Re: Draft Environmental Impact Report for the UCSF 2014 Long Range Development Plan
State Clearinghouse Number 2013092047

This is the Draft Environmental Impact Report (Draft EIR) for the proposed UCSF 2014 Long Range Development Plan (LRDP). Pursuant to the California Environmental Quality Act (CEQA), the Draft EIR analyzes the potential impacts of campus growth under the 2014 LRDP at a program level, and analyzes the potential impacts of a number of specific 2014 LRDP development proposals at a project level where greater project detail is available.

The Draft EIR is available for public review for 60 days from **August 15, 2014 to October 14, 2014 at 5 p.m.** To provide written feedback on the Draft EIR, please write to Ms. Wong at UCSF Campus Planning, Box 0286, San Francisco, CA 94143-0286, or email her at EIR@planning.ucsf.edu. Please include your full name and address in written correspondence. Please note that all public comments made in writing or in oral testimony at the public hearing are part of the public record. **All comments must be submitted during the 60-day public review period from August 15, 2014 to October 14, 2014 at 5 p.m.**

UCSF will also hold a public hearing regarding the Draft EIR on Monday, September 22, 2014 at 7:00 p.m. at the UCSF Millberry Union Conference Center, 500 Parnassus Avenue. The purpose of this hearing is to solicit public comments on the adequacy and accuracy of the information presented in the Draft EIR.

Comments received at the public hearing or in writing will be responded to in a Comments and Responses document to be prepared subsequent to the close of the comment period. After preparation of the Comments and Responses document, a draft of the Final EIR will be prepared for certification by the University of California Regents.

To obtain a paper or CD copy of the Draft EIR or to view reference materials, email UCSF Environmental Coordinator Diane Wong at EIR@planning.ucsf.edu or call (415) 502-5952. Copies of the Draft EIR will also be available for viewing at the UCSF Kalmanovitz Library at 530 Parnassus Avenue, the UCSF Mission Bay Library at 1675 Owens Street, and the following public library branches: San Francisco Main Branch, 100 Larkin Street; Mission Branch, 300 Bartlett Street; Mission Bay Branch, 960 4th Street; Park Branch, 1833 Page Street; Sunset Branch, 1305 18th Avenue; and the Western Addition Branch, 1550 Scott Street.

Thank you for your interest in UCSF's 2014 LRDP and this EIR. For more information, please visit our website at www.ucsf.edu/lrdp.

Sincerely,
Diane Wong, Environmental Coordinator
UCSF Campus Planning, 654 Minnesota Street, San Francisco, CA 94143-0286

University of California San Francisco

Draft EIR Publication Date: August 15, 2014
Draft EIR Public Review Period: August 15, 2014 through October 14, 2014
Draft EIR Public Hearing Date: September 22, 2014

TABLE OF CONTENTS

UCSF 2014 Long Range Development Plan Environmental Impact Report

	Page
1. Introduction	**1-1**
1.1 Purpose of the EIR	1-2
1.2 Overview of the 2014 LRDP	1-3
1.3 Project Background	1-4
1.4 Program EIR and Project EIR	1-6
1.5 Environmental Review Process	1-9
1.6 Uses of the LRDP EIR	1-10
1.7 Other Agency Approvals	1-10
1.8 Report Organization	1-11
2. Summary of Environmental Impacts and Mitigation Measures	**2-1**
2.1 Introduction	2-1
2.2 Project Description	2-1
2.3 Project Objectives	2-2
2.4 Impact Summary	2-2
2.5 Alternatives to the Proposed Project	2-3
2.6 Known Areas of Controversy	2-3
3. Project Description	**3-1**
3.1 Introduction	3-1
3.2 Purpose of the LRDP	3-1
3.3 Campus and Context	3-3
3.4 LRDP Objectives	3-5
3.4.1 Campus-Wide Objectives	3-5
3.4.2 Campus Site-Specific Objectives	3-11
3.5 Plan Elements	3-12
3.5.1 Land Use	3-12
3.5.2 Open Space	3-13
3.5.3 Circulation, Transportation and Parking	3-14
3.5.4 Utilities and Other Infrastructure	3-15
3.6 Projected Growth	3-15
3.6.1 Existing Space and Buildings Under Construction	3-15
3.6.2 LRDP Proposed Space Program	3-16
3.6.3 Existing and Projected Population	3-21
3.7 LRDP Proposals	3-21
3.7.1 Greenhouse Gas Reduction Strategy	3-21
3.7.2 Transportation Demand Management Program	3-23

Page

3. Project Description (Continued)

3.8 Campus Site Locations and Proposed Physical Development Plans 3-24
3.8.1 Parnassus Heights 3-24
3.8.2 Mission Bay 3-37
3.8.3 Mount Zion 3-48
3.8.4 Mission Center 3-53
3.8.5 Other Campus Sites and Affiliations 3-54
3.8.6 Leased Sites 3-60
3.9 Projects and Activities Not Included in the LRDP EIR 3-62
3.9.1 Parnassus Heights 3-62
3.9.2 Mission Bay 3-63
3.9.3 Laurel Heights 3-63
3.9.4 San Francisco General Hospital 3-63
3.10 Community Planning Principles 3-63

4. Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology 4-1
4.0 Introduction 4-1
4.0.1 Baseline 4-1
4.0.2 Levels of Significance 4-2
4.0.3 Analysis of Cumulative Effects 4-2
4.1 Aesthetics 4-3
4.1.1 Regional Setting 4-3
4.1.2 Regulatory Considerations 4-3
4.1.3 Significance Standards 4-4
4.1.4 Analysis Methodology 4-5
4.2 Air Quality 4-6
4.2.1 Regional Setting 4-6
4.2.2 Regulatory Considerations 4-15
4.2.3 Significance Standards 4-17
4.2.4 Analysis Methodology 4-18
4.2.5 References 4-19
4.3 Biological Resources 4-21
4.3.1 Regional Setting 4-21
4.3.2 Regulatory Considerations 4-36
4.3.3 Significance Standards 4-42
4.3.4 Analysis Methodology 4-43
4.3.5 References 4-43
4.4 Cultural Resources 4-44
4.4.1 Regional Setting 4-44
4.4.2 Regulatory Considerations 4-48
4.4.3 Significance Standards 4-49
4.4.4 Analysis Methodology 4-50
4.4.5 References 4-51
4.5 Geology, Soils and Seismicity 4-52
4.5.1 Regional Setting 4-52
4.5.2 Regulatory Considerations 4-59
4.5.3 Significance Standards 4-65
4.5.4 Analysis Methodology 4-65
4.5.5 References 4-66

4. Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology (Continued)

4.6 Greenhouse Gas Emissions 4-67
4.6.1 Regional Setting 4-67
4.6.2 Regulatory Considerations 4-70
4.6.3 Significance Standards 4-81
4.6.4 Analysis Methodology 4-82
4.6.5 References 4-83
4.7 Hazards and Hazardous Materials 4-85
4.7.1 Regional Setting 4-85
4.7.2 Regulatory Considerations 4-91
4.7.3 Significance Standards 4-100
4.7.4 Analysis Methodology 4-100
4.7.5 References 4-101
4.8 Hydrology and Water Quality 4-102
4.8.1 Regional Setting 4-102
4.8.2 Regulatory Considerations 4-104
4.8.3 Significance Standards 4-108
4.8.4 Analysis Methodology 4-108
4.8.5 References 4-109
4.9 Land Use and Planning 4-110
4.9.1 Regional Setting 4-110
4.9.2 Regulatory Considerations 4-110
4.9.3 Significance Standards 4-111
4.9.4 Analysis Methodology 4-112
4.10 Noise and Vibration 4-113
4.10.1 Setting 4-113
4.10.2 Regulatory Considerations 4-116
4.10.3 Significance Standards 4-120
4.10.4 Analysis Methodology 4-120
4.10.5 References 4-124
4.11 Population and Housing 4-125
4.11.1 Regional Setting 4-125
4.11.2 Regulatory Considerations 4-126
4.11.3 Significance Standards 4-127
4.11.4 Analysis Methodology 4-128
4.11.5 References 4-128
4.12 Public Services 4-129
4.12.1 Regional Setting 4-129
4.12.2 Regulatory Considerations 4-134
4.12.3 Significance Standards 4-135
4.12.4 Analysis Methodology 4-136
4.12.5 References 4-136
4.13 Recreation 4-138
4.13.1 Regional Setting 4-138
4.13.2 Regulatory Considerations 4-139
4.13.3 Significance Standards 4-140
4.13.4 Analysis Methodology 4-140
4.13.5 References 4-141

5. 2014 LRDP – Impacts and Mitigation Measures 5-1
5.0 Components of the 2014 LRDP 5-1
5.0.1 Introduction 5-1
5.0.2 Major Components of the 2014 LRDP 5-2
5.0.3 Other LRDP Programs and Policies 5-2
5.0.4 Proposals under the 2014 LRDP 5-3
5.1 Aesthetics Impacts of the 2014 LRDP 5-9
5.2 Air Quality Impacts of the 2014 LRDP 5-14
5.3 Biological Resources Impacts of the 2014 LRDP 5-26
5.4 Cultural Resources Impacts of the 2014 LRDP 5-32
5.5 Geology, Soils and Seismicity Impacts of the 2014 LRDP 5-37
5.6 Greenhouse Gas Emissions Impacts of the 2014 LRDP 5-40
5.7 Hazards and Hazardous Materials Impacts of the 2014 LRDP 5-47
5.8 Hydrology and Water Quality Impacts of the 2014 LRDP 5-55
5.9 Land Use and Planning Impacts of the 2014 LRDP 5-59
5.10 Noise Impacts of the 2014 LRDP 5-62
5.11 Population and Housing Impacts of the 2014 LRDP 5-69
5.12 Public Services Impacts of the 2014 LRDP 5-71
5.13 Recreation Impacts of the 2014 LRDP 5-74
5.14 Transportation and Traffic Impacts of the 2014 LRDP 5-76
5.15 Utilities and Service Systems Impacts of the 2014 LRDP 5-81

6. Parnassus Heights Campus Site – Setting, Impacts and Mitigation Measures 6-1
6.0 Introduction 6-1
6.0.1 Functional Zones 6-1
6.0.2 Space Program 6-1
6.0.3 Average Daily Population 6-1
6.0.4 Parnassus Heights - 2014 LRDP Proposals 6-2
6.1 Aesthetics 6-5
6.1.1 Aesthetics Issues Adequately Addressed in the Initial Study 6-5
6.1.2 Aesthetics – Parnassus Heights Setting 6-5
6.1.3 Aesthetics – Parnassus Heights Impacts and Mitigation Measures 6-7
6.2 Air Quality 6-14
6.2.1 Air Quality Issues Adequately Addressed in the Initial Study 6-14
6.2.2 Air Quality – Parnassus Heights Setting 6-14
6.2.3 Air Quality – Parnassus Heights Impacts and Mitigation Measures 6-17
6.2.4 References 6-24

CHAPTER 1
Introduction

This Draft Environmental Impact Report (EIR) assesses the potentially significant environmental effects of adoption and implementation of the proposed University of California, San Francisco (UC San Francisco or UCSF) 2014 Long Range Development Plan (2014 LRDP or LRDP). UCSF has prepared the 2014 LRDP as a comprehensive physical land use plan and policy document to guide the physical development of the campus to accommodate increases in enrollment and academic and research activities at UCSF to meet its projected educational, clinical and research demand through the year 2035, the LRDP horizon. The LRDP plans for projected campus growth of approximately 2.39 million gross square feet[1] (gsf) by 2035. Phase 2 of the Medical Center at Mission Bay is not included in the total anticipated development under the LRDP because the 793,500 gsf Phase 2 Medical Center is anticipated to be constructed after the LRDP horizon year of 2035; however, the impacts associated with its construction and operation are evaluated in this EIR in order to provide a conservative analysis of future development of the entire Mission Bay campus site. Therefore, the projected campus growth analyzed in the EIR is approximately 3.18 million gsf.

As required by the California Environmental Quality Act (CEQA), this EIR: (1) assesses the potentially significant environmental effects that could result from implementation of the proposed 2014 LRDP as well as the potentially significant cumulative impacts of the 2014 LRDP; (2) identifies feasible means of avoiding or substantially lessening significant adverse impacts; and (3) evaluates a range of reasonable alternatives to the proposed 2014 LRDP, including the required No Project Alternative. The University of California (University or UC) is the "lead agency" for the 2014 LRDP and for the proposals evaluated in this Draft EIR. In addition to analyzing the potential impacts of campus growth under the 2014 LRDP at a program level under CEQA, this EIR analyzes under CEQA a number of specific LRDP development proposals at a project level.

The Board of Regents of the University of California (the Regents) has the responsibility for adopting the 2014 LRDP and approving specific proposals under the LRDP. When certified, this EIR will serve as the environmental document for the 2014 LRDP. The 2014 LRDP and LRDP EIR will replace the 1996 LRDP, as amended, and the 1996 EIR and related CEQA documents as a basis for decisions on future campus growth and development.

[1] Gross square feet (gsf), as used for UC facilities, is the sum of all floor areas, finished and unfinished, on all floors of an enclosed structure. It excludes spaces such as attics without flooring, mezzanines, exterior courts, and balconies.

1.1 Purpose of the EIR

The University has prepared this EIR on the 2014 LRDP for the following purposes:

- To inform the general public, the local community, and responsible, trustee and federal public agencies of the nature of the 2014 LRDP, its potentially significant environmental effects, feasible measures to mitigate those effects, as well as reasonable and feasible alternatives;
- To enable the University to consider the environmental consequences of adopting and implementing the 2014 LRDP and approving those specific projects identified in the LRDP;
- To serve as a reference document and first tier document for subsequent review of individual projects undertaken to implement the 2014 LRDP;
- To enable responsible agencies to consider the environmental consequences of those 2014 LRDP proposals for which they have a role in approving or issuing permits; and
- To satisfy CEQA requirements.

As described in CEQA and the CEQA Guidelines, public agencies cannot approve projects that may cause a significant environmental impact without adopting mitigation measures or alternatives to avoid or substantially lessen those significant environmental effects, where feasible. In discharging this duty, a public agency has an obligation to balance the project's significant effects on the environment with its benefits, including economic, social, technological, legal and other benefits. This EIR is an informational document, the purpose of which is to identify the potentially significant environmental effects of implementing the 2014 LRDP, and to indicate the manner in which those significant effects can be avoided or significantly lessened. The EIR also identifies any significant and unavoidable adverse impacts that cannot be mitigated to a less-than-significant level. Reasonable and feasible alternatives to the 2014 LRDP are identified that would eliminate any significant adverse environmental effects or reduce the impacts to a less-than-significant level.

The University (or the Regents or its designee) is required to consider the information in the EIR, along with any other relevant information, in making its decision to approve the 2014 LRDP and each specific proposed project that may be brought forth for approval in the future to implement the 2014 LRDP. Although the EIR does not determine the ultimate decision that will be made regarding implementing the LRDP or any individual LRDP project, CEQA requires the Regents or its designee to consider the information in the EIR and make findings regarding each significant effect identified in the EIR.

If determined to comply with CEQA, the Regents will certify the Final EIR prior to adopting the proposed 2014 LRDP.

1.2 Overview of the 2014 LRDP

UCSF is one of 10 campuses in the University of California system. It is the only UC campus devoted exclusively to health sciences, with professional degree programs in dentistry, medicine, nursing and pharmacy, as well as interdisciplinary graduate programs and numerous postdoctoral programs. Unlike other UC campuses, UCSF has no undergraduate students, but instead has a small population of graduate and professional students[2] (4,760 in 2013: 3,080 enrolled in degree programs and 1,680 clinical residents). The UCSF clinical enterprise consists of the UCSF Health System – UCSF Medical Center (the hospitals plus all clinics and physician practices operated by the medical center and the School of Medicine) and UCSF Benioff Children's Hospital – and the UCSF Dental Center.

UCSF is an urban institution with campus sites throughout the City of San Francisco and some locations beyond the city limits, comprising a total of approximately 201 acres, 61 of which make up the Mount Sutro Open Space Reserve at the Parnassus Heights campus site. UCSF occupies more than 8.04 million gsf of building space (excluding structured parking) in both owned and leased buildings. In addition to the three primary campus sites of Parnassus Heights, Mission Bay and Mount Zion, UCSF owns buildings at Mission Center (1855 Folsom Street), Laurel Heights (3333 California Street) and 654 Minnesota Street, which are predominantly offices; animal care and research facilities at Hunters Point (830 and 831 Palou Street); a materiel management facility at Oyster Point (616 Forbes Boulevard in South San Francisco); and the Buchanan Dental Center (100 Buchanan Street). UCSF also leases more than a million square feet of space for a variety of purposes at numerous locations in San Francisco.

Each University of California campus is required to periodically prepare a LRDP to guide campus growth and future physical development. The 2014 LRDP is a comprehensive physical land use plan and policy document that articulates a long-term development strategy for achieving the academic, clinical and research missions of UCSF through the year 2035. It contains objectives to guide decisions for future facilities to meet needs over the next 20 years, projects the quantities and uses of new building space needed during this time frame, and sets forth planning principles that will apply to future activities undertaken to implement the LRDP. Future individual construction projects will be evaluated for general conformity with the LRDP and considered for approval following a community process and any additional environmental analysis and public review that may be required under CEQA. A project is generally found to be in conformance with the LRDP if the proposed land use is consistent with established land use designations and complies with the LRDP objectives. The 2014 LRDP also includes *Community Planning Principles*, which were produced in collaboration with the UCSF Community Advisory Group that will aid future planning by providing a framework for addressing neighborhood concerns that may arise regarding UCSF development under the LRDP.

[2] Professional students are those attending the UCSF Schools of Dentistry, Medicine, Nursing and Pharmacy in pursuit of state licenses to practice dentistry, medicine, etc.; they earn professional degrees (DDS, MD, etc.). Graduate students are those students seeking Certificate, Master or PhD degrees, who are pursuing a research track in basic, translational, clinical, social and population sciences, either at the four schools or in other UCSF programs.

The 2014 LRDP serves as an opportunity for UCSF to assess its current status and needs and establish goals for the future. The 2014 LRDP proposes land use designations, program square footage and population growth through the LRDP planning horizon of 2035 and will be presented to the Regents for their review and consideration. Land use designations are described in the LRDP using functional zones, which provide guidance for where certain types of uses are best located based on desired land use adjacencies and other geographic considerations. The LRDP includes six functional zone categories: research, clinical, support, housing, open space and parking. Instruction space is distributed throughout the research, clinical, and support zones. Functional zone maps are provided for the three main campus sites (Parnassus Heights, Mission Bay and Mount Zion) to guide the location of future capital construction and infrastructure development.

The 1996 LRDP focused on the acquisition of and planning for a major new site, which led to the development of the Mission Bay campus site. UCSF has directed most of its capital resources toward the Mission Bay campus site in the intervening years. The 2014 LRDP focuses on investment in existing facilities and older sites, along with further development at the Mission Bay campus site.

The 2014 LRDP proposes to develop up to an additional 2.39 million gsf, for a total of 11.56 million gsf, in owned and leased buildings across all of UCSF's sites through 2035, not including Phase 2 of the Medical Center at Mission Bay. However, as noted above, for the purposes of the EIR analysis, the construction and operation of Phase 2 of the Medical Center at Mission Bay are analyzed in this EIR. Therefore, the projected campus growth analyzed in the EIR is approximately 3.18 million gsf.

Although a major portion of the additional space needs would be accommodated in new buildings on campus sites or in new off-site leases, some of the need would be met through a combination of better utilization of existing vacant or underutilized space, consolidating functions or leases and converting existing space to other uses to meet changing priorities.

The proposed 2014 LRDP is further described in Chapter 3, *Project Description*, and is available online at www.ucsf.edu/lrdp.

1.3 Project Background

UCSF's first LRDP was completed in 1964. It called for the expansion of the Parnassus Heights campus site, the only site owned by UCSF at the time, through the use of eminent domain. In response to neighborhood groups who opposed UCSF's expansion and organized an effort to halt construction of the School of Dentistry and Long Hospital, the Regents adopted the 1976 Regents' Resolution, which established permanent boundaries for the campus site, and imposed a "space ceiling" on further growth within these boundaries, among other conditions. UCSF's 1976 LRDP contained policies to limit campus growth at this campus site, but allowed those and several other buildings to be completed. The 1982 LRDP limited use of the Parnassus Heights campus site to primarily academic and clinical functions and called for the relocation of most campus-wide administrative functions to other sites that would be subsequently purchased or leased.

Decentralization resulted in operational challenges and higher operating costs. Consequently, the 1996 LRDP emphasized the consolidation of smaller but widely dispersed sites to fewer locations. In addition, the 1996 LRDP called for the decompression of space at the Parnassus Heights campus site by demolishing buildings that were seismically vulnerable or obsolete and by converting offices in the 'Avenues' back to residential use. The 1996 LRDP further emphasized the expansion of space at existing sites for meritorious and new programs by renovating buildings or constructing new ones. The principal proposal of the 1996 LRDP was to acquire land to develop a major new campus site to fulfill a growing need for research space, which ultimately led to the selection of the Mission Bay campus site.

To a large degree, the 2014 LRDP is an extension of the principles of the 1996 LRDP, in that UCSF would continue to work towards compliance with the space ceiling at the Parnassus Heights campus site, expand the Mission Bay campus site and consolidate UCSF facilities to fewer locations. While the 1996 LRDP focused on the acquisition of, and planning for, a major new site, where UCSF has directed most of its capital resources in the intervening years, the 2014 LRDP emphasizes investment in existing facilities and older sites, along with further development at the Mission Bay campus site. The 2014 LRDP is also driven by the need to comply with the requirements of the *Alfred E. Alquist Hospital Facilities Seismic Safety Act of 1983(Alquist Seismic Safety Act)* and subsequent amendments, the UC *Seismic Safety Policy*, the UC *Sustainable Practices Policy* and the *1976 Regents Resolution* regarding the Parnassus Heights campus site space ceiling, as well as numerous other state and local policies, codes and plans, to the extent applicable. With regard to the *1976 Regents Resolution*, UCSF proposes to ask the Regents to update the resolution to recognize that many of its recommendations have been successfully implemented, and to modify the way space and population are monitored at Parnassus Heights, and to rename the *1976 Regents' Resolution* to the *Regents' Resolution Regarding the Parnassus Heights Campus Site*.

Also, with increased constraints on operating budgets, the 2014 LRDP strives to address UCSF's goal to improve operational efficiency through better utilization and consolidation of, and investment in, existing facilities. 2014 LRDP development proposed at the Mission Bay campus site promotes these objectives, while also providing opportunity for growth.

Preparation of the LRDP has been a multi-year process which began in 2010. First, background data were collected and reviewed by a campus LRDP Oversight Committee and campus site-specific subcommittees comprised of a broad spectrum of campus representatives. The LRDP subcommittees assessed future needs associated with instruction, clinical and research uses, and made recommendations as to space needs. In 2012, UCSF developed physical options capable of accommodating the space needs. A preferred plan for each campus site was identified in 2013, and presentations were then made to the San Francisco Planning Commission and the San Francisco Commission on Community Investment and Infrastructure to apprise them of the LRDP.

In addition to the guidance of the LRDP Oversight Committee and its topic-specific subcommittees, the 2014 LRDP was prepared with input from the UCSF Academic Senate, senior leadership, Faculty Councils of the Schools, the Graduate Division, a work group focusing on administrative space and many other groups and individuals. The UCSF Foundation Real Estate Committee and UC Office of the President also advised on the LRDP. Reaching beyond the campus, community

feedback was provided by UCSF's Community Advisory Group (CAG), and from the public at large throughout the planning process, in numerous meetings and workshops held at UCSF's main campus sites.

A Draft LRDP was published on May 23, 2014. In addition, on June 16th and 18th, 2014, community meetings were held at the Mission Bay and Parnassus Heights campus sites, respectively, to provide information about the LRDP and to receive public feedback.

1.4 Program EIR and Project EIR

The 2014 LRDP is a land use plan to guide the physical development of the UCSF campus through 2035. It is not an implementation plan; that is, its adoption does not constitute a commitment to any specific project, construction schedule or funding priority. Rather, the proposed 2014 LRDP describes a program of potential development for UCSF through 2035. An LRDP is defined by statute (Public Resources Code Section 21080.09) as a "physical development and land use plan to meet the academic and institutional objectives for a particular campus or medical center of public higher education."

A program EIR generally establishes a framework for tiered or project-level environmental documents that are prepared in accordance with the overall program (CEQA Guidelines Section 15168(a)). Chapter 5 of this EIR provides a program-level analysis of the proposed 2014 LRDP, evaluates the effects of maximum growth that could occur throughout the UCSF campus under the proposed LRDP through 2035 and identifies the LRDP-level mitigation measures to reduce the potential significant effects of the plan. The LRDP EIR will be used by the Regents to evaluate the environmental implications of adopting the proposed 2014 LRDP. As a program EIR, the LRDP EIR sets standards of significance for environmental impacts and evaluates whether construction and operation activities of UCSF under the LRDP through 2035 would exceed these standards of significance.

CEQA Guidelines Section 15168 governs use of a program EIR with later activities. It states that if the effects of proposed activities were examined in the previous program EIR, if no new or substantially more severe significant effects would occur, and if no new mitigation measures would be required, then a program EIR has adequately analyzed the later activities for CEQA purposes (i.e., the later activities are within the "scope" of the project covered by the program EIR, and no new environmental document or further review under CEQA would be required.)

CEQA Guidelines Section 15168(c) thus provides:

> (c) Use with Later Activities. Subsequent activities in the program must be examined in the light of the program EIR to determine whether an additional environmental document must be prepared.
>
> (1) If a later activity would have effects that were not examined in the program EIR, a new Initial Study would need to be prepared leading to either an EIR or a Negative Declaration.

(2) If the agency finds that pursuant to Section 15162, no new effects could occur or no new mitigation measures would be required, the agency can approve the activity as being within the scope of the project covered by the program EIR, and no new environmental document would be required.

(3) An agency shall incorporate feasible mitigation measures and alternatives developed in the program EIR into subsequent actions in the program.

(4) Where the subsequent activities involve site specific operations, the agency should use a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the program EIR.

(5) A program EIR will be most helpful in dealing with subsequent activities if it deals with the effects of the program as specifically and comprehensively as possible. With a good and detailed analysis of the program, many subsequent activities could be found to be within the scope of the project described in the program EIR, and no further environmental documents would be required.

Once certified, this EIR will also be used to tier subsequent environmental analyses for future UCSF development projects (CEQA Guidelines Section 15152). Each UCSF development proposal would then be reviewed in light of the LRDP EIR to determine the appropriate level of additional environmental review, if any, needed before approval and implementation of the particular proposal. After approval of the LRDP, each discretionary development proposal undertaken during the planning horizon of the 2014 LRDP will be subject to individual approval by the University, in compliance with CEQA.

In addition to analyzing the proposed 2014 LRDP at a program-level per CEQA Guidelines Section 15168 in Chapter 5, this EIR also analyzes a number of specific development proposals at a program-level or at a project-level per CEQA Guidelines Section 15161 in Chapters 6, 7, 8 and 9. The analysis of these development proposals at the project-level is intended to provide sufficient detail to permit project approval and implementation following certification of the EIR. The project-level analyses in Chapters 6 through 9 are tiered from the program-level analysis in Chapter 5 and all projects incorporate relevant LRDP Mitigation Measures into their project descriptions. The University anticipates seeking project approval for some of these projects in the near-term (within several years of EIR certification), while others will occur at a later date but are included because there is sufficient information about the proposals to conduct project-level analyses in this EIR. Approvals for these projects will be sought when funding becomes available and project implementation is logistically feasible.

Table 1-1 identifies those 2014 LRDP proposals that are analyzed in this EIR at a program level, and those LRDP proposals that are analyzed at a project-level sufficient to support approval by the Regents or its designee, when those projects are ready to be brought forth for approval. Those proposals receiving project-level analysis in this EIR are not expected to require further environmental review to support approval, so long as none of the conditions identified in CEQA Guidelines Section 15162(a) exist. Details regarding the 2014 LRDP and its proposals are described in Chapter 3 of this EIR.

TABLE 1-1
2014 LRDP PROPOSALS
PROGRAM AND PROJECT LEVEL ANALYSES

	Program-Level Analysis	Project-Level Analysis
2014 LRDP	• Campus-wide space growth • Campus-wide population growth • Land use plan – functional zones • Greenhouse Gas Reduction Strategy • Transportation Demand Management Measures • Update to the 1976 Regents' Resolution for Parnassus Heights	
2014 LRDP Proposals	• **LRDP -** Growth and/or change at each campus site resulting from LRDP proposals, including: • **New Construction** *Parnassus Heights:* - New Hospital Addition - Faculty housing at Fifth and Parnassus avenues - Faculty housing on Proctor site *Mission Bay:* - Additional research capacity on Blocks 16, 18A, 23A, 25B, 33 and 34 - Phase 2 Medical Center *Mount Zion:* - Clinical/research building *Mission Center:* - Office building and parking • **Open Space Proposals** *Mission Bay:* - Additional open space on Blocks 15,16, 18C and 23A *Mount Zion:* - Additional open space on main block • **Circulation, Transportation and Parking** *Parnassus Heights:* - Parnassus Avenue Streetscape Plan - Parking and loading Improvements *Mission Bay:* - Structured parking on Blocks 18B, 33/34, and 38 - Complete street network - Increase bicycle and motorcycle parking *Mount Zion:* - Additional parking in conjunction with new building on main block *Mission Center:* - Structured parking in conjunction with new building • **Utilities/Infrastructure Proposals** *Parnassus Heights:* - Diesel fuel storage tanks - Medical gas storage tanks - Retaining wall *Mission Bay:* - Central utility plant on Block 16	• **New Construction** *Mission Bay:* - Block 15 Housing - Cancer Outpatient Building • **Demolition Program** *Parnassus Heights:* - Surge - Woods - Medical Research 4 - Laboratory of Radiobiology - Environmental Health & Safety - Proctor - Koret Vision Research - Langley Porter Psychiatric Institute *Mount Zion:* - Hellman - Harold Brunn Institute - Dialysis Center - 2255 Post Street (or retrofit) • **Rehabilitation Program** *Parnassus Heights:* - UC Hall - Moffitt Hospital - Millberry Union Towers - Fifth Avenue houses conversion to faculty housing - Faculty Alumni House seismic retrofit *Mount Zion:* - Main Hospital - 2255 Post Street (or demolition) • **Open Space Proposals** *Parnassus Heights:* - Saunders Court renovation and pedestrian spine improvements - Mount Sutro Open Space Reserve – new trails • **Utilities/Infrastructure** *Parnassus Heights:* - Saunders Court renovation and pedestrian spine improvements *Mission Bay:* - Block P15 pump station upgrade

1.5 Environmental Review Process

1.5.1 Public and Agency Review

On September 24, 2013, a Notice of Preparation (NOP), including an Initial Study, was published for the 2014 LRDP EIR[3]. The 30-day public comment period was extended by two weeks and ended on November 12, 2013. A copy of the NOP/Initial Study is included in Appendix A.[4] A scoping meeting was held on October 28, 2013, at Millberry Union on the Parnassus Heights campus site, to accept public input on environmental topics to be analyzed in the EIR and approaches to the impact analyses. Written comments received on the NOP are included in Appendix B.

Pursuant to Section 15063 of the CEQA Guidelines, an Initial Study is a preliminary environmental analysis that may be used by the lead agency to focus an EIR on the environmental effects resulting from a proposed project that may be significant. The Initial Study prepared for the 2014 LRDP identified activities proposed under the LRDP that would clearly result in no impact or result in a less-than-significant impact under the CEQA significance criteria. No further analysis beyond that provided in the Initial Study is necessary for those activities.

The Initial Study also identified potential environmental effects that require detailed study in the EIR. As discussed in the Initial Study, these effects consist of less-than-significant impacts that were included in this EIR in order to provide a more comprehensive analysis; impacts for which further analysis is necessary or desirable before determinations about significance could be made; impacts that were potentially significant but may be reduced to less-than-significant levels with the adoption of mitigation measures; and impacts that may be significant and unavoidable.

Copies of the Draft EIR and Draft LRDP are available online for public review at ucsf.edu/lrdp. Paper copies of these documents are available for viewing at the following libraries:

UCSF Libraries:

- UCSF Kalmanovitz Library, 530 Parnassus Avenue
- UCSF Mission Bay Library, 1675 Owens Street

San Francisco Public Library:

- San Francisco Main Branch, 100 Larkin Street
- Mission Branch, 300 Bartlett Street
- Mission Bay Branch, 960 4th Street

[3] The scope of the LRDP, as described in the Initial Study, has changed to reflect the acquisition and development of Mission Bay Redevelopment Area Blocks 33 and 34 to the east of the UCSF Mission Bay campus site. Environmental review of development of Blocks 33 and 34 in accordance with the *Mission Bay Redevelopment Plan* was completed in the *Mission Bay Redevelopment Plan Subsequent EIR*, as subsequently amended. The 2014 LRDP EIR considers future development of Mission Bay Redevelopment Area Blocks 33 and 34 to assess the current adequacy of that environmental review in light of potential UCSF uses of those properties, as well as to update the environmental analysis for potential UCSF uses on the site.

[4] At the time that the NOP was issued, UCSF envisioned that the LRDP EIR would also provide project-level environmental review of specific proposals that were anticipated to be considered for approval concurrent with the LRDP or in the near term after LRDP approval. The projects covered in the LRDP have subsequently been refined to reflect the most recent list.

- Sunset Branch, 1305 18th Avenue
- Western Addition Branch, 1550 Scott Street

1.5.2 Project Approvals

Following the close of the public and agency comment period on this Draft EIR (October 14, 2014), the University will prepare responses to all written comments and to oral comments received at the public hearing that raise CEQA-related environmental issues regarding the 2014 LRDP and the analysis in this EIR. The responses will be published in the Final EIR. The Final EIR will be considered by the Regents in a public meeting and certified if it is determined to be in compliance with CEQA. Upon certification of the EIR, the Regents or its designee will consider whether to adopt the proposed 2014 LRDP, as well as approve any individual projects that are brought forth at that time.

1.6 Uses of the LRDP EIR

The Regents will use this EIR to evaluate the environmental implications of adopting the 2014 LRDP. The Regents and/or its designee, with authority delegated by the Regents, also will use the EIR to evaluate the environmental implications of approving specific LRDP proposals brought forth for approval. If the LRDP EIR is certified and the 2014 LRDP is adopted, this Program EIR will be used to tier or focus environmental review of subsequent UCSF development projects.

This EIR is intended to be used for the following actions, and will serve the following purposes:

1) The EIR provides the Regents with information upon which to evaluate the environmental consequences of the 2014 LRDP, including environmental impacts and mitigation measures and alternatives that could avoid some of those impacts, and will be used as the CEQA document for the Regents' consideration of the 2014 LRDP and the adoption of required findings and other actions by the Regents in connection with their consideration and possible adoption of the LRDP.

2) The EIR will also be utilized in connection with the consideration by the Regents of specific projects pursuant to the LRDP. Pursuant to CEQA Guidelines Section 15168, some projects may be approved as within the scope of this EIR without further environmental review and other projects will be approved after a second-tier CEQA document is prepared if not within the scope of this EIR.

3) Consistent with the use of this EIR for specific projects pursuant to CEQA Guidelines Section 15168, this EIR will also provide information to responsible agencies with permitting or approval authority over projects that may be implemented under the 2014 LRDP.

1.7 Other Agency Approvals

There are no responsible agencies that have approval authority over the proposed 2014 LRDP. In addition, there are no responsible agencies that have approval authority over the LRDP proposals, with the exception of certain activities that are proposed to occur within the public right-of-way.

For example, the Parnassus Avenue Streetscape Plan contains various proposals that would occur within the public right-of-way and that would require approval by the San Francisco Municipal Transportation Agency (MTA) and encroachment permits from the San Francisco Department of Public Works (DPW). In addition, the LRDP identifies a cushioning action related to the renovation and reuse of UC Hall that would involve traffic-calming measures at the intersection of Fifth Avenue and Kirkham Street. Such activities would also require review and approval by DPW and MTA.

1.8 Report Organization

Chapter 1, ***Introduction***, provides an introduction and overview of the 2014 LRDP and EIR, as well as the intended use of the EIR, including the review and certification process.

Chapter 2, ***Summary of Environmental Impacts and Mitigation Measures***, summarizes the environmental impacts that would result from implementation of the 2014 LRDP, lists proposed mitigation measures and indicates the level of significance of impacts after mitigation.

Chapter 3, ***Project Description***, provides a detailed description of the 2014 LRDP, including project objectives, projected growth and proposed physical development at UCSF campus sites.

Chapter 4, ***Regional Setting***, ***Regulatory Considerations***, ***Significance Standards and Analysis Methodology***, includes discussion of baseline conditions and presents the Significance Standards used in the EIR to assess the program-level environmental impacts of the 2014 LRDP per CEQA Guidelines Section 15168. Following this introductory material, the chapter is divided into 15 sections, one for each environmental topic considered in this EIR. Each section contains regional setting information about the environmental topic, as well as relevant background and regulatory material. The analysis methodology for each topic is also included in Chapter 4.

Chapter 5, ***2014 LRDP – Impacts and Mitigation Measures***, analyzes the campus-wide effects resulting from implementing the 2014 LRDP. This chapter first summarizes the three major components of the 2014 LRDP: Land Use (functional zones), Space Program (allocation of projected growth) and Daily Population. The 2014 LRDP, by assigning uses and a space program at specific campus sites, directs the growth and change that will occur during the lifetime of the LRDP. The major physical changes proposed under the 2014 LRDP would occur only at four campus sites: Parnassus Heights, Mission Bay, Mount Zion, and Mission Center.

The interrelated components of 2014 LRDP growth will be implemented, in part, by undertaking individual development "proposals" at each campus site. These proposals naturally group into four general categories - 1) demolition, 2) renovation and re-use of existing structures, 3) construction of new facilities, and 4) circulation, open space, and utilities/infrastructure proposals – that are convenient ways to organize and consider the physical actions that would occur with the implementation of the 2014 LRDP. Specific 2014 LRDP proposals are listed in Chapter 5 under these categories.

The environmental effects of the 2014 LRDP are discussed in terms of the overall effects of the plan. The analysis includes program-level 2014 LRDP mitigation measures that would reduce the magnitudes of most potentially significant impacts to less than significant and apply to all 2014 LRDP proposals, as applicable. As is done in Chapter 4, the environmental analysis of the LRDP is divided into 15 sections, one for each environmental topic considered in the EIR.

Chapters 6 through 9, 2014 LRDP Proposals – *Setting, Impacts and Mitigation Measures* by campus site: Impacts and mitigations of the 2014 LRDP proposals that are unique to the Parnassus Heights campus site are presented in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures*. Chapters 7 through 9 analyze, at a program-level or project-level per, the unique effects of LRDP proposals at the Mission Bay, Mount Zion, and Mission Center campus sites, respectively. Each of these four campus site chapters also is divided into 15 sections, one for each environmental topic. Each section may contain local site-specific setting information that is important to the understanding of the impacts that occur at that campus site. Chapters 6 through 9 include discussion of the potential effects of the 2014 LRDP manifested at specific campus sites, with mitigation measures provided, where necessary and feasible, to reduce these unique effects to a less-than-significant level. In addition, the impact analyses cross-reference the applicable general mitigation measures of the 2014 LRDP provided in Chapter 5 if such measures would reduce effects resulting from a specific proposal at a campus site.

Readers of the EIR who live or work near one of these four campus sites will likely be most interested in the effects that would occur at that particular campus site. The geographic focus of effects presented in Chapters 6 through 9 will assist readers to determine whether or not environmental effects resulting from implementation of the 2014 LRDP would occur in their neighborhood, near their home or work, or along their daily travel routes.

Chapter 10, ***CEQA Statutory Section****s*, includes discussions required by CEQA, including growth-inducing impacts, cumulative impacts, and a list of significant unavoidable impacts.

Chapter 11, ***Alternatives***, describes the alternatives to the 2014 LRDP.

Chapter 12, ***Report Preparation***, identifies the persons who prepared the EIR and those who were consulted during its preparation.

CHAPTER 2
Summary of Environmental Impacts and Mitigation Measures

2.1 Introduction

This EIR evaluates the potential for environmental impacts from the implementation of the UCSF 2014 LRDP. As detailed in section 1.8 *Report Organization*, Chapter 5 of this EIR provides a program-level analysis of the proposed 2014 LRDP, evaluates the effects of maximum growth that could occur throughout the UCSF campus sites under the proposed LRDP through the year 2035 and identifies the LRDP-level mitigation measures to reduce potentially significant effects of the LRDP. In addition to the program-level analysis of the proposed 2014 LRDP in Chapter 5, this EIR also analyzes a number of specific and foreseeable 2014 LRDP development proposals at a project-level per CEQA Guidelines Section 15161 in Chapters 6, 7, 8 and 9. These project-level analyses are intended to provide sufficient detail to permit approval and implementation of these proposals following certification of the EIR.

This summary highlights the major areas of importance in the environmental analysis for the proposed 2014 LRDP, as required by Section 15123 of the CEQA Guidelines. It provides a brief description of the 2014 LRDP, the project objectives, alternatives to the 2014 LRDP and areas of controversy known to the University. In addition, this chapter provides **Table 2-1**, summarizing: (1) the potential environmental impacts that would occur as the result of implementation of the 2014 LRDP; (2) the recommended mitigation measures that would avoid or reduce significant environmental impacts; and (3) the level of impact significance after mitigation measures are implemented.

The potential environmental impacts of 2014 LRDP proposals, and any necessary mitigation measures, at the Parnassus Heights (PH), Mission Bay (MB), Mount Zion (MZ) and Mission Center (MC) campus sites are listed in **Tables 2-2**, **2-3**, **2-4** and **2-5**, respectively.

2.2 Project Description

The 2014 LRDP is a comprehensive physical land use plan and policy document that articulates a long-term development strategy for achieving the academic, clinical and research missions of UCSF through the year 2035. It contains objectives to guide decisions for developing future facilities to meet UCSF's needs over the next 20 years and projects the quantities and uses of new building space needed during this time frame and sets forth planning principles formalizing

UCSF's commitment to communicate with neighbors regarding its space needs and potential future development.

The 2014 LRDP proposes land use designations, program square footage and population growth through the LRDP planning horizon of 2035 and will be presented to the Regents for their review and consideration. Land use designations are described in the LRDP using functional zones, which provide guidance for where certain types of uses are best located based on desired land use adjacencies and other geographic considerations.

The 2014 LRDP proposes to develop up to an additional 2.39 million gsf, for a total of 11.56 million gsf, in owned and leased buildings across all of UCSF's campus sites through 2035. For the purposes of the EIR analysis, total campus growth in 2035 assumes that the Phase 2 Medical Center at Mission Bay would be constructed during the LRDP horizon although the 2014 LRDP contemplates a later construction date. Thus, the total projected campus growth under the 2014 LRDP analyzed in the EIR is 3.18 million gsf.

