

5.3 Water Conservation Technology Overview and Definitions

The description of the UCSF Parnassus Campus water using fixtures (shown in Table 4) outlines the possible future improvements that can be made for the toilets, washing machines, ice machines, dishwashers, spray valves, urinals and faucets (see Section 3 for comments by individual area). It is recommended the UCSF Parnassus Campus purchase water and energy efficiency equipment now and in the future as technology continues to advance. Often the cost for the more energy and water efficient devices is the same as the less efficient models. One simply needs to be aware and read or ask the manufacturers for the energy and water using specifications and compare among different models and manufacturers to ensure that the most efficient and economical model is purchased. The selection of an efficient model can greatly reduce the energy and water costs as much as 70 percent, which is highly desirable.

Sanitary Plumbing Fixture Standards and Definitions

National Plumbing Code

National law requires that for new construction after January 1, 1992 only fixtures meeting the following standards can be installed in new buildings:

- Toilet – 1.6 gal/flush maximum
- Urinals – 1.0 gal/flush maximum

- Showerhead - 2.5 gal/min at 80 psi
- Residential Faucets – 2.2 gal/min at 60 psi
- Public Restroom Faucets - 0.5 gal/min at 60 psi (2005 amendment)

Replacement of fixtures in existing buildings is governed by the Federal Energy Policy Act that requires only devices with the specified level of efficiency (shown above) can be sold after January 1, 1994 for residential use and January 1, 1997 for commercial toilets. Only efficient models can be legally sold by manufacturers to be placed in new structures or used as replacement parts for existing fixtures. The net result of the plumbing regulations is that new buildings will be more efficient and old inefficient fixtures will slowly be replaced with new more efficient models. The national and state plumbing legislation and regulations are carefully taken into consideration when analyzing the overall water efficiency of a service area.

State Plumbing Code

The Plumbing Code includes a California State Law requiring High Efficiency Toilets (HET) and High Efficiency Urinals (HEU) be exclusively sold in the state by 2014. Recently, this was augmented by a new state plumbing code called Cal Green (See Table 12). This code will require only HETs and HEUs be used in permitted new construction after July 2011. Non High Efficiency Fixtures can still be sold for replacement up until 2014.

Table 12 - Cal Green Building Code

Cal Green Building Code						
Building Class	**Component**	**Effective Date[I]**	**Indoor Fixtures Included**	**Indoor Requirement**	**Landscaping & Irrigation Requirements**	**Are the Requirements Mandatory?**
Residential	Indoor	1/1/2011	Toilets, Showers, Lavatory & Kitchen Faucets, Urinals	Achieve 20% savings overall below baseline		Yes
	Outdoor	1/1/2011			Provide weather adjusting controllers	Yes
Non Residential	Indoor	1/1/2011	Submeter leased spaces	Only if building >50,000 sq. ft. & if leased space use >100 gpd		Yes

			Toilets, Showers, Lavatory & Kitchen Faucets, Wash Fountains, Metering Faucets, Urinals	Achieve 20% savings overall below baseline		Yes
	Outdoor	1/1/2011			Provide water budget	> 1,000 sq. ft. landscaped area
					Separate meter	As per Local or DWR ordinance
					Prescriptive landscaping requirements	> 1,000 sq. ft. landscaped area
					Weather adjusting irrigation controller	Yes
[I] Effective date is 7/1/2011 for toilets						

Starting in 2014 the fixtures that will be the only ones sold are listed below along with suggestions for a campus standard of even higher efficient fixtures where appropriate.

Table 13 - Plumbing Fixture Legislation and Regulations

Plumbing Fixture	Required by Plumbing Legislation and Regulations	Proposed Future Replacement Fixtures
Urinals	0.5 gpf by 2014 in California	One Pint
Lavatory Faucets	2.5 gpm	1.5 gpm
Toilets	1.6 gpf	1.28 gpf
High Efficiency Toilets	1.28 gpf Required by 2014 in California	1.28 gpf

gpf = gallons per flush gpm = gallons per minute

5.4 Water Conservation Project Costs

A summary matrix of the recommended projects and rough estimates of costs, assuming contractor labor and retail prices, is shown in Table 15. The labor rate for all plumbing projects is assumed to be $98 per hour as provided by Facilities Management staff. The project costs quoted in this report include labor costs. The time estimate to for each project varies and is shown in Table 14 below. However, UCSF can mitigate these costs by using in-house staff to complete the projects. UCSF should decide whether to replace fixtures quicker with contractors in order to save

water and money sooner or schedule the replacement into the normal workload, taking longer but lowering the installation cost. The availability of SFPUC rebates should also enter into the decision. SFPUC does not reimburse labor costs and the rebates may not continue indefinitely.