Specifically, the 2014 LRDP proposes that major physical changes would occur only at four campus sites: Parnassus Heights, Mission Bay, Mount Zion and Mission Center. These changes entail: 1) at Parnassus Heights to demolish buildings to reduce existing building space, to renovate two existing buildings to make office and new housing space available, and by 2030, to decommission and reuse Moffitt Hospital and build a new addition to Long Hospital; 2) at Mount Zion to demolish existing buildings on the main block to make room for a new office and research building; 3) at Mission Bay, to construct new housing, office, research and clinical buildings, as well as infrastructure and, 4) at Mission Center, to construct a new office building and parking structure.

2.3 Project Objectives

The 2014 LRDP contains five main campus-wide objectives to guide UCSF's physical development:

1) Respond to the City and Community Context
2) Accommodate UCSF's Growth Through 2035
3) Ensure UCSF's Facilities are Seismically Safe
4) Promote Environmental Sustainability
5) Minimize Facility Costs

2.4 Impact Summary

Table 2-1, provides a complete list of all impacts and mitigation measures. Each impact lists applicable mitigation measures and the level of significance of the impact before and after the implementation of the mitigation measure(s).

2.5 Alternatives to the Proposed Project

The following alternatives were analyzed in detail in the EIR and compared to the proposed 2014 LRDP. The objective of the alternatives analysis is to determine whether an alternative would feasibly attain some or most of the project objectives, while avoiding or substantially lessening some of the significant effects of the proposed 2014 LRDP.

1) No Project—No Development
2) No Project—Development Under Existing LRDP
3) Reduced Program
4) No Demolition of Historical Resources

Detailed descriptions and an analysis of potential impacts of each alternative are presented in Chapter 11, *Alternatives*.

The No Project—No Development Alternative would avoid all environmental impacts of development under the proposed 2014 LRDP. However, the No Project—No Development Alternative would not meet any of the 2014 LRDP objectives.

If the environmentally superior alternative is the No Project Alternative, CEQA Guidelines Section 15126.6(e)(2) requires that the EIR also identify an environmentally superior alternative among the other alternatives. Other than the No Project Alternative, the No Project—Development Under Existing LRDP Alternative is the environmentally superior alternative, because it would reduce the significant and unavoidable impacts associated with the 2014 LRDP more than the other alternatives. Significant and unavoidable air quality and noise, as well as traffic impacts related to construction and operation of the UCSF campus sites would be reduced in magnitude, even if not necessarily reduced to less than significant levels.

2.6 Known Areas of Controversy

This EIR addresses issues associated with the 2014 LRDP that are known to UCSF or were raised by agencies or interested parties during the Notice of Preparation public and agency review period. These issues include:

- Traffic, parking, noise and construction effects at the Parnassus Heights campus site
- Compliance with the space ceiling at the Parnassus Heights campus site

TABLE 2-1
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures[1]	Level of Significance After Mitigation
Aesthetics			
AES-LRDP-1: Implementation of the 2014 LRDP would not have a substantial adverse effect on a scenic vista.	Less than Significant	None required	Less than Significant
AES-LRDP-2: Implementation of the 2014 LRDP would not degrade the existing visual character or quality of UCSF campus sites and surrounding area.	Less than Significant	None required	Less than Significant
AES-LRDP-3: Implementation of the 2014 LRDP could result in flood lighting during nighttime construction activities that would adversely affect nighttime views in the area.	Potentially Significant	**AES-LRDP-1:** UCSF shall require a condition in construction contracts that flood or area lighting for construction activities be placed and directed so as to avoid potential disturbances to adjacent residences or other uses.	Less than Significant
AES-LRDP-4: Implementation of the 2014 LRDP could create new sources of substantial light or glare that would adversely affect day or nighttime views in the area.	Potentially Significant	**AES-LRDP-2:** Minimize light and glare resulting from new buildings through the orientation of the building, use of landscaping materials and choice of primary facade materials. Design standards and guidelines to minimize light and glare shall be adopted for the new buildings, including: • Reflective metal walls and mirrored glass walls shall not be used as primary building materials for facades. • Installation of illuminated building signage shall strive to be consistent with City Planning Code sign standards for illumination and/or UCSF design guidelines. • Exterior light fixtures shall be configured to emphasize close spacing and lower intensity light. Light fixtures shall use luminaries that do not direct the cone of light towards off-campus structures.	Less than Significant
AES-LRDP-5: Implementation of the 2014 LRDP could create street-level winds that could be hazardous to pedestrians in the area.	Potentially Significant	**AES-LRDP-3:** Proposed buildings that would exceed 100 feet in height shall be evaluated by a qualified wind consultant to determine the potential of the design to cause a wind hazard as defined in City Planning Code Section 148. If a hazard cannot be judged unlikely, the design shall be wind tested to verify compliance with the hazardous wind criterion of City Planning Code Section 148. Wind tunnel testing would provide site- and design-specific information pertaining to potential wind effects. Feasible means of eliminating or reducing wind hazards include modulating facades through architectural devices (e.g., articulation, variation of planes and building heights, etc.); incorporating building setbacks/terraces into building designs; and, landscaping in appropriate locations (e.g., using plantings to create wind screens). If preliminary wind testing indicates that the building design would increase pedestrian-level wind hazards, UCSF shall modify the proposed building or develop other measures to eliminate increases in hazardous pedestrian-level wind effects.	Less than Significant

[1] Mitigation measures apply to each subsequent development project at each campus site.

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Aesthetics (cont.)			
AES-LRDP-6: Implementation of the 2014 LRDP could substantially reduce sunlight or significantly increase shadows in public open space areas. (Less than Significant with Mitigation)	Potentially Significant	**AES-LRDP-4:** UCSF shall assure that final building designs would not increase shadow on Recreation and Park Department property between one hour after sunrise and one hour before sunset, in such a way that the use of the property would be adversely affected.	Less than Significant
Air Quality			
AIR-LRDP-1: Implementation of the 2014 LRDP would be consistent with the primary goals of the Bay Area Clean Air Plan (CAP) and would not fundamentally conflict with the CAP because the LRDP demonstrates reasonable efforts to implement control measures contained in the CAP.	Less than Significant	None required	Less than Significant
AIR-LRDP-2: The 2014 LRDP would provide sufficient buffer distances between sensitive land uses and those land uses associated with toxic air contaminants (TACs) such as freeways, high traffic roadways and stationary sources.	Less than Significant	None required	Less than Significant
AIR-LRDP-3: Implementation of the 2014 LRDP proposals would provide sufficient buffer distances between sensitive land uses and sources of odors.	Less than Significant	None required	Less than Significant
AIR-LRDP-4: Implementation of the 2014 LRDP would result in increased emissions of criteria air pollutants during demolition and construction activities.	Potentially Significant	**AIR-LRDP-1: Best Management Practices for Controlling Particulate Emissions** The following BAAQMD Best Management Practices for particulate control will be required for all construction activities. These measures will reduce particulate emissions primarily during soil movement, grading and demolition activities but also during vehicle and equipment movement on unpaved project sites 1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day. 2. All haul trucks transporting soil, sand, or other loose material off-site shall be covered. 3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited. 4. All vehicle speeds on unpaved roads shall be limited to 15 mph.	Significant and Unavoidable

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Air Quality (cont.)			
AIR-LRDP-4 (cont.)		5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used. 6. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure Title 13, § 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points. 7. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation. 8. Post a publically visible sign with the telephone number and person to contact at UCSF regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's telephone number shall also be visible to ensure compliance with applicable regulations. **AIR-LRDP-2: Architectural Coatings** ROG emissions from the use of architectural coatings shall be reduced by implementing either or both of the following measures if total emissions of ROG exceed 54 pounds per day on average over the construction period. • Architectural coatings shall be applied over the course of 4 months or longer, in order to reduce daily ROG emissions to below the significance threshold. • A minimum of 67% of exterior building materials shall be prefinished to reduce ROG emissions. **AIR-LRDP-3: Off-Road Equipment Control Measures for NO_x** All off-road equipment greater than 25 hp and operating for more than 20 total hours over the duration of construction activities shall meet the following requirements that will not be fully implemented via regulation until 2018 (i.e., the equipment is available for purchase or rental at present but its use not mandated throughout all fleets until 2018): a. All off-road equipment shall have: i. Engines that meet or exceed either U.S. EPA Tier 3 off-road emission standards, or ii. Engines that are retrofitted with an ARB Level 3 Verified Diesel Emissions Control Strategy (VDECS).	

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Air Quality (cont.)			
AIR-LRDP-4 (cont.)		*Mitigation Measure AIR-LRDP-1: Best Management Practices for Controlling Particulate Emissions will be required for all construction activities to reduce those impacts to less than significant. Mitigation Measure AIR-LRDP-2: Architectural Coatings would reduce average daily construction emissions of ROG to less than 54 pounds per day of ROG. Mitigation Measure AIR-LRDP-3: Off-Road Equipment Control Measures for NOx would reduce average daily NOx emissions during building construction, but NOx would still exceed the 54 pound per day threshold. For that reason, the impact of increased emissions of criteria air pollutants during demolition and construction activities would be significant and unavoidable.*	
AIR-LRDP-5: Implementation of the 2014 LRDP would result in increased emissions of criteria air pollutants during operation.	Potentially Significant	**AIR-LRDP-4: BAAQMD-Suggested Operational Measures** The following measures identified in the 2012 BAAQMD *CEQA Guidelines* shall be considered for implementation for site-specific development projects if not already in place: • Provide and maintain secure bike parking (at least one space per 20 vehicle spaces); • Provide and maintain showers and changing facilities for employees; • Provide information on transportation alternatives to employees; • Provide and maintain preferential carpool and vanpool parking for non-residential uses; • Increase building energy efficiency below Title 24 (reduces NOx related to natural gas combustion); • Require use of electrically powered landscape equipment, where feasible; • Use low VOC architectural coatings in maintaining buildings; • Meet California Green Building Code standards in new construction (reduces NO_x related to natural gas combustion); • Adopt policies supporting infill development; • Create and enhance landscaped greenway, trail, and sidewalk connections between neighborhoods, commercial areas, activity centers, and parks; and • Ensure that proposed land uses are supported by a multi-modal transportation system and that the land uses themselves support the development of the transportation system.	Significant and Unavoidable

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Air Quality (cont.)			
AIR-LRDP-5 (cont.)		*Mitigation Measure AIR-LRDP-4 would not result in the 78% reduction necessary (for ROG) or 41% (for NOx) to reduce the impact to a less-than-significant level. This amount of traffic reduction exceeds the best reduction estimates for TDM programs (BAAQMD, 2012b). Assuming a conservative 12% reduction in vehicle miles travelled associated with TDM measures, emissions of ROG and NOx would still exceed thresholds. Consequently, development under the 2014 LRDP with implementation of feasible mitigation measures would still result in significant environmental effects on air quality and contribute substantially to an existing air quality violation (ozone precursors and particulate matter). Therefore, even with implementation of Mitigation Measure AIR-LRDP-4, the impact would remain significant and unavoidable for emissions of ROG and NOx.*	
AIR-LRDP-6: Implementation of the 2014 LRDP would result in increased emissions of toxic air contaminants that could increase health risks for nearby residents during demolition and construction activities.	Less than Significant	None required	Less than Significant
Biological Resources			
BIO-LRDP-1: Implementation of the 2014 LRDP could have a substantial adverse effect, either directly or through habitat modifications, on species identified as candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.	Less than Significant	None required	Less than Significant
BIO-LRDP-2: Implementation of the 2014 LRDP would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service.	Less than Significant	None required	Less than Significant
BIO-LRDP-3: Implementation of the 2014 LRDP would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.	No Impact	None required	No Impact

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Biological Resources (cont.)			
BIO-LRDP-4: Implementation of the 2014 LRDP would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	Potentially Significant	**BIO-LRDP-1: Bird-Safe Building Treatments.** • Employ glazing options such as use of either fritted glass, Dichroic glass, etched glass, translucent glass, or glass that reflects ultraviolet light in appropriate portions of the façade. • Minimize light and glare resulting from new buildings through the orientation of the building, use of landscaping materials and choice of primary facade materials. Design standards and guidelines to minimize light and glare shall be adopted for the new buildings, including: reflective metal walls and mirrored glass walls shall not be used as primary building materials for facades.	Less than Significant
BIO-LRDP-5: Implementation of the 2014 LRDP would not conflict with any applicable policies protecting biological resources.	No Impact	None required	No Impact
BIO-LRDP-6: Implementation of the 2014 LRDP would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan or other applicable habitat conservation plan.	No Impact	None required	No Impact
BIO-LRDP-7: Implementation of the 2014 LRDP would not exceed the LRDP EIR standard of significance by damaging or removing heritage or landmark trees or native oak trees of a diameter specified in a local ordinance.	Less than Significant	None required	Less than Significant
Cultural Resources			
CUL-LRDP-1: Implementation of the 2014 LDP could result in a substantial adverse change in the significance of historical resources as defined in CEQA Guidelines Section 15064.5.	Potentially Significant	**CUL-LRDP-1:** Before altering or otherwise affecting a building or structure 50 years old or older, the campus shall retain a qualified architectural historian to record it on a California Department of Parks and Recreation DPR 523 form. Its significance shall be assessed by a qualified architectural historian, using the significance criteria set forth for historic resources under CEQA Guidelines Section 15064.5. For historic buildings, structures or features that do not meet the CEQA criteria for historical resource, no further mitigation is required and the impact is less than significant. For a building or structure that qualifies as a historic resource, the architectural historian and UCSF shall consider measures that would enable the project to avoid direct or indirect impacts to the building or structure. These could include project redesign or other measures that would avoid altering the building. All rehabilitation work of an historic building or structure shall be conducted in compliance with the *Secretary of the Interior's*	Less than Significant

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cultural Resources (cont.)			
CUL-LRDP-1 (cont.)		*Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings*, to the extent feasible. Alterations to cultural landscapes shall be conducted in compliance with the *Secretary of the Interior's Guidelines for Rehabilitating Cultural Landscapes*. *If it is not feasible to meet the Secretary's Standards, the impact could be a significant and unavoidable impact.*	
CUL-LRDP-2: Implementation of the 2014 LRDP could result in demolition of historical resources as defined in CEQA Guidelines Section 15064.5.	Significant	**CUL-LRDP-2:** If a significant historic building or structure is proposed for substantial alteration or demolition, UCSF shall ensure that a qualified architectural historian thoroughly documents the building and associated landscaping and setting. Documentation shall include still photography and a written documentary record of the building to the National Park Service's standards of the Historic American Building Survey or Historic American Engineering Record, including accurate scaled mapping and architectural descriptions. If available, scaled architectural plans will also be included. Photos include large-format (4"X5") black-and-white negatives and 8"X10" enlargements. Digital photography may be substituted for large-format negative photography if archived locally. The record shall be accompanied by a report containing site-specific history and appropriate contextual information. This information shall be gathered through site specific and comparative archival research, and oral history collection as appropriate. A copy of the record shall be archived with the UCSF archives, the History Room of the San Francisco Public Library, the Northwest Information Center at Sonoma State University, and the San Francisco Planning Department. UCSF shall install interpretive materials at or near the site to enhance public awareness in the form of a historical marker, kiosk, or other display that contains historical photos and text about the building's historical significance.	Significant and Unavoidable
CUL-LRDP-3: Implementation of the 2014 LRDP could result in a substantial adverse change to archaeological resources.	Potentially Significant	**CUL-LRDP-3:** Should an archaeological artifact be discovered during project construction and excavation, pursuant to CEQA Guidelines 15064.5 (f), "provisions for historical or unique archaeological resources accidentally discovered during construction" shall be instituted. In the event that any prehistoric or historic subsurface cultural resources are discovered during ground disturbing activities, all work within 100 feet of the resources shall be halted and UCSF shall consult with a qualified archaeologist or paleontologist to assess the significance of the find (per Public Resource Code Section 5024.1, Title 14 CCR, Section 4852 and/or Public Resource Code 21083.2 in the event of a unique archaeological find). If any find is determined to be significant and will be adversely affected by the project, representatives of UCSF and the qualified archaeologist and/or paleontologist shall meet to	Less than Significant

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cultural Resources (cont.)			
CUL-LRDP-3 (cont.)		determine the appropriate avoidance measures or other appropriate mitigation (per CEQA Guidelines 15064.5 (b) and Public Resource Code 21083.2). All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and documented by the qualified archaeologist according to current professional standards (per the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation (48 FR44716)).	
CUL-LRDP-4: Implementation of the 2014 LRDP could result in a substantial adverse change to paleontological resources.	Potentially Significant	**CUL-LRDP-4:** If paleontological resources, such as fossilized bone, teeth, shell, tracks, trails, casts, molds, or impressions are discovered during ground-disturbing activities, all ground disturbing activities within 50 feet of the find shall be halted until a qualified paleontologist can assess the significance of the find and, if necessary, develop appropriate salvage measures in consultation with UCSF and in conformance with Society of Vertebrate Paleontology Guidelines (SVP, 1995; SVP, 1996).	Less than Significant
CUL-LRDP-5: Implementation of the 2014 LRDP could result in a substantial adverse change to human remains.	Potentially Significant	**CUL-LRDP-5:** If the discovery includes human remains, CEQA Guidelines 15064.5 (e)(1) shall be followed: In the event of the accidental discovery or recognition of any human remains in any location other than a dedicated cemetery, the following steps should be taken: (1) There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until: (A) The coroner of the county in which the remains are discovered must be contacted to determine that no investigation of the cause of death is required, and (B) If the coroner determines the remains to be Native American: (1) the coroner shall contact the Native American Heritage Commission within 24 hours. (2) The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased Native American. (3) The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or (2) Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.	Less than Significant

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cultural Resources (cont.)			
CUL-LRDP-5 (cont.)		(A) The Native American Heritage Commission is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission. (B) The descendant identified fails to make a recommendation; or (C) The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the Native American Heritage Commission fails to provide measures acceptable to the landowner.	
Geology, Soils and Seismicity			
GEO-LRDP-1: Implementation of the 2014 LRDP could result in adverse effects to people and structures resulting from geologic hazards.	Less than Significant	None required	Less than Significant
GEO-LRDP-2: Implementation of the 2014 LRDP could result in substantial soil erosion or loss of topsoil.	Less than Significant	None required	Less than Significant
Greenhouse Gas Emissions			
GHG-LRDP-1: Implementation of the 2014 LRDP would result in an increase in construction-related greenhouse gas emissions.	Potentially Significant	**GHG-LRDP-1: Construction-Related GHG Reduction Measures** The following BAAQMD-suggested measures shall be implemented during demolition and construction activities: • Use alternative fueled (e.g., biodiesel, electric) construction vehicles/equipment where feasible; • Use locally sourced building materials for at least 10% of overall materials brought to site; and • Recycle or reuse at least 50% of construction waste or demolition materials.	Less than Significant
GHG-LRDP-2: Implementation of the 2014 LRDP would result in an increase in operational greenhouse gas emissions.	Less than Significant	None required	Less than Significant
GHG-LRDP-3: Implementation of the 2014 LRDP would not conflict with the AB32 Scoping Plan, the UCSF Climate Action Plan or the UCSF GHG Reduction Strategy.	Less than Significant	None required	Less than Significant

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Hazards and Hazardous Materials			
HAZ-LRDP-1: Implementation of the 2014 LRDP could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions.	Potentially Significant	**HAZ-LRDP-1:** An Excavation Management Plan shall be prepared by a qualified consultant to include the California Air Resource Board (CARB) Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations to minimize naturally occurring asbestos through the application of best management practices for fugitive dust from construction, grading and excavation operations. Unless site specific testing by a certified laboratory can demonstrate the absence of encountering naturally occurring asbestos, construction specifications shall include implementation of this CARB ATCM.	Less than Significant
HAZ-LRDP-2: Implementation of the 2014 LRDP could result in hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or waste within one-quarter mile of existing or proposed schools.	Less than Significant	None required	Less than Significant
HAZ-LRDP-3: 2014 LRDP proposals are located on campus sites that are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public.	Potentially Significant	**HAZ-LRDP-2:** Prior to development on the Mission Center campus site, a Soil Management Plan shall be prepared by a qualified environmental consulting firm to reflect current regulatory requirements and risk management protocols that are in accordance with Regional Water Quality Control Board oversight. The Plan shall include measures to address protocols for identifying, handling, and characterizing suspect contaminated soils. Notification and sampling requirements for adequate characterization shall be in accordance with the overseeing agency (RWQCB or SFDEH) and any additional removal or remediation work completed prior to occupancy of the new structure.	Less than Significant
HAZ-LRDP-4: Implementation of the 2014 LRDP would not result in a safety hazard for people residing or working in the vicinity of a private airstrip.	Less than Significant	None required	Less than Significant
HAZ-LRDP-5: Implementation of the 2014 LRDP would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. (Less than Significant)	Less than Significant	None required	Less than Significant
HAZ-LRDP-6: Implementation of the 2014 LRDP would not expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands. (Less than Significant)	Less than Significant	None required	Less than Significant

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Hydrology and Water Quality			
HYD-LRDP-1: Implementation of the 2014 LRDP could violate water quality standards or waste discharge requirements or otherwise substantially degrade water quality.	Less than Significant	None required	Less than Significant
HYD-LRDP-2: Implementation of the 2014 LRDP would not substantially alter the existing drainage pattern of the area in a manner that would result in substantial erosion or siltation on- or off-site, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site.	Less than Significant	None required	Less than Significant
HYD-LRDP-3: Implementation of the 2014 LRDP would not generate runoff that would exceed the capacity of existing or planned stormwater drainage systems, or provide substantial additional sources of polluted runoff.	Less than Significant	None required	Less than Significant
HYD-LRDP-4: Implementation of the 2014 LRDP would place housing within a 100-year flood hazard area, potentially impede flood flows and potentially expose people to a significant risk of loss, injury or death associated with flooding.	Less than Significant	None required	Less than Significant
HYD-LRDP-5: Implementation of the 2014 LRDP would expose people or structures to a significant risk of loss, injury or death due to tsunami, seiche or mudflow.	Less than Significant	None required	Less than Significant
HYD-LRDP-6: Implementation of the 2014 LRDP would expose people or structures to an increased risk of loss, injury or death due to flooding from sea level rise.	Less than Significant	None required	Less than Significant
Land Use and Planning			
LU-LRDP-1: Implementation of the 2014 LRDP would be consistent with applicable land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental effect.	Less than Significant	None required	Less than Significant
LU-LRDP-2: The 2014 LRDP would not be incompatible with the City of San Francisco land use regulations.	Less than Significant	None required	Less than Significant

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Noise			
NOI-LRDP-1: Implementation of the 2014 LRDP would result in increased ambient noise levels during demolition and construction activities.	Potentially Significant	**NOI-LRDP-1a: Construction Noise Control Measures** UCSF contractors shall employ site-specific noise attenuation measures during construction to reduce the generation of construction noise. These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by UCSF to ensure that construction noise is consistent with the standards set forth in the City's Noise Ordinance. Measures specified in the Noise Control Plan and implemented during project construction shall include, at a minimum, the following noise control strategies: • Equipment and trucks used for construction shall use the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds. • Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible; this could achieve a reduction of 5 dBA. Quieter procedures, such as use of drills rather than impact tools, shall be used where feasible. • Stationary noise sources shall be located as far from adjacent receptors as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or include other measures. **NOI-LRDP-1b: Construction Hours** Construction hours are restricted to the hours listed in the table below. In rare circumstances, work may need to occur outside of these work hour limits. In such cases, UCSF Community and Government Relations will receive advance notice from the project manager, at least one week in advance as feasible, and will engage the community to identify measures to minimize potential impacts.	Less than Significant

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

<table>
<tr><th>Environmental Impact</th><th>Level of Significance Before Mitigation</th><th>Mitigation Measures</th><th>Level of Significance After Mitigation</th></tr>
<tr><td colspan="4">Noise (cont.)</td></tr>
<tr><td>NOI-LRDP-1 (cont.)</td><td></td><td>
<table>
<tr><th></th><th colspan="2">“Not Noisy” Work[1]</th><th colspan="2">Noisy Work</th></tr>
<tr><th></th><th>Regular hours</th><th>Extended hours[2]</th><th>Regular hours</th><th>Extended hours</th></tr>
<tr><td>Monday - Friday</td><td>7:00 am to 5:00 pm</td><td>5:00 pm to 8:00 pm</td><td>8:00 am to 5:00 pm</td><td></td></tr>
<tr><td>Saturday</td><td></td><td>8:00 am to 5:00 pm</td><td></td><td>9:00 am to 4:00 pm</td></tr>
<tr><td>Sunday</td><td></td><td>8:00 am to 5:00 pm</td><td></td><td></td></tr>
</table>
[1] “Not Noisy” work = 80 decibels or less at 100 feet; “Noisy” work = more than 80 decibels at 100 feet.
[2] Extended hours to be considered by UCSF Community and Government Relations with advance notice from the project manager.
</td><td></td></tr>
<tr><td>NOI-LRDP-2: Implementation of the 2014 LRDP would result in increased ambient noise levels during pile-driving activities.</td><td>Potentially Significant</td><td>NOI-LRDP-2: Pile Driving Noise-Reducing Techniques and Muffling Devices

Noise-reducing pile-driving techniques shall be employed during project construction. These techniques shall include:

• Installing cast in place concrete piles. Noise from auger drilling is 17 dBA less than an impact pile driver.

• Vibrating piles into place, and installing shrouds around the pile-driving hammer where feasible.

• Installing intake and exhaust mufflers on pile-driving equipment

• Implement “quiet” pile-driving technology (such as pre-drilling of piles and the use of more than one pile driver to shorten the total pile driving duration).

• Use cushion blocks to dampen impact noise. Cushion blocks are blocks of material that are used with impact hammer pile drivers. They consist of blocks of material placed atop a piling during installation to minimize noise generated when driving the pile. Materials typically used for cushion blocks include wood, nylon and micarta (a composite material).

• At least 48 hours prior to pile-driving activities, UCSF shall notify building owners and occupants within 600 feet of the project site of the dates, hours, and expected duration of such activities.</td><td>Significant and Unavoidable</td></tr>
</table>

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Noise (cont.)			
NOI-LRDP-2 (cont.)		*Mitigation Measure NOI-LRDP-2 would reduce the severity of noise generated by pile-driving activities and reduce the potential annoyance to nearby residents and others who could be disturbed by pile-driving to the extent feasible. If piles can be installed though drilling and cast in place measures then this mitigation measure would result in a less than significant impact.* *However, if geotechnical conditions exist such that impact or vibratory pile-driving is required, then construction noise would be significant. Although pile-driving noise would be intermittent and would occur over a short duration, even after mitigation the noise level above the ambient noise level would likely exceed 20 dBA during pile-driving activities, resulting in a significant and unavoidable impact.*	
NOI-LRDP-3: Implementation of the 2014 LRDP would generate ground-borne vibration during demolition and construction activities.	Less than Significant	None required	Less than Significant
NOI-LRDP-4: Implementation of the 2014 LRDP could cause a long-term increase in ambient noise levels in the vicinity.	Less than Significant	None required	Less than Significant
NOI-LRDP-5: Implementation of the 2014 LRDP would result in exposure of persons (new residents) to noise levels in excess of standards established in the City of San Francisco General Plan.	Less than Significant	None required	Less than Significant
Population and Housing			
POP-LRDP-1: The 2014 LRDP would induce population growth in the San Francisco Bay area, which could create demand for housing outside the market area.	Less than Significant	None required	Less than Significant
Public Services			
PUB-LRDP-1: Implementation of the 2014 LRDP would not result in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities, need for new or physically altered fire protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives.	Less than Significant	None required	Less than Significant

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Public Services (cont.)			
PUB-LRDP-2: Implementation of the 2014 LRDP would not result in substantial adverse physical impacts associated with the provision of new or physically altered police facilities, need for new or physically altered police facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives.	Less than Significant	None required	Less than Significant
PUB-LRDP-3: Implementation of the 2014 LRDP would not result in substantial adverse physical impacts associated with the provision of new or physically altered public school facilities, need for new or physically altered public school facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives.	Less than Significant	None required	Less than Significant
Recreation			
REC-LRDP-1: Implementation of the 2014 LRDP would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.	Less than Significant	None required	Less than Significant
REC-LRDP-2: The 2014 LRDP includes new recreational facilities, the construction of which could have an adverse impact on the environment.	Less than Significant	None required	Less than Significant
Transportation and Traffic			
TRAF-LRDP-1: Implementation of the 2014 LRDP would be consistent with the primary goals of the City and County of San Francisco (CCSF) with respect to transportation and would not fundamentally conflict with the CCSF's Transit First Policy because the 2014 LRDP demonstrates reasonable efforts to continue transportation services (e.g., the UCSF Shuttles) that encourage alternatives to use of single-occupant automobiles.	Less than Significant	None required	Less than Significant

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Transportation and Traffic (cont.)			
TRAF-LRDP-2: Implementation of the 2014 LRDP could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during demolition and construction activities.	Potentially Significant	**TRAF-LRDP-1: Construction Coordination and Monitoring Measures.** ***Traffic Control Plan for Construction*** –In order to reduce potential conflicts between construction activities and pedestrians, transit and autos during construction activities at the four campus sites, UCSF shall require construction contractor(s) to prepare a traffic control plan for major phases of project construction (e.g. demolition, construction, or renovation of individual buildings). UCSF and its construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations (e.g. Parnassus Avenue (Parnassus Heights), Sutter Street (Mount Zion), etc.) and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction of the 2014 LRDP Projects. For any work within the public right-of-way, the contractor would be required to comply with the City of San Francisco's Regulations for Working in San Francisco Streets (the Blue Book), which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic. 2 In addition to the regulations in the Blue Book, UCSF shall require the construction contractor(s) to comply with all state and federal codes, rules and regulations. In the event that the construction timeframes of the major phases and other development projects adjacent to UCSF overlap, such as the adjacent proposed development at Mission Bay Blocks 29-32, UCSF shall coordinate with City Agencies through the Transportation Advisory Staff Committee (TASC) and the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation impacts. UCSF, in conjunction with the adjacent developer, shall propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as staggering start and end times, coordinated material drop offs, collective worker parking and transit to job site and other measures. ***Reduce SOV Mode Share for Construction Workers*** – In order to minimize parking demand and vehicle trips associated with construction workers, UCSF shall require the construction contractor to include in the Traffic Control Plan for Construction methods to encourage walking, bicycling, carpooling and transit access to the campus sites by construction workers in the coordinated plan.	Less than Significant

2 The SFMTA Blue Book, 8th Edition (2012), is available online through SFMTA (sfmta.com).

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Transportation and Traffic (cont.)			
TRAF-LRDP-2 (cont.)		***Project Construction Updates for Adjacent Residents and Businesses*** – In order to minimize construction impacts on access for nearby residences, institutions and businesses, UCSF shall provide nearby residences and adjacent businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and lane closures via a newsletter and/or website.	
TRAF-LRDP-3: Implementation of the 2014 LRDP would result in temporary increases in traffic volumes on roadways in the vicinity of each of the four campus sites during demolition and construction activities.	Potentially Significant	Implement **TRAF-LRDP-1**	Less than Significant
TRAF-LRDP-4: Implementation of the 2014 LRDP would increase traffic (vehicles, transit ridership, pedestrian and bicycle volumes) on the roadway network that serves each of the four campus sites, as well as increase loading and parking demand.	Less than Significant	None required	Less than Significant
Utilities and Service Systems			
UTIL-LRDP-1: There would be sufficient water supplies available to serve the 2014 LRDP from existing entitlements and resources and no new or expanded water treatment facilities would be required.	Less than Significant	None required	Less than Significant
UTIL-LRDP-2: The wastewater treatment provider has adequate capacity to serve UCSF's projected demand resulting from implementation of the 2014 LRDP and no new or expanded wastewater treatment facilities would be required.	Less than Significant	None required	Less than Significant
UTIL-LRDP-3: Implementation of the 2014 LRDP would not exceed the wastewater treatment requirements of the Regional Water Quality Control Board.	Less than Significant	None required	Less than Significant
UTIL-LRDP-4: Implementation of the 2014 LRDP would not require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.	Less than Significant	None required	Less than Significant

TABLE 2-1 (Continued)
SUMMARY OF 2014 LRDP IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Utilities and Service Systems (cont.)			
UTIL-LRDP-5: UCSF be served by a landfill with sufficient permitted capacity to accommodate solid waste needs resulting from implementation of the 2014 LRDP and would comply with federal, state and local statutes and regulation related to solid waste.	Less than Significant	None required	Less than Significant
UTIL-LRDP-6: Implementation of the 2014 LRDP would not result in the wasteful, inefficient and unnecessary consumption of energy.	Less than Significant	None required	Less than Significant
UTIL-LRDP-7: Implementation of the 2014 LRDP could result in the construction of new electrical or natural gas facilities, which could cause significant environmental effects.	Less than Significant	None required	Less than Significant

TABLE 2-2
SUMMARY OF 2014 LRDP PROPOSALS – PARNASSUS HEIGHTS IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures[3]	Level of Significance After Mitigation
Aesthetics			
AES-PH-1: The New Hospital Addition and faculty housing at the Proctor site and Fifth and Parnassus avenues at the Parnassus Heights campus site would not have a substantial adverse effect on a scenic vista.	Less than Significant	None required	Less than Significant
AES-PH-2: The New Hospital Addition, new faculty housing and the Parnassus Avenue Streetscape Plan at the Parnassus Heights campus site would not substantially degrade the existing visual character or quality of the site and its surroundings.	Less than Significant	None required	Less than Significant
AES-PH-3: Construction of the New Hospital Addition and faculty housing at the Parnassus Heights campus site could result in flood lighting sites during nighttime construction activities.	Potentially Significant	Implement **AES-LRDP-1**	Less than Significant
AES-PH-4: The New Hospital Addition and new faculty housing at the Parnassus Heights campus site could create new sources of substantial light or glare that would adversely affect day or nighttime views in the area.	Potentially Significant	Implement **AES-LRDP-2**	Less than Significant
AES-PH-5: The demolition of 8 existing buildings, including LPPI, and construction of the New Hospital Addition at the Parnassus Heights campus site would create street-level winds that could be hazardous to pedestrians in the area.	Potentially Significant	Implement **AES-LRDP-3**	Less than Significant
Air Quality			
AIR-PH-1: Implementation of the 2014 LRDP at the Parnassus Heights campus site would result in increased emissions of criteria air pollutants during demolition and construction activities.	Potentially Significant	Implement **AIR-LRDP-1**, **AIR-LRDP-2**, and **AIR-LRDP-3**	Less than Significant
AIR-PH-2: Demolition and construction activities at the Parnassus Heights campus site under the 2014 LRDP would increase emissions of toxic air contaminants (TACs) and increase health risks for nearby residents.	Less than Significant	None required	Less than Significant
AIR-PH-3: Operations at the Parnassus Heights campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants.	Potentially Significant	Implement **AIR-LRDP-4**	Less than Significant
AIR-PH-4: Operations at the Parnassus Heights campus site under the 2014 LRDP would expose persons (new receptors) to substantial levels of TACs, which may lead to adverse health effects.	Less than Significant	None required	Less than Significant

[3] This table references the mitigation measures in Table 2-1, as well as additional mitigation measures that apply to the Parnassus Heights campus site.

TABLE 2-2 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – PARNASSUS HEIGHTS IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Air Quality (cont.)			
AIR-PH-5: Operations at the Parnassus Heights campus site under the 2014 LRDP would cumulatively expose persons (existing and new receptors) to substantial levels of TACs, which may lead to adverse health effects.	Less than Significant	None required	Less than Significant
Biological Resources			
BIO-PH-1: Demolition and construction activities at the Parnassus Heights campus site could have a substantial adverse effect, either directly or through habitat modifications, on species identified as candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.	Potentially Significant	**BIO-PH-1a: Preconstruction Surveys for Monarch Butterfly Winter Roosts and Avoidance.** Prior to demolition activities, a qualified biologist familiar with monarch butterfly aggregating behavior and habitat shall conduct a preconstruction survey for the presence of overwintering monarch butterfly aggregations. The survey shall be conducted in December or January during the period when overwintering aggregations appear. Should an overwintering aggregation be identified in trees adjacent to individual proposal sites within the Reserve, a 200-foot buffer shall be established around the occupied trees until the aggregation has dispersed. **BIO-PH-1b: Preconstruction Breeding Bird Surveys and Nest Avoidance.** Should construction activities associated with the new retaining wall, new trails, demolition of buildings, relocation, expansion, and replacement of the medical gas and diesel fuel tank storage, and construction of the new hospital addition within the Parnassus Heights campus site, commence during breeding bird season (February 15 – August 15) annually, UCSF shall retain a qualified biologist to conduct preconstruction nesting bird surveys in surrounding habitat for nesting birds. Specific measures to avoid and minimize impacts on nesting birds include, but are not limited to, those described below. • To avoid and minimize potential impacts on nesting raptors and other birds, preconstruction surveys shall be performed not more than two weeks prior to initiating vegetation removal and/or construction and demolition activities during the breeding season (i.e., February 15 through August 15). • To avoid and minimize potential impacts on nesting raptors and other birds, a no-disturbance buffer zone shall be established around active nests during the breeding season until the young have fledged and are self-sufficient, when no	Less than Significant

TABLE 2-2 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – PARNASSUS HEIGHTS IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Biological Resources (cont.)			
BIO-PH-1 (cont.)		further mitigation would be required. Typically, the size of individual buffers ranges from a minimum of 250 feet for raptors to a minimum of 50 feet for other birds but can be adjusted based on an evaluation of the site by a qualified biologist in cooperation with the USFWS and/or CDFW. • Birds that establish nests after construction starts are assumed to be habituated to and tolerant of the indirect adverse impacts resulting from construction noise and human activity. However, direct take of nests, eggs, and nestlings is still prohibited and an appropriate buffer must be established around the nest according to species and proximity to project activities in order to avoid nest abandonment or destruction. • If construction or demolition activities ceases for a period of more than two weeks, or vegetation removal is required after a period of more than two weeks has elapsed from the preconstruction surveys, then new nesting bird surveys must be conducted. **BIO-PH-1c: Avoidance and Minimization Measures for Special-Status Bats.** A qualified wildlife biologist shall conduct preconstruction special-status bat surveys of suitable roost sites in the vicinity of construction and demolition sites that abut the forest of Mount Sutro Open Space Reserve. If active day or night roosts are found, the wildlife biologist shall take actions to make such roosts unsuitable habitat before construction and demolition activities begin. A no-disturbance buffer of 100 feet shall be created around active bat roosts being used for maternity or hibernation purposes. Bat roosts that are established during active construction or demolition are presumed to be unaffected by these activities, and no buffer would be necessary. **BIO-PH-1d: Preconstruction Surveys for Special-Status Plants and Plant Avoidance.** Prior to construction activities, a qualified botanist shall conduct preconstruction surveys for special-status plants, coastal triquetrella and San Francisco gumplant, within the footprints of and in suitable habitat adjacent to locations of the new retaining wall, new trail alignments, and any access routes and staging areas to be used in support of these projects. Surveys for coastal	

TABLE 2-2 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – PARNASSUS HEIGHTS IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Biological Resources (cont.)			
BIO-PH-1 (cont.)		triquetrella can be conducted at any time of the year however surveys for San Francisco gumplant shall occur in the summer (June – September). Should special-status plant species be found during surveys, occurrences shall be marked in the field for avoidance during construction. **BIO-PH-1e: Relocation of Special-Status Plants.** If special-status plants are located within the retaining wall or new trails footprint and cannot be avoided, then a rare plant salvage and relocation plan shall be developed to relocate individuals to suitable habitat within the Reserve. A qualified botanist shall develop and implement the plan according to CDFW guidelines and in coordination with CDFW. At a minimum, the plan shall include collection of reproductive structures from affected plants, a full description of microhabitat conditions necessary for each affected species, seed germination requirements, restoration techniques for temporarily disturbed occurrences, assessments of potential transplant and enhancement sites, success and performance criteria, and monitoring programs, as well as measures to ensure long-term population viability. The mitigation methods shall include either salvage and transplantation or collection and propagation of seeds or other vegetative material. Any plant relocation shall be done under the supervision of a qualified restoration botanist.	
BIO-PH-2: Demolition and construction activities at the Parnassus Heights campus site could interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	Potentially Significant	**Implement BIO-LRDP-1: Bird-Safe Building Treatments** and **BIO-PH-2a: Night Lighting Minimization during Construction** Construction areas set up for nighttime activity and requiring lights shall implement the following measures as long as the safety of workers is not compromised: • All construction related lighting shall be fully shielded and focused down to ensure no significant illumination passes beyond the immediate work area. Lighting shall be positioned around the perimeter of the work area positioned toward activity and not surrounding habitat of the Reserve. • Yellow or orange light shall be used where possible. • Construction personnel shall reduce the amount of lighting to the minimum necessary to safely accomplish the work.	Less than Significant

TABLE 2-2 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – PARNASSUS HEIGHTS IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Biological Resources (cont.)			
BIO-PH-2 (cont.)		• Night construction near suitable habitat for nesting and migratory birds and bats (i.e. the Reserve forest and understory vegetation) shall be avoided during nesting season (February 15 – August 15). If night construction near these areas cannot be avoided, light shall not be allowed to shine directly into suitable habitat. • Construction areas set-up for night time activity are subject to all of the same preconstruction surveys for nesting birds and roosting bats listed in this section, above. **BIO-PH-2b: Operational Night Lighting Minimization.** In addition to minimizing night lighting during demolition and construction of the 2014 LRDP proposals, UCSF shall similarly ensure that the design and specifications for buildings implement design elements to reduce lighting usage, change light direction, and contain light. These include, but are not limited to, the following general considerations that shall be applied wherever feasible throughout 2014 LRDP proposals within the Parnassus Heights campus site to reduce night lighting impacts on avian and bat species: • Avoid installation of lighting in areas where not required for public safety. • Examine and adopt alternatives to bright, all-night, floor-wide lighting when interior lights would be visible from the exterior or when exterior lights must be left on at night, including: – Installing motion-sensitive lighting – Installing task lighting – Installing programmable timers – Installing fixtures that use lower-wattage, sodium, and yellow-red spectrum lighting (if compatible with personnel safety requirements). • Install strobe or flashing lights in place of continuously burning lights for any obstruction lighting that may be required. • Where exterior lights are to be left on at night, install fully shielded lights to contain and direct light away from the sky.	

TABLE 2-2 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – PARNASSUS HEIGHTS IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cultural Resources			
CUL-PH-1: Demolition of seven buildings at the Parnassus Heights campus site would not result in a substantial adverse change in the significance of historical resources.	No Impact	None required	No Impact
CUL-PH-2: Demolition of the Surge building at the Parnassus Heights campus site would result in a substantial adverse change in the significance of an historical resource.	Potentially Significant	Implement **CUL-LRDP-2**	Significant and Unavoidable
CUL-PH-3: Renovation of Moffitt Hospital, UC Hall and Millberry Union towers at the Parnassus Heights campus site would not result in a substantial adverse change in the significance of historical resources.	Less than Significant	None required	Less than Significant
CUL-PH-4: Seismic rehabilitation of the historic Faculty Alumni House could result in a significant impact to this historic structure if not completed in accordance with the Secretary of the Interior's Standards.	Potentially Significant	**CUL-PH-4:** UCSF shall ensure that the proposed seismic upgrades to the Faculty Alumni House at 745 Parnassus Avenue would comply with the Secretary of the Interior's Standards for Rehabilitation. UCSF may need to hire a qualified professional architectural historian to review the proposed seismic upgrade plans for compliance with the Standards, and prepare a technical memorandum which describes any changes to the seismic design (if any) that may be needed to meet the Standards. Generally, under CEQA, projects that comply with the Secretary of the Interior's Standards are considered to have a less-than-significant impact on the environment.	Less than Significant
CUL-PH-5: Renovation of Saunders Court at the Parnassus Heights campus site could alter the features and spaces which convey its historic significance as a cultural landscape, which could result in a substantial adverse change in the significance of historical resources.	Potentially Significant	**CUL-PH-5:** Prior to undertaking any further designs for the renovation of Saunders Court, UCSF shall; 1) complete additional research at the UCSF Archives and the Robert R. Royston Collection (1946-1972) at the Environmental Design Library at UC Berkeley to determine the relative significance of this cultural landscape within Royston's overall body of work, 2) identify the character-defining features of the landscape itself (i.e., those features which convey its historic significance), and 3), hire a professional landscape architect and/or landscape historian to design the renovation project in a manner that is respectful of, and compatible with, the character-defining features of the landscape and is consistent with the *Secretary of the Interior's Guidelines for Rehabilitating Cultural Landscapes*.	Less than Significant
CUL-PH-6: Construction of the New Hospital Addition at the Parnassus Heights campus site could cause substantial adverse changes to archaeological resources.	Potentially Significant	Implement **CUL-LRDP-3**	Less than Significant

TABLE 2-2 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – PARNASSUS HEIGHTS IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cultural Resources (cont.)			
CUL-PH-7: Construction of the New Hospital Addition at the Parnassus Heights campus site could cause substantial adverse changes to paleontological resources.	Potentially Significant	Implement **CUL-LRDP-4**	Less than Significant
CUL-PH-8: Construction of the New Hospital Addition at the Parnassus Heights campus site could cause substantial adverse changes to human remains.	Potentially Significant	Implement **CUL-LRDP-5**	Less than Significant
CUL-PH-9: Infrastructure and utilities improvements proposed at the Parnassus Heights campus site, including the Parnassus Avenue Streetscape Plan, would not result in a substantial adverse change in the significance of historical resources.	Potentially Significant	Implement **CUL-LRDP-3**, **CUL-LRDP-4**, and **CUL-LRDP-5**	Less than Significant
Geology, Soils and Seismicity			
Geology, soils and seismicity impacts at the Parnassus Heights campus site are included in evaluation of overall 2014 LRDP effects as discussed under **Impact GEO-LRDP-1** and **GEO-LRDP-2** (see Table 2-1).	Less than Significant	None required	Less than Significant
Greenhouse Gas Emissions			
GHG-PH-1: Development at the Parnassus Heights campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions.	Potentially Significant	Implement **GHG-LRDP-1**	Less than Significant
GHG-PH-2: Development at the Parnassus Heights campus site under the 2014 LRDP would result in an increase in operational GHG emissions.	Less than Significant	None required	Less than Significant
Hazards and Hazardous Materials			
HAZ-PH-1: Implementation of the 2014 LRDP at the Parnassus Heights campus could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions.	Potentially Significant	Implement **HAZ-LRDP-1**	Less than Significant
HAZ-PH-2: Implementation of the 2014 LRDP at the Parnassus Heights campus site could result in hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or waste within one-quarter mile of existing or proposed schools.	Less than Significant	None required	Less than Significant
HAZ-PH-3: 2014 LRDP proposals located at the Parnassus Heights campus sites that are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public.	Less than Significant	None required	Less than Significant

TABLE 2-2 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – PARNASSUS HEIGHTS IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Hazards and Hazardous Materials (cont.)			
HAZ-PH-4: Implementation of the 2014 LRDP at the Parnassus Heights campus would not expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.	Less than Significant	None required	Less than Significant
Hydrology and Water Quality			
Hydrology and water quality impacts at the Parnassus Heights campus site are included in evaluation of overall 2014 LRDP effects as discussed under **Impact HYD-LRDP-1** through **HYD-LRDP-4** (see Table 2-1).	Less than Significant	None required	Less than Significant
Land Use and Planning			
LU-PH-1: Implementation of the 2014 LRDP at the Parnassus Heights campus site would be consistent with applicable land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental effect.	Less than Significant	None required	Less than Significant
LU-PH-2: The proposed New Hospital Addition at the Parnassus Heights campus site would be compatible with adjacent land uses.	Less than Significant	None required	Less than Significant
LU-PH-3: The proposed renovations of Moffitt Hospital, UC Hall Millberry Union towers, and the Faculty Alumni House at the Parnassus Heights campus site would be compatible with existing City regulations.	Less than Significant	None required	Less than Significant
Noise			
NOI-PH-1: Demolition activities proposed under the 2014 LRDP at the Parnassus Heights campus site would result in a temporary increase in ambient noise levels.	Potentially Significant	Implement **NOI-LRDP-1** *Mitigation Measure NOI-LRDP-1 would reduce noise levels associated with demolition activities by 5 to 10 dBA. However it is likely that intermittent hoe-ram operations to break up concrete structures could result in noise levels at sensitive receptors in excess of 70 dBA during one to two weeks of the demolition of Proctor, even after mitigation. Consequently, this impact, although temporary, would be significant and unavoidable.*	Significant and Unavoidable
NOI-PH-2: Construction activities proposed under the 2014 LRDP at the Parnassus Heights campus site would result in increases in ambient noise levels over the term of the exterior construction activities.	Potentially Significant	Implement **NOI-LRDP-1** and **NOI-LRDP-2** *Mitigation Measures LRDP-NOI-1 and NOI-LRDP-2 would reduce the severity of noise generated by construction and pile-driving activities and reduce the potential annoyance to nearby residents*	Significant and Unavoidable

TABLE 2-2 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – PARNASSUS HEIGHTS IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Noise (cont.)			
NOI-PH-2 (cont.)		*and others who could be disturbed by pile-driving to the extent feasible. If piles can be installed though drilling and cast in place measures then these mitigation measures would result in a less than significant impact.* *However, if geotechnical conditions exist such that impact or vibratory pile-driving is required, then construction noise would be significant. Although pile-driving noise would be intermittent and would occur over a short duration (up to about six weeks in total), even after mitigation the noise level would likely exceed ambient noise levels by 20 dBA during pile-driving activities, resulting in a significant and unavoidable impact.*	
NOI-PH-3: Demolition and construction and demolition activities proposed under the 2014 LRDP at the Parnassus Heights campus site could generate ground-borne vibration.	Less than Significant	None required	Less than Significant
NOI-PH-4: Operational noise generated by development under the 2014 LRDP at the Parnassus Heights campus site could cause a long-term increase in ambient noise levels in the campus vicinity.	Less than Significant	None required	Less than Significant
NOI-PH-5: Operations under the 2014 LRDP at the Parnassus Heights site would result in exposure of persons (new residents) to noise levels in excess of standards established in the general plan.	Less than Significant	None required	Less than Significant
Population and Housing			
No site-specific impacts			
Public Services			
No site-specific impacts			
Recreation			
No site-specific impacts			
Transportation and Traffic			
TRAF-PH-1: Implementation of the 2014 LRDP on the Parnassus Heights campus site could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during demolition and construction activities.	Potentially Significant	Implement **TRAF-LRDP-1**	Less than Significant
TRAF-PH-2: Implementation of the 2014 LRDP on the Parnassus Heights campus site would increase traffic at intersections on the adjacent roadway network.	Less than Significant	None required	Less than Significant

TABLE 2-2 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – PARNASSUS HEIGHTS IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Transportation and Traffic (cont.)			
TRAF-PH-3: Implementation of the 2014 LRDP on the Parnassus Heights campus site would increase transit ridership demand.	Less than Significant	None required	Less than Significant
TRAF-PH-4: Implementation of the 2014 LRDP on the Parnassus Heights campus site would not cause a substantial conflict with pedestrian facilities, or otherwise decrease the performance or safety of such facilities.	Less than Significant	None required	Less than Significant
TRAF-PH-5: Implementation of the 2014 LRDP on the Parnassus Heights campus site would not would not cause a substantial conflict with bicycle facilities, or otherwise decrease the performance or safety of such facilities.	Less than Significant	None required	Less than Significant
TRAF-PH-6: Implementation of the 2014 LRDP on the Parnassus Heights campus site would increase loading demand.	Less than Significant	None required	Less than Significant
TRAF-PH-7: Implementation of the 2014 LRDP on the Parnassus Heights campus site would increase parking demand.	Less than Significant	None required	Less than Significant
Utilities and Service Systems

TABLE 2-3
SUMMARY OF 2014 LRDP PROPOSALS – MISSION BAY IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures[4]	Level of Significance After Mitigation
Aesthetics			
AES-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site would not have a substantial adverse effect on a scenic vista.	Less than Significant	None required	Less than Significant
AES-MB-2: Implementation of the 2014 LRDP at the Mission Bay campus site would not substantially degrade the existing visual character or quality of the site and its surroundings.	Less than Significant	None required	Less than Significant
AES-MB-3: Implementation of the 2014 LRDP at the Mission Bay campus site could create new sources of substantial light or glare which would adversely affect day or nighttime views in the area.	Potentially Significant	Implement **AES-LRDP-1**	Less than Significant
AES-MB-4: Implementation of the 2014 LRDP at the Mission Bay campus site could result in flood lighting during nighttime construction activities.	Potentially Significant	Implement **AES-LRDP-2**	Less than Significant
AES-MB-5: Implementation of the 2014 LRDP at the Mission Bay campus site could create street-level winds that could be hazardous to pedestrians in the area.	Potentially Significant	Implement **AES-LRDP-3**	Less than Significant
AES-MB-6: Implementation of the 2014 LRDP at the Mission Bay campus site could substantially reduce sunlight or significantly increase shadows in public open space areas or could shadow the potential school site on Block 14.	Less than Significant	None required	Less than Significant
Air Quality			
AIR-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site would result in increased emissions of criteria air pollutants during construction activities.	Potentially Significant	Implement **AIR-LRDP-1**, **AIR-LRDP-2**, and **AIR-LRDP-3**	Less than Significant
AIR-MB-2: Construction activities at the Mission Bay campus site under the 2014 LRDP would increase emissions of toxic air contaminants (TACs) and increase health risks for nearby residents.	Potentially Significant	**AIR-MB-1:** Obtain written verification from BAAQMD that the facility has been issued a permit from BAAQMD, if required by law, or that permit requirements do not apply to the facility. (Modified from *Mission Bay Subsequent EIR Mitigation Measure F.03*)	Less than Significant
AIR-MB-3: Operations at the Mission Bay campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants.	Potentially Significant	Implement **AIR-LRDP-4** *Mitigation Measure AIR-LRDP-4 would not result in the 59% reduction necessary (for ROG) or 27% (for NOx) to reduce the impact to a less-than-significant level. This amount of traffic reduction exceeds the best reduction estimates for TDM programs (BAAQMD, 2012b). Assuming a conservative 12% reduction in vehicle miles travelled*	Significant and Unavoidable

[4] This table references the mitigation measures in Table 2-1, as well as additional mitigation measures that apply to the Mission Bay campus site.

TABLE 2-3 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MISSION BAY IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Air Quality (cont.)			
AIR-MB-3 (cont.)		*associated with TDM measures, operational emissions of ROG at the Mission Bay campus site would be reduced to 126.8 pounds per day and emissions of NOx would be reduced to 62.68 pounds per day. Consequently, 2014 LRDP development at the campus site with implementation of feasible mitigations would still result in significant environmental effects on air quality and contribute substantially to an existing air quality violation (ozone precursors and particulate matter). Therefore, even with implementation of Mitigation Measure AIR-MB-4, this impact would remain significant and unavoidable for emissions of ROG, NOx and PM_{10}.*	
AIR-MB-4: Operations at the Mission Bay campus site under the 2014 LRDP would expose persons (new receptors) to substantial levels of TACs, which may lead to adverse health effects.	Potentially Significant	**AIR-MB-4: Particulate Filtration Systems for Block 15 Housing and Child Care.** *Air Filtration and Ventilation Requirements for Sensitive Land Uses.* As part of the building design, UCSF shall include a ventilation plan for the proposed housing and day care building. The ventilation plan shall show that the building ventilation system removes at least 80% of the outdoor $PM_{2.5}$ concentrations from habitable areas and be designed by an engineer certified by ASHRAE, who shall provide a written report documenting that the system meets the 80% performance standard and offers the best available technology to minimize outdoor to indoor transmission of $PM_{2.5}$. *Maintenance Plan.* UCSF shall prepare a plan that ensures ongoing maintenance for the ventilation and filtration systems.	Less than Significant
AIR-MB-5: Operations at the Mission Bay campus site under the 2014 LRDP would cumulatively expose persons (existing and new receptors) to substantial levels of TACs, which may lead to adverse health effects.	Less than Significant	None required	Less than Significant
Biological Resources			
None			
Cultural Resources			
CUL-MB-1: Construction of 2014 LRDP proposals at the Mission Bay campus site could cause substantial adverse changes to archaeological resources.	Potentially Significant	Implement **CUL-LRDP-3**	Less than Significant
CUL-MB-2: Construction of 2014 LRDP proposals at the Mission Bay campus site could cause substantial adverse changes to paleontological resources.	Potentially Significant	Implement **CUL-LRDP-4**	Less than Significant

TABLE 2-3 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MISSION BAY IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cultural Resources (cont.)			
CUL-MB-3: Construction of 2014 LRDP proposals at the Mission Bay campus site could cause substantial adverse changes to human remains.	Potentially Significant	Implement **CUL-LRDP-5**	Less than Significant
Geology, Soils and Seismicity			
Geology, soils and seismicity impacts at the Mission Bay campus site are included in evaluation of overall 2014 LRDP effects as discussed under **Impact GEO-LRDP-1** and **GEO-LRDP-2** (see Table 2-1).	Less than Significant	None required	Less than Significant
Greenhouse Gas Emissions			
GHG-MB-1: Development at the Mission Bay campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions.	Potentially Significant	Implement **GHG-LRDP-1**	Less than Significant
GHG-MB-2: Development at the Mission Bay campus site under the 2014 LRDP would result in an increase in operational GHG emissions.	Less than Significant	None required	Less than Significant
Hazards and Hazardous Materials			
HAZ-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions.	Potentially Significant	Implement **HAZ-LRDP-1**	Less than Significant
HAZ-MB-2: Implementation of the 2014 LRDP at the Mission Bay site could result in hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or waste within one-quarter mile of existing or proposed schools.	Less than Significant	None required	Less than Significant
HAZ-MB-3: 2014 LRDP proposals located at the Mission Bay campus sites that are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public.	Less than Significant	None required	Less than Significant
HAZ-MB-4: Implementation of the 2014 LRDP at the Mission Bay campus would not result in a safety hazard for people residing or working in the vicinity of a private airstrip.	Less than Significant	None required	Less than Significant

TABLE 2-3 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MISSION BAY IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Hydrology and Water Quality			
HYD-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site could violate water quality standards or waste discharge requirements or otherwise substantially degrade water quality.	Potentially Significant	**HYD-MB-1a:** Participate in the City's existing Water Pollution Prevention Program. UCSF shall facilitate implementation of the City's Water Pollution Prevention Program by providing and installing wastewater sampling ports in any building anticipated to have a potentially significant discharge of pollutants to the sanitary sewer, as determined by the Water Pollution Prevention Program of the San Francisco Public Utilities Commission's Bureau of Environmental Regulation and Management, and in locations as determined by the Water Pollution Prevention Program. (*Mission Bay Subsequent EIR Mitigation Measure K.02*). **HYD-MB-1b:** UCSF shall design and construct sewer improvements such that potential flows to the City's combined sewer system from the project do not contribute to an increase in the annual overflow volume as projected by the Bayside Planning Model by providing increased storage in oversized pipes, centralized storage facilities, smaller dispersed storage facilities, or detention basins, or through other means to reduce or delay stormwater discharges to the City system. (*Mission Bay Subsequent EIR Mitigation Measure K.03*). **HYD-MB-1c:** Implement alternative technologies or use other means to reduce settleable solids and floatable materials in stormwater discharges to China Basin Channel to levels equivalent to, or better than, City-treated combined sewer overflows. Such alternatives technologies could include one or more of the following: biofilter system, vortex sediment system, catch basin filters, and/or additional source control measures to remove particulates from streets and parking lots. (Modified from *Mission Bay Subsequent EIR Mitigation Measure K.04*).	Less than Significant
HYD-MB-2: Development of proposed housing on Block 15 at the Mission Bay campus site would place housing within a 100-year flood hazard area as mapped on the preliminary (2013) FIRM map for San Francisco, potentially impede flood flows, and potentially expose people to a significant risk of loss, injury, or death associated with flooding.	Less than Significant	None required	Less than Significant
HYD-MB-3: Development of 2014 LRDP proposals on the Mission Bay campus site would expose people or structures to a significant risk of loss, injury or death due to inundation by seiches or tsunamis.	Less than Significant	None required	Less than Significant
HYD-MB-4: Development of 2014 LRDP proposals on the Mission Bay campus site would expose people or structures to an increased risk of loss, injury or death due to flooding from sea level rise.	Less than Significant	None required	Less than Significant

TABLE 2-3 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MISSION BAY IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Land Use and Planning			
LU-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site would be consistent with applicable land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental effect.	Less than Significant	None required	Less than Significant
LU-MB-2: Implementation of the 2014 LRDP at the Mission Bay campus site would be compatible with existing land uses, density, and height and bulk restrictions.	Less than Significant	None required	Less than Significant
Noise			
NOI-MB-1: Construction activities proposed under the 2014 LRDP at the Mission Bay campus site would result in increases in ambient noise levels over the term of the exterior construction activities.	Potentially Significant	Implement **NOI-LRDP-1**	Less than Significant
NOI-MB-2: Construction activities proposed under the 2014 LRDP at the Mission Bay campus site would result in increases in ambient noise levels during pile-driving activities.	Potentially Significant	Implement **NOI-LRDP-2** *Mitigation Measure NOI-LRDP-2 would reduce the severity of noise generated by pile-driving activities and reduce the potential annoyance to nearby residents and others who could be disturbed by pile-driving to the extent feasible. If piles can be installed though drilling and cast in place measures then this mitigation measure would result in a less than significant impact.* *However, if geotechnical conditions exist such that impact or vibratory pile-driving is required, then construction noise would be significant. Although pile-driving noise would be intermittent and would occur over a short duration, even after mitigation the noise level would likely exceed 20 dBA during pile-driving activities, resulting in a significant and unavoidable impact.*	Significant and Unavoidable
NOI-MB-3: Construction activities proposed under the 2014 LRDP at the Mission Bay campus site could generate ground-borne vibration.	Less than Significant	None required	Less than Significant
NOI-MB-4: Operational noise generated by development under the 2014 LRDP at the Mission Bay campus site could cause a long-term increase in ambient noise levels in the campus vicinity.	Less than Significant	None required	Less than Significant
NOI-MB-5: Operations under the 2014 LRDP at the Mission Bay campus site would result in exposure of persons (new residents) to noise levels in excess of standards established in the general plan.	Less than Significant	None required	Less than Significant
Population and Housing			
No site-specific impacts			

TABLE 2-3 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MISSION BAY IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Public Services			
No site-specific impacts			
Recreation			
No site-specific impacts			
Transportation and Traffic			
TRAF-MB-1: Implementation of the 2014 LRDP on the Mission Bay campus site could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during construction activities.	Potentially Significant	Implement **TRAF-LRDP-1**	Less than Significant
TRAF-MB-2: Implementation of the 2014 LRDP on the Mission Bay campus site would increase traffic at intersections on the adjacent roadway network.	Less than Significant	None required	Less than Significant
TRAF-MB-3: Implementation of the 2014 LRDP on the Mission Bay campus site would increase transit ridership demand.	Less than Significant	None required	Less than Significant
TRAF-MB-4: Implementation of the 2014 LRDP on the Mission Bay campus site would not cause a substantial conflict with pedestrian facilities, or otherwise decrease the performance or safety of such facilities.	Less than Significant	None required	Less than Significant
TRAF-MB-5: Implementation of the 2014 LRDP on the Mission Bay campus site would not would not cause a substantial conflict with bicycle facilities, or otherwise decrease the performance or safety of such facilities.	Less than Significant	None required	Less than Significant
TRAF-MB-6: Implementation of the 2014 LRDP on the Mission Bay campus site would increase loading demand.	Less than Significant	None required	Less than Significant
TRAF-MB-7: Implementation of the 2014 LRDP on the Mission Bay campus site would increase parking demand.	Less than Significant	None required	Less than Significant
Utilities and Service Systems			
The overall effects on utilities at the Mission Bay campus site are included in evaluation of 2014 LRDP effects as discussed under **Impact UTIL-LRDP-1** through **UTIL-LRDP-7** (see Table 2-1).	Less than Significant	None required	Less than Significant
UTIL-MB-1: There would be sufficient water supply infrastructure to serve 2014 LRDP development at the Mission Bay campus site.	Less than Significant	None required	Less than Significant

TABLE 2-3 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MISSION BAY IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Utilities and Service Systems (cont.)			
UTIL-MB-2: There may be impacts related to wastewater infrastructure as a result of 2014 LRDP development at the Mission Bay campus site.	Potentially Significant	**UTIL-MB-1:** UCSF will monitor sanitary sewer flows to the P15 pump station in congruence with on-going monitoring conducted by the SFPUC. If the SFPUC determines that improvements are required to increase the capacity of the P15 pump station as a result of development within the pump station basin, including 2014 UCSF LRDP development at the Mission Bay campus site, UCSF will contribute its fair share to SFPUC for the potential required pump capacity improvements. UCSF will monitor sanitary sewer flows to the Mariposa Pump Station in congruence with on-going monitoring conducted by the SFPUC. If the SFPUC determines that improvements are required to increase the capacity of the Mariposa Pump Station as a result of development within the pump station basin, including 2014 UCSF LRDP development at the Mission Bay campus site, UCSF will contribute its fair share to SFPUC for the potential required improvements. *Because potential improvements are outside UCSF jurisdiction to implement, the impact is considered significant and unavoidable even with the incorporation of the above-noted mitigation measures.*	Significant and Unavoidable
UTIL-MB-3: There would be sufficient storm drainage infrastructure to serve 2014 LRDP development at the Mission Bay campus site.	Less than Significant	None required	Less than Significant

TABLE 2-4
SUMMARY OF 2014 LRDP PROPOSALS – MOUNT ZION IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures[5]	Level of Significance After Mitigation
Aesthetics			
AES-MZ-1: The proposed office/research building at the Mount Zion campus site would not substantially degrade the existing visual character or quality of the campus site and its surroundings.	Less than Significant	None required	Less than Significant
AES-MZ-2: The proposed office/research building at the Mount Zion campus site could create new sources of substantial light or glare which would adversely affect day or nighttime views in the area.	Potentially Significant	Implement **AES-LRDP-1**	Less than Significant
AES-MZ-3: Construction of the proposed office/research building at the Mount Zion campus site could result in flood lighting sites during nighttime construction activities.	Potentially Significant	Implement **AES-LRDP-2**	Less than Significant
AES-MZ-4: The proposed office/research building at the Mount Zion campus site would cast shadow on the Hamilton Recreation Center.	Potentially Significant	Implement **AES-LRDP-4**	Less than Significant
AES-MZ-5: The demolition of the three existing buildings and construction of the Office / Research building at the Mount Zion campus site would create street-level winds that could be hazardous to pedestrians in the area.	Potentially Significant	Implement **AES-LRDP-43**	Less than Significant
Air Quality			
AIR-MZ-1: Implementation of the 2014 LRDP at the Mount Zion campus site would result in increased emissions of criteria air pollutants during demolition and construction activities.	Potentially Significant	Implement **AIR-LRDP-1**, **AIR-LRDP-2**, and **AIR-LRDP-3**	Less than Significant
AIR-MZ-2: Demolition and construction activities at the Mount Zion campus site under the 2014 LRDP would increase emissions of toxic air contaminants (TACs) and increase health risks for nearby residents.	Less than Significant	None required	Less than Significant
AIR-MZ-3: Operations at the Mount Zion campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants.	Potentially Significant	Implement **AIR-LRDP-4**	Less than Significant
AIR-MZ-4: Operations at the Mount Zion campus site under the 2014 LRDP would increase emissions of TACs and increase health risks for nearby residents.	Less than Significant	None required	Less than Significant
Biological Resources			
None			

[5] This table references the mitigation measures in Table 2-1, as well as additional mitigation measures that apply to the Mount Zion campus site.

TABLE 2-4 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MOUNT ZION IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cultural Resources			
CUL-MZ-1: Demolition of the Hellman building at the Mount Zion campus site would result in a substantial adverse change in the significance of an historical resource.	Potentially Significant	**CUL-MZ-1:** Typical mitigation for the demolition of a historic resource includes HABS-level photodocumention, as well as public interpretation. HABS-level photodocumentation was already completed in 2006. UCSF shall furnish copies of the report to local depositories of historical information to enhance public understanding and increase the availability of these materials for future research. Such depositories shall include the History Room of the San Francisco Public Library (Main Branch), San Francisco Heritage, and the Northwest Information Center at Sonoma State University. As part of the design for the proposed new office/research building to be constructed in this location, UCSF shall install interpretive materials at or near the site to enhance public awareness in the form of a historical marker, kiosk, or other display which contains historical photos and text about the Hellman building's historical significance. The contents of the display can be obtained from the HABS documentation effort.	Significant and Unavoidable
CUL-MZ-2: Renovation of the Main Hospital at the Mount Zion campus site would not result in a substantial adverse change in the significance of historical resources.	Less than Significant	None required	Less than Significant
CUL-MZ-3: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to historical resources.	Less than Significant	None required	Less than Significant
CUL-MZ-4: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to archaeological resources.	Potentially Significant	Implement **CUL-LRDP-3**	Less than Significant
CUL-MZ-5: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to paleontological resources.	Potentially Significant	Implement **CUL-LRDP-4**	Less than Significant
CUL-MZ-6: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to human remains.	Potentially Significant	Implement **CUL-LRDP-5**	Less than Significant
Geology, Soils and Seismicity			
Geology, soils and seismicity impacts at the Mount Zion campus site are included in evaluation of overall 2014 LRDP effects as discussed under **Impact GEO-LRDP-1** and **GEO-LRDP-2** (see Table 2-1).	Less than Significant	None required	Less than Significant

TABLE 2-4 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MOUNT ZION IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Greenhouse Gas Emissions			
GHG-MZ-1: Development at the Mount Zion campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions.	Potentially Significant	Implement **GHG-LRDP-1**	Less than Significant
GHG-MZ-2: Development at the Mount Zion campus site under the 2014 LRDP would result in an increase in operational GHG emissions.	Less than Significant	None required	Less than Significant
Hazards and Hazardous Materials			
HAZ-MZ-1: Implementation of the 2014 LRDP could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions.	Potentially Significant	Implement **HAZ-LRDP-1**	Less than Significant
HAZ-MZ-2: Implementation of the 2014 LRDP at the Mount Zion campus site could result in hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or waste within one-quarter mile of existing or proposed schools.	Less than Significant	None required	Less than Significant
Hydrology and Water Quality			
Hydrology and water quality impacts at the Mount Zion campus site are included in evaluation of overall 2014 LRDP effects as discussed under **Impact HYD-LRDP-1** through **HYD-LRDP-3** (see Table 2-1).	Less than Significant	None required	Less than Significant
Land Use and Planning			
LU-MZ-1: Implementation of the 2014 LRDP at the Mount Zion campus site would be consistent with applicable land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental effect.	Less than Significant	None required	Less than Significant
LU-MZ-2: Renovation of the Main Hospital at the Mount Zion campus site would be compatible with existing land uses, density, and height and bulk restrictions.	Less than Significant	None required	Less than Significant
LU-MZ-3: The proposed office/research building at the Mount Zion campus site would be compatible with adjacent land uses.	Less than Significant	None required	Less than Significant

TABLE 2-4 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MOUNT ZION IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Noise			
NOI-MZ-1: Demolition activities proposed under the 2014 LRDP at the Mount Zion campus site would result in a temporary increase in ambient noise levels.	Potentially Significant	Implement **NOI-LRDP-1** *Mitigation Measure NOI-LRDP-1 would reduce noise levels associated with demolition activities by 5 to 10 dBA. However, it is likely that intermittent hoe-ram operations to break up concrete structures could result in noise levels at sensitive receptors in excess of 70 dBA, even after mitigation. Consequently, this impact, although temporary, would be significant and unavoidable.*	Significant and Unavoidable
NOI-MZ-2: Construction activities proposed under the 2014 LRDP at the Mount Zion campus site would result in increases in ambient noise levels over the term of the exterior construction activities.	Potentially Significant	Implement **NOI-LRDP-1** and **NOI-LRDP-2** *Mitigation Measures NOI-LRDP-1 and 2 would reduce the severity of noise generated by construction and pile-driving activities and reduce the potential annoyance to nearby residents and others who could be disturbed by pile-driving to the extent feasible. If piles can be installed though drilling and cast in place measures then these mitigation measures would result in a less than significant impact.* *However, if geotechnical conditions exist such that impact or vibratory pile-driving is required, then construction noise would be significant. Although pile-driving noise would be intermittent and would occur over a short duration (up to about six weeks in total), even after mitigation the noise level would likely exceed 20 dBA during pile-driving activities, resulting in a significant and unavoidable impact.*	Significant and Unavoidable
NOI-MZ-3: Demolition and construction activities proposed under the 2014 LRDP at the Mount Zion campus site could generate ground-borne vibration.	Less than Significant	None required	Less than Significant
NOI-MZ-4: Operational noise generated by development under the 2014 LRDP at the Mount Zion campus site could cause a long-term increase in ambient noise levels in the campus vicinity.	Less than Significant	None required	Less than Significant

TABLE 2-5 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MISSION CENTER IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cultural Resources			
CUL-MC-1: Construction of the proposed office building at the Mission Center campus site would not result in a substantial adverse change in the significance of a historical resource.	Less than Significant	None required	Less than Significant
CUL-MC-2: Construction of the proposed office building at the Mission Center campus site could cause substantial adverse changes to archaeological resources.	Potentially Significant	**CUL-MC-1: Archaeological Testing Program.** Based on a reasonable presumption that archeological resources may be present within the Mission Center campus site, the following measures shall be undertaken to avoid any potentially significant adverse effect from the proposed project on buried archaeological resources. UCSF shall retain the services of an archaeological consultant that meets Secretary of Interior standards for archaeology, and has knowledge of California prehistory and historical archaeology. The archeological consultant shall perform sufficient archival and background research to determine if an archeological testing program is appropriate. The archeological consultant shall prepare an archeological testing plan (ATP). The ATP shall identify the property types of the expected archeological resource(s) that potentially could be adversely affected by the proposed project, the testing method to be used, and the locations recommended for testing. The purpose of the archeological testing program will be to determine to the extent possible the presence or absence of archeological resources and to identify and to evaluate whether any archeological resource encountered on the site constitutes an historical resource under CEQA. If required, an archeological testing program shall be conducted in accordance with the approved ATP. After the completion of the archeological testing program, the archeological consultant shall submit a written report of the findings. If based on the archeological testing program the archeological consultant finds that significant archeological resources may be present, the archeological consultant shall determine if additional measures are warranted. If feasible, the proposed project shall be re-designed so as to avoid any adverse effect on the significant archeological resource. If avoidance is not feasible, additional measures that may be undertaken include additional archeological testing, archeological monitoring, and/or an archeological data recovery program. These measures would be undertaken to reduce to a less than significant level any potential effects on a significant archeological resource as defined in CEQA Guidelines Sect. 15064.5 (a)(c).	Less than Significant

TABLE 2-5 (Continued)
SUMMARY OF 2014 LRDP PROPOSALS – MISSION CENTER IMPACTS AND MITIGATION MEASURES

Environmental Impact	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance After Mitigation
Cultural Resources (cont.)			
CUL-MC-2 (cont.)		**CUL-MC-2: Consultation with Descendant Communities.** On discovery of an archeological site associated with a specific Native American or other descendant group, an appropriate representative of the descendant group shall be contacted. Topics may include archeological field investigations, appropriate archeological treatment of resources, and, if applicable, interpretative treatment of the associated archeological site. A copy of the Final Archaeological Resources Report shall be provided to the representative of the descendant group. **CUL-MC-3: Archaeological Monitoring.** The ATP (Mitigation Measure CUL-MC-1) will determine the need for archaeological monitoring. Should it be required before or after archaeological testing and/or data recovery, an archaeologist that meets the Secretary of the Interior's Standards and Guidelines for professional archaeologists will monitor ground-disturbing activities in areas proposed for ground disturbing activities associated with the building construction. The monitor will be empowered to temporarily halt construction in the immediate vicinity of a discovery while it is evaluated for significance. With the archaeologist's approval, work may continue on other portions of the site. If the discovery proves to be significant, additional measures will be implemented; these may include avoidance, capping beneath a layer of sterile soil, or data recovery through archaeological excavation. Should an archaeological artifact be discovered at the Mission Center campus site during project construction and excavation, pursuant to CEQA Guidelines 15064.5 (f), "provisions for historical or unique archaeological resources accidentally discovered during construction" shall be instituted. In the event that any prehistoric or historic subsurface cultural resources are discovered during ground disturbing activities, all work within 100 feet of the resources shall be halted and UCSF shall consult with a qualified archaeologist or paleontologist to assess the significance of the find (per Public Resource Code Section 5024.1, Title 14 CCR, Section 4852 and/or Public Resource Code 21083.2 in the event of a unique archaeological find). If any find is determined to be significant and will be adversely affected by the project, representatives of UCSF and the qualified archaeologist and/or paleontologist shall meet to determine the appropriate avoidance measures or other appropriate

Cultural Resources (cont.)			
CUL-MC-2 (cont.)		mitigation (per CEQA Guidelines 15064.5 (b) and Public Resource Code 21083.2). All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and documented by the qualified archaeologist according to current professional standards (Per the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation (48 FR44716)). Whether or not significant archeological resources are encountered during monitoring, the archeological consultant shall submit a written report of the findings.	
CUL-MC-3: Construction of the proposed office building at the Mission Center campus site could cause substantial adverse changes to paleontological resources.	Potentially Significant	Implement **CUL-LRDP-4**	Less than Significant
CUL-MC-4: Construction of the proposed office building at the Mission Center campus site could cause substantial adverse changes to human remains.	Potentially Significant	Implement **CUL-MC-1**, **CUL-MC-2**, and **CUL-LRDP-5**	Less than Significant
Geology, Soils and Seismicity			
Geology, soils and seismicity impacts at the Mission Center campus site are included in evaluation of overall 2014 LRDP effects as discussed under **Impact GEO-LRDP-1** and **GEO-LRDP-2** (see Table 2-1).	Less than Significant	None required	Less than Significant
Greenhouse Gas Emissions			
GHG-MC-1: Development at the Mission Center campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions.	Potentially Significant	Implement **GHG-LRDP-1**	Less than Significant
GHG-MC-1: Development at the Mission Center campus site under the 2014 LRDP would result in an increase in operational GHG emissions.	Less than Significant	None required	Less than Significant
Hazards and Hazardous Materials			
HAZ-MC-1: Implementation of the 2014 LRDP at the Mission Center campus site could result in hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or waste within one-quarter mile of existing or proposed schools.	Less than Significant	None required	Less than Significant

CHAPTER 3
Project Description

3.1 Introduction

The University of California, San Francisco (UC San Francisco or UCSF) is one of ten campuses in the University of California (UC) system, and is the only UC campus devoted solely to the health sciences. UCSF's mission is to advance health worldwide through innovative health sciences education, research and patient care.

In support of its mission, UCSF is preparing a new Long Range Development Plan (LRDP) to guide future campus growth and development over a 20+ year planning horizon through the year 2035. UCSF currently occupies 8.04 million gross square feet[1] (gsf) in owned and leased space (excluding 1.62 million gsf in structured parking) in San Francisco. The LRDP plans for projected campus growth of approximately 2.39 million gsf by 2035. Phase 2 of the Medical Center at Mission Bay is not included in the total anticipated development under the LRDP because the 793,500 gsf Phase 2 Medical Center is anticipated to be constructed after the LRDP horizon year of 2035; however, the impacts associated with its construction and operation are evaluated in this EIR in order to provide a conservative analysis of future development of the entire Mission Bay campus site. Therefore, the projected campus growth analyzed in the EIR is approximately 3.18 million gsf. The main objectives of the LRDP are to:

- respond to the City and community context;
- accommodate UCSF's growth through 2035;
- ensure UCSF's facilities are seismically safe;
- promote environmental sustainability; and
- minimize facility costs.

3.2 Purpose of the LRDP

Each UC campus is required to periodically prepare a LRDP to guide campus growth and future physical development. The 2014 LRDP is a comprehensive physical land use plan and policy document that articulates a long-term development strategy for achieving the academic, clinical and research missions of UCSF through the year 2035. It contains objectives to guide decisions for future facilities to meet needs over the next 20 years and projects the quantities and uses of new building space needed during this time frame. Future individual construction projects will be

[1] Gross square feet (gsf), as used for UC facilities, is the sum of all floor areas, finished and unfinished, on all floors of an enclosed structure. It excludes spaces such as attics without flooring, mezzanines, exterior courts, and balconies.

evaluated for general conformity with the LRDP and considered for approval following a community process and any additional environmental analysis and public review required under CEQA. A project is generally found to be in general conformance with the LRDP if the proposed land use is consistent with the functional zones for that campus site and the LRDP objectives. The 2014 LRDP also includes *Community Planning Principles* which were produced in collaboration with the UCSF Community Advisory Group. These *Principles* formalize UCSF's commitment to communicate with neighbors regarding its space needs and potential future development, in order to identify potential community concerns that may arise from UCSF's physical development prior to the time that individual projects are brought forward for approval.

These are intended to aid UCSF in both complementing and advancing the planning priorities of the City and of its campus neighbors. The planning process for the 2014 LRDP is an opportunity for UCSF to assess its needs, establish goals for the future and provide a forum to discuss issues of mutual concern to UCSF, the City and County of San Francisco (City) and the communities surrounding UCSF's main campus sites. The LRDP serves as UCSF's request to the Regents for approval of proposed land use designations, program square footage and population growth during the LRDP planning horizon.

Land use designations are described in the LRDP using functional zones, which provide guidance for where certain types of uses are best located based on desired land use adjacencies and other geographic considerations. The LRDP includes six categories of functional zones: research, clinical, support, housing, open space, and parking. Functional zone maps are provided for the three main campus sites (Parnassus Heights, Mission Bay, and Mount Zion) to guide the location of future capital construction and infrastructure development.

The *1996 LRDP* focused on the acquisition of, and planning for, a major new site, which led to the development of the Mission Bay campus site, toward which UCSF has directed most of its capital resources in the intervening years. The 2014 LRDP contemplates investment in existing facilities and older sites, along with further development at Mission Bay.

In addition to land use designations, program square footage and population growth, the 2014 LRDP includes proposals, two of which would affect the campus as a whole – a Greenhouse Gas Reduction Strategy and an enhanced Transportation Demand Management Program; and a number of development proposals described in this chapter. The 2014 LRDP and its proposals are analyzed at a program level in this EIR, except as noted for those proposals that are analyzed at a project level for CEQA purposes.

This Draft EIR has been prepared in accordance with CEQA to analyze potential environmental impacts that could result from implementing the LRDP. Following public review, the EIR and LRDP will be finalized and submitted to the Regents for their review and approval. Upon adoption by the Regents, this LRDP will replace UCSF's 1996 LRDP, as amended.

3.3 Campus and Context

UCSF is an urban institution with campus sites throughout the City and some locations beyond the city limits comprising a total of approximately 198 acres, 61 of which make up the Mount Sutro Open Space Reserve at the Parnassus Heights campus site. UCSF occupies more than 8.04 million gsf of building space (excluding 1.62 million gsf of structured parking) in both owned and leased buildings. In addition to the three primary campus sites of Parnassus Heights, Mission Bay and Mount Zion, UCSF owns buildings at Mission Center (1855 Folsom Street), Laurel Heights (3333 California Street) and 654 Minnesota Street, which are predominately offices; animal care and research facilities at Hunters Point (830 and 831 Palou Street); a materiel management facility at Oyster Point (616 Forbes Boulevard in South San Francisco); and the Buchanan Dental Center (100 Buchanan Street). UCSF also leases more than a million square feet of space for a variety of purposes at numerous locations in San Francisco. **Figure 3-1** shows the main locations of UCSF-owned and leased sites in San Francisco.

UCSF has long-standing affiliations with San Francisco General Hospital and Trauma Center (SFGH), operated by the City; the San Francisco Veterans Affairs Medical Center (SFVAMC), operated by the U.S. Department of Veteran Affairs, where UCSF faculty provide patient care and conduct professional teaching and research programs; and with research entities such as the J. David Gladstone Institutes. While UCSF leases or otherwise occupies space in exchange for services at SFGH, UCSF does not lease or otherwise control any of the space at the SFVAMC. The remaining UCSF locations outside its main campus sites provide a variety of program space in buildings that are owned or leased by UCSF. UCSF also operates the UCSF Fresno Center for Medical Education and Research in the Central San Joaquin Valley, which provides training for doctors and other health professionals.

Unlike other UC campuses, UCSF has no undergraduate students, but instead has a small population of graduate and medical school students exclusively in health science related fields. The four schools are Dentistry, Medicine, Nursing and Pharmacy. UCSF also offers interdisciplinary graduate programs and numerous postdoctoral programs. UCSF's research enterprise conducts basic research in biology, biochemistry, and other disciplines related to health and disease; carries out translational medicine studies in epidemiology, behavioral, and social sciences; studies health care policies; and provides training in each of these fields. UCSF's clinical enterprise consists of the UCSF Health System—the UCSF Medical Center (the hospitals plus all clinics and physician practices operated by the Medical Center and the School of Medicine and UCSF Benioff Children's Hospital—and the UCSF Dental Center. The UCSF Medical Center is recognized as a world leader in health care. It consists of existing inpatient facilities at Parnassus Heights and Mount Zion, three new specialty hospitals under construction at Mission Bay (the new UCSF Benioff Children's Hospital facility at Mission Bay, plus the UCSF Betty Irene Moore Women's Hospital and the UCSF Bakar Cancer Hospital), and outpatient clinics at these sites and at numerous other locations throughout the City. UCSF Benioff Children's Hospital also entered into an affiliation agreement in January 2014 with Children's Hospital and Research Center Oakland (CHRCO), expanding UCSF's pediatric

UCSF Long Range Development Plan Environmental Impact Report

Figure 3-1

UCSF Main Locations

network in the Greater Bay Area. Mount Zion will become UCSF's outpatient hub by 2015 when existing Mount Zion inpatient uses will relocate to Mission Bay.

Support facilities are designed for staff, students and visitors, and include campus housing, retail, child care, recreation and fitness facilities and parking.

As an urban institution with multiple campus sites, UCSF is located in neighborhoods of highly varied building use, density and design. UCSF facilities and property adjoin residential, neighborhood commercial, research and development, industrial and mixed use districts. All campus sites lie within the urban framework of the city and are served by the city's street network in well-established neighborhoods. The surrounding urban character influences how UCSF buildings and open spaces respond to their context and contribute to the public realm.

In addition, UCSF influences and is influenced by the city in a number of other ways. For example, UCSF maintains a network of shuttles that use city streets to transport faculty, staff, students, patients and patient family members, and formal guests among the campus sites. The amount of parking and housing provided on campus sites affects off-site traffic and off-site housing demand. Many of UCSF's facilities, such as recreation and fitness, child care and conference centers, as well as all of its outdoor areas, are available for public use. Consequently, UCSF works closely with both neighbors and city staff when planning development.

3.4 LRDP Objectives

UCSF's 2014 LRDP contains five main campus-wide objectives to guide UCSF's physical development. The campus-wide objectives are discussed below, followed by campus site-specific objectives.

3.4.1 Campus-Wide Objectives

1. Respond to the City and Community Context

A. Coordinate with City agencies in areas of mutual interest

B. Acknowledge and respond to local zoning and height and bulk limitations to the extent possible

C. Design new buildings to be sensitive to the surrounding neighborhood and landscape, taking into account use, scale, and density

D. Incorporate pedestrian-friendly urban design principles to relate campus buildings to surrounding streetscape and neighborhoods

E. Consult with neighbors in proximity to UCSF's sites, guided by *Community Planning Principles* (see below).

F. Consider neighborhood and city-wide impacts related to UCSF's physical growth

2. Accommodate UCSF's Growth Through 2035

A. Meet physical needs for growth in research, clinical, and instructional programs at appropriate locations

B. Address the need for campus housing for students, postdoctoral scholars, house staff and junior and incoming faculty at main campus sites by constructing an adequate number of new units while taking into account financial feasibility and physical site constraints

C. Provide additional amenities such as retail, permanent child care facilities, recreation and fitness facilities, improved outdoor areas, and other support services to the extent feasible, to enhance the quality of campus life and the public realm

D. Locate programs and activities at campus sites where they are suitable and compatible with UCSF's missions, and best foster collaboration, accommodate interdependent programs and reinforce academic and operational relationships

E. Locate buildings in accordance with campus site-specific objectives, functional zones, and other LRDP elements related to open space, transportation, and utilities

F. Site and design buildings and develop open space in accordance with the universal planning and design principles contained in UCSF's *Physical Design Framework*

3. Ensure UCSF's Facilities are Seismically Safe

A. Ensure inpatient facilities meet state seismic requirements, as set forth in the *Alquist Seismic Safety Act* (SB 1953), by constructing and maintaining modern, seismically safe hospitals and facilities that will remain operational in the event of a major earthquake

B. Plan new facilities and implement improvements to comply with UC's *Seismic Safety Policy*, to ensure a seismically safe environment for UCSF patient, visitors, physicians and staff

C. Designate buildings for renovation, demolition, and replacement as warranted

4. Promote Environmental Sustainability

A. Optimize the use of existing facilities, sites and campus space through repurposing, renovation, densification and consolidation where appropriate

B. Reduce commute travel by providing additional campus housing

C. Reduce the number of UCSF remote locations by consolidation of owned and leased sites, thereby reducing travel between sites

D. Enhance the Transportation Demand Management program by developing adequate facilities and transportation demand reduction policies, to emphasize transportation alternatives that will lessen auto traffic in and around campus sites and to meet changing needs consistent with the City's *Transit First* policy

E. Continue to prioritize scarce parking for use by patients and essential healthcare providers

F. Facilitate growth in an environmentally responsible manner while reducing UCSF's greenhouse gas emissions in compliance with the UC *Sustainable Practices Policy*

and the goals of Assembly Bill 32 (AB32), the California Global Warming Solutions Act.[2]

5. Minimize Facility Costs

A. Invest in existing facilities to reduce future maintenance costs

B. Optimize use of existing space to forestall the construction of new buildings

C. Consolidate leases at owned facilities when appropriate and cost-effective

D. Eliminate remote campus sites

E. Target site expansion in areas that strengthen programmatic relationships, allowing resources and support to be shared

3.4.1.1 Objective 1: Respond to the City and Community Context

UCSF's owned and leased facilities are dispersed throughout San Francisco, a dense urban area with over 825,000 residents living in roughly 49 square miles. Because UCSF facilities are physically integrated into the fabric of the city, and UCSF provides clinical and research services that complement City services (e.g., community clinics) or are in facilities owned by the City (e.g., SFGH), there is close collaboration between the two entities. In 1987, the City and UCSF entered into a *Memorandum of Understanding*, or MOU to foster harmonious relations between the City and UCSF regarding the growth and development of UCSF facilities within the City's boundaries. The MOU describes the responsibilities of the City and UCSF for the oversight of their respective land uses and of the development, maintenance, and use of physical facilities, including methods of communication and consultation regarding UCSF's development.

UCSF consults with the City when planning new development, especially if improvements are being proposed within City rights-of-way adjacent to campus sites. The City coordinates with UCSF whenever changes are being planned in the public streets that run through or adjacent to campus sites. UCSF coordinates on a regular basis with the City of San Francisco Planning Department, Municipal Transportation Agency, Department of Public Works and Office of Community Investment and Infrastructure, among other departments and agencies.

It is UCSF's intent to adhere, to the extent practicable, to City zoning codes related to building use, height, and bulk limitations; floor area ratios; and parking requirements or restrictions. At Mission Bay, campus development is subject to agreements that were negotiated by UCSF with the City and the developer as part of the *Mission Bay Redevelopment Area North and South Plans*.[3] UCSF also works closely with surrounding community members in acknowledgement that UCSF affects neighbors in both positive and negative ways.

---

2 UCSF is required to develop a long-term strategy for voluntarily meeting the State of California's goal for reducing greenhouse gas (GHG) emissions to 1990 levels by 2020, pursuant to the California Global Warming Solutions Act of 2006 (AB32).

3 North plan: www.sfredevelopment.org/Modules/ShowDocument.aspx?documentid=775
South plan: www.sfredevelopment.org/Modules/ShowDocument.aspx?documentid=777

3.4.1.2 Objective 2: Accommodate UCSF's Growth Through 2035

To achieve UCSF's mission over the next 20 years, the LRDP proposes an additional 2.39 million gsf in owned and leased buildings, for a total of 11.56 million gsf across all of UCSF's sites. For the purposes of the EIR analysis, total campus growth in 2035 assumes that the Phase 2 Medical Center at Mission Bay at 793,500 gsf would be constructed during the LRDP horizon. Therefore, the projected campus growth analyzed in the EIR is 3.18 million gsf.

The largest proportion of the LRDP increase in capacity is proposed as clinical space, closely followed by research and campus housing space. A substantial amount of support space is proposed, along with a minor amount of instruction space. The LRDP proposes to accommodate most of this growth in new buildings at the Mission Bay campus site, where there is undeveloped land available and infrastructure planned that will support such growth. Additional space in new buildings is proposed at the Parnassus Heights, Mount Zion, and Mission Center campus sites. At Parnassus Heights and Mount Zion, some existing buildings would need to be demolished to allow for new uses.

New clinical space would be distributed among the Parnassus Heights, Mission Bay, and Mount Zion campus sites as appropriate to maintain or improve operational efficiency and enhance adjacencies with related research programs.

New research space would be developed at Mission Bay and at Mount Zion. The LRDP proposes clinical expansion at the Mount Zion campus site, as well as the demolition of several older buildings. A new research building is being considered at SFGH to provide seismically safe research areas for UCSF employees.[4] Didactic instruction is expected to remain primarily at Parnassus Heights, and new instruction space is expected there, as well as at Mission Bay and Mount Zion, to support overall growth. New campus housing would be developed at Parnassus Heights and at Mission Bay.

3.4.1.3 Objective 3: Ensure UCSF's Facilities are Seismically Safe

Many of the LRDP proposals for building renovation and demolition are in response to UCSF's need to ensure that its facilities are seismically safe.

UC Seismic Safety Policy

The purpose of the UC *Seismic Safety Policy*[5] is to provide an acceptable level of earthquake safety, to the maximum extent feasible by present earthquake engineering practice and university resources, for students, employees and the public who occupy university buildings and other facilities. Feasibility is determined by weighing practicality and the cost of protective measures against severity and probability of injury resulting from seismic occurrences.

[4] Although the new building is discussed in the LRDP, UCSF does not currently own any space at SFGH, and environmental review for the new building at SFGH would occur separately from the LRDP EIR.

[5] http://policy.ucop.edu/doc/3100156/SeismicSafety3100155

In 2012, UCSF updated the seismic evaluations of buildings that had already been assessed, and evaluated those that had not, using a new rating system. This system has seven levels of earthquake damageability, with level V being "Serious," level VI "Severe," and level VII "Dangerous." The highest-priority buildings (those rated level V and above) identified for seismic retrofit, removal, or other appropriate action are:

- **Parnassus Heights:** 735 and 374 Parnassus Avenue, which have since been removed; Clinical Sciences, for which retrofit plans are underway; and UC Hall and the Faculty Alumni House (745 Parnassus Avenue), which are proposed to be retrofitted
- **Mount Zion:** the Hellman and Brunn buildings which are planned for demolition, and the building at 2255 Post Street which is proposed to be retrofitted or demolished
- **SFGH:** five City-owned buildings in which UCSF leases space; UCSF is considering a replacement building

California Senate Bill 1953

In 1994, Senate Bill (SB) 1953 was passed by the California legislature as an amendment to the *Alquist Seismic Safety Act*. The law was in direct response to the Northridge earthquake, which damaged many hospitals in the Los Angeles area. SB 1953 requires hospitals to meet progressively higher levels of seismic safety by retrofitting or replacing facilities that do not meet the newer standards. The intent of the law is to ensure that hospitals are structurally sound and are able to offer uninterrupted service after an earthquake.

Moffitt Hospital and the hospital at Mount Zion have a Structural Performance Category (SPC) rating of SPC-2.[6] These buildings do not significantly jeopardize life, but may not be repairable or functional following strong ground motion. To comply with SB 1953, UCSF is building a new hospital at Mission Bay (opening in February 2015), into which inpatient facilities from both Mount Zion and some from Parnassus Heights will relocate. To meet the 2030 deadline, rather than undergoing an extensive, expensive, and extremely disruptive retrofit of Moffitt Hospital, the UCSF Medical Center plans to build a New Hospital Addition to Long Hospital, which does comply with the higher seismic standards, and to decommission Moffitt Hospital for clinical uses. This addition would be built on the site of the Langley Porter Psychiatric Institute, which is proposed to be demolished.

3.4.1.4 Objective 4: Promote Environmental Sustainability

The University of California has expressed a commitment to responsible stewardship of its physical resources and to demonstrating leadership in sustainable practices. To that end, the UC President has adopted a detailed *Sustainable Practices Policy*[7] that establishes goals for the individual campuses in nine areas of sustainable practices: green building, clean energy,

6 Buildings with SPC-2 ratings must be brought into compliance with the structural provisions of the Alquist Hospital Facilities Seismic Safety Act, its regulations or its retrofit provisions by January 1, 2030, or be removed from acute care service. http://www.oshpd.ca.gov/FDD/seismic_compliance/SB1953/SeisPerfRatings-v3-2.html#SPC2

7 policy.ucop.edu/doc/3100155/Sustainable%20Practices

transportation, climate protection, sustainable operations, waste reduction and recycling, environmentally preferable purchasing, sustainable foodservice and sustainable water systems. In addition, UCSF is striving to reduce the generation of hazardous materials and the use of toxic cleaning and other products. UCSF's Living Green program is intended to inform and engage the campus and medical center community to act more sustainably.

As part of implementing the UC *Sustainable Practices Policy*, UCSF has developed a Climate Action Plan, a long-term strategy for voluntarily meeting the State of California's goal for reducing greenhouse gas (GHG) emissions to 1990 levels by 2020, pursuant to the *California Global Warming Solutions Act of 2006* (AB 32),[8] and also achieving climate neutrality as soon as possible thereafter.

In 2007, UCSF signed the *American College and University President's Climate Commitment* (ACUPCC)[9] to complete an emissions inventory, set target dates and interim milestones for becoming climate-neutral,[10] take steps to reduce GHG emissions and prepare public progress reports. UCSF GHG emissions reduction goals pertain to emissions of the six Kyoto greenhouse gasses originating from sources specified in the ACUPCC.[11] The sustainability policy specifies that these goals will be pursued while maintaining the primary research and education mission of the University.

As part of the LRDP, UCSF is updating its portfolio of GHG reduction strategies (see Appendix D). These strategies include the following: campus infrastructure improvements, renewable energy facilities construction, renewable energy purchase, equipment retrofits, operational energy efficiencies, new construction energy efficiency and measures that can be applied to individual projects with the goal of incrementally reducing UCSF's overall GHG emissions over the LRDP horizon.

The UC President has set a goal for UC to become a zero net energy consumer by 2025 and use only clean energy.[12] UC is now working on the President's initiative to be the first university to achieve net energy and carbon neutrality.

To grow as sustainably as possible, UCSF will minimize new development by reinvesting in existing facilities and utilizing them more efficiently. This will be accomplished by implementing a new campus space policy to ensure optimal use of space, and by increasing the density of occupants.

To promote sustainable transportation and minimize traffic impacts, UCSF proposes to seek opportunities to consolidate its campus population to fewer locations by terminating leases (or vacating spaces upon expiration of leases) and vacating sites in more remote locations, which will

8 www.leginfo.ca.gov/pub/05-06/bill/asm/ab_0001-0050/ab_32_bill_20060927_chaptered.pdf
9 www.presidentsclimatecommitment.org/about/commitment
10 Climate neutrality for UCSF is defined as the University having a net-zero impact on the Earth's climate; it will be achieved by minimizing GHG emissions as much as possible and using carbon offsets or other measures to mitigate the remaining GHG emissions (*UCSF Climate Action Plan*, December 2009).
11 The six greenhouse gases identified in the Kyoto Protocol/ACUPCC are carbon dioxide, methane, nitrous oxide, sulfur hexafluoride, hydrofluorocarbons, and perfluorocarbons.
12 http://sustainability.universityofcalifornia.edu/documents/carbon-neutrality2025.pdf

reduce the amount of private vehicle and UCSF shuttle traffic throughout the day between campus sites. In addition, UCSF proposes to build additional campus housing at the Parnassus Heights and Mission Bay campus sites to reduce commute travel; implement more robust Transportation Demand Management (TDM) measures; reduce truck deliveries to campus sites; prioritize scarce parking for use by patients and essential healthcare providers; and keep parking-space-to-building-space ratios low.

3.4.1.5 Objective 5: Minimize Facility Costs

UCSF proposes to control maintenance costs by investing in existing facilities; limit new construction by using existing and future space more efficiently; minimize the cost of building leases by moving programs into UCSF-owned buildings and consolidating leases; and avoid expensive investment and operational costs by reducing the number of remote campus sites.

3.4.2 Campus Site-Specific Objectives

1. Parnassus Heights

A. Continue to promote excellence and leadership in health science education, maintaining the Parnassus Heights campus site as the central location for classroom instruction.

B. Ensure that adequate space is provided to foster collaboration and to facilitate the inter-dependence and connectivity for operational efficiency and effectiveness of instruction, clinical, research and support uses in close physical proximity to each other.

C. Ensure that Long Hospital and the New Hospital Addition have adequate clinical and administrative support and are aligned with education, research and specialized care programs and support that remain at the campus site.

D. Provide additional campus housing and improve campus life amenities including outdoor space.

E. Strive to better achieve the remaining unfulfilled components of the 1976 Regents' Resolution by reducing space, minimizing population growth, and improving transportation-related programs.

F. Preserve the Mount Sutro Open Space Reserve as permanent open space, and serve as the steward of the Reserve by maintaining and expanding the trail system and by ensuring the safety of visitors and neighboring structures.

2. Mission Bay

A. Accommodate the majority of UCSF's growth through the LRDP horizon.

B. Allow for the consolidation of some of UCSF's leased and remote sites to Mission Bay to reduce operating and occupancy costs.

C. Continue UCSF's commitment to excellence, innovation and collaboration as the university grows and expands the research and education programs at Mission Bay, and continue to support the new UCSF Medical Center at Mission Bay.

D. Strategically expand the existing North Campus at Mission Bay by maximizing the development capacity under the 2014 LRDP while increasing efficiency by aligning and locating interdependent research and clinical teams and joint endeavors at the Mission Bay campus site.

E. Complete Phase 1 of the Medical Center on the South Campus and consolidate specialized services associated with women's, children's and cancer services.

F. Expand campus housing and child care on the North Campus and continue to develop the campus site with new other campus life amenities, such as retail, and outdoor recreation and fitness facilities.

G. Relocate programs from Parnassus Heights to Mission Bay, if they complement programs already located at Mission Bay and are not required to be at Parnassus Heights to function efficiently.

3. Mount Zion

A. Convert the Mount Zion campus site into a patient-friendly ambulatory care center to meet existing and future projected outpatient needs.

B. Address seismically compromised and obsolete buildings.

C. Develop new facilities to accommodate programmatic needs.

3.5 Plan Elements

The four required elements of an LRDP are: (1) land use, (2) open space, (3) circulation, transportation, and parking, and (4) utilities and other infrastructure. The land use element includes functional zone maps that illustrate the general location of proposed uses, which serves to guide future decisions as to where to locate buildings and uses. The open space element indicates the locations of open space, and how it relates to campus buildings and the campus as a whole. The circulation and transportation element considers how people get to and from and around campus sites using various modes of travel, and includes parking. The utilities and other infrastructure element addresses significant utility system or infrastructure facilities needed to accommodate growth. These elements are described in general terms below.

3.5.1 Land Use

UCSF building space is occupied for various institutional uses according to the following major categories:

- **Instruction**, including classrooms, teaching laboratories, seminar rooms, and academic offices
- **Research**, including research conducted in laboratories and offices
- **Clinical**, including space for services provided to patients in hospitals or clinics such as inpatient rooms, surgical rooms, radiation services, diagnostic laboratories, and treatment rooms, and for functions that directly support patient care such as nursing stations, administrative offices, and conference rooms

- **Support**, consisting of the following types of uses:
  - *Academic Support*, including library and animal care space
  - *Academic and Campus Administration*, including all administrative space at the department, school, and campus levels: deans' and directors' offices, conference rooms, copying facilities, etc., as well as non-academic support space such as police, personnel, and accounting offices
  - *Campus Community*, including campus amenities such as recreation, fitness, child care, conference centers, food service, and retail
  - *Logistics*, including space devoted to the delivery of materials and physical plant space such as machine shops, service yards, laundry services, utilities, and storage
- **Housing,** including residential facilities for students, postdoctoral scholars, clinical residents, and faculty

3.5.1.1 Functional Zones

Land use designations are described in the LRDP using functional zones, which provide guidance on where certain types of uses are best located, based on desired land use adjacencies and other geographic considerations. The LRDP includes six categories of functional zones: research, clinical, support, housing, open space, and parking. For program and operational efficiencies, clinical and research functional zones tend to cluster in an area. For circulation reasons, parking functional zones are typically situated on campus edges. To create an active and inviting campus setting, housing, open space and support zones are located throughout the campus sites. **Table 3-1** describes the land use functional zones for UCSF's main campus sites at Parnassus Heights, Mission Bay, and Mount Zion, and the predominant and secondary uses that are permitted within each zone. The space categories above are generally consistent with these functional zones, except instruction space, which is distributed throughout the research, clinical, and support zones.

3.5.2 Open Space

UCSF's open spaces vary widely in size and character. The Mission Bay campus site has a great deal of open space, including Koret Quad and open space plazas at all building entrances; open space and connectivity has been integral to every plan and design for the campus site. The Fourth Street Public Plaza, which is under construction at the UCSF Medical Center at Mission Bay campus site, will include landscaped areas, seating, an amphitheater, multi-use promenade, and bicycle paths. The 61-acre Mount Sutro Open Space Reserve (Reserve), an urban forest under the stewardship of UCSF, is located at the Parnassus Heights campus site and is open to the public; it includes a popular trail system for hiking and biking. The Recreation and Open Space Element of the *San Francisco General Plan* discusses the Green Connections Network, which identifies two trail systems—the Crosstown Trail and the Ridge Trail—that incorporate some of the trails of the Reserve. Otherwise, however, UCSF's open spaces are mainly limited to relatively small courtyards and plazas surrounded by campus buildings, and some tree-lined streets and landscaped areas. These open spaces and landscaped areas complement and provide valuable opportunities for people to relax, socialize, eat lunch, study, play, heal, or otherwise be outdoors.

TABLE 3-1
PREDOMINANT AND SECONDARY USES IN FUNCTIONAL ZONES

Functional Zone	Predominant Use	Secondary Uses
Research	• Research activities	• Offices • Clinics • Instruction space • Support uses • Open space • Parking
Clinical	• Clinical activities	• Offices • Research activities • Instruction space • Support uses • Open space • Parking
Support	• Offices • Food services • Retail • Child care • Recreation and fitness • Conference space • Library • Police services • Animal care • Utilities	• Instruction space • Housing • Open space • Parking
Housing	• Campus housing	• Support uses • Open space • Parking
Open Space[1]	• Major open space areas	• Recreation and fitness • Retail • Parking
Parking	• Structured parking	• Support uses • Open space • Surface Parking

[1] The area designated as Mount Sutro Open Space Reserve shall be kept free of any permanent structures or facilities except footpaths and appropriate landscape construction intended to enhance its use as a natural area.

Under the 2014 LRDP, UCSF is committed to improving existing open space and creating new open space areas as part of new building proposals. These will be improved or developed in accordance with the universal planning and design principles in the UCSF 2010 *Physical Design Framework.* Because of the lack of outdoor recreation and fitness facilities, one priority is a sports field, which can best be accommodated at the Mission Bay campus site.

3.5.3 Circulation, Transportation and Parking

UCSF proposes to continue to enhance its TDM program and encourage its faculty, staff and students to use alternative modes of travel to driving alone to campus sites. Growth would require some additional parking, but consistent with UCSF's parking policy, parking would be prioritized for patients and essential healthcare providers. The LRDP also proposes to reduce congestion and truck deliveries to campus sites through transportation improvement measures. A critical transportation goal is to reduce UCSF's greenhouse gas emissions.

Direct, aesthetic, and experiential pedestrian connectivity is stressed in the UCSF 2010 *Physical Design Framework* and will be considered as buildings and open space are developed. The needs of pedestrians on public streets that pass through campus sites and have UCSF shuttle and Muni stops, particularly Parnassus Avenue at Parnassus Heights, Fourth Street at Mission Bay, and Sutter and Divisadero Streets at Mount Zion, would be given the greatest consideration.

3.5.4 Utilities and Other Infrastructure

Under the 2014 LRDP, UCSF intends to invest considerable financial resources in improving and expanding its infrastructure. This would include utilities within and between existing buildings, as well as utilities to serve new structures. A goal of the LRDP is to shift away from equipping new buildings at the Mission Bay campus site with utilities that could be incorporated more efficiently in a central utility plant, and to install redundant utility loops at the Mission Bay and Parnassus Heights campus sites to increase service reliability.

3.6 Projected Growth

As explained in detail below, this LRDP would provide for an additional 2.39 million gsf of space through 2035 if all the planned capacity were to be developed within that time frame. As noted above, for the purposes of the EIR analysis, campus growth includes the 793,500 gsf Phase 2 Medical Center at Mission Bay. Thus, the total projected campus growth analyzed in the EIR is 3.18 million gsf.

The LRDP is intended to serve as a general guide to the physical development of the campus. The LRDP does not propose a commitment to any specific project, construction schedule or funding priority.

3.6.1 Existing Space and Buildings Under Construction

UCSF currently occupies approximately 8.04 million gsf in owned and leased space at all of its campus sites in San Francisco, excluding approximately 1.62 million gsf in structured parking. In addition to this, approximately 1.13 million gsf of new construction is underway at Mission Bay: the Phase 1 UCSF Medical Center at Mission Bay, scheduled for completion in 2015, and Mission Hall, scheduled for completion in 2014.

Figure 3-2 shows the allocation of all existing UCSF-owned and leased space at all sites in San Francisco among the major space categories. As can be seen in Figure 3-2, there are substantial amounts of support, research and clinical space, with the remaining space divided roughly equally between instruction and housing.

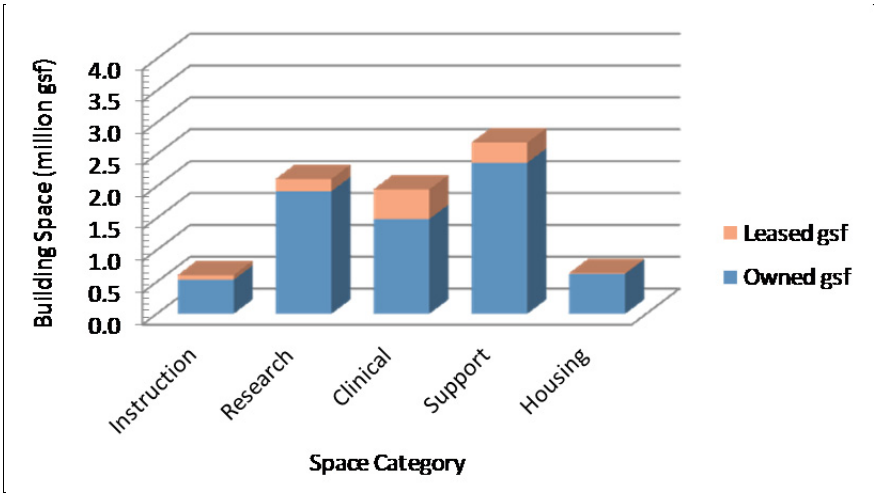

Figure 3-2
Existing Space at All Sites in 2014

3.6.2 LRDP Proposed Space Program

The LRDP proposes an additional 2.39 million gsf, for a total of 11.56 million gsf, in owned and leased buildings across all of UCSF's sites through 2035. The allocation of this space between instruction, clinical, research and support uses is described below. All square footage proposed under the LRDP is subject to funding availability and CEQA evaluation as individual projects arise for consideration.

Although a major portion of the additional space would be accommodated in new buildings on campus sites, some of the need for space would be met by improving utilization of existing vacant or underutilized space, consolidating existing functions or leases, converting existing space to other uses to meet changing priorities (e.g., converting office space at the Parnassus Heights campus site to housing and renovating Moffitt Hospital to provide hospital support areas after 2030).

3.6.2.1 Instruction

The proposed LRDP space program for instruction space is approximately 104,000 gsf over the existing amount of 608,000 gsf. This number is based on projected student enrollment, UCSF's financial ability to renovate academic space to accommodate the increase in the number of students, current classroom utilization rates and other factors.

Figure 3-3 illustrates the number of students projected to be enrolled in each of the four UCSF schools between 2013 and 2035. A total increase of 13% in enrollment is expected by 2025. For purposes of the LRDP, it is assumed that enrollment after 2025 would remain relatively flat because enrollment projections beyond 2025 would be highly speculative.

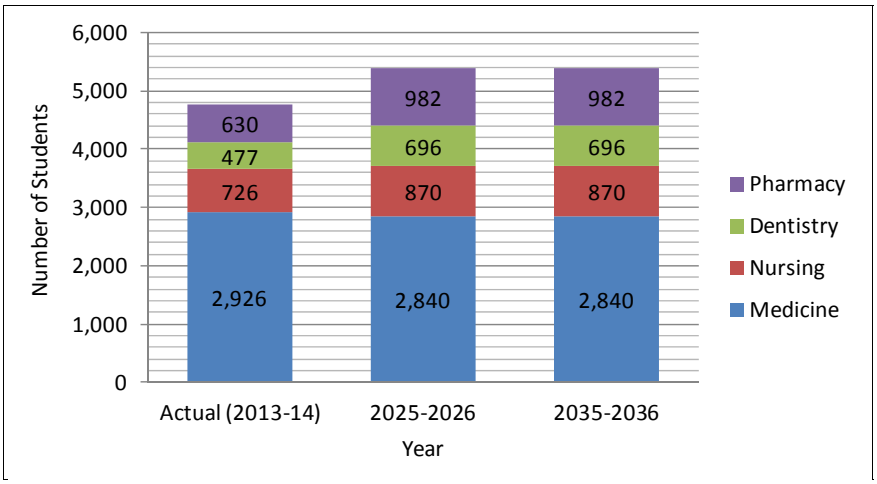

Figure 3-3
Existing and Projected Enrollment

3.6.2.2 Research

The existing amount of research space is about 2,116,800 gsf. The proposed LRDP research space[13] program is 951,500 gsf over the existing amount, for a 2035 total of 3.07 million gsf. This includes space for wet and dry research laboratories, translational research, clinical trials and administrative and technology support. It is assumed that growth in research space need would be met in existing facilities through 2021. Between 2021 and 2030, an annual growth rate of 2.5% in research space need is assumed. Due to the uncertainty in funding, and due to industry trends that could affect research space needs and configurations, it is too speculative to assume additional space or faculty growth beyond 2030. It is assumed that research growth would occur at Mission Bay, both in support of the existing research programs and where future programs would align with the new Medical Center that is currently under construction. Also, additional research space could be developed at Mount Zion.

3.6.2.3 Clinical

The existing amount of clinical space is about 1,952,000 gsf. Driving the need for additional clinical space, the inpatient space need is expected to increase by 23% by 2035. This projection is based on the current hospital average daily census, historical growth, and staff estimates for growth in pediatric, obstetric and other adult programs. It reflects plans to backfill space vacated by moves to Mission Bay in Moffitt Long Hospital at Parnassus Heights and the hospital at Mount Zion after the new Medical Center at Mission Bay opens in early 2015, as well as in the new hospital addition planned at Parnassus Heights by 2030 to respond to the seismic deadline for inpatient facilities. Clinical space growth is expected to be highest in the near term with the opening of the Medical Center at Mission Bay, followed by less growth thereafter with the construction of the new hospital addition at Parnassus Heights by 2030. Between 2030 and 2035,

[13] Research space does not include 18,000 gsf of research support functions and 79,200 gsf for animal care space that are included in the academic support category.

the inpatient average daily census is projected to grow by about 4% and would be accommodated in the new hospital addition at Parnassus Heights and the Medical Center at Mission Bay. Due to the financial resources that will be needed to complete the new hospital addition at Parnassus Heights, it is most likely that the Phase 2 Medical Center at Mission Bay will be built after 2035, beyond the LRDP Horizon. However, for purposes of the EIR analysis, it is assumed that it would be constructed prior to 2035. Outpatient volume is expected to grow by 72% by 2035.[14] Including both inpatient and outpatient space, and assuming the Phase 2 Medical Center is constructed prior to 2035, the total increase in the clinical space[15] program at LRDP horizon is 1,869,600 gsf.

3.6.2.4 Support

The proposed LRDP support space program is projected to be about 709,400 gsf. This growth includes plans to expand child care, retail, recreation and fitness and conference space but excludes structured parking.[16]

3.6.2.5 Housing

The projected LRDP growth of 667,600 gsf for housing is based on the potential capacity for new housing at Parnassus Heights and Mission Bay, and non-residential uses that could be converted to housing at Parnassus Heights.

3.6.2.6 Parking

Surface parking is proposed to be accommodated within each functional zone as an allowable secondary use. Structured parking (i.e., garages) is proposed in the Parking functional zone and is generally proposed to be located at the periphery of main campus sites to enable easier pedestrian movement within the campus core. Smaller garages would be allowed in non-parking zones if built as part of a larger structure such as faculty housing. A summary of existing and proposed parking facilities is shown in Table 4-18 of the Transportation Impact Study (Appendix G).

3.6.2.7 Total Space at LRDP Horizon

Total UCSF owned and leased space across all UCSF sites if all projects in the 2014 LRDP were implemented would be about 11.56 million gsf by 2035, which includes 1.13 million gsf of building space currently under construction at the Mission Bay campus site. This would be an increase of about 3.52 million gsf over the existing 8.04 million gsf; therefore, future growth under the LRDP by 2035 would be 2.39 million gsf.

---

14 This projection is based on compound annual growth rates of 3% through 2020, 2% from 2021 to 2030 and 1% from 2031 to 2035.

15 Clinical space includes 308,000 gsf of new inpatient space at Parnassus Heights, 172,700 gsf of new outpatient space at Parnassus Heights and Mount Zion, and 169,300 gsf of new academic office space at Parnassus Heights (150,100 gsf in UC Hall and CSB) and Mount Zion (19,200 gsf). Not included in Clinical space are office and outpatient space need at Mission Bay that will be accommodated in Mission Hall and in the Medical Center outpatient building to be built by 2015 and 2020, respectively.

16 Some of this space need was determined by applying multipliers to base space needs (e.g., research), or by assuming a constant ratio to the amount of existing space (e.g., logistics).

As assumed for purposes of the EIR, construction of the 793,500 gsf Phase 2 Medical Center at Mission Bay during the LRDP horizon would result in total space of about 12.36 gsf by 2035.

The distribution of total projected space in 2035 is shown in **Figure 3-4** below. **Figures 3-5** and **3-6** compare the existing and future distributions of building space by use category.

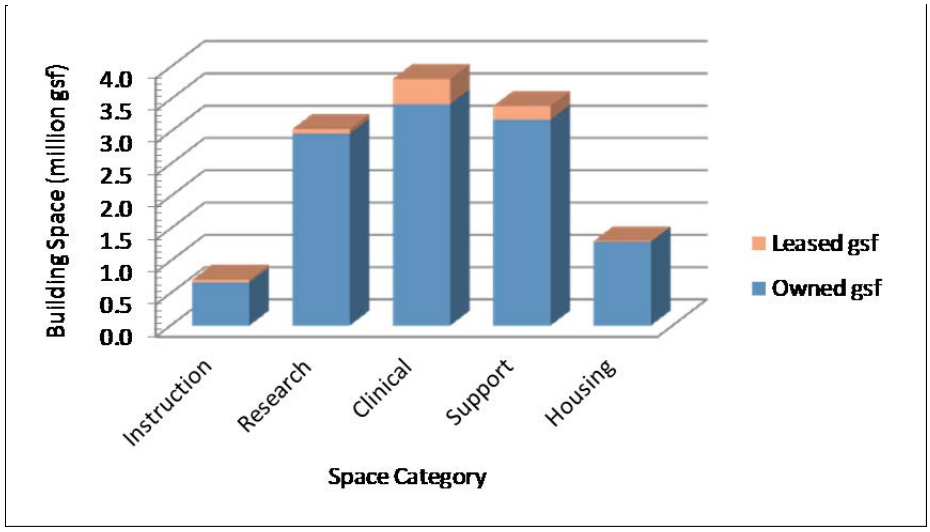

Figure 3-4
Proposed Space at All Sites in 2035

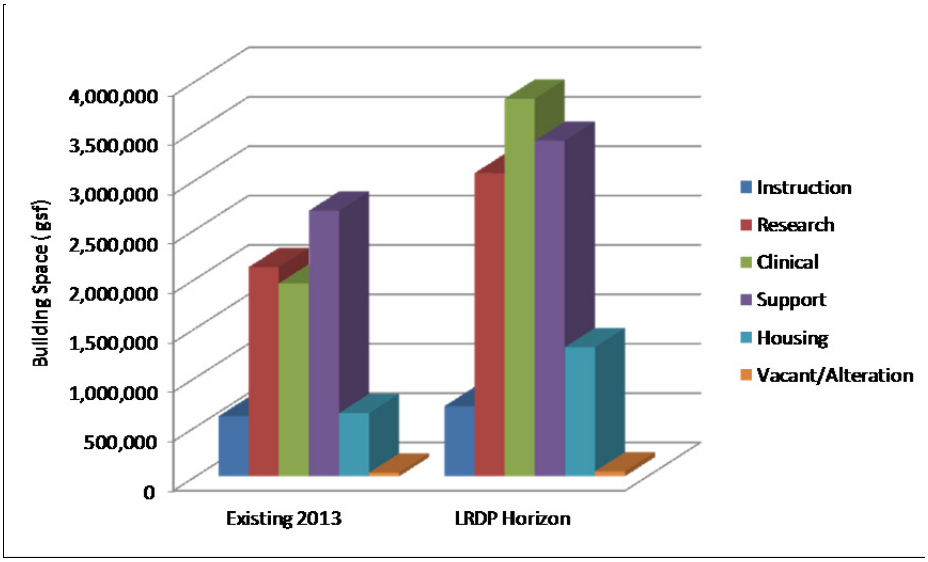

Figure 3-5
Space by Use Category,
Existing and LRDP Horizon

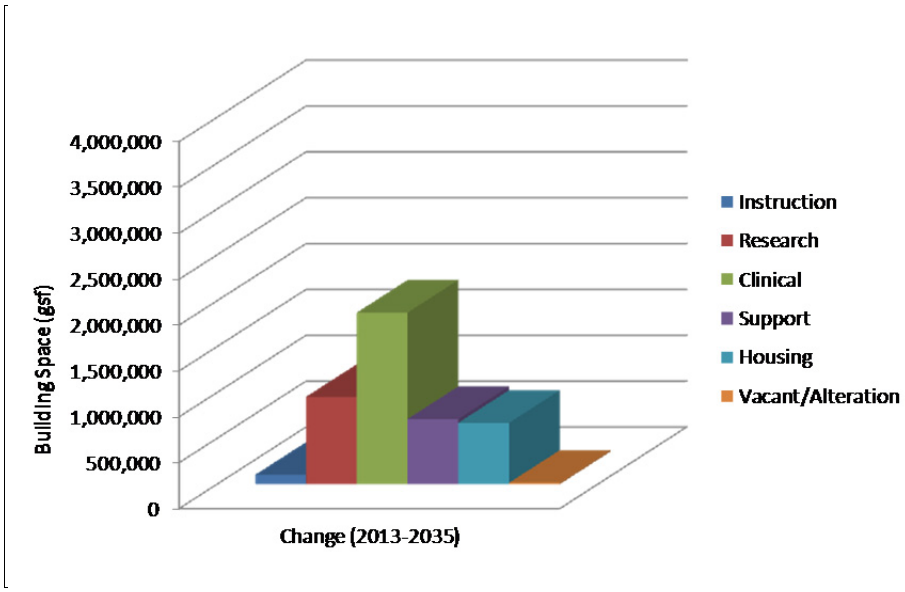

Figure 3-6
Change in Space by Use Category,
Existing to LRDP Horizon

The summary of existing and total projected gsf at LRDP horizon in 2035 is shown below in **Table 3-2**.

TABLE 3-2
SUMMARY OF TOTAL UCSF EXISTING AND LRDP HORIZON GSF

Type of Space	Existing[1,2] Total gsf	LRDP Horizon 2035 Total gsf
Instruction	607,500	708,800
Research	2,116,800	3,068,300
Clinical	1,952,000	3,821,600
Support		
Academic Support	414,400	569,600
Academic/Campus Admin	1,487,000	1,790,800
Campus Community	385,000	473,700
Logistics	400,300	562,600
Support Subtotal	2,687,300	3,396,700
Housing	638,500	1,306,100
Vacant/Alteration	36,200	49,700
Total	**8,038,300**	**12,351,200**

1 Excluding 1,618,100 gsf of structured parking (653,700 gsf at Parnassus Heights; 176,500 gsf at Mount Zion; 680,500 gsf at Mission Bay; and 107,400 at Laurel Heights)
2 Total leased space assumed to be reduced by approximately 300,000 gsf from 1,049,000 gsf at LRDP horizon
3 Includes the 793,500 gsf Phase 2 Medical Center at Mission Bay.
4 Includes Mission Hall and the Phase 1 Medical Center at Mission Bay, both of which are currently under construction on the Mission Bay campus site.

3.6.3 Existing and Projected Population

The estimated UCSF population across all sites in 2013, and upon full implementation of the LRDP space program, is shown below in **Table 3-3**. The projected population at LRDP horizon includes growth associated with the Phase 2 Medical Center at Mission Bay. The total population across all campus sites, including patients and visitors, would increase by approximately 17,000.

TABLE 3-3
EXISTING AND PROJECTED UCSF POPULATION

	Existing (2013)	Projected Population at LRDP Horizon (2035)[8]	Total Change
Students[1]	4,760	5,390	630
Faculty[2]	3,170	4,460	1,290
Staff[3]	16,440	25,530	9,090
Unpaid Faculty[4]	4,920	5,340	420
Postdoctoral Scholars[5]	1,550	1,550	--
Patients[6]	3,560	6,050	2,490
Visitors[7]	5,020	8,100	3,080
Total	**39,420**	**56,420**	**17,000**

1 Students as of Fall 2013; includes all Clinical Residents
2 Does not include volunteer faculty and community health providers
3 Full-time equivalent staff as of Fall 2013
4 The majority of unpaid faculty not physically present on campus daily
5 Includes clinical fellows
6 Average daily inpatient population and outpatient visits to outpatient care clinics, private practice physicians, dental clinics and other referred visits.
7 Includes visitors to patients, faculty, students and staff; conference center visitors; participants in continuing education and recreation programs; volunteers; children at child care facilities; and vendors.
8 Includes population associated with Mission Hall and both Phase 1 and Phase 2 of the Medical Center at Mission Bay.

3.7 LRDP Proposals

The following campus-wide proposals are part of an ongoing planning process conducted by UCSF for the LRDP. Revisions and/or additions to these programs may be made during the LRDP planning process.

3.7.1 Greenhouse Gas Reduction Strategy

The University of California is committed to responsible stewardship of its physical resources and to demonstrating leadership in sustainable practices. To that end, the Regents have adopted a detailed Policy on Sustainable Practices.[17] As part of implementing the policy, UCSF prepared a Climate Action Plan, a long-term strategy for voluntarily meeting the State of California's goal for reducing greenhouse gas (GHG) emissions to 1990 levels by 2020, pursuant to the California Global Warming Solutions Act of 2006 (AB 32).

17 http://policy.ucop.edu/doc/3100155

As an intermediate target, UCSF also has the goal of reducing GHG emissions to 2000 levels by 2014; and intends to achieve climate neutrality[18] as soon as possible after achieving the 2014 and 2020 reduction targets.[19] UCSF GHG emissions reduction goals pertain to Scope 1 and Scope 2 emissions[20] of the six Kyoto greenhouse gasses originating from sources specified in the American College and University Presidents Climate Commitment[21] as well as Scope 3 emissions[22] from business airline travel and commuting by UCSF staff and students. The Regents Policy specifies that these goals will be pursued while maintaining the primary research and education mission of the University.

UCSF has included its proposed GHG Reduction Strategy in the LRDP to provide CEQA analysis of the GHG Reduction Strategy and future development activities under the LRDP, pursuant to the streamlining provisions of CEQA Guidelines Section 15183.5. The GHG Reduction Strategy updates UCSF's portfolio of GHG reduction strategies in categories that pertain to physical development under the LRDP. These categories include the following: campus infrastructure improvements, renewable energy facilities construction, renewable energy purchase, equipment retrofits, operational energy efficiencies, and measures that can be applied to individual projects with the goal of incrementally reducing UCSF's overall GHG emissions over the LRDP horizon. UCSF has prepared and previously published comprehensive emissions inventories covering Scope 1 and 2 for the 1990 baseline, 2000 interim year, year 2008, year 2011, year 2012 and future projections (2014 and 2020).

UCSF reported its 2012 Scope 1 and Scope 2 emissions to The Climate Registry (TCR). Past inventories for 1990 and 2008 were revised during the development of the GHG Reduction Strategy due to discovered data errors (1990) and a change in the UCSF inventory organizational boundary starting in 2012.[23] UCSF total emissions (including Scope 3 emissions from business air travel and commuting) were 109,817 metric tons of carbon dioxide equivalents (CO_2e) in 1990; 156,339 metric tons CO_2e in 2008; and 150,258 metric tons CO_2e in 2012. UCSF's 2012 emissions make up about 2.8% of the City of San Francisco's estimated total emissions of 5.3 million metric tons of CO_2e/year.

18 Climate neutrality is defined as the University having a net zero impact on the Earth's climate, and will be achieved by minimizing GHG emissions as much as possible and using carbon offsets or other measures to mitigate the remaining GHG emissions (UCSF Climate Action Plan, December 2009).

19 CA Executive Order S-3-05 calls for reducing GHG emissions to 80% below 1990 levels by 2050.

20 Scope 1 (Direct Emissions), includes stationary combustion such as boilers, hydrofluorocarbon (HFC) refrigerant use, or combustion of fuels in UCSF-owned vehicles; Scope 2 (Indirect Emissions) includes emissions from purchased electricity for UCSF facilities (UCSF Climate Action Plan, December 2009).

21 The six greenhouse gases identified in the Kyoto Protocol/ACUPCC are carbon dioxide, methane, nitrous oxide, sulfur hexafluoride, hydrofluorocarbons and perfluorocarbons.

22 Scope 3 emissions are indirect emissions (other than those associated with purchased electricity or steam) that are a consequence of the activities of UCSF, but occur from sources not owned or controlled by UCSF.

23 As explained in the GHG Reduction Strategy, starting with the 2012 GHG inventory reported to TCR, UCSF delineates its organizational boundary using the financial control criterion. Under financial control, UCSF reports emissions from facilities and sources that are wholly-owned, and from facilities and sources that are partially-owned but where UCSF retains financial control (e.g., through a capital or financial lease, or where majority ownership establishes management control). Due to this organizational boundary change, the boundaries of inventories pre-dating 2012 were adjusted to enable direct comparison with current and future inventories. Essentially, emissions associated with leased facilities were removed from the pre-2012 inventories.

The California Air Resource Board has proposed an efficiency threshold of 4.6 metric tons of CO_2e /year per service population (residents plus employees) for the State in order to meet the year 2020 goal of AB 32. UCSF per capita emissions for 2013 were 5.5 metric tons of CO_2e/year, slightly lower than the 6.5 metric tons of CO_2e/year per capita emissions for the City of San Francisco.

UCSF currently has one facility – the Parnassus Central Utility Plant – that is subject to Cap-and-Trade rules under AB 32. UCSF has pre-purchased Cap-and-Trade allowances for this facility for future years. UCSF has also committed to purchasing additional offsets to meet its 2014 interim Sustainable Practices policy goal. Despite the addition of significant space and population over the life of the LRDP, UCSF anticipates meeting its 2020 emissions goals.

The UC President has set a goal for UC to become "carbon neutral" by 2025 and purchase only clean energy. UC is now working on the President's initiative to be the first major research university to achieve net energy and carbon neutrality.[24]

3.7.2 Transportation Demand Management Program

UCSF currently manages a robust campus-wide TDM program with the goal of reducing single-occupant vehicle (SOV) trips to all of the campus sites. The details of this program are presented in Section 5.14, *Transportation and Traffic*. To minimize traffic generated by UCSF current and planned facilities, UCSF proposes to implement more robust TDM measures. These measures were developed as part of an internal planning process to identify feasible TDM measures that could reasonably result in a reduction in UCSF-generated SOV trips, given UCSF's already low SOV rate.[25] To accomplish this, UCSF would implement some or all of the following in the 2014 LRDP:

- Expand UCSF Vanpool Program (add new vanpools and subsidize costs to attract new riders);
- Develop more robust UCSF Carpool Matching and convert additional parking spaces to carpool only;
- Enhance existing City CarShare pods on campus sites and participate in the city's new Medical Center Rideshare program;
- Increase supply and access to bicycle parking and showers/lockers;
- Enhance shuttle system with Wifi and Next Bus;
- Limit parking for non-faculty tenants in new housing;
- Gradually increase cost of employee parking, over time; and
- Promote flexible work schedules, as possible.

[24] President Janet Napolitano in an address to the UC Board of Regents, November 2013.
[25] At present, less than 35% of all UCSF-generated trips are by single-occupant vehicle.

As a matter of course in managing campus operations, UCSF monitors transportation conditions at all campus sites, and, in relation to the proposed 2014 LRDP, would continue to do so in particular at the four UCSF campus sites where development is proposed. As the campus sites develop, UCSF would monitor vehicle traffic conditions, transit operations, shuttle ridership, adequacy of pedestrian and bicycle facilities, and loading and parking conditions within and surrounding the campus sites. The results of monitoring would inform when and whether UCSF would implement these additional TDM strategies, enhance shuttle service, or make other operational improvements to ensure transportation facilities are sufficient and safe.

3.8 Campus Site Locations and Proposed Physical Development Plans

The following development plans are part of an ongoing planning process conducted by UCSF for the LRDP. Revisions and/or additions to these programs may be made during the LRDP planning process.

3.8.1 Parnassus Heights

The Parnassus Heights campus site is the oldest and largest of the UCSF campus sites, occupying about 107 acres of land at the base of Mount Sutro, in the Inner Sunset mixed-use neighborhood. The campus site is bounded by Carl and Irving Streets to the north, Fifth Avenue to the west and Clarendon Avenue, Christopher Drive and Crestmont Drive to the south. The eastern boundary abuts the Cole Valley neighborhood and the City's Interior Greenbelt Natural Area. UCSF's facilities are concentrated at the north end of the campus site where Moffitt and Long Hospitals, the four schools, clinics, research, auxiliary services, housing, parking and other support uses are located. The 61-acre Mount Sutro Open Space Reserve (Reserve) occupies the central and southern portion of the campus site, up to 400 feet in elevation above Parnassus Avenue. The Reserve is designated by the Regents as permanent open space and is available for public use. Adjacent to the Reserve are three small office and support buildings, Environmental Health and Safety, Aldea Housing (formerly the Aldea San Miguel apartment complex), and a community center. These buildings are accessible via Medical Center Way, a narrow, two-lane campus road.

Parnassus Heights is the primary UCSF campus site for providing instruction, a role that is expected to continue through the 20+ year planning horizon of the LRDP. The population of the campus site consists of students, faculty and staff, patients, visitors and residents of UCSF housing. The total population of Parnassus Heights is not expected to grow substantially over the life of the LRDP. Changes in population, however, will reflect changes in the types and uses of space at the site. As of 2013, approximately 80% of UCSF's 4,760 students are educated at Parnassus Heights. The majority of the projected growth in student enrollment is expected to occur here. An additional 630 students are expected at Parnassus Heights. There are currently over 8,300 UCSF faculty and staff employed at the Parnassus Heights campus site, which is not expected to increase under the LRDP. 560 residents currently reside in UCSF housing at Parnassus Heights. This number could grow to 980 residents with the proposed new housing and with the future conversion of existing program space into housing. Over 256,000 outpatient visits per year are currently seen at clinics at

Parnassus Heights. Depending on the future mix of services, this number could grow to 340,000 outpatient visits per year during the life of the LRDP.

3.8.1.1 1976 Regents' Resolution

In the 1976 Regents' Resolution[26], that was adopted to address potential impacts associated with development of the Parnassus Heights campus site, the Regents' designated the Mount Sutro Open Space Reserve as a permanent open space[27]; defined campus boundaries to prohibit further property acquisition (by purchase, condemnation or gift) and leasing of private residential properties outside this area by UCSF; directed that the houses acquired and occupied by UCSF on Third Avenue, Fifth Avenue, Parnassus Avenue, Irving Street and Kirkham Street be returned to residential use, and that some be sold; and adopted a limit on the amount of built space of 3.55 million gsf, commonly referred to as the "space ceiling", within the newly designated campus site boundaries. The space ceiling applies to all building space, including parking structures, but excludes residential uses in UCSF buildings on Third, Fourth, Fifth, and Parnassus Avenues and Kirkham and Irving Streets. The space ceiling was intended to limit environmental impacts such as traffic and parking impacts on the neighborhoods surrounding the Parnassus Heights campus site by limiting UCSF's square footage. Currently, Parnassus Heights contains approximately 3.845 million gsf of space, approximately 295,000 gsf or 8.3% above the space ceiling limit. The LRDP identifies strategies to reduce the space ceiling overage over the life of the LRDP.

The 1976 Regents' Resolution also recognized the principle of limiting the average daily population at Parnassus Heights to be substantially in accordance with the level projected in the 1976 LRDP EIR (13,400 persons). The 1982 LRDP limited use of the Parnassus Heights campus site to purely academic and clinical functions and called for the relocation of most campus-wide administrative functions to other sites that subsequently had to be purchased or leased. The 1996 LRDP established a new goal to limit the average daily population to 16,000 persons. Currently, the average daily population at Parnassus Heights is estimated at approximately 17,950 persons.

3.8.1.2 Proposed Update to the 1976 Regents' Resolution

UCSF proposes to ask the Regents to update the 1976 Regents' Resolution to:.

- Reaffirm continuing commitments, including 1) maintaining the designation of the Mount Sutro Open Space Reserve as permanent open space; 2) continuing to respect the Parnassus Heights campus boundary established in 1976; and 3) continuing to adhere to the expansion restriction area within which UCSF would not acquire property or lease residential property.

- Remove references to aspects of the 1976 Regents' Resolution that have already been fulfilled, including 1) the conversion of office space in houses on Third, Fifth, and Parnassus Avenues back to residential use; 2) the sale of certain parcels on Third Avenue; and 3) the allocation of funds for traffic studies related to the 1976 LRDP.

[26] The 1976 Regents' Resolution was incorporated in the 1976 LRDP and all subsequent EIRs.

[27] The reserve on Mount Sutro was designated as open space for a 25-year period by the Regents in 1975. In the 1976 Regents' Resolution, the Regents increased the Mount Sutro Open Space Reserve from 52 acres to 58 acres and made the open space designation permanent. The 1996 LRDP updated the boundaries of the Reserve to reflect the results of a survey which found that the Reserve contained an additional three acres, for a total of 61 acres.

- Modify the way space and population are monitored at the Parnassus Heights campus site by 1) excluding all housing from the calculation of space subject to the Parnassus Heights space ceiling, and 2) tying the average daily population goal for the Parnassus Heights campus site to population projections contained in the LRDP EIR, as it may be updated from time to time. Both of these proposed modifications are discussed further below.

The 2014 LRDP proposes to exclude all residential space within the Parnassus Heights campus site boundaries from the space ceiling calculation, regardless of where it is located, to help meet UCSF's housing goals and support city-wide housing goals. With this change, the three older Aldea Housing buildings and University House, which together contain approximately 132,400 gsf, would be removed from the space ceiling calculation. The proposed modification to exclude all residential space from the space ceiling calculation recognizes the importance of campus housing in supporting Citywide housing goals, improving UCSF's jobs-housing balance, lessening traffic impacts, and enhancing campus vitality and focuses the monitoring of space on non-residential space. This proposed change also recognizes the growing community sentiment that UCSF should provide on-campus housing, and this is something to be fostered, not penalized. All non-residential space[28] would continue to be included in the space ceiling calculation.

The exclusion of all residential space from the space ceiling calculation, plus all of the physical proposals for the Parnassus Heights campus site described in the 2014 LRDP and analyzed in this EIR, would decrease the amount of space subject to the space ceiling to approximately 3.61 million gsf by the LRDP horizon of 2035, or approximately 60,000 gsf (1.7%) above the 3.55 million gsf space ceiling limit.

With the proposed modification to the *1976 Regents' Resolution*, described above, to remove all residential space from the space ceiling calculation, the three older Aldea Housing buildings (which contain a total of 42 one-bedroom units) previously planned for demolition are proposed to be retained, due to the current demand for housing in San Francisco and the scarcity of affordable housing options for UCSF population groups; retention of the units would provide much needed housing for UCSF students and personnel. The 2014 LRDP and update to the *1976 Regents' Resolution* would supersede the Aldea Agreements[29] to reflect this change.

As described above, the principle of administering the Parnassus Heights campus site in accordance with average daily population projections contained in the LRDP EIR was included in the *1976 Regents' Resolution*. The 2014 LRDP reaffirms this principle, and proposes to tie average daily population projections for the Parnassus Heights campus site to the then-current LRDP EIR, as updated from time to time and approved by the Regents. The 2014 LRDP EIR projects an average daily population for the Parnassus Heights campus site of approximately 18,600 persons in 2035.

---

28 Non-residential space subject to the space ceiling is measured using Basic Gross Area, which is the sum of all area, finished and unfinished, on the floors of the building included within the outside face of the environmentally controlled envelope for all stories or areas which have floor surfaces. Basic Gross Area includes garages, lobbies and other such spaces, but excludes all open to the weather spaces, such as light wells, courts, balconies, plazas, etc.

29 The Aldea Agreements are a series of agreements related to the occupancy/demolition of the remaining older Aldea Housing buildings. For information, please see the Draft 2014 LRDP, p. 53.

3.8.1.3 Proposed Functional Zones

The existing functional zones of the Parnassus Heights campus site is depicted in **Figure 3-7**. Proposed functional zones are shown in **Figure 3-8**. These zones reflect the desired predominant land uses through 2035. Other uses may occur in these zones as indicated in Table 3-1.

Under the 2014 LRDP, the Housing zone would be enlarged to capture UC Hall and Proctor, which are proposed for housing[30], from the Instruction and Research zone (which would be reclassified as Research). The Kirkham Child Care Center would be reclassified from Housing to Support. The Environmental Health and Safety Annex and the Mechanical Annex (formerly known as Emergency Fire Water Pumphouse and Ammonia Tank) on Parnassus Avenue would be newly classified as Support. The former Campus Community and Logistical Support functional zones would be combined into a single Support zone, with a new, separate Parking zone for structured parking. The footprints of the Environmental Health and Safety, Surge and Woods buildings proposed for demolition would be reclassified as Open Space and would become part of the Reserve.

3.8.1.4 Proposed Plan

With the goal of reducing the space ceiling overage, the LRDP proposes to: 1) convert some existing office space (in UC Hall and Millberry Union towers) to residential use, and 2) demolish a number of buildings and either move occupants and programs to other campus sites or absorb them into other buildings at Parnassus Heights.

UCSF would also implement additional TDM measures beyond those that have already been implemented to further help reduce traffic impacts on neighbors. In addition, high-volume clinics may be relocated to other campus sites. Many of these actions are proposed for implementation before the New Hospital Addition would be built by 2030. The proposed New Hospital Addition is driven by a State mandate to address seismically vulnerable buildings in compliance with SB 1953 by 2030. UCSF currently plans to comply with this legislation by decommissioning Moffitt Hospital for acute care use and constructing a New Hospital Addition physically connected to Long Hospital (which does comply with SB 1953) after demolishing the Langley Porter Psychiatric Institute building.

Because UCSF proposes to backfill Moffitt Hospital with outpatient facilities, hospital support and other campus uses after the New Hospital Addition is constructed, the overall gross square feet at Parnassus Heights campus site would increase and other actions would need to be considered to offset the net new space both before and after the New Hospital Addition is built.

LRDP proposals at the Parnassus Heights campus site are discussed below and depicted on **Figure 3-9**.

30 The Proctor site could instead become open space.

Parnassus Heights-Proposed Plan

3.8.1.5 2014 LRDP Proposals at the Parnassus Heights Campus Site

The following proposals fulfill the 2014 LRDP site-specific objectives at the Parnassus Heights campus site:

Land Use

Demolish the Laboratory of Radiobiology, Medical Research 4, Surge, Woods, Environmental Health and Safety (EHS), Langley Porter Psychiatric Institute (LPPI), Koret Vision Research (Koret), and Proctor buildings.

In order to reduce the space ceiling overage, the 1996 LRDP proposed to demolish seven small buildings, five of which have not yet been demolished: the Laboratory of Radiobiology, Medical Research 4, Surge, Woods, and the Proctor building (735 and 374 Parnassus Avenue have been demolished). Together, these five buildings contain about 55,600 gsf. None of the small buildings are potentially eligible for the CRHR or the NRHP, with the exception of the Surge building, which was constructed in 1966 and would likely be eligible for the CRHR and NRHP when it reaches 50 years of age in 2016.[31]

After demolition of the Laboratory of Radiobiology and the Medical Research 4 buildings, their sites would be used for construction staging for the renovation of the Clinical Sciences building and UC Hall, and would subsequently be developed to provide additional surface parking. The Clinical Sciences building is scheduled to be renovated in mid-2014 and is not included as part of the LRDP proposals. The Medical Research 4 site may also be developed with an expanded outdoor play yard space for the nearby Kirkham Child Care Center. The Surge and Woods building sites would be restored to open space and incorporated into the Reserve, though their existing parking areas would remain.

The two-story 6,200 gsf EHS building is located south and uphill of the Dolby Regeneration Medicine building across Medical Center Way on the northern edge of the Reserve. The occupants would be moved into other buildings on the campus site and the building demolished before the construction of a New Hospital Addition. The site would be restored as open space and added to the Reserve, though the existing parking area would remain. The building was constructed in 1971. It was determined to be ineligible for inclusion in the CRHR or the NRHP and is not listed on a local register. Hence, it is not considered to be a historic resource. The adjacent Annex building would remain.

LPPI is located on the east side of the campus site on Parnassus Avenue and Medical Center Way. The seven-story 104,800 gsf LPPI building houses psychiatric inpatient and outpatient uses, as well as instruction, research and administrative space. LPPI and three small support structures are planned to be demolished to allow for construction of a New Hospital Addition. The LPPI building, constructed in 1941, and the three small support buildings have been determined to be ineligible for inclusion in the CRHR and the NRHP. They are not identified on any local registers or surveys and are not considered historic resources.

Located behind the Dental Clinics building and UC Hall on Koret Way, the four-story Koret Vision Research building contains approximately 43,000 gsf. The Koret Vision

31 Carey & Company, Inc., *UCSF Historic Resources Survey*, February 8, 2011, p. 49.

Research building would be demolished toward the end of the LRDP horizon, after the New Hospital Addition is built and Moffitt Hospital is renovated and can accommodate Koret Vision Research occupants and programs. The demolition would help UCSF reduce the space ceiling overage. The site may be developed with parking or open space. Constructed in 1986, this building will be 49 years old by 2035. It has not yet been evaluated for its historic significance.

Because the Proctor building was constructed with funds donated by the Proctor family for use by the foundation for its clinical, research and teaching functions, UCSF is obligated to provide the Proctor Foundation with comparable replacement space or funds to construct equivalent new space. Such obligations must be met before the building is vacated and demolished; therefore, demolition of the Proctor building is likely to occur toward the end of the LRDP horizon.

Construct a New Hospital Addition building on the LPPI site. In order to comply with the requirements of the *Alquist Seismic Safety Act*, as amended, a New Hospital Addition, containing approximately 308,000 gsf and connected to Long Hospital is proposed on the LPPI site, to replace inpatient facilities currently in Moffitt Hospital. Construction would take about four years, ending by 2030. The New Hospital Addition would contain up to 140 beds and would be seven stories or about 110 feet in height, excluding rooftop mechanical equipment which could add up to an additional 17 feet. The building has not yet been designed, but is proposed to be set back from Parnassus Avenue to include a loop driveway for passenger drop-off/pick-up, parking and loading, and exiting directly across from Hillway Avenue. When the building is designed in the future, some of the current loading areas may be redesigned or repurposed to provide additional loading space off of Medical Center Way. During the LRDP planning process, desirable building features were identified for the hospital addition design. It is important that the New Hospital Addition have an attractive appearance and pedestrian scale along Parnassus Avenue, and the upper portion of the building be designed to minimize shade on the street. As the eastern gateway to the campus site, the building would be designed to be architecturally prominent.

Renovate and reuse Moffitt Hospital with non-acute care uses. After the addition to Long Hospital is constructed, the inpatient uses currently in Moffitt Hospital would be moved to a New Hospital Addition. The decommissioned Moffitt Hospital would be renovated and repurposed for outpatient, hospital support and other non-acute care uses. The existing circular driveway along Parnassus Avenue, which would no longer be needed for patient drop-off and pick-up, would be repurposed and could be used for commercial loading, shuttle loading or open space.

Renovate and reuse UC Hall. Built in 1917, UC Hall is one of the oldest buildings on the Parnassus Heights campus site. It is potentially eligible for the California Register of Historical Resources (CRHR) and the National Register of Historic Places (NRHP). This seven-story building is located on Parnassus Avenue, at the west end of the campus site, and constitutes approximately 148,300 gsf. UC Hall was identified for demolition in the 1996 LRDP and 1982 LRDP in order to reduce the space ceiling overage. However, UCSF now proposes to retain, seismically retrofit, renovate and reuse UC Hall for housing and offices by 2019. This would allow UCSF to preserve an historic resource, help meet campus housing goals, and reduce the overage of program space that counts against the space ceiling, by reusing UC Hall for housing which is exempt from the space ceiling calculation. In Phase 1, it is proposed that the top three floors be renovated for student housing and the lower three

floors for offices. Retail, meeting, housing, office, and storage space could be located on the ground floor, along with a new loading dock at the west end of the building. In Phase 2, it is proposed that the three floors with offices be converted to housing; this would occur after Moffitt Hospital is decommissioned, renovated, and available for other uses, including the office use displaced from UC Hall. With the completion of Phase 2, it is estimated that the building would contain approximately 210 beds in about 170 units. UCSF retained the firm of Page & Turnbull, an architectural firm specializing in historic preservation, to make preliminary recommendations regarding alterations to the exterior of UC Hall that would be consistent with the Secretary of the Interior's Standards for Rehabilitation. UCSF would follow those recommendations to ensure that, in carrying out the renovation project, the Secretary of the Interior's Standards for Rehabilitation are met.

Convert Millberry Union towers from office to residential use. The Millberry Union towers, used as office space, constitute about 47,100 gsf. UCSF proposes to convert the upper levels to student housing (the original use of the towers). Preliminary studies indicate that up to 83 studio and one-bedroom units could be provided. This conversion is expected to occur toward the end of the LRDP horizon after Moffitt Hospital is vacated and renovated, so that the office occupants in the Millberry Union towers could be relocated into Moffitt. The support uses on Millberry Union's ground floor and the levels below, which are mostly retail, office and a limited amount of outpatient space, are expected to continue.

Construct faculty housing at Fifth Avenue and Parnassus Avenue. UCSF may propose to build faculty housing next to the Faculty Alumni house at 745 Parnassus Avenue. UCSF is currently conducting a feasibility analysis for constructing five units of housing on the 1414 Fifth Avenue site and up to 40 units on the former site of 735 Parnassus for a total of up to 45 units and about 48,400 gsf in an L-shape configuration around the Faculty Alumni House.

Construct faculty housing on the Proctor site. The Proctor site may be developed with housing if it is not developed as open space. The Proctor site may be developed with up to 32 residential units.

Complete the Conversion of Fifth Avenue houses to faculty housing. UCSF owns 17 houses along Fifth Avenue between Parnassus Avenue and Kirkham Street, of which approximately two-thirds are used as faculty housing. Over the LRDP horizon, UCSF proposes to continue to convert the remaining houses on Fifth Avenue to faculty housing.

Seismically retrofit the Faculty Alumni House. UCSF proposes to retrofit the Faculty Alumni House at 745 Parnassus Avenue to meet seismic standards.

Open Space

Continue to manage the Mount Sutro Open Space Reserve as permanent open space, and create new/restored trails. To enhance and improve access throughout the Reserve for the enjoyment of visitors three new trails are proposed in the Mount Sutro Reserve: 1) a trail on the north side of the Reserve connecting the Historic Trail to the campus, allowing for ease of access to/from the campus (Sunset Trail). This trail would begin near the Koret Vision Research building and connect with Medical Center Way before continuing to the Historic Trail; 2) a trail connecting the South Ridge and Quarry Road Trails to Christopher Drive, allowing for easier public access from the south side of the Reserve (Christopher

Trail); and 3) an extension of this trail to Clarendon Avenue, which also would provide access to trails in the Interior Greenbelt (on City-owned land) located southeast of the Reserve (Clarendon Trail). The proposed trail alignments are approximate and have not yet been designed. Creating these new trails will require minimal vegetation removal, minor amounts of grading and new trail markers. (See **Figure 3-10**)

Renovate Saunders Court and enhance the pedestrian spine. The LRDP proposes to renovate Saunders Court to improve its functionality for general use and special events, to make it more attractive and engaging, and to provide greater connectivity to Parnassus Avenue through Clinical Sciences. Improvements may include an expansion of the pavement, seating and tables at the north end to accommodate more people without compromising pedestrian movement between Medical Sciences and School of Nursing buildings; a new diagonal walkway with historic information about UCSF, which would cut through the center of the courtyard; conversion of part of the lawn to a different surface material; new plants; features that minimize windy conditions; and better access for the disabled and for fire trucks. (See **Figure 3-11**)

An existing walkway between the Schools of Dentistry and Nursing and extending to the south past the Koret Vision Research building is referred to as the campus pedestrian spine. As adjacent buildings are renovated or demolished, UCSF would consider additional landscaping, seating nodes, better lighting, higher quality paving, and weather protection to enhance the pedestrian experience and to encourage more social interaction.

Circulation, Transportation and Parking

Implement Parnassus Avenue Streetscape Plan. As UCSF renovates the Clinical Sciences and UC Hall buildings, and builds new faculty housing near the Fifth and Parnassus Avenue intersection, UCSF proposes to begin implementing the Parnassus Avenue Streetscape Plan. This plan calls for improvements that make crossing the street safer and more convenient for pedestrians; increase bicycle safety; reorganize and improve transit and UCSF shuttle operations; create more usable outdoor space; strengthen UCSF's identity; and enhance the public realm as called for in the *Physical Design Framework*. Improvements may include new paving, street furniture, lighting and street trees, as well as sidewalk and crosswalk widening and better defined campus gateways. These improvements are proposed to occur in phases starting on the south side of Parnassus Avenue, at the west end at Fifth Avenue, and moving through the campus core of the campus site and along the front of the New Hospital Addition, finishing at Medical Center Way.

Reduce congestion through parking and loading improvements. To reduce congestion on Parnassus Avenue, UCSF proposes to develop more off-street parking and loading and increase parking enforcement to reduce competition for on-street parking. UCSF proposes new loading areas accessible from Parnassus Avenue, and new parking areas, accessible through the Fifth and Kirkham intersection. Most of the new parking will be designated as contractor parking, which generates less traffic throughout the day than patient or visitor parking. In addition, some loading areas would be removed as a result of proposed building demolitions.

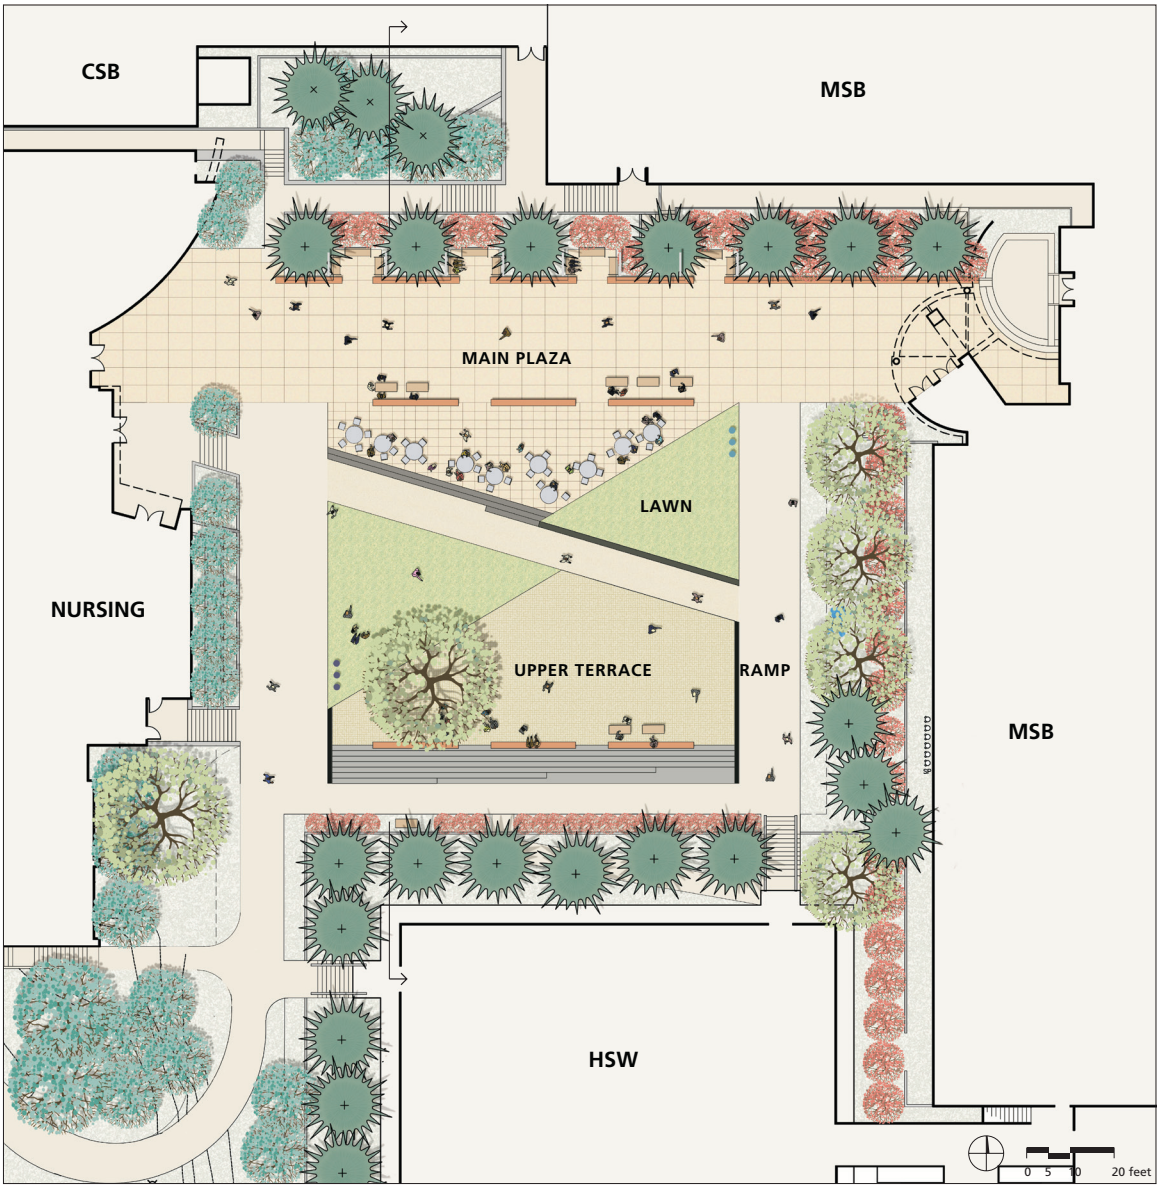
In order to improve loading and delivery operations, UCSF proposes to implement a cross-docking model where vendors deliver goods to Oyster Point and goods are consolidated onto UCSF vehicles for delivery, limiting the number of individual deliveries to this and other campus sites. Oyster Point houses UCSF's Distribution and Storage warehouse,

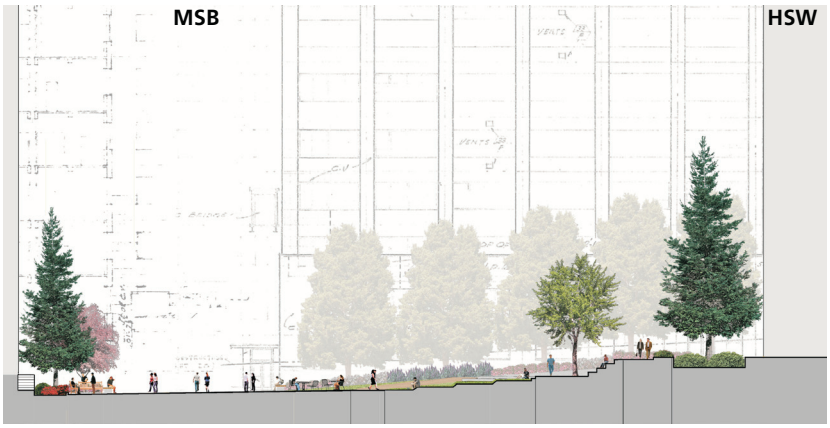
SOURCE: UCSF

UCSF Long Range Development Plan Environmental Impact Report

Figure 3-10

Parnassus Heights-Proposed Open Space Plan





UPPER TERRACE
Conceived as a quiet alternative to the more active main plaza, the upper terrace offers seating for small groups and open areas for larger events. The surface of sand-set stone pavers is punctuated by a single sculptural tree. Stairs form a simple backdrop and provide additional seating.

MAIN PLAZA
The enlarged plaza captures the sunniest portion of the court. Seatwalls finished with wood line the plaza. Pocket spaces with benches offer a sunny yet sheltered place for pause, conversation, or lunch. Tables and benches allow flexible gathering as the weather permits. Wood seating units in the center of the plaza are movable to allow for large events.

WALKWAYS & RAMPS
The eastern walkway, connecting to HSW, is graded to be accessible. Required fire truck access is provided by 20 foot lanes- often accomplished with planted paver strips.

LAWN
Lawn areas are used purposefully to green the courtyard and provide sloped seating during special events.

SOURCE: UCSF

UCSF Long Range Development Plan Environmental Impact Report

Figure 3-11

Parnassus Heights-Saunders Court Conceptual Design

which provides distribution, storage, and mail services to UCSF campus sites. Should Oyster Point be relinquished as part of UCSF's strategy to consolidate its remote sites, a suitable site and relocation plan would need to be identified in order to accommodate these functions. UCSF also proposes to reconfigure the existing Central Receiving area, located at the back of Moffitt and Long Hospitals; station a dockmaster; and implement a scheduling system to restrict on-site delivery times and vehicle sizes. These loading and delivery improvements would reduce campus congestion, creating a more safe, attractive, and efficient campus.

Utilities and Other Infrastructure

Relocate and expand utility lines and replacement of gas and fuel storage tanks. UCSF is planning to relocate and expand medical gas storage tanks in the vicinity of Medical Center Way near the hospital. However, no location has been identified at this time. In addition, existing underground diesel fuel storage tanks in Medical Center Way and underground lines connecting the tanks to Long Hospital must be replaced to meet State and local codes. Current plans anticipate phased replacement of these tanks in their current location. The closure of Medical Center Way for several months could be required during construction.

Construct retaining wall. Landslides have occurred along the northern slope of the Reserve just south of the Dolby Regeneration Medicine building. UCSF proposes to construct a retaining wall to shore up the hillside to prevent future landslides. Additionally, if it is determined that the Mechanical Annex at Parnassus Avenue and Medical Center Way is no longer needed, the building site would be reconfigured to allow for the widening of Medical Center Way. This action would facilitate better circulation, and ideally would be developed in conjunction with the New Hospital Addition.

3.8.2 Mission Bay

The 56.4 acre UCSF Mission Bay campus site is generally bounded by Mission Bay Boulevard South to the north, Owens Street to the west, Mariposa Street to the south and Third Street to the east. The campus site is within the Mission Bay South Redevelopment area which is part of the larger 303-acre Mission Bay Redevelopment Area in the Mission Bay neighborhood north of the Potrero Hill and Dogpatch neighborhoods. It is approximately 3.8 miles east of the Parnassus Height campus site and 3.6 miles southeast of the Mount Zion campus site. As UCSF's primary location for basic science research, it is home to programs in biological sciences, biochemistry and biophysics, cellular and molecular pharmacology, the Center for Brain Development, the Cardiovascular Research Institute, and the Neurosciences Center, among others.

The campus site comprises the original 42 acres north of Sixteenth Street (North Campus, formerly known as the Research Campus) and the 14.4 acres south of Sixteenth Street (South Campus) subsequently acquired for the Medical Center at Mission Bay. UCSF also leases space for research and clinical purposes in the nearby China Basin building at 185 Berry Street, at 1500 Owens Street, and at 499 Illinois Street; and owns an office building at 654 Minnesota Street.

The north and south portions of the campus site are separated by Sixteenth Street, a city street that serves as the primary gateway from the west into the Mission Bay area. The North Campus is bifurcated by Fourth Street, a city street that connects the campus site to the area further north. When Fourth Street is completed through the South Campus, it will transition into a large public pedestrian plaza and bicycle route, which will serve the UCSF Medical Center, scheduled to open in 2015, and the broader community. Fourth Street and several private campus streets help disperse traffic, reinforce the urban pattern of the area, and provide view corridors.

The population of the Mission Bay campus site consists of students, faculty and staff, patients, visitors and residents of UCSF housing. Reflecting the growth in space, the total population of Mission Bay is expected to grow substantially over the life of the LRDP. Currently, the daily population is more than 4,800, including students, faculty, staff and campus housing occupants. With the inclusion of UCSF employees in nearby leased and owned sites, the total daily population is more than 5,000. With the completion of construction currently in progress and implementation of the LRDP proposals for the North, South, and East campuses, this number could grow to nearly 22,000 by 2035. UCSF housing at Mission Bay is currently home to over 900 residents, some of whom work or study at the Mission Bay campus site. This number could grow to 1,900 residents in the future through the construction of additional campus housing. Approximately 70,000 annual outpatient visitors are currently seen at UCSF clinics at Mission Bay in owned and nearby leased space. This number is projected to grow to 450,000 annual outpatient visits during the life of the LRDP, primarily due to the new Medical Center at Mission Bay, including both Phase 1 and 2.

As described below, new construction totaling approximately 1.13 million gsf is currently underway at the Mission Bay campus site and is scheduled for completion in fall 2014 and February 2015. Approximately 1.46 million gsf of new space is proposed under the LRDP, all of which would be located on the North Campus. In addition, the cancer outpatient building (Part of Phase 1 of the Medical Center) and the Phase 2 Medical Center are assumed to be constructed prior to 2035 for purposes of the EIR analysis, although the LRDP assumes that the Phase 2 Medical Center would be constructed after 2035. These two projects combined are approximately 918,000 gsf.

Under the 1996 LRDP and the 1998 *Mission Bay South Redevelopment Plan*, the North Campus was entitled for 2.65 million gsf for research, instruction, and support uses (excluding structured parking). Of the 2.65 million gsf entitlement, 1.92 million gsf, representing 73% of the 1996 LRDP approved entitlement, has been built: six research buildings, a campus community center (known formally as the William J. Rutter Center, or simply as the Rutter Center) on Owens Street, and 430 units of housing between Third and Fourth Streets. Research is currently the dominant use of space at Mission Bay. Housing was not in the original space program, but approximately 400,000 gsf of housing was substituted for other previously planned uses in *LRDP Amendment #1* to help meet UCSF demand, and to minimize pressure on neighborhood housing demand and traffic impacts. A child care center temporarily housed in a modular building on Block 18 is excluded from the square footage because it is expected to move into a permanent facility. There are also two parking structures on Owens and Third Streets with a total of approximately 1,300 parking spaces, and a minor amount of vacant space that could be developed for retail or offices.

Mission Hall, an academic office building of 264,800 gsf at the northeast corner of Fourth and Sixteenth Streets, is expected to open in late 2014. Upon its completion, the total development on the North Campus will be approximately 2.2 million gsf, or about 83% of the existing allowable entitlement of 2.65 million gsf. Approximately 458,400 gsf of this entitlement will remain to accommodate substantial unmet academic needs that could benefit from a presence at Mission Bay. Existing built space at this campus site has been developed at a higher density than originally anticipated so the remaining undeveloped land on the North Campus has additional development capacity.

Since the original Mission Bay campus site was envisioned, clinical programs have been introduced and an additional 14.4 acres of adjacent land (the South Campus) was acquired for the UCSF Medical Center at Mission Bay. The 2008 *LRDP Amendment #3* included 1,787,000 gsf of clinical uses for the South Campus. Phase 1 of the UCSF Medical Center at Mission Bay is expected to open in 2015. Located on the east side of the South Campus, Phase 1 comprises the future UCSF Benioff Children's Hospital, UCSF Betty Irene Moore Women's Hospital, and UCSF Bakar Cancer Hospital, which together form a 289-bed hospital complex; a future outpatient cancer building (sometimes called Phase 1B); and an energy center – a total of 869,000 gsf, or 49 percent of the South Campus entitlement. Over 1,000 parking spaces will be provided in a surface lot and existing garage. Phase 2 of the Medical Center at Mission Bay will be constructed across the Fourth Street Public Plaza, likely sometime after 2035. Development of these UCSF Medical Center facilities will result in the integration of patient care into the Mission Bay research community.

In summary, a total of approximately 1.14 million gsf is currently under construction at the Mission Bay campus site. When completed, there will be approximately three million gsf of UCSF-occupied space, excluding structured parking and the temporary child care center.

In December 2012, UCSF issued a Request for Qualifications to property owners and developers to identify opportunities for acquisition of a site for office use near UCSF's Mission Bay campus site. The site would serve as a consolidation location for both owned and leased properties to reduce operating and occupancy costs, improve efficiency and collaboration and provide programmatic flexibility among its campus sites. UCSF is in advanced discussions to acquire Mission Bay Blocks 33 and 34, a 3.83-acre parcel directly across Third Street from the South Campus. UCSF hopes to complete the acquisition in the summer of 2014. Therefore, the potential further expansion of the Mission Bay campus site to include Blocks 33-34 is analyzed in this EIR.

Under the 2014 LRDP, the Mission Bay campus site boundaries would be expanded to include Blocks 33 and 34, which would be known as the East Campus. In connection with the pending acquisition of Blocks 33 and 34, UCSF anticipates entering into a Memorandum of Understanding with the Successor Agency to the San Francisco Redevelopment Agency (also known as the Office of Community Investment and Infrastructure) regarding UCSF's financial obligations, including contributions towards the construction of public infrastructure, affordable housing, maintenance of the open space system throughout Mission Bay, and agreement to follow the *Mission Bay South Redevelopment Area Plan "Design for Development"* regarding building height, bulk, setbacks, maximum tower floorplate and other design matters for buildings on the

East Campus. UCSF also anticipates entering into an Infrastructure Agreement with the infrastructure developer for Mission Bay (FOCIL-MB, LLC) regarding UCSF's contribution towards public infrastructure.

3.8.2.1 Proposed Functional Zones

The existing functional zones of the Mission Bay campus site is depicted in **Figure 3-12**. Proposed functional zones are shown in **Figure 3-13**. These zones reflect the desired predominant land uses through 2035. Functional zones on the North Campus reflect the organizational structure of the original *Mission Bay Master Plan and Design Guidelines*, which were prepared in 1999 to guide campus site growth and envisioned research buildings clustered to the north and south of a network of large open space areas, with parking at the periphery along Owens and Third streets. The large areas in the Research functional zone would also contain smaller amounts of secondary uses such as instruction, administration, retail, and other support space. The existing Rutter Center is in the Support functional zone, and existing campus housing between Third and Fourth streets is in the Housing zone. A second Housing functional zone is proposed on the northern edge of the North Campus on Block 15, identified for future housing use because of its proximity to off-site residential development under construction north of the campus site, and proximity to on- and off-site open space and a potential public school site on Block 14.

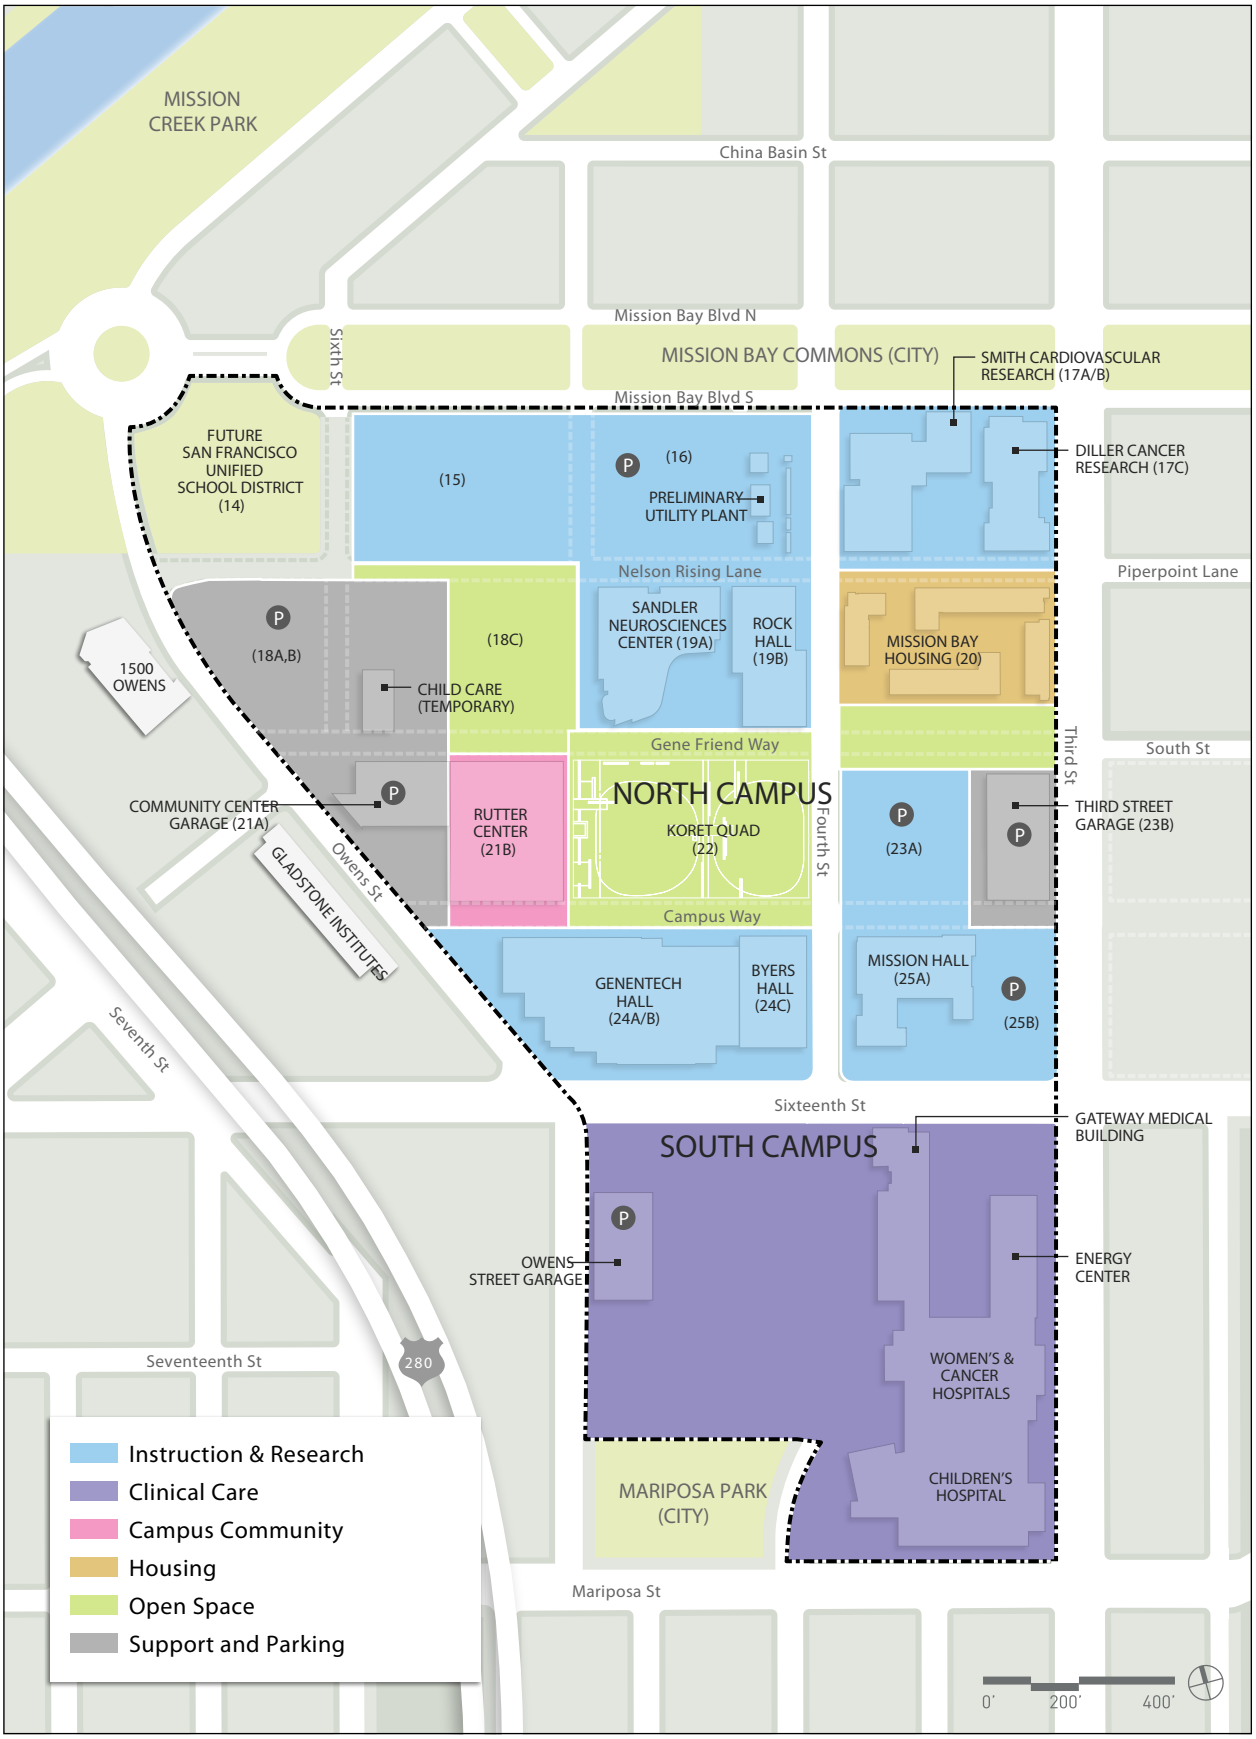
The majority of clinical uses are expected to be located on the South Campus in the Clinical functional zone, in support of the UCSF Medical Center at Mission Bay. However, several clinics have been developed as a secondary use within the Research functional zone in cases where there is a close functional relationship between clinical and research programs, and this is likely to continue in the future.

Parking functional zones are located near the periphery of the campus site so as to minimize vehicular traffic within the campus site. The two parking zones on Owens Street provide for parking expansion when it is needed to support future program growth.

The East Campus (Blocks 33 and 34) is functionally zoned for research and parking use, shown as a striped pattern on Figure 3-13 because the exact footprints for those uses have not yet been determined. When the locations of specific uses on the parcel are identified, the functional zones for the East Campus will be updated accordingly.

3.8.2.2 Proposed Plan

The 2014 LRDP proposes to increase the square footage of the North Campus by 1,450,300 gsf, which includes 458,500 gsf of existing remaining entitlement plus 991,800 gsf of new entitlement, sized to make efficient use of the land while avoiding traffic and city-wide infrastructure impacts. This increase would help UCSF meet its space needs through the LRDP horizon of 2035, but is unlikely to accommodate all of UCSF's programmatic needs at Mission Bay. Development of the North Campus for research and other uses will depend on funding that may or may not fully materialize during the LRDP horizon.

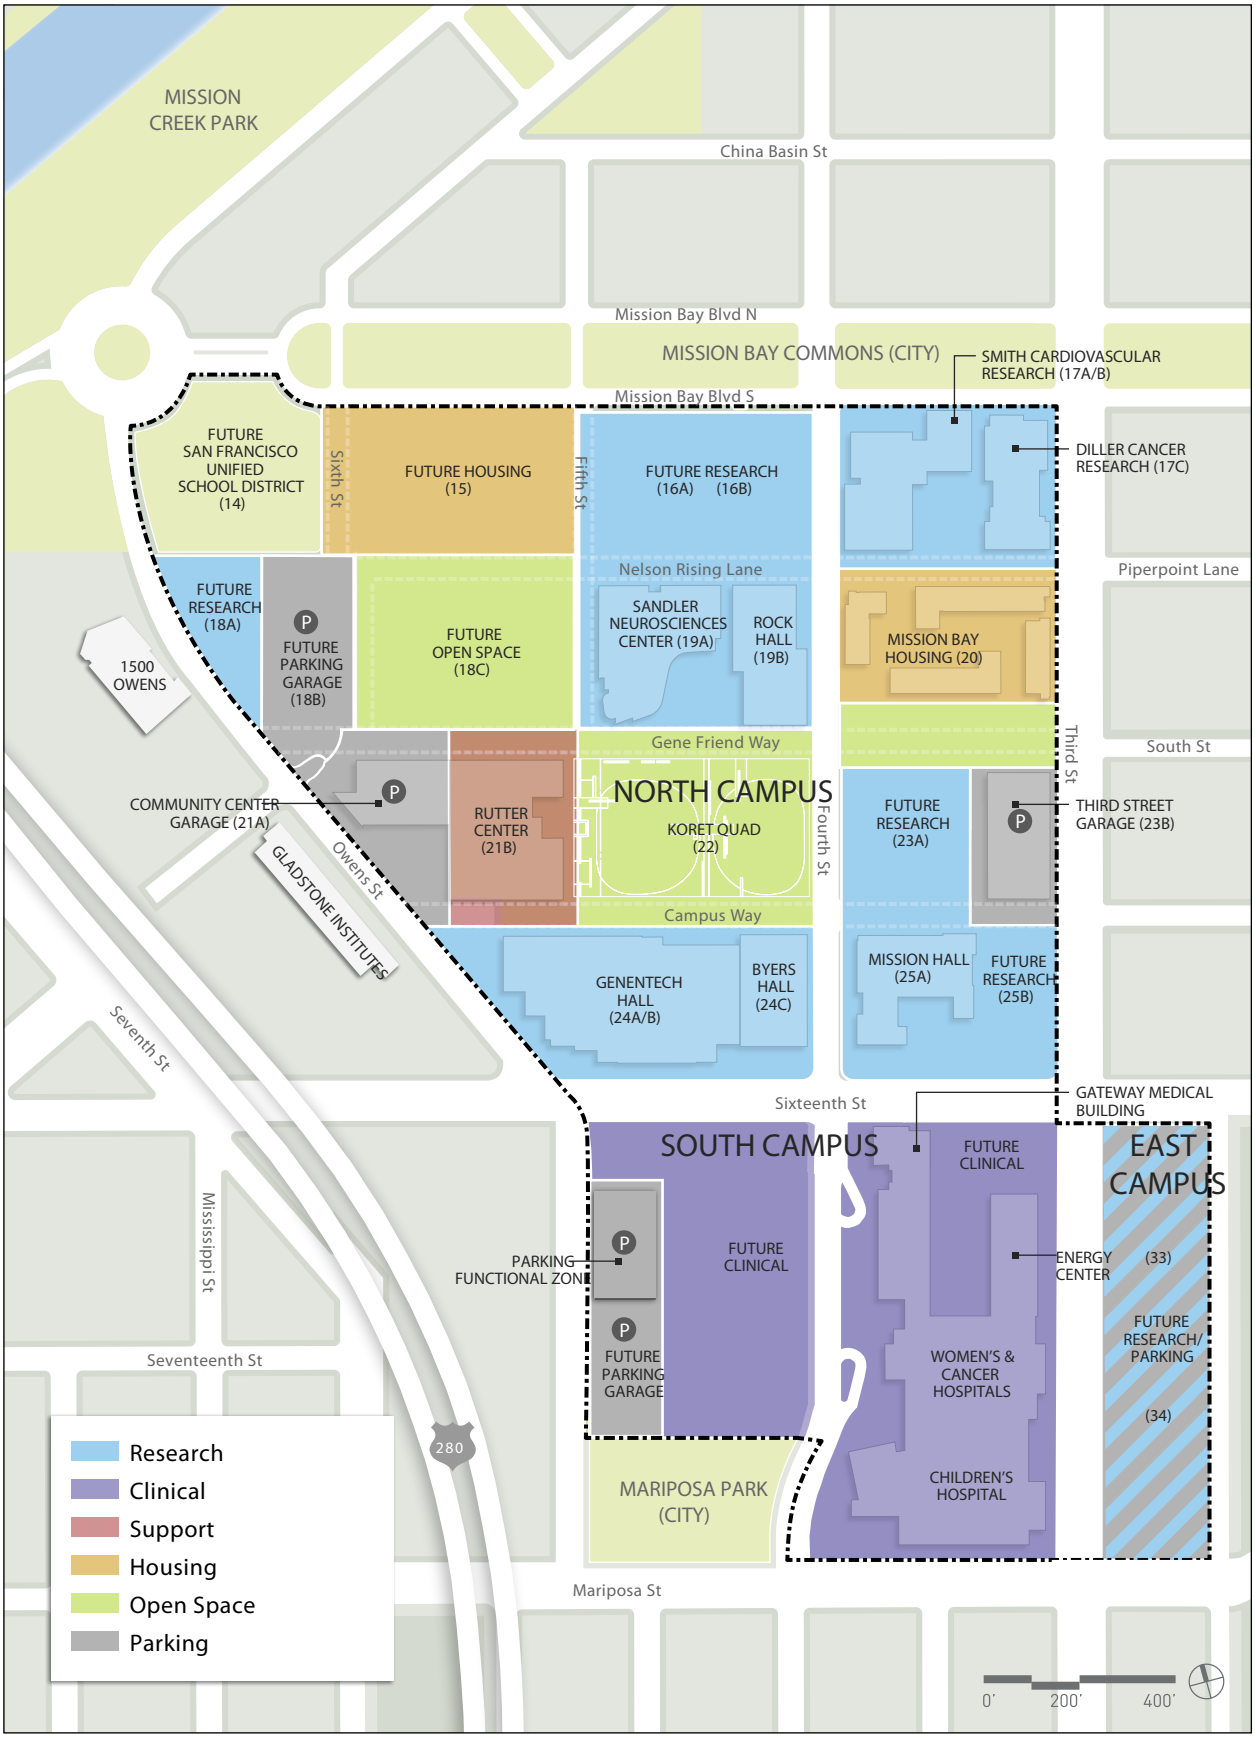


SOURCE: UCSF

UCSF Long Range Development Plan Environmental Impact Report

Figure 3-12

Mission Bay-Existing Functional Zones



SOURCE: UCSF

UCSF Long Range Development Plan Environmental Impact Report

Figure 3-13

Mission Bay-Proposed Functional Zones

With the 991,800 gsf of new entitlement described above, under this LRDP the development capacity for the North Campus is proposed to increase from 2,650,000 gsf to 3,641,800 gsf. Although housing was not included in the original entitlement for the Mission Bay campus site (it was added in 2002 with LRDP Amendment #1), 786,100 gsf of the total capacity will be devoted to housing (387,400 gsf of existing housing on Block 20 and 398,700 gsf of new housing on Block 15).

On the South Campus, construction of a 124,500-gsf cancer outpatient building is anticipated prior to 2035, which will complete Phase 1 of the UCSF Medical Center at Mission Bay. This will bring the total space for Phase 1 to 993,500 gsf. Phase 2 facilities will be located on the west side of the South Campus, across the Fourth Street Public Plaza. Phase 2 Medical Center at Mission Bay is planned for after 2035 as a 261-bed hospital with additional outpatient space, totaling 793,500 gsf.

Development of the East Campus would accommodate 500,000 gsf. As a result, the total anticipated development through 2035 with the proposed expansion of the Mission Bay campus site (North, South, and East campuses) would be 5,135,400 gsf.

Under the 2014 LRDP, Phase 2 of the Medical Center at Mission Bay is assumed to occur after 2035, beyond the LRDP horizon. Therefore, the anticipated development of Phase 2 of the Medical Center at Mission Bay, about 793,500 gsf of additional hospital and outpatient space, is not included in the LRDP. However, it is evaluated in this EIR to provide a conservative analysis of potential impacts.

The preferred development on each block at the Mission Bay campus site is summarized below and shown on **Figure 3-14**.

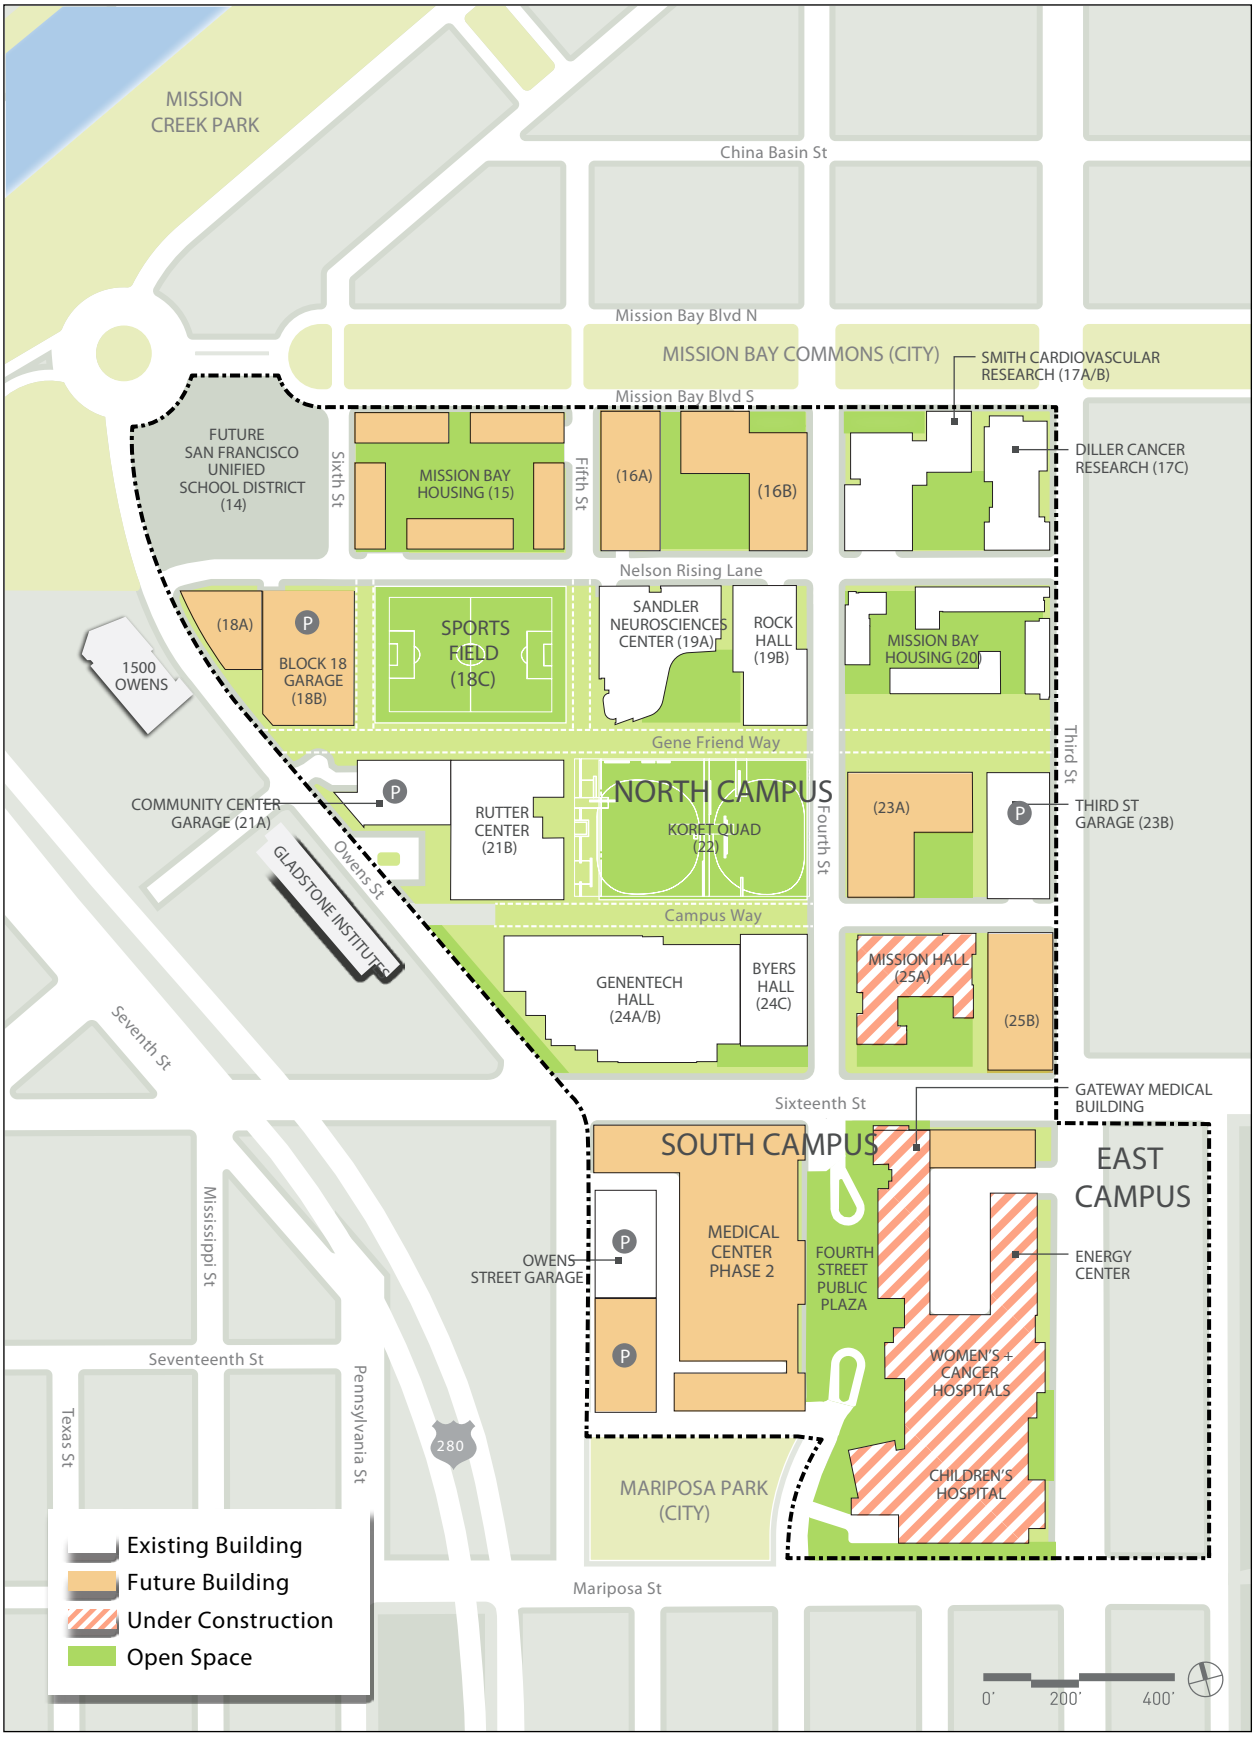
3.8.2.3 2014 LRDP Proposals at the Mission Bay Campus Site

The following proposals fulfill the 2014 LRDP site-specific objectives at the Mission Bay campus site:

Land Use

Develop Additional Research Capacity (Blocks 16, 18A, 23A, and 25B). Develop approximately 1,037,200 gsf of additional research capacity on Blocks 16, 18A, 23A, and 25B. Building heights would be within the parameters described in the *Contribution Agreement* with Catellus, and designed to minimize shading on open space areas. The tallest buildings (up to 160 feet, exclusive of rooftop mechanical equipment) would be located along major arterials (18A on Owens Street, and 25B at the corner of Third and Sixteenth streets). In accordance with the *Mission Bay Campus Master Plan and Design Guidelines*, buildings along Mission Bay Boulevard South (Block 16) would include a 30-foot step-back from the property line above 55 feet.

Block 16. One research and/or office building and a central utility plant totaling approximately 289,000 gsf, or alternatively two research buildings totaling up to 377,400 gsf may be built on Block 16. The current plan is to build a 53,000 gsf central utility plant, but the funding for this facility may not be realized, or may not



SOURCE: UCSF

UCSF Long Range Development Plan Environmental Impact Report

Figure 3-14

Mission Bay-Proposed Plan

be available soon enough to be cost effective if too many buildings that it would have served are already built, each with their own utility systems, by the time funding for the central plant becomes available. The height of the buildings would be similar in height to other research buildings on the campus site, but would have a setback of 30 feet at the 55-foot height along Mission Bay Boulevard South in accordance with the *Mission Bay Campus Master Plan and Design Guidelines*. Building footprint configurations would be flexible, but the building on the east side of the block must preserve and respond to the north gateway area. If the central utility plant is constructed, a centralized Environmental Health & Safety facility could be located within the building, along with a Facilities Management landscape yard between the two buildings. Trucks would enter from Nelson Rising Lane and exit onto Mission Bay Boulevard South.

Block 18. An office and/or research building (possibly with clinics) with up to 193,000 gsf in a building up to 160 feet in height could be built on this block. To the east of it, a separate or attached eleven-story (110 feet in height) parking garage with approximately 1,540 spaces could be built. The ground floor of the garage would be sized to accommodate about 60 UCSF shuttles. A portion of the garage may be used for storage by Facilities Services. Garage entrances/exits would be on Nelson Rising Lane and mid-block on Owens Street to avoid conflicts with Gene Friend Way, which is a pedestrian corridor. A full-size, multi-purpose sports field would be developed on the eastern portion of the block, providing outdoor recreation and fitness space between the existing community center and future housing. Pedestrian connectivity through the block and to and from the garage would be facilitated in the layout of the facilities and landscape yard.

Block 23. An 85-foot tall 232,200 gsf research building would be constructed on the western side of the block in an "L" shape configuration along Fourth Street and the plaza, across from Koret Quad. This building may also contain clinics, classrooms, offices and retail uses, as well as police space not provided on the Block 15 site as part of the housing project, or elsewhere. A south-oriented courtyard would also be developed on the block between the existing Third Street Garage and the new building. If the child care center is developed on this block, part of the courtyard would be dedicated as an outdoor play yard. This building would relate to the public street, plaza and Koret Quad at the ground level with transparent facades, active uses and accessibility features.

Block 25. A research/office building, possibly with clinics and retail uses, would be developed on the eastern side of the block. Mission Hall is currently under construction on the western side of the block. All or a portion of the building may be constructed up to 160 feet in height and may contain up to 323,300 gsf. With its visually prominent location at the southeast corner of the research campus along Third and Sixteenth streets, it would be an architecturally important building that would be designed with sensitivity to the public realm and connect with the courtyard currently under construction.

Develop New Housing (Block 15). A housing complex of approximately 418,200 gsf (which includes 398,700 gsf of housing and 19,500 gsf of support), with approximately 774 beds in 523 units, is proposed on Block 15. The complex would be comprised of five or fewer buildings framing an interior courtyard. The buildings' heights would range from 55 feet in height along Mission Bay Boulevard South, 85 feet along Sixth Street and Nelson Rising Lane and up to 120 feet along Fifth Street, and would be designed to minimize shading on open space areas. In accordance with the *Mission Bay Campus Master Plan and*

Design Guidelines, development along Mission Bay Boulevard South would include a 30-foot step-back from the property line above 55 feet. The complex could include a 20,000 gsf child care center with about 200 child care slots. If the child care center is developed, approximately 15,000 square feet of the courtyard would be dedicated as an outdoor play yard. If child care is located elsewhere, approximately 12 additional units could be added to the housing program on Block 15. In addition, approximately 1,500 square feet could be considered on this block (or Block 23) for UCSF police.

Complete Phase 1 of the Medical Center (South Campus). The UCSF Medical Center proposes to build a 124,500-gsf cancer outpatient building at Third and Sixteenth streets, which would physically adjoin the hospital structure currently under construction and due to open in 2015. The outpatient cancer building would be the final building planned as part of Phase 1 of the UCSF Medical Center at Mission Bay.

Phase 2 of the Medical Center (South Campus). Phase 2 of the Medical Center at Mission Bay is planned to include a 261-bed hospital with additional outpatient space, totaling 793,500 gsf. While it is anticipated to be constructed after the LRDP horizon year of 2035, the impacts associated with its construction and operation are evaluated in this EIR in order to provide a conservative analysis of future development of the entire Mission Bay campus site.

Expand the Mission Bay campus site to include Blocks 33 and 34 (East Campus). The East Campus would be developed with up to 500,000 gsf and 500 parking spaces, and as part of the 2014 LRDP, the site would be functionally zoned for research and parking use. When the locations of specific uses on the parcel are identified, the functional zone for the East Campus will be updated accordingly. No specific UCSF programs have been identified yet to relocate to the site, and no specific building design is proposed. Proposed development would follow the *Mission Bay South Redevelopment Area Plan "Design for Development"* regarding building height, bulk, setbacks, maximum tower floorplate and other design matters. The site is within Height Zone 5 (HZ-5). Based on the *Design for Development* standards for the site, a building up to 90 feet in height (excluding rooftop mechanical equipment) may be developed on Block 34, with no bulk restrictions. On Block 33, a building with a base height of 90 feet (excluding rooftop mechanical equipment) may be developed, and a tower may be constructed up to a height of 160 feet (excluding mechanical equipment) with a maximum floorplate of 20,000 sq. ft. Development on the site would be setback 5 feet from Third Street. A minimum of 70% of block length frontage would be developed for streetwalls along Third Street and along Sixteenth Street.

> ***LRDP Variant*:** UCSF is considering the development of clinical uses for a portion of the 500,000 gsf on the Block 33 and 34 site. The amount of clinical space that may be developed has not yet been determined, but up to about 250,000 gsf of clinical space could be developed, with the remainder 250,000 gsf as research/office use. Clinical uses are a "secondary use" under the *Mission Bay South Redevelopment Plan* and would require a finding of consistency with the plan by the San Francisco Office of Community Investment and Infrastructure.

Open Space

Develop additional open space (Blocks 15, 16, and 23A). When Blocks 15, 16, and 23A are developed, courtyards are to be considered on those blocks to provide additional open space. If a child care center is included as part of proposed housing on Block 15, an

estimated 15,000 square feet of the courtyard could be dedicated as an outdoor play yard for the child care center, unless designated at another nearby location. If a central utility plant is built on a portion of Block 16, a portion of the courtyard may be needed by Facilities Services for outdoor storage and other support uses, or alternatively that function could be accommodated elsewhere.

Develop outdoor recreation space (Block 18C). A regulation-sized sports field for soccer and other games is under consideration on the eastern portion of the block, providing outdoor recreation and fitness space between the Rutter Center and future campus housing on Block 15.

Circulation, Transportation and Parking

Develop additional structured parking (Block 18B, 33/34, and 38). To support the future growth of the campus site and as existing surface parking lots are replaced by buildings, new structured parking is proposed on Block 18B, just east of the proposed research building on Block 18A. It would be constructed in two phases and may contain approximately 1,540 total parking spaces. The ground floor of the garage may be sized to accommodate about 60 UCSF shuttles. Garage entrances and exits would be proposed on Nelson Rising Lane and mid-block on Owens Street to avoid conflicts with Gene Friend Way, a pedestrian corridor. A portion of the garage may be used for storage by Facilities Services. In addition, up to 500 parking spaces could be developed on Blocks 33 and 34. Additional structured parking is anticipated on Block 38 on the Medical Center at Mission Bay site that could include up to 1,300 parking spaces.

Complete the street network. On the North Campus, Nelson Rising Lane (from Owens Street to the Sandler Neurosciences Center) and one-block segments of Fifth and Sixth streets (between Nelson Rising Lane and Mission Bay Boulevard South) is proposed for development. Nelson Rising Lane would continue to serve as a loading street for future buildings located there. Once these campus streets are completed, UCSF shuttle routes and stops may change in order to provide more direct access to these new buildings.

Increase bicycle and motorcycle parking capacity. As Mission Bay is further developed, UCSF plans to continue to add bicycle and motorcycle parking around new buildings, in the proposed garage on Block 18B, and in open space areas.

Utilities and Other Infrastructure

Block P15 pump station upgrade. UCSF is proposing to upgrade the Block P15 pump station in order to provide additional pumping capacity to accommodate 2014 LRDP development at the Mission Bay campus site. Potential upgrades proposed by UCSF include the replacement of existing pumps at the pump station with larger horsepower pumps required to serve increased University flow. Pre-existing deficiencies with the pump station as observed by SFPUC will not be corrected by UCSF.

Consider a central utility plant (Block 16). UCSF is considering a central utility plant on a portion of Block 16, potentially using cogeneration technology, as well as a redundant utility distribution loop for steam, chilled water, and high-temperature hot water, to help ensure that utility supplies to future buildings on the North Campus are not interrupted should a break or power outage in existing lines occur. If a central utility plant is determined not to be needed, as discussed previously, the site would be developed with research capacity.

3.8.3 Mount Zion

The UCSF Mount Zion campus site is approximately 7.6 acres on six contiguous city blocks in the Western Addition neighborhood of San Francisco. It is located approximately two miles northeast of the Parnassus Heights campus site and one mile east of the Laurel Heights campus site. The Mount Zion campus site is generally bounded by Bush Street to the north, Scott Street to the east, Post Street to the south and Broderick Street to the west. UCSF-owned buildings are concentrated on a 'main block' bounded by Sutter, Scott, Post, and Divisadero streets.

The Mount Zion campus site is located in the commercial district of a mixed-use neighborhood, and is fully integrated with the city street grid. Most non-UCSF buildings along Divisadero Street consist of residential and office uses above ground floor retail. Also, in the vicinity of the campus site are private medical office buildings that are not affiliated with UCSF. Kaiser Permanente Medical Center is located on Geary Boulevard, one block to the southwest. Residential uses are widespread to the north and west, as well as directly across Scott Street to the east of the main block.

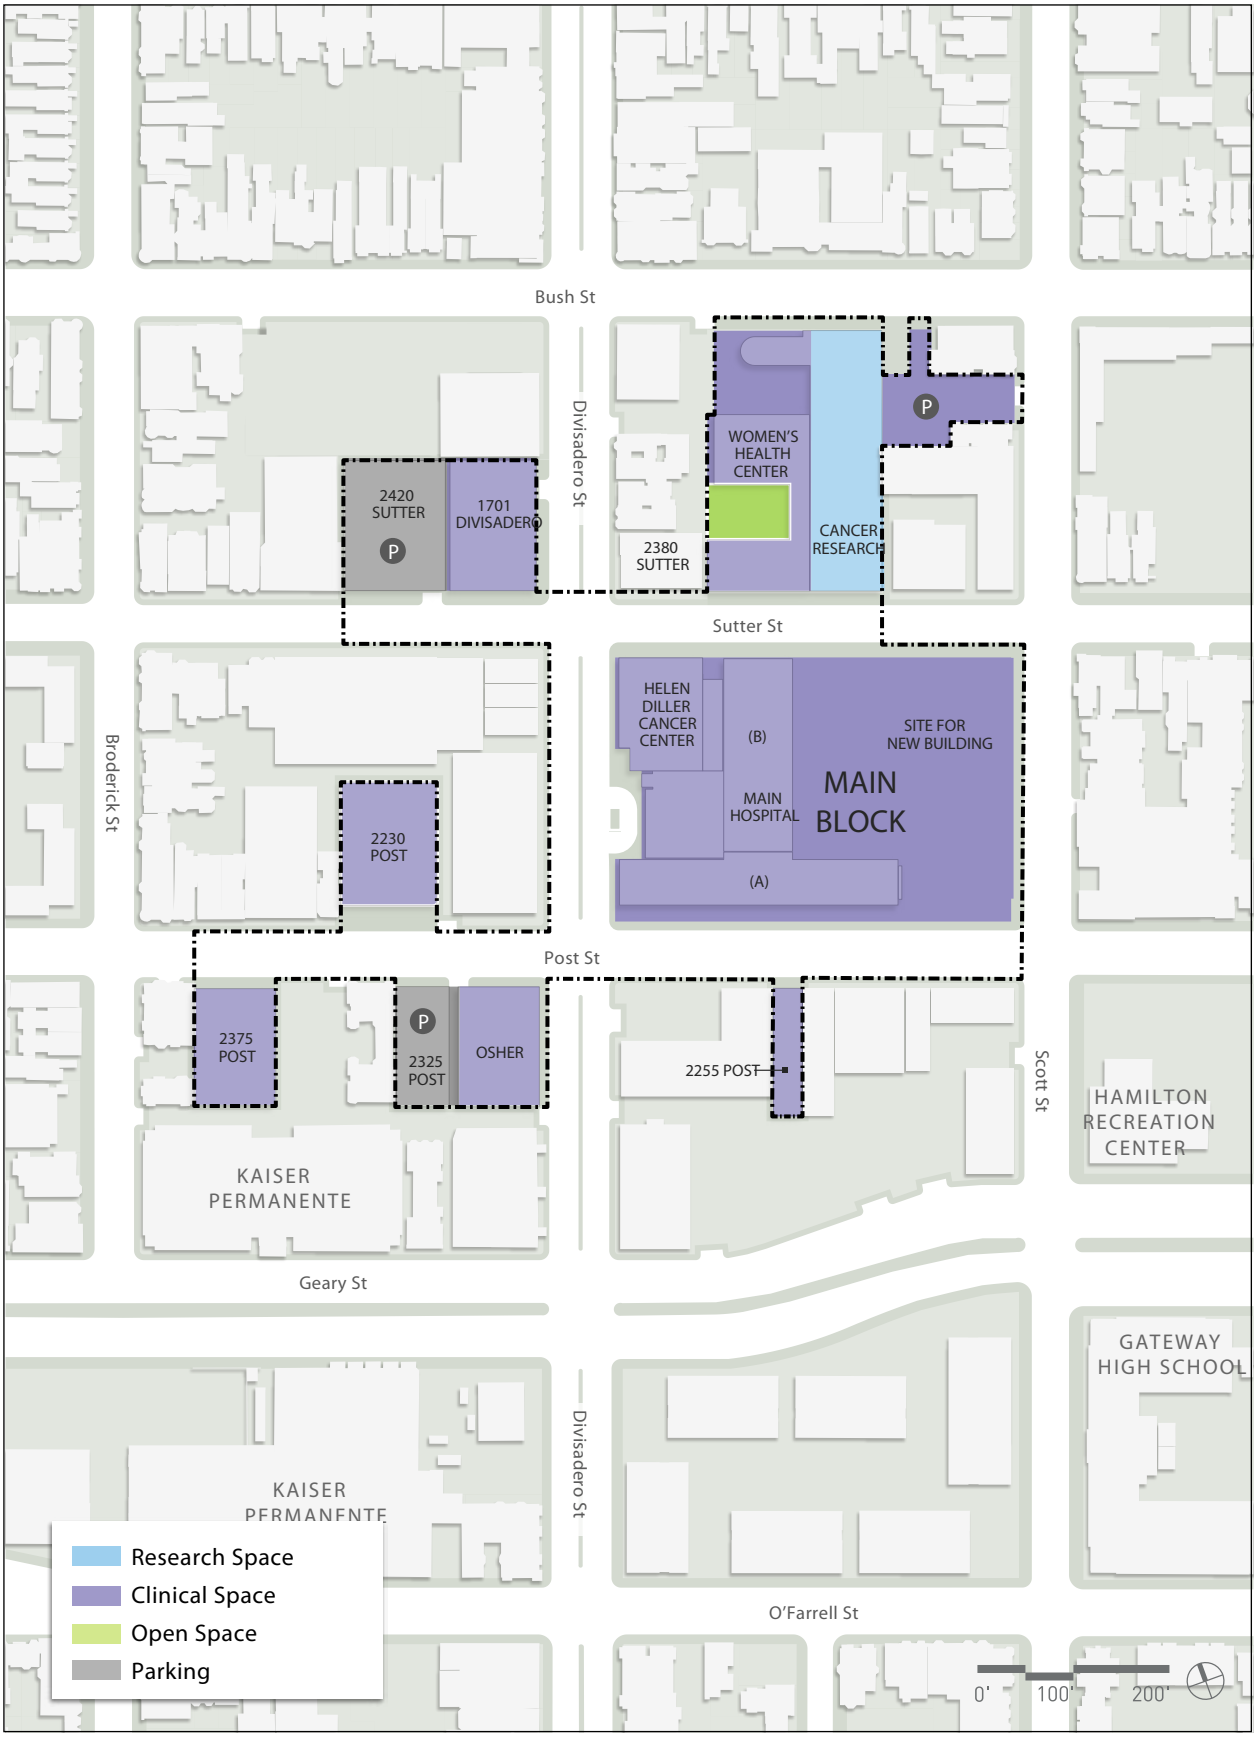
Clinical uses are predominant on the campus site. UCSF owns buildings at Mount Zion comprising 776,200 gsf and leases another 45,300 gsf of space within a quarter-mile of the site, for a total of 821,500 gsf. The UCSF Medical Center at Mount Zion is home of the Helen Diller Family Comprehensive Cancer Center, with 91 licensed inpatient beds and an average daily census of 50 patients; the UCSF Women's Health Center, Northern California's only nationally designated Center of Excellence in Women's Health; the Osher Center for Integrative Medicine; the Pain Management Center, Sleep Disorders Center, and Dialysis Center; and other outpatient programs. Cancer research is conducted in a building on Sutter Street.

About 1,840 UCSF faculty and staff are located at the Mount Zion campus site. There are about 1,300 daily and 314,000 annual visits to its outpatient facilities. It is estimated that Mount Zion has a daily population of nearly 4,760 employees, students, patients, and visitors. Based on the Medical Center's outpatient projections, the annual number of outpatient visits may rise to over 420,000 with the implementation of the 2014 LRDP. An additional 600 UCSF faculty and staff would be needed to support this increase in outpatient visitors, for a total of up to 2,400 employees.

To support these programs, UCSF owns and operates three parking garages and one parking lot with a total of 475 parking spaces. Other garages, lots and street parking are available nearby. Because parking in the vicinity is in high demand, patients and essential healthcare providers are given priority access to parking under UCSF's control.

3.8.3.1 Proposed Functional Zones

Currently, there is no functional zone map for the Mount Zion campus site. **Figure 3-15** illustrates the proposed campus boundary and functional zones. The proposed boundary encompasses only those buildings owned by UCSF. A majority of the site is proposed as Clinical, consistent with the predominance of inpatient and outpatient uses. The cancer research building is designated as Research. Support areas include structured parking controlled by UCSF.



SOURCE: UCSF

UCSF Long Range Development Plan Environmental Impact Report

Figure 3-15

Mount Zion-Proposed Functional Zones

3.8.3.2 Proposed Plan

The Mount Zion campus site was identified as an outpatient hub in *LRDP Amendment #2*, which proposed the elimination of inpatient facilities at this site after relocation to the UCSF Medical Center at Mission Bay or Parnassus Heights. Accordingly, development at the Mount Zion campus site is expected to be for clinical use driven by the demand for outpatient space, in addition to addressing seismically compromised buildings. The hospital at the Mount Zion campus site will be repurposed as an ambulatory care center. Vacated space will be backfilled with growth of the cancer program, expansion of outpatient treatments, new clinics, and support spaces.

Approximately 75,500 gsf of additional outpatient space is proposed at the Mount Zion campus site through 2035. In addition, it is anticipated that some clinical programs at the Parnassus Heights campus site would eventually be relocated to the Mount Zion campus site, and nearby leased space would be consolidated into owned space in one or more new buildings on the main block.

The LRDP proposes to demolish the Hellman, Harold Brunn Institute, and Dialysis Center buildings (totaling approximately 85,000 gsf) and construct a new office/research building (see **Figures 3-16** and **3-17**). In addition, 2255 Post Street (7,450 gsf) is also proposed for retrofit or demolition. The new office/research building would be approximately 257,300 gsf; should 2255 Post Street be demolished, it would result in a net increase at the Mount Zion campus site of about 164,850 gsf or 172,300 gsf if the building was to remain and be retrofitted. UCSF currently has no plans to acquire additional property in the vicinity or expand the campus boundary.

3.8.3.3 2014 LRDP Proposals at the Mount Zion Campus Site

The following proposals fulfill the 2014 LRDP site-specific objectives at the Mount Zion campus site:

Land Use

Demolish the Hellman, Harold Brunn Institute, and the Dialysis Center buildings. These three buildings are located on the east side of the main block along Scott Street between Sutter and Post Streets. The Hellman and Brunn buildings are seismically compromised, and both of these building, as well as the Dialysis Center building, are considered obsolete. The LRDP proposes to demolish these three buildings, which total approximately 85,000 gsf. The occupants and programs would be relocated into the repurposed hospital buildings or located elsewhere. Demolition of the Hellman building is proposed to occur in 2016-2017, and the other two buildings would be demolished then as well, or at a later date when the building sites are needed for other purposes. In 2003, the Hellman building was determined to be potentially eligible for the CRHR. The Harold Brunn Institute and Dialysis Center buildings are not eligible for the NRHP or CRHR.

Construct new clinical and/or research space and additional parking. One or more buildings (or a phased building) may be built on the east side of the main block where the Hellman, Harold Brunn Institute, and Dialysis Center buildings are currently located. Such a building(s) may accommodate up to 257,000 gsf of space for clinical and/or research uses. A new building along Scott Street may be constructed up to 65 feet in height. To minimize the

SOURCE: UCSF

UCSF Long Range Development Plan Environmental Impact Report

Figure 3-16

Mount Zion-Proposed Demolition

SOURCE: UCSF

UCSF Long Range Development Plan Environmental Impact Report

Figure 3-17

Mount Zion-Proposed Building

building scale at the street level, it would be designed with a 20-foot step back at the 40-foot height level. It may also be set back from Post Street to align with the existing hospital building for a prominent landscaped entrance. A building on Sutter Street may be built up to 105 feet in height with a 20-foot setback along Sutter and Scott Streets. Although not subject to the City's height and bulk restrictions, a building designed in this manner would comply with the City's height limit, but not the bulk limit. Up to 185 parking spaces could be constructed in two levels underground, if not developed off-site. Streetscape improvements would be made along the affected street frontages.

Renovate and reuse the existing hospital. The inpatient facilities at the Mount Zion campus site are provided in two interconnected buildings. Neither building will meet SB 1953 requirements after January 1, 2030, so both will require decommissioning as inpatient facilities by that date. Subsequent to the opening of the UCSF Medical Center at Mission Bay in 2015, the inpatient uses at the Mount Zion campus site will be relocated to the Mission Bay campus site. UCSF proposes to repurpose the hospital as an ambulatory care center with ambulatory surgery. Vacated space would be backfilled with growth of the cancer program, expansion of outpatient services and support space. The decommissioned hospital may also accommodate program space and clinics displaced from buildings proposed for demolition, and from nearby leased space if and when leases are not renewed.

Retrofit or demolish the building at 2255 Post Street. The 7,450 gsf building at 2255 Post Street is seismically compromised, and would be retrofitted or demolished.

Open Space

Develop open space. When the new building(s) are constructed on the main block, a central courtyard could be developed for both campus and public use. The courtyard, which could be open-air or covered, would provide pedestrian access through the block.

Circulation, Transportation and Parking

Provide additional parking. When planning new building(s) on the main block, the need for additional parking should be considered, which could be provided in the building, underground, or off-site. Parking demand would be assessed when new development is pursued, and the community's input would be sought at that time. Patients and essential healthcare providers would continue to be given parking priority.

3.8.4 Mission Center

The three-acre Mission Center campus site is located at 1855 Folsom Street on the southern half of the block bounded by Fourteenth, Harrison, Fifteenth and Folsom streets. The site is in the northeast portion of San Francisco's mixed-use Mission District; it is located approximately three miles east of Parnassus Heights, 1.25 miles west of Mission Bay, and one mile northeast of San Francisco General Hospital.

The Mission Center campus site has only one building that is six stories tall and constitutes 291,700 gsf. The building fronts on Folsom Street, but may also be entered from the 207-space parking lot, which makes up the rest of the site, and which can be accessed from Harrison and Fifteenth streets. Approximately 800 employees work in the building in various departments

primarily consisting of Campus and Medical Center administrative units. The building also contains a small amount of research space as well as a cafe.

The existing building would remain under the proposed LRDP, and no changes in use are planned. As of 2014, UCSF has not identified any programmatic or space need at Mission Center. However, UCSF has evaluated options for developing this campus site should it be determined by UCSF in the future that such a need exists for additional program space. The capacity study analyzed the potential size and location of a new building and parking structure, and took into consideration urban design elements that would preserve the existing outdoor plaza, create additional open space, enhance the public realm and improve shuttle circulation, while also respecting the City's height and bulk limits. Because the new building would be constructed on an existing surface parking lot, the study also determined that a parking structure would need to be built first so that some parking on the site would be available for the displaced spaces.

3.8.4.1 2014 LRDP Proposals at the Mission Center Campus Site

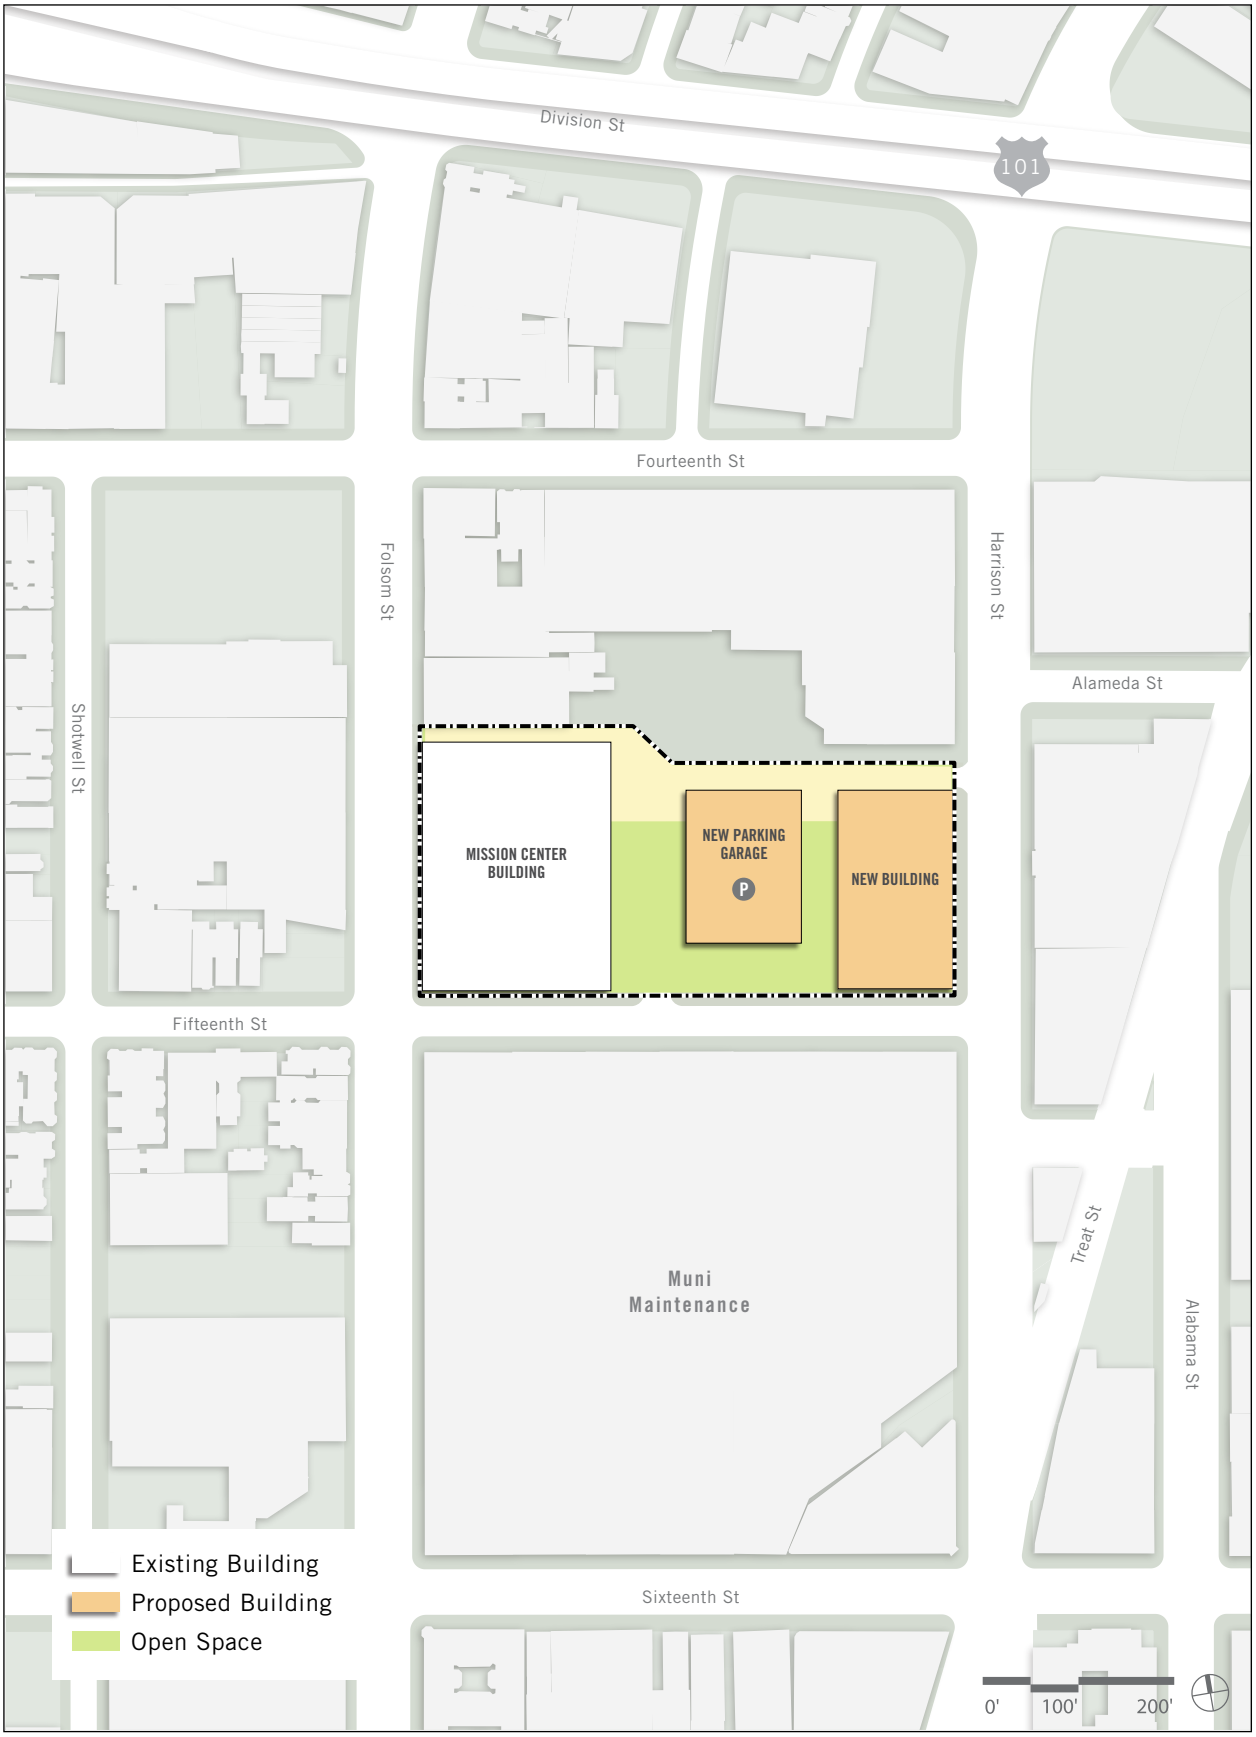
The following proposal fulfills the 2014 LRDP site-specific objectives at the Mission Center campus site:

> **Construct a new office building and additional parking.** For planning purposes, the LRDP assumes that a new building would be no greater than the City's height limit of 55 feet, which would allow for a four-story building up to 100,000 gsf. Therefore, it is assumed that Mission Center would increase to 390,700 gsf from the current 290,700 gsf with implementation of the LRDP. To help integrate the site into the surrounding fabric of the City, a small amount of retail space or another active use at the ground floor would be considered when this building is programmed. A five-story, approximately 96,000 gsf parking structure with up to 294 parking spaces would be built between the existing and new buildings. Additional open space with a southern exposure would be developed between the buildings. The existing shuttle stop would be relocated next to this open space, along Fifteenth Street where up to two on-street parking spaces would be removed. Vehicular ingress and egress would be from Harrison Street, with an egress-only driveway on Fifteenth Street, utilizing the existing curb cut. Access to the existing service dock would remain from Harrison Street, with Folsom Street as the service exit. Development of this new building would occur only if additional program space were determined to be needed in the future, and if and when funding becomes available. This LRDP proposal will be evaluated in the EIR at a program level. **Figure 3-18** shows the proposed development at Mission Center.

3.8.5 Other Campus Sites and Affiliations

3.8.5.1 Laurel Heights

The 10.3 acre Laurel Heights campus site is located at 3333 California Street. The campus site is located on the block bounded by California, Presidio, Euclid, and Laurel streets. The main building is approximately 350,000 gsf with three below-grade floors and four above-grade floors. A one-story annex building with 14,000 gsf is located at the corner of California and Laurel Streets. There are 212 parking spaces in the underground garage and 329 at ground level, for a total of 541 parking spaces.



SOURCE: UCSF

UCSF Long Range Development Plan Environmental Impact Report

Figure 3-18

Mission Center-Proposed Plan

The campus site is in the Laurel Heights neighborhood adjacent to the Presidio Heights neighborhood. The Jewish Community Center of San Francisco is located directly across California Street to the north. The California campus of the California Pacific Medical Center is a half mile to the west. The Laurel Heights campus site is approximately two miles northeast of the Parnassus Heights campus site and about one mile west of the Mount Zion campus site.

The Laurel Heights buildings were constructed in several phases between 1955 and 1966 but were not acquired by UCSF until 1985. There are approximately 1,200 employees at this campus site, which is the primary location of UCSF's social, behavioral and policy science research. A number of academic and campus administrative departments are located there along with food services, a conference center and a child care center.

UCSF is evaluating opportunities to consolidate remote campus sites in order to reduce operating and occupancy costs and to improve collaboration across campus sites. As part of this effort, UCSF has reviewed its long-term occupancy of the Laurel Heights campus site. Given the substantial capital investment required to maintain and extend the main building's useful life, UCSF is considering a long-term ground lease of the property to a third-party developer for a non-University use. If an agreement is reached, any future development plans for the site would be subject to City entitlement, including environmental review under the California Environmental Quality Act (CEQA).

If UCSF leases the site to a third party, it currently anticipates that it would continue to occupy the site for about five years. No change in use would occur during that time. Because a final decision on where or when to relocate programs from Laurel Heights has not yet occurred, no changes for the Laurel Heights campus site are proposed in this LRDP.

3.8.5.2 654 Minnesota Street

Located two blocks south of the Mission Bay campus site in the mixed-use Dogpatch neighborhood, the three-story 654 Minnesota Street building constitutes 65,500 gsf and sits on 0.92 acres. The building and its associated parking lot make up the south end of the block bounded by Indiana, Eighteenth, Minnesota, and Nineteenth streets. UCSF purchased the building in 2005 and renovated it to higher seismic standards that allow for the continuation of essential functions such as campus police and data services in the event of an earthquake. The building houses a variety of campus and Medical Center administrative units. There are approximately 200 UCSF personnel working in the building. Programs and uses at 654 Minnesota Street are expected to remain unchanged under the new LRDP.

3.8.5.3 Buchanan Dental Center

The Buchanan Dental Center is operated by UCSF's School of Dentistry. It is located at 100 Buchanan Street, approximately two miles east of the Parnassus Heights campus site. The facility is located on a 0.6-acre parcel within the boundaries of a 5.4-acre parcel that was formerly occupied by UC Berkeley Extension's San Francisco campus. UC Berkeley vacated the site in 2003. A private developer has undertaken a redevelopment project, 55 Laguna, on the remainder of the parcel, which will include 330 units of market-rate housing and 110 units for low-income

seniors, as well as retail uses and a community center. Construction began in the fall of 2013 and is slated for completion in early 2015.

The Buchanan Dental Center, a two-story, 18,200-gsf clinic building was constructed in 1979. The building contains dental laboratories, treatment and exam rooms, offices, and a classroom. There are approximately 25 UCSF personnel employed at the clinic. It is proposed that the clinic remain at this location for the foreseeable future.

3.8.5.4 Hunters Point

The 3.8-acre Hunters Point site is located at 800 and 831 Palou Avenue, adjacent to the former Hunters Point Naval Shipyard in the Bayview/Hunters Point neighborhood. It is approximately 3.2 miles south of the Mission Bay campus site. The Hunters Point site contains two single-story buildings that total approximately 20,500 gsf. The property is used as an animal care facility (vivarium), employing approximately 14 UCSF personnel. The surrounding land use is primarily industrial, with a pocket of residential to the north of and above the low-lying site.

The City has approved the Candlestick-Hunters Point Shipyard Development Plan, an extensive mixed-use redevelopment plan for the surrounding area that would include housing, retail, office, commercial, industrial, and open space uses. Because UCSF's facilities on this site are in relatively poor condition, UCSF is exploring the relocation of those functions and occupants and disposition of the site as part of the strategy to consolidate remote sites.

3.8.5.5 Oyster Point

The 5.7-acre Oyster Point site is located at 616 Forbes Boulevard in the City of South San Francisco. This property includes a warehouse from which UCSF provides distribution, storage and mail services; the warehouse has an adjacent parking lot. Some vendors deliver goods to Oyster Point that are then consolidated onto UCSF vehicles for delivery to campus sites. The building constitutes approximately 144,300 gsf. There are approximately 42 UCSF personnel working at the Oyster Point facility. Surrounding land uses include industrial, research, office, and distribution. Several biotechnology companies, such as Genentech, are located in close proximity to the site.

UCSF continues to evaluate other sites for centralized receiving, to potentially reduce the number of deliveries to each campus site. Relocation of functions from and subsequent disposition of Oyster Point is being considered as part of UCSF's strategy to consolidate remote sites. Should Oyster Point be relinquished as part of that strategy, a suitable site and relocation plan would need to be identified in order to accommodate the existing functions and operations at Oyster Point.

3.8.5.6 UCSF Fresno Center for Medical Education and Research

UCSF established a regional medical education program in Fresno in 1975 to provide training for doctors and other health care professionals in the Central San Joaquin Valley. The program was created with support from the California Legislature and the Veterans Administration to address the shortage of physicians practicing in California's San Joaquin Valley and to increase access to

continuing medical education in the region. UCSF Fresno provides medical education and physician training programs through community and university partnerships. Training for clinical residents (and in some programs, fellows) is available in: emergency medicine, family practice, general surgery, internal medicine, obstetrics/gynecology, pediatrics, psychiatry, and surgical critical care. As a regional medical campus, UCSF Fresno carries out its training and patient care through a network of affiliation agreements with a number of hospitals in the area, including the Community Healthcare Network (Clovis Community Medical Center, Fresno Heart & Surgical Hospital, and University Medical Center), the Veterans Affairs Medical Center, Children's Hospital Central California, Saint Agnes Medical Center, and Kaiser Permanente, as well as several community hospitals and other specialized facilities.

The UCSF Fresno Center for Medical Education and Research opened in 2004. The three-story, 84,200-gsf building sits on 3.02 acres. It serves as the hub of medical education and research at UCSF Fresno, and includes a clinical skills lab, a standardized patient center, the digital medical library, virtual classrooms, and research facilities.

UCSF expects to continue its academic, research, and clinical activities at Fresno, and UCSF uses are not anticipated to change under the LRDP.

3.8.5.7 San Francisco General Hospital

San Francisco General Hospital and Trauma Center (SFGH) is located in the Mission district, bordering the western portion of the Potrero Hill neighborhood (Figure 22). The site is generally bounded by U.S. Highway 101 to the north and east, Twenty-third Street to the south, and Potrero Avenue to the west. The area immediately surrounding SFGH is mostly residential, with some ground-floor, neighborhood-serving commercial activity, especially along Twenty-fourth Street.

SFGH is an acute-care medical center owned and operated by the City. UCSF does not own facilities at SFGH, but through an affiliation agreement with the City, UCSF faculty and physicians provide all of the medical care at SFGH in City-owned buildings. In addition, UCSF faculty conduct research at SFGH. UCSF leases or otherwise occupies space in exchange for services. There are approximately 2,000 UCSF faculty and staff at SFGH.

UCSF occupies approximately 257,800 gsf of research labs, office and clinic space on the SFGH campus in ten buildings (Buildings 1, 3, 5, 9, 10, 20, 30, 40, 80/90, and 100). Because the University of California Office of the President considers SFGH to be an adjunct campus to UCSF, it is subject to UC's Policy on Seismic Safety (Policy), which requires that all personnel be located in seismically safe buildings. Out of the total space occupied by UCSF at the SFGH campus site, approximately 175,000 gsf is in seismically compromised buildings. UCSF intends to continue to occupy Building 3, which is seismically safe, and Building 5, which the City plans to retrofit. UC does not own the land where SFGH is located, thus no functional zones are applied to this site.

To comply with the UC Seismic Safety Policy, UCSF will need to relocate its SFGH personnel. UCSF is considering relocation of its UCSF personnel to a new, UCSF-constructed and

seismically robust research building of about 175,000 gsf. The building may also accommodate UCSF personnel now in off-site leased space. As of 2014, it is proposed on the existing SFGH surface parking lot (B/C Lot) located between the existing hospital (SFGH Building 5) and Twenty-third Street. Due to the timing of the proposed project, the new research building will undergo its own environmental review process, separate from the 2014 LRDP EIR.

Parking spaces displaced by the new building may be replaced on the SFGH campus. One option being explored is the expansion of the City's parking structure on Twenty-third Street. This potential expansion would extend the garage footprint toward Twenty-fourth Street on the surface parking lot of the garage site. This project would be undertaken by the City, as it is located on City property.

Under the LRDP, UCSF expects to maintain its activities and affiliation at SFGH, and no changes in UCSF uses are anticipated at SFGH.

3.8.5.8 San Francisco Veterans Affairs Medical Center

The 29-acre San Francisco Veterans Affairs Medical Center (SFVAMC) Fort Miley Campus is located in the northwest area of the City, adjacent to the Outer Richmond district. It is bounded by Clement Street and Seal Rock Drive and the Outer Richmond neighborhood to the south, and otherwise by the National Park Service's Golden Gate National Recreation Area (GGNRA). SFVAMC also leases space in 1700 Owens Street, west of UCSF's Mission Bay campus site.

SFVAMC has four overarching missions: patient care, education, research and Department of Defense Support/Emergency Management. The SFVAMC is home to the Northern California Institute for Research and Education (NCIRE), a non-profit with the mission to improve the health and well-being of veterans and the general population by supporting world-class biomedical research programs conducted by UCSF faculty. SFVAMC-based faculty are supported by more National Institute of Health grants than any other group in the VA system.

The SFVAMC is owned by the US Department of Veterans Affairs (the VA) and has been affiliated with UCSF as a teaching hospital for over 50 years. All physicians are recruited jointly by the VA and the UCSF School of Medicine. UCSF faculty and staff – 189 clinical residents and fellows and 40 allied health professionals – are SFVAMC employees. Annually, more than 700 UCSF trainees from 36 programs rotate through the SFVAMC, providing one-third of all of UCSF's medical training. The SFVAMC has no independent training programs of its own.

Although UCSF faculty and their practices are physically located at the SFVAMC site, UC does not own, lease, or otherwise control any of the space. For these and other reasons, SFVAMC space is not part of the proposed space program in this LRDP, and no functional zones are proposed.

The *SFVAMC 2012 LRDP* and the updated *2014 LRDP* (prepared by SFVAMC, U.S. Department of Veterans Affairs) identified the need to retrofit existing buildings, in order to meet the most recent seismic safety requirements, and to expand its research program at another off-site location. The SFVAMC's LRDP has a planning horizon of 2027; it was developed to meet the SFVAMC's particular requirements and is unrelated to UCSF's LRDP. In 2013, the SFVAMC established a

42,000 square-foot research center at 1700 Owens Street in the Mission Bay area; the SFVAMC intends to lease this space for 10 years. SFVAMC also plans to begin construction of a 100,000 gsf laboratory building at the Fort Miley Campus in 2015 as part of its seismic upgrade requirements. Due to space limitations on the Fort Miley Campus, the SFVAMC is working to establish a larger, permanent academic presence in the Mission Bay area. Any real estate and operating transaction would require federal Office of Management and Budget approval and legislation would need to be approved by Congress. UCSF expects to maintain its activities as an affiliated institution at the SFVAMC, and no changes in uses are proposed.

3.8.6 Leased Sites

UCSF leases approximately 1.05 million gsf in San Francisco (including space at SFGH). UCSF is actively engaged in an effort to reduce the number of leased locations by consolidating leases into UCSF-owned space to improve operational efficiency. For the purposes of the LRDP, it is assumed that UCSF's total lease portfolio will be reduced to about 750,000 gsf over the LRDP planning horizon to provide long-term flexibility and account for fluctuations associated with changes in community health care needs, growth in clinical and research programs and other unforeseen needs.

As of April 2014, UCSF occupies a number of leases larger than 10,000 gsf within a quarter-mile of its main campus sites at Parnassus Heights, Mission Bay, and Mount Zion. The following is a summary of UCSF's main leased sites that are greater than 10,000 gsf and located beyond a quarter of a mile from UCSF's three major campus sites. These sites are not addressed individually in the LRDP or the EIR.

3.8.6.1 San Francisco

50 Beale Street

UCSF leases approximately 57,400 gsf at 50 Beale Street in downtown San Francisco for Global Health Sciences and the Center for AIDS Prevention Study. UCSF will continue to lease space at this location until most, if not all, of the occupants have been relocated to Mission Hall on the Mission Bay campus site after the building opens in 2014.

220 Montgomery Street

UCSF leases approximately 38,300 gsf at 220 Montgomery Street in downtown San Francisco for use by University Development and Alumni Relationships. UCSF expects to continue to occupy this location until 2017, and then to determine if the lease should be renewed or if occupants should be consolidated into owned space at Mission Bay as part of UCSF's lease consolidation strategy.

250 Executive Park Boulevard

UCSF leases approximately 42,400 gsf at 250 Executive Park Boulevard in the Bayview/Candlestick Park area, located off U.S. Highway 101 near the San Francisco County line. Executive Park is part of a privately-owned mixed-use development. The space leased by UCSF is used by the Medical

Center's Information Technology Center. UCSF plans to remain at 250 Executive Park through the end of the term of its lease, after which the University anticipates vacating the building due to its seismic condition.

982 Mission Street

UCSF leases approximately 24,800 gsf at 982 Mission Street in the South of Market district for the Citywide Case Management and Community Focus Center, which is affiliated with UCSF and SFGH Department of Psychiatry programs. The center provides outpatient psychiatric care, crisis intervention, therapy and clinical case management services. No changes are planned at this location.

1930 Market Street

UCSF Alliance Health Project Center is located in the Upper Market neighborhood at 1930 Market Street, on the north side of the street between Guerrero Street and Duboce Avenue. UCSF leases approximately 14,800 gsf in this two-story building. It is a community-based clinic and counseling center, also known as the AIDS Health Center, affiliated with the Department of Psychiatry at UCSF, San Francisco General Hospital and the UCSF AIDS Research Institute. UCSF plans to remain at this location.

2727 Mariposa Street

The UCSF Trauma Recovery and Treatment Center, affiliated with SFGH, is located at 2727 Mariposa Street in the Mission District. UCSF leases approximately 12,000 gsf in this mixed-use building and has no plans to relocate.

3360 Geary Boulevard

UCSF leases approximately 19,300 gsf at 3360 Geary Boulevard, between Parker and Commonwealth streets. UCSF Medical Center administrative support units occupy the building space. For the present, UCSF intends to remain at this location, although the University may consider moving the occupants into owned space as part of UCSF's lease consolidation strategy.

China Basin Building (185 Berry Street)

UCSF leases approximately 187,000 gsf at 185 Berry Street in the China Basin Landing Building, situated between Third and Fourth streets, next to AT&T Park and one block south of the Fourth and King Street Caltrain Station. The UCSF Imaging Center, Department of Epidemiology and Biostatistics and several other research, academic and campus administration units are located in this building. Some of UCSF's units at China Basin will be moving into owned space or other leased space. Other programs will likely remain at China Basin in the near-term, but may eventually move into owned space at Mission Bay or into other leased space as part of UCSF's lease consolidation strategy.

3.8.6.2 Emeryville

2000 Powell Street

The UCSF Medical Center's Medical Group Business Services (MGBS) department is located at 2000 Powell Street in Emeryville. UCSF currently leases approximately 15,600 gsf in this mixed-use building, and has no plans to relocate.

6425 Christie Street

UCSF Medical Center accounting is located at 6425 Christie Street in Emeryville. UCSF currently leases approximately 27,900 gsf in this mixed-use building, and has no plans to relocate.

3.9 Projects and Activities Not Included in the LRDP EIR

The following is a list of projects and activities that are not included in the LRDP EIR.

3.9.1 Parnassus Heights

3.9.1.1 Mount Sutro Management Project

The Draft EIR for the Mount Sutro Management Project was issued on January 18, 2013. The proposal would implement a number of management activities in the Mount Sutro Open Space Reserve. These management activities include thinning the forest, native plant restoration and enhancement, conversion planting (removal of non-native trees and plants and conversion to native species) in select areas and construction of new trails. The proposed management activities have subsequently been revised and no longer include construction of new trails. Proposed trails are now being analyzed as part of proposed activities under the LRDP and are described in this EIR in Section 3.7.

UCSF is committed to maintaining the Mount Sutro Open Space Reserve so it can be enjoyed by visitors from throughout the city, the Bay Area, and elsewhere. UCSF's primary responsibility as the steward of the Reserve must be ensuring the safety of students, employees, patients, visitors, and neighbors, as well as ensuring the safety of campus and neighboring structures, particularly in light of the elevated fire danger resulting from California's current and periodic drought conditions.

To ensure the safety of visitors and nearby structures, UCSF retained a professional forester to help develop a plan for the Reserve that focused on reducing the danger of wildfire. Proposed hazard reduction measures, consistent with best management practices applied throughout California in forests located near urban areas, were developed and presented to the community in November, 2013. As of this writing, UCSF is carefully considering the public feedback received

to date—responding to both previous forest management proposals and to the proposed fire hazard reduction measures presented in November, 2013—to determine the best path forward.

Because this project is currently underway with its own environmental review, it is not included as part of the LRDP EIR.

3.9.2 Mission Bay

Block 14 of the Mission Bay campus site is currently reserved for use by the San Francisco Unified School District (SFUSD) as a public school site. Per the Contribution Agreement through which the Mission Bay campus site was acquired by the Regents, the SFUSD has until 2027 to request conveyance of the 2.4-acre Block 14 for use as a school site. UCSF fully expects SFUSD to develop the site for a school. However, if the SFUSD does not request Block 14 during that timeframe, UCSF may develop Block 14 for its own use after the necessary planning, environmental review and amendment of the LRDP. The use and configuration of the site would be determined at that time.

3.9.3 Laurel Heights

As described previously, UCSF is reviewing its use of the Laurel Heights campus site. No change in UCSF's use is currently proposed at the Laurel Heights campus site thus it will not be studied in the EIR.

3.9.4 San Francisco General Hospital

As described previously, UCSF will need to vacate seismically compromised buildings at SFGH and is considering the construction of a new research building of about 175,000 gsf on the existing parking lot along Twenty-third Street. Due to the timing of this proposed project, the proposed SFGH Research Building will undergo its own UCSF environmental review process, separate from the LRDP EIR.

Under the LRDP, UCSF expects to maintain its activities and affiliation at SFGH and no changes in UCSF uses are anticipated at SFGH.

3.10 Community Planning Principles

While the LRDP Objectives described in Section 3.4 are intended to guide UCSF's physical development under the 2014 LRDP and serve as criteria against which future projects will be evaluated for consistency with the LRDP, UCSF has partnered with its neighbors to also prepare *Community Planning Principles*. These Principles formalize UCSF's commitment to communicate with neighbors regarding its space needs and potential future development, in order to identify potential community concerns that may arise from UCSF's physical development prior to the time that individual projects are brought forward for approval.

The *Community Planning Principles* are intended to aid UCSF in both complementing and advancing the planning priorities of the City and of its campus neighbors, and were jointly developed by the UCSF Community Advisory Group (CAG) and the UCSF LRDP Oversight Committee. The five Overarching Principles describe how UCSF will communicate with neighbors about its physical development plans both on-and off-campus, and consider the cushioning of impacts that result from UCSF's development. The five Overarching Principles are: (1) community consultation, to the extent allowed by confidentiality agreements governing real estate transactions, regarding property acquisition in neighborhoods under certain circumstances, or intensify use of existing property; (2) community notification when UCSF acquires property, including notification on a website, notice to the CAG and other neighbors as requested; (3) consider cushioning actions to offset neighborhood impacts, if any, as a result of UCSF property acquisition, development, and operations; (4) provide "proportional share" funding to the City to pay for adopted mitigation measures that are the responsibility of the City and identified in CEQA documents prepared for UCSF projects; and (5) provide a community involvement mechanism for the ongoing coordination and inclusion of neighborhood and community-based organizations in monitoring UCSF's planning and development activities, through the UCSF CAG and/or its sub-committees, the CAG Action Teams.

The *Community Planning Principles* are inspired by the 1996 LRDP Goals and Objectives as well as by the 2008 UCSF Mission Bay Community Planning Principles—all of which resulted from campus-community collaboration. The *Community Planning Principles* supersede the 1996 LRDP Goals and Objectives and the *2008 UCSF Mission Bay Community Planning Principles*, and apply to UCSF's development throughout San Francisco, including at existing campus sites ("on-campus development") as well as at other locations ("off-campus development"), as of adoption of the 2014 LRDP and at locations which may be proposed in the future under the LRDP.

CHAPTER 4
Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology

4.0 Introduction

Chapter 4 includes discussion of baseline conditions and presents the thresholds of significance ("Significance Standards") used in this EIR to assess the program-level impacts of the 2014 LRDP. Following this introductory material, the rest of this chapter is divided into 15 major sections, one for each environmental topic considered. Each major section contains: environmental and regulatory regional setting information regarding the environmental topic, relevant background and regulatory material, the Significance Standards and the analysis methodology for the topic. The Regional Setting section describes those regional baseline conditions pertinent to an environmental topic and thus, provides the context for an analysis of potential impacts resulting from implementation of the 2014 LRDP. Site-specific setting information applicable to a particular proposal at a campus site is presented in the relevant chapter in which campus site impacts are discussed (i.e., Chapters 6 through 9). The Regulatory Considerations section summarizes relevant federal, state and local laws that govern various aspects of an environmental topic.

The preparation of this EIR was preceded by an Initial Study (included as Appendix A), which determined that the 2014 LRDP would not result in certain identified impacts. Each of the environmental resource sections clearly identifies those effects that were adequately addressed in the Initial Study and are therefore not evaluated further in this EIR. The topics of Agriculture and Forestry Resources and Mineral Resources were determined in the Initial Study to require no further analysis in the EIR. Accordingly, these topics are not discussed in this EIR.

4.0.1 Baseline

The environmental setting sections describe the baseline physical environmental conditions. For purposes of the analyses in this EIR, the baseline is the most recent completed academic year: 2012-2013.

This EIR evaluates environmental impacts in terms of changes resulting from implementation of the 2014 LRDP as compared to existing conditions. With a few exceptions as stated in the text, the

conditions that would result at the LRDP planning horizon year (2035) are compared to baseline conditions to characterize the changes that would result from implementing the 2014 LRDP.

4.0.2 Levels of Significance

This EIR uses a variety of terms to describe the levels of significance of adverse impacts identified during the course of the environmental analysis. The following are definitions of terms used in this EIR:

- **Less than Significant Impact**. Impacts that are adverse but are not substantial because they do not exceed the specified standards of significance.

- **Potentially Significant**. Impacts that exceed the defined standards of significance and that may be eliminated or reduced to a less-than-significant level through the implementation of feasible mitigation measures.

- **Significant and Unavoidable**. Impacts that exceed the defined standards of significance and that cannot be eliminated or reduced to a less-than-significant level through the implementation of feasible mitigation measures.

4.0.3 Analysis of Cumulative Effects

The geographic extents of potential cumulative effects of the 2014 LRDP differ according to the environmental topic. For each environmental topic area, the analysis specifies the geographic scope of the cumulative impact, considers whether implementation of the 2014 LRDP in conjunction with past, present, and probable future projects would result in potentially significant cumulative impacts, and finally, determines whether the LRDP's contribution to that effect would be "cumulatively considerable." Cumulative impacts of the 2014 LRDP are discussed in Chapter 10 of this EIR.

4.1 Aesthetics

This section presents the Regional Setting, Regulatory Considerations, Significance Standards, and Analysis Methodology for the evaluation of Aesthetics impacts. 2014 LRDP Aesthetics effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Aesthetics effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.1.1 Regional Setting

The regional setting for aesthetics is the City of San Francisco, a relatively dense urban environment that is built out in most areas. Visual resources and issues within the City focus predominantly on protection of waterfront views and long-range views and encouragement of development that is compatible with adjacent existing or planned development and neighborhoods. Each campus site is located in a visually distinct area of the City, characterized by natural landforms and topography, existing buildings and unique land use patterns.

4.1.2 Regulatory Considerations

4.1.2.1 UCSF Facilities Design Guidelines

New development at UCSF is guided by the *Facilities Design Guidelines*. The guidelines set forth design objectives and special considerations for UCSF projects, with an emphasis on a project's functional requirements, overall economy and technical guidelines.

The *Facilities Design Guidelines* also contain specific policies related to landscaping at UCSF campus sites. These policies include designing landscapes at entrances and exits to UCSF facilities (e.g., roadways, parking lots and pedestrian areas) to maximize visibility and allow adequate lighting. Vegetation should be compatible with the natural limitations presented by the Bay Area's climate and soil conditions, and also be appropriate for man-made environments (e.g., adequate for use as street trees). Additional policies related to landscaping include incorporating water and energy conservation features and utilizing low-maintenance materials.

4.1.2.2 UCSF Physical Design Framework

Development at UCSF is also guided by the *Physical Design Framework*, which sets forth a vision for the physical development of all UCSF campus sites. It serves as the foundation for UCSF to plan and design future projects according to a clear and consistent set of planning and design principles, guidelines and strategies. The *Physical Design Framework* contains six planning principles that are universally applicable to UCSF campus sites. They express key thematic concepts of Context, Connectivity, Cohesiveness, Collegiality, Community and Conservation.

Each of the above principles contains related specific guidelines, such as designing buildings to fit within their urban context, considering massing, style, pattern and color of buildings in the vicinity; relating buildings to pedestrians and scale to human activity and visual interest; providing a positive campus interface at campus edges; providing comfortable, activated campus open spaces; and incorporating sustainability features in buildings.

4.1.2.3 San Francisco General Plan

The City's General Plan includes policies that pertain to views and visual quality. The policies most relevant to aesthetics are contained in the Urban Design Element of the General Plan. Policies 1.1 through 1.5 of the City Pattern section of the Urban Design Element relate to the appearance of buildings and landscaping, and their total effect that characterizes the various city districts. These policies also recognize and protect major public views in the city, with particular attention to views of open space. Policies 2.4 through 2.6 of the Conservation section of the Urban Design Element address notable landmarks of aesthetic or other importance, as well as convey a need to respect the character of nearby older development in the design of new buildings. The Major New Development section of the Urban Design Element, Policies 3.1 through 3.7, relate to building design and the visual relationship between new and established development, with an emphasis on promoting a harmonious relationship between existing and new buildings, relating building heights to important attributes of the city pattern and to heights of existing buildings, and recognizing the special urban design problems posed in development of large properties. Policy 4.15 of the Neighborhood Environment section of the Urban Design Element includes requirements for protecting the livability and character of neighborhoods from intrusion of incompatible new development. Although the University is not subject to local planning policies whenever using land under its control in furtherance of its educational mission, the University strives to be consistent with local policies where feasible.

4.1.2.4 San Francisco Planning Code

The standards contained within the San Francisco Planning Code are used to analyze the potential wind and shadow impacts of projects. San Francisco Planning Code Section 148 establishes, in certain districts of San Francisco, wind speed criteria for the comfort and safety of pedestrians. Wind speeds in excess of 26 miles per hour (equivalent wind speed for a single hour of the year) are considered hazardous. As a general rule, structures less than 100 feet tall are not considered to be of sufficient height to alter wind speeds at ground level and are therefore usually not evaluated for wind effects. San Francisco Planning Code Section 295 generally prohibits development above a height of 40 feet if it would cause significant new shadow on open space under the jurisdiction of the San Francisco Recreation and Park Commission between one hour after sunrise and one hour before sunset, at any time of the year.

4.1.3 Significance Standards

Would the implementation of the proposed 2014 LRDP:

a) Have a substantial adverse effect on a scenic vista?

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

c) Substantially degrade the existing visual character or quality of the site and its surroundings?

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

e) Exceed the LRDP EIR significance standard by substantially reducing sunlight or significantly increasing shadows in public open space areas, or by increasing pedestrian-level wind speeds above the hazard level set forth in the San Francisco Planning Code?

Regarding criterion b), after evaluation of the activities proposed by the 2014 LRDP, the Initial Study concluded that implementation of the 2014 LRDP would clearly result in no impact or a less-than-significant impact. Therefore, this criterion is not discussed further in the EIR.

4.1.4 Analysis Methodology

For purposes of this EIR, the visual impact assessment provides a description of the physical setting surrounding UCSF campus sites to illustrate the backdrop against which impacts of the 2014 LRDP are evaluated. The scale, massing, bulk and form of the proposed 2014 LRDP development proposals are evaluated in the context of surrounding development. The existing physical characteristics include short-range and long-range views; the type, height and scale of existing development on or near a campus site; man-made landmarks such as major highways or skyline views; and natural landmarks such as hillsides or San Francisco Bay. In general, views from public streets and parks are emphasized; impacts on private views are not considered under CEQA. Generally, this analysis does not evaluate the visual impacts of final site plans or building designs for LRDP development proposals unless specific design information is available at this time. Basic assumptions are discussed regarding the physical appearance of proposed new buildings and other LRDP activities.

In addition, Public Resources Code Section 21099(d), effective January 1, 2014, provides that, "aesthetics and parking impacts of a residential, mixed-use residential, or employment center projects on an infill site located within a transit priority area shall not be considered significant impacts on the environment." Accordingly, aesthetic impacts are no longer to be considered in determining if a project has the potential to result in significant environmental effects for projects that meet all of the following three criteria:

a) The project is in a transit priority area;
b) The project is on an infill site; and
c) The project is residential, mixed-use residential, or an employment center.

Activities proposed by the 2014 LRDP would have a significant effect if they would result in pedestrian-level wind speeds that exceed the hazardous level as established by San Francisco Planning Code Section 148, or if it would result in substantial new shadows on designated public open space under the jurisdiction of the Recreation and Park Commission during daylight hours. Shadow impacts on the usability of public open space not under the jurisdiction of the Recreation and Park Commission are also considered.

4.2 Air Quality

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Air Quality impacts. 2014 LRDP Air Quality effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Air Quality effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures,* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.2.1 Regional Setting

4.2.1.1 Climate and Meteorology

UCSF's campus sites are located within the San Francisco Bay Area Air Basin. The air basin's moderate climate steers storm tracks away from the region for much of the year, although storms generally affect the region from November through April. San Francisco's proximity to the onshore breezes stimulated by the Pacific Ocean provide for generally very good air quality in the San Francisco area.

Temperatures in the San Francisco area average in the mid-50s annually, generally ranging from the low 40s on winter mornings to mid-70s during summer afternoons. Daily and seasonal oscillations of temperature are small because of the moderating effects of the nearby San Francisco Bay. In contrast to the steady temperature regime, rainfall is highly variable and confined almost exclusively to the "rainy" period from November through April. Precipitation may vary widely from year to year as a shift in the annual storm track of a few hundred miles can mean the difference between a very wet year and drought conditions.

Atmospheric conditions such as wind speed, wind direction, and air temperature gradients interact with the physical features of the landscape to determine the movement and dispersal of air pollutants regionally. The project campuses lie within the Peninsula climatological subregion. Marine air traveling through the Golden Gate is a dominant weather factor affecting dispersal of air pollutants within the region. Increased temperatures create the conditions in which ozone formation can increase.

4.2.1.2 Ambient Air Quality – Criteria Air Pollutants

As required by the 1970 federal Clean Air Act, the United States Environmental Protection Agency (USEPA) initially identified six criteria air pollutants that are pervasive in urban environments and for which state and federal health-based ambient air quality standards have been established. USEPA calls these pollutants "criteria air pollutants" because the agency has regulated them by developing specific public-health-based and welfare-based criteria as the basis for setting permissible levels. Ozone, carbon monoxide (CO), particulate matter (PM), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and lead are the six criteria air pollutants originally identified by USEPA. Since that time, subsets of particulate matter have been identified for which

permissible levels have been established. These include particulate matter of 10 microns in diameter or less (PM_{10}) and particulate matter of 2.5 microns in diameter or less ($PM_{2.5}$).

The Bay Area Air Quality Management District (BAAQMD) is the regional agency with jurisdiction for regulating air quality within the nine county San Francisco Bay Area Air Basin (SFBAAB). The region's air quality monitoring network provides information on ambient concentrations of criteria air pollutants at various locations in the San Francisco Bay Area. **Table 4.2-1** presents a five-year summary for the period 2009 to 2013 of the highest annual criteria air pollutant concentrations, collected at the air quality monitoring station operated and maintained by the BAAQMD at Sixteenth and Arkansas Streets, in San Francisco's lower Potrero Hill area, which is the closest monitoring station to the campus sites. Table 4.2-1 also compares measured pollutant concentrations with the most stringent applicable ambient air quality standards (state or federal). Concentrations shown in bold indicate an exceedance of the standard.

Ozone

Ozone is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving reactive organic gases (ROG, also sometimes referred to as volatile organic compounds or VOC by some regulating agencies) and nitrogen oxides (NOx). The main sources of ROG and NOx, often referred to as ozone precursors, are combustion processes (including motor vehicle engines) and the evaporation of solvents, paints, and fuels. In the Bay Area, automobiles are the single largest source of ozone precursors. Ozone is referred to as a regional air pollutant because its precursors are transported and diffused by wind concurrently with ozone production through the photochemical reaction process. Ozone causes eye irritation, airway constriction, and shortness of breath and can aggravate existing respiratory diseases such as asthma, bronchitis, and emphysema.

Table 4.2-1 shows that, according to published data, the most stringent applicable standard, the state 1-hour standard of 9 parts per hundred million [pphm], was not exceeded and the federal 8-hour standard of 8 pphm was also not exceeded in San Francisco between 2009 and 2013.

Carbon Monoxide (CO)

CO is an odorless, colorless gas usually formed as the result of the incomplete combustion of fuels. The single largest source of CO is motor vehicles; the highest emissions occur during low travel speeds, stop-and-go driving, cold starts, and hard acceleration. Exposure to high concentrations of CO reduces the oxygen-carrying capacity of the blood and can cause headaches, nausea, dizziness, and fatigue; impair central nervous system function; and induce angina (chest pain) in persons with serious heart disease. Very high levels of CO can be fatal. As shown in Table 4.2-1, the more stringent state CO standards were not exceeded between 2009 and 2013. Measurements of CO indicate hourly maximums ranging between 9% to 29% of the more stringent state standard, and maximum 8-hour CO levels that are approximately 19% to 32% of the allowable 8-hour standard.

TABLE 4.2-1
SUMMARY OF SAN FRANCISCO AIR QUALITY MONITORING DATA (2009–2013)

Pollutant	Most Stringent Applicable Standard	Number of Days Standards Were Exceeded and Maximum Concentrations Measured[a]				
		2009	2010	2011	2012	2013
Ozone						
- Days 1-Hour Standard Exceeded		0	0	0	0	0
- Maximum 1-Hour Concentration (pphm)	>9 pphm[b]	7	8	7	7	7
- Days 8-Hour Standard Exceeded		0	0	0	0	0
- Maximum 8-Hour Concentration (pphm)	>7 pphm[c]	6	5	5	5	6
Carbon Monoxide (CO)						
- Days 1-Hour Standard Exceeded		0	0	0	0	0
- Maximum 1-Hour Concentration (ppm)	>20 ppm[b]	4.3	1.8	1.8	2.0	1.8
- Days 8-Hour Standard Exceeded		0	0	0	0	0
- Maximum 8-Hour Concentration (ppm)	>9 ppm[b]	2.9	1.4	1.2	1.2	1.4
Suspended Particulates (PM_{10})						
- Days 24-Hour Standard Exceeded[d]		0	0	0	1	0
- Maximum 24-Hour Concentration ($\mu g/m^3$)	>50 $\mu g/m^3$ [b]	36	40	46	**51**	44
Suspended Particulates ($PM_{2.5}$)						
- Days 24-Hour Standard Exceeded[e]		1	3	2	1	2
- Maximum 24-Hour Concentration ($\mu g/m^3$)	>35 $\mu g/m^3$ [c]	**36**	**45**	**47**	**36**	**49**
- Annual Average ($\mu g/m^3$)	>12 $\mu g/m^3$ [b]	9.7	10.5	9.5	8.2	10.1
Nitrogen Dioxide (NO_2)						
- Days 1-Hour Standard Exceeded		0	0	0	1	0
- Maximum 1-Hour Concentration (pphm)	>10 pphm[c]	6	9	9	**12**	7
Sulfur Dioxide (SO2)[f]						
- Days 24-Hour Standard Exceeded		ND	ND	ND	ND	ND
- Maximum 24-Hour Concentration (ppb)	>40 ppb[b]	ND	ND	ND	ND	ND

NOTES:
Bold values are in excess of applicable standard. "ND" indicates that data is not available.
ppm = parts per million; pphm = parts per hundred million; ppb=parts per billion
$\mu g/m^3$ = micrograms per cubic meter
ND = No data or insufficient data

[a] Number of days exceeded is for all days in a given year, except for particulate matter. PM_{10} and $PM_{2.5}$ are monitored every six days and therefore the number of days exceeded is out of approximately 60 annual samples.
[b] State standard, not to be exceeded.
[c] Federal standard, not to be exceeded.
[d] Based on a sampling schedule of one out of every six days, for a total of approximately 60 samples per year.
[e] Federal standard was reduced from 65 $\mu g/m^3$ to 35 $\mu g/m^3$ in 2006.
[f] Sulfur dioxide monitoring was terminated in San Francisco in 2009. Monitoring only continues near refineries.

SOURCE: BAAQMD, Bay Area Air Pollution Summary, 2009 – 2013. Available online at: http://www.baaqmd.gov/Divisions/Communications-and-Outreach/Air-Quality-in-the-Bay-Area/Air-Quality-Summaries.aspx.

Particulate Matter (PM_{10} and $PM_{2.5}$)

Particulate matter is a class of air pollutants that consists of heterogeneous solid and liquid airborne particles from man-made and natural sources. Particulate matter is measured in two size ranges: PM_{10} for particles less than 10 microns in diameter, and $PM_{2.5}$ for particles less than 2.5 microns in diameter. In the Bay Area, motor vehicles generate about one-half of the air basin's particulates, through tailpipe emissions as well as brake pad and tire wear. Wood burning in fireplaces and stoves, industrial facilities, and ground-disturbing activities such as construction

are other sources of such fine particulates. These fine particulates are small enough to be inhaled into the deepest parts of the human lung and can cause adverse health effects. According to the California Air Resources Board (CARB), studies in the United States and elsewhere "have demonstrated a strong link between elevated particulate levels and premature deaths, hospital admissions, emergency room visits, and asthma attacks," and studies of children's health in California have demonstrated that particle pollution "may significantly reduce lung function growth in children." The CARB also reports that statewide attainment of particulate matter standards could prevent thousands of premature deaths, lower hospital admissions for cardiovascular and respiratory disease and asthma-related emergency room visits, and avoid hundreds of thousands of episodes of respiratory illness in California (CARB, 2007). Among the criteria pollutants that are regulated, particulates appear to represent a serious ongoing health hazard. As long ago as 1999, the BAAQMD was reporting, in its *CEQA Air Quality Guidelines*, that studies had shown that elevated particulate levels contribute to the death of approximately 200 to 500 people per year in the Bay Area. High levels of particulate matter can exacerbate chronic respiratory ailments, such as bronchitis and asthma, and have been associated with increased emergency room visits and hospital admissions.

Table 4.2-1 shows that an exceedance of the state PM_{10} standard occurred on one monitored occasion between 2009 and 2013 in San Francisco. It is estimated that the state 24-hour PM_{10} standard of 50 micrograms per cubic meter ($\mu g/m^3$) was exceeded on up to 6 days per year between 2009 and 2013.[1] The BAAQMD began monitoring $PM_{2.5}$ concentrations in San Francisco in 2002. The federal 24-hour $PM_{2.5}$ standard was not exceeded until 2006, when the standard was lowered from 65 $\mu g/m^3$ to 35 $\mu g/m^3$. It is estimated that the state 24-hour $PM_{2.5}$ standard was exceeded on up to 54 days per year between 2009 and 2013. The state annual average standard was not exceeded between 2009 and 2013.

$PM_{2.5}$ is of particular concern because epidemiologic studies have demonstrated that people who live near freeways and high-traffic roadways have poorer health outcomes, including increased asthma symptoms and respiratory infections and decreased pulmonary function and lung development in children (SFDPH, 2008).

Nitrogen Dioxide (NO_2)

NO_2 is a reddish brown gas that is a byproduct of combustion processes. Automobiles and industrial operations are the main sources of NO_2. Aside from its contribution to ozone formation, NO_2 can increase the risk of acute and chronic respiratory disease and reduce visibility. NO_2 may be visible as a coloring component on high pollution days, especially in conjunction with high ozone levels. Table 4.2-1 shows that the current state standard for NO_2 is being met in San Francisco. In 2010, the U.S. EPA implemented a new 1-hour NO_2 standard presented in **Table 4.2-2**. Currently, the CARB is recommending that the Bay Area air basin be designated as an attainment area for the new standard. This new federal standard was exceeded on one day at the San Francisco station between 2009 and 2013.

[1] PM_{10} and $PM_{2.5}$ are sampled every sixth day; therefore, actual days over the standard can be estimated to be six times the numbers listed in the table.

TABLE 4.2-2
STATE AND FEDERAL AMBIENT AIR QUALITY STANDARDS AND ATTAINMENT STATUS

Pollutant	Averaging Time	State (SAAQs[a])		Federal (NAAQS[b])	
		Standard	Attainment Status	Standard	Attainment Status
Ozone	1 hour	0.09 ppm	**N**	NA	See Note c
	8 hour	0.07 ppm	U[d]	0.075 ppm	**N**/Marginal
Carbon Monoxide (CO)	1 hour	20 ppm	A	35 ppm	A
	8 hour	9 ppm	A	9 ppm	A
Nitrogen Dioxide (NO_2)	1 hour	0.18 ppm	A	0.100 ppm	U
	Annual	0.030 ppm	NA	0.053 ppm	A
Sulfur Dioxide (SO_2)	1 hour	0.25 ppm	A	0.075 ppm	A
	24 hour	0.04 ppm	A	0.14 ppm	A
	Annual	NA	NA	0.03 ppm	A
Particulate Matter (PM_{10})	24 hour	50 µg/m^3	**N**	150 µg/m^3	U
	Annual[e]	20 µg/m^3 [f]	**N**	NA	NA
Fine Particulate Matter ($PM_{2.5}$)	24 hour	NA	NA	35 µg/m3g	**N**
	Annual	15 µg/m^3	**N**	12 µg/m3	A
Sulfates	24 hour	25 µg/m^3	A	NA	NA
Lead	30 day	1.5 µg/m^3	A	NA	NA
	Cal. Quarter	NA	NA	1.5 µg/m^3	A
Hydrogen Sulfide	1 hour	0.03 ppm	U	NA	NA
Visibility-Reducing Particles	8 hour	See Note h	A	NA	NA

NOTES:
A = Attainment; **N** = Nonattainment; U = Unclassified; NA = Not Applicable, no applicable standard; ppm = parts per million; µg/m^3 = micrograms per cubic meter.

a SAAQS = state ambient air quality standards (California). SAAQS for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1-hour and 24-hour), nitrogen dioxide, particulate matter, and visibility-reducing particles are values that are not to be exceeded. All other state standards shown are values not to be equaled or exceeded.

b NAAQS = national ambient air quality standards. NAAQS, other than ozone and particulates, and those based on annual averages or annual arithmetic means, are not to be exceeded more than once a year. The 8-hour ozone standard is attained when the three-year average of the fourth highest daily concentration is 0.08 ppm or less. The 24-hour PM_{10} standard is attained when the three-year average of the 99th percentile of monitored concentrations is less than the standard. The 24-hour $PM_{2.5}$ standard is attained when the three-year average of the 98th percentile is less than the standard.

c The United States Environmental Protection Agency (U.S. EPA) revoked the national 1-hour ozone standard on June 15, 2005.

d This state 8-hour ozone standard was approved in April 2005 and became effective in May 2006.

e State standard = annual geometric mean; national standard = annual arithmetic mean.

f In June 2002, The California Air Resources Board (CARB) established new annual standards for $PM_{2.5}$ and PM_{10}.

g On January 9, 2013, EPA issued a final rule to determine that the Bay Area attains the 24-hour $PM_{2.5}$ national standard. This EPA rule suspends key SIP requirements as long as monitoring data continues to show that the Bay Area attains the standard. Despite this EPA action, the Bay Area will continue to be designated as "non-attainment" for the national 24-hour $PM_{2.5}$ standard until such time as the Air District submits a "redesignation request" and a "maintenance plan" to EPA, and EPA approves the proposed redesignation.

h Statewide visibility-reducing particle standard (except Lake Tahoe Air Basin): Particles in sufficient amount to produce an extinction coefficient of 0.23 per kilometer when the relative humidity is less than 70%. This standard is intended to limit the frequency and severity of visibility impairment due to regional haze and is equivalent to a 10-mile nominal visual range.

SOURCE: Bay Area Air Quality Management District (BAAQMD), Standards and Attainment Status, 2012a, http://hank.baaqmd.gov/pln/air_quality/ambient_air_quality.htm, accessed February 19, 2014; and U.S. EPA National Ambient Air Quality Standards, 2011, http://www.epa.gov/air/criteria.html, accessed February 19, 2014.

The U.S. EPA has also established requirements for a new monitoring network to measure NO_2 concentrations near major roadways in urban areas with a population of 500,000 or more. Sixteen new near-roadway monitoring sites are required in California, three of which will be in the Bay Area. These monitors are planned for Berkeley, Oakland, and San Jose. The Oakland station

commenced operation in February 2014 while the other two are not yet operational but will be by January 2015. The new monitoring data may result in a need to change area designations in the future. The CARB will revise the area designation recommendations, as appropriate, once the new monitoring data become available.

Sulfur Dioxide (SO_2)

SO_2 is a colorless acidic gas with a strong odor. It is produced by the combustion of sulfur-containing fuels such as oil, coal, and diesel. SO_2 has the potential to damage materials and can cause health effects at high concentrations. It can irritate lung tissue and increase the risk of acute and chronic respiratory disease. Table 4.2-2 shows that the state standard for SO_2 is being met in the Bay Area, and pollutant trends suggest that the air basin will continue to meet this standard for the foreseeable future.

In 2010, the U.S. EPA implemented a new 1-hour SO_2 standard presented in Table 4.2-2. The U.S. EPA has initially designated the SFBAAB as an attainment area for $PM_{2.5}$. Similar to the new federal standard for NO_2, the U.S. EPA has established requirements for a new monitoring network to measure SO_2 concentrations to be operational by January 2013 (USEPA, 2010a). No additional SO_2 monitors are required for the Bay Area because BAAQMD jurisdiction has never been designated as non-attainment for SO_2 and no SIP or maintenance plans have been prepared for SO_2 (BAAQMD, 2013).

Lead

Leaded gasoline (phased out in the United States beginning in 1973), paint (on older houses, cars), smelters (metal refineries), and manufacturers of lead storage batteries have been the primary sources of lead released into the atmosphere. Lead has a range of adverse neurotoxic health effects, which put children at special risk. Some lead-containing chemicals cause cancer in animals. Lead levels in the air have decreased substantially since leaded gasoline was eliminated. Ambient lead concentrations are only monitored on an as-warranted, site-specific basis in California. On October 15, 2008, the U.S. EPA strengthened the national ambient air quality standard for lead by lowering it from 1.5 $\mu g/m^3$ to 0.15 $\mu g/m^3$. The U.S. EPA revised the monitoring requirements for lead in December 2010. These requirements focus on airports and large urban areas resulting in an increase in 76 monitors nationally (USEPA, 2010b).

4.2.1.3 Toxic Air Contaminants

Toxic air contaminants (TACs) are air pollutants that may lead to serious illness or increased mortality, even when present in relatively low concentrations. Potential human health effects of TACs include birth defects, neurological damage, cancer, and death. There are hundreds of different types of TACs with varying degrees of toxicity. Individual TACs vary greatly in the health risk they present; at a given level of exposure, one TAC may pose a hazard that is many times greater than another.

TACs do not have ambient air quality standards, but are regulated by the BAAQMD using a risk-based approach. This approach uses a health risk assessment to determine what sources and pollutants to control as well as the degree of control. A health risk assessment is an analysis in which human health exposure to toxic substances is estimated and considered together with information regarding the toxic potency of the substances, to provide quantitative estimates of health risks.[2]

In addition to monitoring criteria pollutants, both the BAAQMD and CARB operate TAC monitoring networks in the San Francisco Bay Area Air Basin. These stations measure 10 to 15 TACs, depending on the specific station. The TACs selected for monitoring are those that have traditionally been found in the highest concentrations in ambient air and therefore tend to produce the most significant risk. The nearest BAAQMD ambient TAC monitoring station to the 2014 LRDP area is the station at Sixteenth and Arkansas Streets in San Francisco. **Table 4.2-3** shows ambient concentrations of carcinogenic TACs measured at the Arkansas Street station, and the estimated cancer risks from a lifetime exposure (70 years) to these substances is also reported in the table. When TAC measurements at this station are compared to ambient concentrations of various TACs for the Bay Area as a whole, the cancer risks associated with mean TAC concentrations in San Francisco are similar to those for the Bay Area as a whole. Therefore, the estimated average lifetime cancer risk resulting from exposure to TAC concentrations monitored at the San Francisco station does not appear to be any greater than for the Bay Area as a region.

TABLE 4.2-3
ANNUAL AVERAGE AMBIENT CONCENTRATIONS OF CARCINOGENIC TOXIC AIR CONTAMINANTS MEASURED AT BAAQMD MONITORING STATION IN 2012, 10 ARKANSAS STREET, SAN FRANCISCO

Substance	Concentration	Cancer Risk per Million[a]
Gaseous TACs	**(ppb)**	
Acetaldehyde	0.50	2
Benzene	0.20	19
1,3-Butadiene	0.034	13
Carbon Tetrachloride	0.082	22
Formaldehyde	1.01	7
Perchloroethylene	0.010	0.4
Methylene Chloride	0.087	0.3
Chloroform	0.018	0.5
Trichloroethylene	0.01	0.1
Particulate TACs	**(ng/m^3)**	
Chromium (Hexavalent)	0.065	10
Total Risk for All TACs		**74.3**

NOTES:
TACs = toxic air contaminants; BAAQMD = Bay Area Air Quality Management District; ppb = part per billion; ng/m^3 = nanograms per cubic meter.

[a] Cancer risks were estimated by applying published unit risk values to the measured concentrations.

SOURCE: California Air Resources Board, *Ambient Air Toxics Summary-2012*, available online at: http://www.arb.ca.gov/adam/toxics/sitesubstance.html

[2] In general, a health risk assessment is required if the BAAQMD concludes that projected emissions of a specific air toxic compound from a proposed new or modified source suggest a potential public health risk; then the applicant is subject to a health risk assessment for the source in question. Such an assessment generally evaluates chronic, long-term effects, calculating the increased risk of cancer as a result of exposure to one or more TACs.

Roadway-Related Pollutants

Motor vehicles are responsible for a large share of air pollution, especially in California. Vehicle tailpipe emissions contain diverse forms of particles and gases and also contribute to particulates by generating road dust and through tire wear. Epidemiologic studies have demonstrated that people living in proximity to freeways or busy roadways have poorer health outcomes, including increased asthma symptoms and respiratory infections and decreased pulmonary function and lung development in children. Air pollution monitoring conducted in conjunction with epidemiologic studies has confirmed that roadway-related health effects vary with modeled exposure to particulate matter and nitrogen dioxide. In traffic-related studies, the additional non-cancer health risk attributable to roadway proximity was seen within 1,000 feet of the roadway and was strongest within 300 feet. (CARB, 2005) As a result, the CARB recommends that new sensitive land uses not be located within 500 feet of a freeway or urban roads carrying 100,000 vehicles per day. In 2008, the City of San Francisco adopted amendments to the Health Code (discussed below under "Regulatory Framework"), requiring new residential projects near high-volume roadways to be screened for particulate matter exposure hazards and, where indicated, to conduct an analysis of exposure and to mitigate hazards through design and ventilation.

Diesel Particulate Matter (DPM)

The CARB identified diesel particulate matter (DPM) as a toxic air contaminant in 1998, primarily based on evidence demonstrating cancer effects in humans. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Mobile sources such as trucks and buses are among the primary sources of diesel emissions, and concentrations of DPM are higher near heavily traveled highways. The CARB estimated average Bay Area cancer risk from exposure to diesel particulate, based on a population-weighted average ambient diesel particulate concentration, is about 480 in one million, as of 2000, which is much higher than the risk associated with any other toxic air pollutant routinely measured in the region. The risk in the Bay Area from DPM as determined by the BAAQMD declined from about 900 in one million in 1990 to about 525 in one million in 2001 and less than 300 in one million in 2012 (BAAQMD, 2014).[3]

Recent air pollution studies have shown an association between respiratory and other non-cancer health effects and proximity to high traffic roadways. The CARB community health risk assessments and regulatory programs have produced air quality information about certain types of facilities for consideration by local authorities when siting new residences, schools, day care centers, parks and playgrounds, and medical facilities (i.e., sensitive land uses). Sensitive land uses deserve special attention because children, pregnant women, the elderly, and those with existing health problems are especially vulnerable to the non-cancer effects of air pollution. There is also substantial evidence that children are more sensitive to cancer-causing chemicals (CARB, 2005).

[3] This calculated cancer risk value from ambient air exposure in the Bay Area can be compared against the lifetime probability of being diagnosed with cancer in the United States, from all causes, which is more than 0.40 (based on a sampling of 17 regions nationwide), or greater than 400,000 in one million, according to the American Cancer Society. (American Cancer Society, "Lifetime Probability of Developing or Dying from Cancer," last revised July 13, 2009, available online at http://www.cancer.org/docroot/CRI/content/CRI_2_6x_Lifetime_Probability_of_Developing_or_Dying_From_Cancer.asp)

In 2000, the CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines. In 2007, the CARB adopted the In-Use Off-Road Diesel Vehicle Regulation to reduce diesel DPM and NOx emissions from in-use (existing) off-road heavy-duty diesel vehicles in California. Such vehicles are used in construction, mining, and industrial operations. Subsequent CARB regulations apply to new trucks and diesel fuel. With new controls and fuel requirements, 60 trucks built in 2007 would have the same particulate exhaust emissions as one truck built in 1988 (Pollution Engineering, 2006). The regulation is anticipated to result in an 80% decrease in statewide diesel health risk in 2020 as compared with the diesel risk in 2000.

Despite notable emission reductions, the CARB recommends that proximity to sources of DPM emissions be considered in the siting of new sensitive land uses. The CARB notes that these recommendations are advisory and should not be interpreted as defined "buffer zones," and that local agencies must balance other considerations, including transportation needs, the benefits of urban infill, community economic development priorities, and other quality of life issues. With careful evaluation of exposure, health risks, and affirmative steps to reduce risk where necessary, the CARB's position is that infill development, mixed use, higher density, transit-oriented development, and other concepts that benefit regional air quality can be compatible with protecting the health of individuals at the neighborhood level.

4.2.1.4 Sensitive Receptors

Air quality does not affect every individual in the population in the same way, and some groups are more sensitive to adverse health effects than others. Population subgroups sensitive to the health effects of air pollutants include the elderly and the young; population subgroups with higher rates of respiratory disease, such as asthma and chronic obstructive pulmonary disease; and populations with other environmental or occupational health exposures (e.g., indoor air quality) that affect cardiovascular or respiratory diseases. The BAAQMD defines sensitive receptors as children, adults, and seniors occupying or residing in residential dwellings, schools, colleges and universities, day care, hospitals, and senior-care facilities. Workers are not considered sensitive receptors because all employers must follow regulations set forth by the Occupation Safety and Health Administration (OSHA) to ensure the health and well-being of their employees (BAAQMD, 2011).

The proximity of sensitive receptors to motor vehicles is an air pollution concern, especially in San Francisco where building setbacks are limited and roadway volumes higher than most other parts of the Bay Area. Epidemiologic studies have consistently demonstrated that children and adults living in proximity to freeways or busy roadways have poorer health outcomes, including increased asthma symptoms and respiratory infections, and decreased pulmonary function and lung development in children. Vehicles also contribute to particulates by generating road dust and through tire wear.

4.2.2 Regulatory Considerations

4.2.2.1 Federal Regulations

The 1970 Clean Air Act (last amended in 1990) requires that regional planning and air pollution control agencies prepare a regional air quality plan to outline the measures by which both stationary and mobile sources of pollutants will be controlled in order to achieve all standards by the deadlines specified in the act. These ambient air quality standards are intended to protect the public health and welfare, and they specify the concentration of pollutants (with an adequate margin of safety) to which the public can be exposed without adverse health effects. They are designed to protect those segments of the public most susceptible to respiratory distress, including asthmatics, the very young, the elderly, people weak from other illness or disease, or persons engaged in strenuous work or exercise. Healthy adults can tolerate occasional exposure to air pollution levels that are somewhat above ambient air quality standards before adverse health effects are observed.

The current attainment status for the San Francisco Bay Area Air Basin, with respect to federal standards, is summarized above in Table 4.2-2. In general, the Bay Area Air Basin experiences low concentrations of most pollutants when compared to federal standards, except for ozone and particulate matter (PM_{10} and $PM_{2.5}$), for which standards are exceeded periodically (see Table 4.2-1).

In June 2004, the Bay Area was designated as a marginal nonattainment area of the national 8-hour ozone standard.[4] The U.S. EPA lowered the national 8-hour ozone standard from 0.80 to 0.75 parts per million (ppm) effective May 27, 2008. In April 2012, the U.S. EPA designated the Bay Area as a marginal nonattainment region for the 0.75 ppm ozone standard established in 2008. The SFBAAB is in attainment for other criteria pollutants, with the exception of the 24-hour standards for PM_{10} and $PM_{2.5}$, for which the Bay Area is designated as "Unclassified." "Unclassified" is defined by the Clean Air Act as any area that cannot be classified, on the basis of available information, as meeting or not meeting the national primary or secondary ambient air quality standard for the pollutant.

On January 9, 2013, EPA issued a final rule to determine that the Bay Area attains the 24-hour $PM_{2.5}$ national standard. This EPA rule suspends key State Implementation Plan (discussed below) requirements as long as monitoring data continues to show that the Bay Area attains the standard. Despite this EPA action, the Bay Area will continue to be designated as "non-attainment" for the national 24-hour $PM_{2.5}$ standard until such time as the Air District submits a "redesignation request" and a "maintenance plan" to EPA, and EPA approves the propose redesignation.

4.2.2.2 State Regulations

Although the federal Clean Air Act established national ambient air quality standards, individual states retained the option to adopt more stringent standards and to include other pollution sources. California had already established its own air quality standards when federal standards were established, and because of the unique meteorological problems in California, there is

[4] "Marginal nonattainment area" means an area designated marginal nonattainment for the 1-hour national ambient air quality standard for ozone.

considerable diversity between the state and national ambient air quality standards, as shown in Table 4.2-2. California ambient standards tend to be at least as protective as national ambient standards and are often more stringent.

In 1988, California passed the California Clean Air Act (California Health and Safety Code Sections 39600 et seq.), which, like its federal counterpart, called for the designation of areas as attainment or nonattainment, but based on state ambient air quality standards rather than the federal standards. As indicated in Table 4.2-2, the SFBAAB is designated as "nonattainment" for state ozone, PM_{10}, and $PM_{2.5}$ standards. The SFBAAB is designated as "attainment" for other pollutants.

4.2.2.3 Regional and Local Regulations

Bay Area Air Quality Planning Relative to State and Federal Standards

Air quality plans developed to meet federal requirements are referred to as State Implementation Plans or SIPs. The federal and state Clean Air Acts require plans to be developed for areas designated as nonattainment (with the exception of areas designated as nonattainment for the state PM_{10} standard). The *2010 Bay Area Clean Air Plan* was adopted on September 15, 2010, by the BAAQMD, in cooperation with the Bay Area Metropolitan Transportation Commission (MTC), the Bay Conservation and Development Commission (BCDC), and the Association of Bay Area Governments (ABAG). The *2010 Clean Air Plan* outlines a multi-pollutant approach for addressing ozone, particulate matter, air toxics, and greenhouse gas emission reductions in a single, integrated strategy. The primary objectives of the plan are to improve local and regional air quality, protect public health, and minimize climate change impacts. The *2010 Clean Air Plan* replaces the Bay Area *2005 Ozone Strategy*, adopted in 2006.

The *2010 Clean Air Plan* updates the *2005 Ozone Strategy* in accordance with the requirements of the California Clean Air Act to implement "all feasible measures" to reduce ozone; provide a control strategy to reduce ozone, particulate matter, toxic air contaminants, and greenhouse gases in a single, integrated plan; review progress in improving air quality in recent years; and establish emission control measures that have since been implemented. The control strategy includes stationary-source control measures to be implemented through BAAQMD regulations; mobile-source control measures to be implemented through incentive programs and other activities; and transportation control measures to be implemented through transportation programs in cooperation with the MTC, local governments, transit agencies, and others. The *2010 Clean Air Plan* also represents the Bay Area's most recent triennial assessment of the region's strategy to attain the state one-hour ozone standard (BAAQMD, 2010).

Toxic Air Contaminants

In 2005, the ARB approved a regulatory measure to reduce emissions of toxic and criteria pollutants by limiting the idling of new heavy-duty diesel vehicles. The regulations generally limit idling of commercial motor vehicles (including buses and trucks) within 100 feet of a school or residential area for more than five consecutive minutes or periods aggregating more than five

minutes in any one hour. Buses or vehicles also must turn off their engines upon stopping at a school and must not turn their engines on more than 30 seconds before beginning to depart from a school. Also, state law Senate Bill 352 (SB 352) was adopted in 2003 and limits locating public schools within 500 feet of a freeway or busy traffic corridor (Section 17213 of the Education Code; Section 21151.8 of the Public Resources Code).

Bay Area Air Quality Management District

The BAAQMD is the regional agency with jurisdiction over the nine-county region located in the San Francisco Bay Area Air Basin. ABAG, MTC, county transportation agencies, cities and counties, and various non-governmental organizations also participate in the efforts to improve air quality through a variety of programs. These programs include the adoption of regulations and policies, as well as implementation of extensive education and public outreach programs. BAAQMD is responsible for attaining and/or maintaining air quality in the region within federal and state air quality standards. Specifically, BAAQMD has the responsibility to monitor ambient air pollutant levels throughout the region and to develop and implement strategies to attain the applicable federal and state standards.

San Francisco Health Code Provisions Regarding Roadway-generated Pollutants (Article 38)

San Francisco adopted Article 38 of the *San Francisco Health Code* in 2008, requiring an Air Quality Assessment for new residential projects of 10 or more units located in proximity to high-traffic roadways, as mapped by the DPH, to determine whether residents would be exposed to unhealthful levels of $PM_{2.5}$. The air quality assessment evaluates the concentration of $PM_{2.5}$ from local roadway traffic that could affect a proposed residential development site. If the DPH air quality assessment indicates that the annual average concentration of $PM_{2.5}$ at the site would be greater than 0.2 $\mu g/m^3$, Health Code Section 3807 requires development on the site to be designed or relocated to avoid exposure greater than 0.2 $\mu g/m^3$, or a ventilation system to be installed that would be capable of removing 80% of ambient $PM_{2.5}$ from habitable areas of the residential units. Article 38 of the Health Code is in the process of being revised, along with the Administrative Code. Once the revisions are adopted, there will be a statutory requirement (outside of CEQA) that requires enhanced ventilation for all new sensitive receptors within newly identified Exposure Zones and construction emissions minimization within these Exposure Zones. These revisions are expected to be considered by the Board of Supervisors in fall 2014.

4.2.3 Significance Standards

Would implementation of the 2014 LRDP:

a) Conflict with or obstruct implementation of the applicable air quality plan?

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation (e.g., induce mobile source carbon monoxide (CO) emissions that would cause a violation of the CO ambient air quality standard)?

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

d) Expose sensitive receptors to substantial pollutant concentrations?

e) Create objectionable odors affecting a substantial number of people?

4.2.4 Analysis Methodology

Potential 2014 LRDP air quality impacts are assessed by modeling the estimated daily emissions generated by LRDP construction activities and operations using the CalEEMod land use emissions model version 2013.2.2. Emissions are then compared to the significance criteria in the BAAQMD 2011 *CEQA Air Quality Guidelines,* which include the following:

- Result in total construction emissions of Reactive Organic Gases (ROG), NO_x, or $PM_{2.5}$ (exhaust) of 10 tons per year or greater or 54 pounds per day or greater.
- Exceed a construction emission threshold for PM_{10} (exhaust) of 15 tons per year or greater, or 82 pounds per day or greater.
- For PM_{10} and $PM_{2.5}$ as part of fugitive dust generated during construction, the BAAQMD Guidelines specify compliance with Best Management Practices as the threshold.
- Result in total operational emissions of ROG, NO_x, or $PM_{2.5}$ of 10 tons per year or greater, or 54 pounds per day or greater.
- Exceed an operational emission threshold for PM_{10} of 15 tons per year or greater, or 82 pounds per day.
- Result in CO concentrations of 9.0 ppm (8-hour average) and 20.0 ppm (1-hour average) as estimated by roadway vehicle volumes exceeding 44,000 vehicles per hour at any intersection.
- Exposure of people to a single source of Toxic Air Contaminants (TACs) that results in (a) a cancer risk level greater than 10 in one million, (b) a non-cancer risk (chronic or acute) hazard index greater than 1.0, or (c) an increase of annual average $PM_{2.5}$ of greater than 0.3 micrograms per cubic meter, where the exposure results from siting a new single source or siting a new sensitive receptor.

A project's contribution to cumulative impacts for criteria pollutants are considered significant if the project's impact individually would be significant (i.e., if it exceeds the BAAQMD's quantitative thresholds).

According to the BAAQMD 2012 *CEQA Air Quality Guidelines*, a project's contribution to cumulative impacts for criteria pollutants should be considered significant if the project's impact individually would be significant (i.e. exceeds the BAAQMD's quantitative thresholds). While the significance thresholds adopted by BAAQMD in 2010 and 2011 have been set aside due to judicial action currently pending before the California Supreme Court, these thresholds are based

on substantial evidence identified in Appendix D of the 2011 BAAQMD CEQA Guidelines and its 2009 Justification Report and are therefore used within this document.

For cumulative impacts from TACs, a project would be considered significant if siting a new sensitive receptor would result in exposure of people to substantial levels of TACs resulting from all cumulative sources within 1,000 feet in (a) a cumulative cancer risk level greater than 100 in one million, (b) a non-cancer risk (chronic or acute) hazard index greater than 10, or (c) an increase of annual average $PM_{2.5}$ of greater than 0.8 micrograms per cubic meter.

4.3 Biological Resources

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Biological Resource impacts. 2014 LRDP Biological Resources effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Biological Resource effects resulting from 2014 LRDP proposals at the Parnassus Heights campus site is discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures.* The Initial Study prepared for the 2014 LRDP concluded that LRDP proposals would result in no impact or less-than-significant impacts to biological resources at the Mission Bay, Mount Zion and Mission Center campus sites. Therefore, no additional analysis of biological resources effects at these campus sites is required.

4.3.1 Regional Setting

The 2014 LRDP planning area[5] is located in the Bay Area–Delta Bioregion,[6] as defined by the State of California's Natural Communities Conservation Program. This bioregion supports a variety of natural communities that range from the open waters of San Francisco Bay and Delta to salt and brackish marshes to grassland, chaparral, and oak woodlands. The temperate climate is Mediterranean in nature, with relatively mild, wet winters and warm, dry summers. The high diversity of vegetation and wildlife found in the region is a result of soil, topographic, and microclimate variations that combine to promote relatively high levels of endemism.[7] This, in combination with a long history of uses that have altered the natural environment and the increasingly rapid pace of development in the region, has endangered some local flora and fauna.

4.3.1.1 Project Area Vegetation Communities and Wildlife Habitats

Urban

Wildlife species utilizing urban areas are often well adapted to the presence of humans and their activities. They are typically generalists, capable of utilizing the limited food sources available, such as garbage and horticultural plants and their fruit. Urban wildlife species expected in the 2014 LRDP area include common raven (*Corvus corax*), northern mockingbird (*Mimus polyglottos*),

---

5 The information on natural communities, plant and animal species, and sensitive biological resources used in the preparation of this section was obtained from: the California Natural Diversity Database (CNDDB) (CDFW, 2014), California Native Plant Society (CNPS) Electronic Inventory (CNPS, 2013), the U.S. Fish and Wildlife Service (USFWS, 2014), and standard biological literature. In addition, the following documents were reviewed and referenced to support the analysis of potential environmental impacts on the project:
- UCSF Long Range Development Plan Final EIR, 1997
- UCSF Long Range Development Plan Initial Study, 2013
- Draft EIR for the UCSF Mount Sutro Management Project, 2013

6 A *bioregion* is an area defined by a combination of ecological, geographic, and social criteria and consists of a system of related, interconnected ecosystems. The Bay-Delta Bioregion is considered the immediate watershed of the Bay Area and the Delta, not including the major rivers that flow into the Delta. It is bounded on the north by the northern edge of Sonoma and Napa Counties and the Delta, and extends east to the edge of the valley floor; on the south, it is bounded by the southern edge of San Joaquin County, the eastern edge of the Diablo Range, and the southern edge of Santa Clara and San Mateo Counties.

7 *Endemism* refers to the degree to which organisms or taxa are restricted to a geographical region or locality and thus are individually characterized as endemic to that area.

raccoon (*Procyon lotor*), Norway rat (*Rattus norvegicus*), Virginia opossum (*Didelphis virgiana*), and feral cats. Several exceptions to the generalist rule are red-tailed hawk (*Buteo jamaicensis*), which prey on rodents, and Cooper's hawk (*Accipiter cooperii*) and peregrine falcon (*Falco peregrinus anatum*), which prey almost exclusively on small to medium sized birds and are known to nest within San Francisco. Bats may colonize abandoned buildings within the vicinity of the 2014 LRDP planning area.

Landscaped

Landscaped areas supporting a variety of ornamental trees, shrubs and maintained non-native vegetation are present on the UCSF campus sites within the 2014 LRDP area. Landscaped areas in an otherwise urban environment can provide cover, foraging, and nesting habitat for a variety of bird species as well as reptiles and small mammals, especially those that are tolerant of disturbance and human presence. Birds commonly found in such areas include non-native birds such as English sparrow (*Passer domesticus*) and European starling (*Sturnus vulgaris*), as well as birds native to the area such as American robin (*Turdus migratorius*), house finch (*Carpodacus mexicanus*), dark-eyed junco (*Junco hyemalis*), western scrub jay (*Aphelocoma californica*), mourning dove (*Zenaida macroura*), and Anna's hummingbird (*Calypte anna*). Reptiles using this type of habitat, particularly in areas bordering natural lands, may include native species such as western terrestrial garter snake (*Thamnophis elegans*) and western fence lizard (*Sceloporus occidentalis*). Other wildlife present in these urban landscaped areas include striped skunk (*Mephitis mephitis*), raccoon, Virginia opossum, roosting bats as well as Botta's pocket gopher (*Thomomys bottae*) and other small rodents. Coyotes (*Canis latrans*) have been sighted occasionally in