Table 14 - Water Using Fixture Replacement Times

Fixture Project	Estimated Fixture Install Time
Faucet Aerator Retrofit	6 min
Showerhead Retrofit	15 min
Dual Flush Toilet/Urinal Handle Retrofit	15 min
Toilet Flush Value Diaphragm Replacement	15 min
Toilet Bowl and Flush Valve Replacement	2 hours
Urinal Bowl and Flush Valve Replacement	2 hours

Table 15 - Estimated Water Conservation Project Costs by Building

UCSF Parnassus Campus Conservation Projects and Paybacks					
	End Use	Measure	Estimated Fixture Costs, $	Estimated Number of Fixtures to be Replaced	Estimated Total Cost, $
Ambulatory Care Center (Estimates not based on measurement but on interview and brief walk through)					
	Faucets	Install low flow faucet aerators in all bathroom faucets (0.5 gpm)	$15	110	$1,650
	Faucets	Install low flow faucet aerators in all exam room faucets (1.5 gpm)	$15	250	$3,750
	Toilets	Replace all high use older toilets in public restrooms with 1.28 gpf type toilets	$400	10	$4,000
	Toilets	Retrofit older toilet handles with DualFlush handles	$105	80	$8,400
	Toilets	Replace diaphragm in 1.6 gpf toilets in public restrooms	$70	10	$700
	Urinals	Replace high use older urinals with low water use urinals	$625	3	$1,875
	Urinals	Retrofit older low use urinals with DualFlush handles	$70	10	$700
	Autoclaves	Install water mizers on autoclaves	$5,294	1	$5,294
	Showers	Install low flow shower heads in locker rooms	$50	4	$200
		Subtotal		478	$26,569
Clinical Sciences					
	Faucets	Reduce pressure on all laboratory distilled faucets	$24	2	$49
	Faucets	Install low flow aerators in all laboratory faucets (2.2 gpm)	$15	37	$555
	Faucets	Install low flow faucet aerators in all bathroom faucets (0.5 gpm)	$15	15	$225
	Toilets	Replace all high use older toilets in public restrooms with 1.28 gpf type toilets	$400	2	$800
	Toilets	Retrofit older toilet handles with DualFlush handles	$105	6	$630
	Toilets	Replace diaphragm in 1.6 gpf toilets in public restrooms	$70	1	$70
	Urinals	Replace high use older urinals with low water use urinals	$625	1	$625
	Urinals	Retrofit older low use urinals with DualFlush handles	$70	3	$210
		Subtotal		64	$2,954
Dental Clinics					
	Faucets	Install low flow aerators in all laboratory faucets (2.2 gpm)	$15	26	$390
	Faucets	Install low flow faucet aerators in all bathroom faucets (0.5 gpm)	$15	23	$345
	Faucets	Install low flow faucet aerators in all exam room faucets (1.5 gpm)	$15	200	$3,000
	Toilets	Replace all high use older toilets in public restrooms with 1.28 gpf type toilets	$400	8	$3,200
	Toilets	Retrofit older toilet handles with DualFlush handles	$105	16	$1,680
	Toilets	Replace diaphragm in 1.6 gpf toilets in public restrooms	$70	1	$70

5.5 Estimated Water, Sewer, and Energy Savings and Paybacks

Table 16 shows the projected water savings and the associated paybacks for all the projects. Projects were identified to be recommended if they had a payback of less than four years. Payback is defined as the number of years for UCSF to recover its investment in a given water conservation project based on the projected water and sewer bill savings associated with implementation of that project. In this case, seventeen water conservation projects identified for the UCSF Parnassus Campus have paybacks which are equal to or less than four years and are recommended.

The value of the saved water for all recommended water conservation projects is an estimated reduction in water, sewer, and energy costs of $266,000 per year (2011 rates). Savings will increase when water, sewer and energy rates increase in the future.

Table 16 shows the estimated annual savings achieved by the completion of the recommended water conservation projects. In terms of priorities, projects should be implemented in the order of increasing payback. The total cost to implement the recommended water conservation projects is estimated to be approximately $254,000. The overall payback for these projects is estimated to be one year. The cost estimates presented in this report are planning level costs, sufficiently accurate to identify projects with attractive paybacks. The exact costs to the UCSF Parnassus Campus to implement these water conservation projects will depend on the specific number and type of fixtures. In addition, MWM recommends that the UCSF Parnassus Campus adjust the estimates contained herein based on estimates provided by plumbing contractors and engineering staff.

Table 16 - Water Conservation Project Savings

6.0 RECOMMENDATIONS

UCSF Parnassus Campus has a history of improving water efficiency, and MWM has identified a number of projects that the campus can fund to improve their water efficiency even further. MWM recommends that the UCSF Parnassus Campus implement the water conservation programs that are cost effective and within available resources.

Implementation of all of the recommended projects is estimated to result in a 20% percent savings in medical school water use and a savings of approximately $266,000 per year (2011 rates). Savings will be higher when utility rates increase. The recommended projects, when combined, have a payback of approximately one year. This is a very favorable return on investment and shows that implementing these projects could lead to large water savings within the year.

Table 17 - Recommended Conservation Projects for UCSF Parnassus Campus

	Measure	Total Project Cost, $	Total Annual Savings, $	Payback Years	Number of Devices
1	Reduce pressure on all laboratory distilled faucets	$4,798	$3,445	1.4	196
2	Install low flow faucet aerators in all industrial faucets (2.2 gpm)	$1,815	$631	2.9	121
3	Install low flow faucet aerators in all exam room faucets (1.5 gpm)	$7,260	$12,182	0.6	484
4	Install low flow aerators in all laboratory faucets (2.2 gpm)	$11,160	$42,992	0.3	744
5	Install low flow shower heads in locker rooms	$400	$2,210	0.2	8
6	Install low flow faucet aerators in all bathroom faucets (0.5 gpm)	$5,535	$33,452	0.2	369
7	Retrofit older low use urinals with DualFlush handles	$7,455	$2,844	2.6	71
8	Retrofit older toilet handles with DualFlush handles	$27,510	$18,890	1.5	262
9	Replace diaphragm in 1.6 gpf toilets in public restrooms	$3,850	$10,971	0.4	55
10	Employee Training	$3,000	$44,916	0.1	1
11	Cold room solenoid valves	$11,000	$12,010	0.9	22
12	Public outreach to detect leaks	N/A	N/A	N/A	N/A
13	Pursue LEED building certification	N/A	N/A	N/A	N/A
14	Maintain 1.6gpd toilet valve	N/A	N/A	N/A	N/A
15	Install water efficient fixtures in new construction projects	N/A	N/A	N/A	N/A
16	Install water mizers on autoclaves	$132,343	$55,995	2.4	25
17	Replace high use older urinals with low water use urinals	$9,375	$4,209	2.2	15
18	Replace all high use older toilets in public restrooms with 1.28 gpf type toilets	$28,000	$20,835	1.3	70
	Total Recommended Projects	$253,501	$265,582		

The number of fixtures to be replaced is shown in Table 17 above. The small and medium projects are intended for UCSF Facilities Management staff to replace these fixtures over time. The large projects may require outside help to complete. The fixture replacement costs include labor but this can be mitigated by using current staff. If it will take many months for staff to implement these

projects, then replacement could be done quicker using outside contractors at a higher replacement cost.

MWM can suggest the following next steps for the project:

1. Meet with SFPUC to maximize rebate/financial incentives.
2. Prioritize and select projects for UCSF to implement.
3. Decide if projects will be implemented by in house staff or by a contractor.
4. Finalize the individual project costs and set aside funds in the budget.
5. Assign a project manager to be in charge of implementation.
6. Record individual item costs (i.e. cost of each toilet or urinal installation) and note the installation dates of new equipment.
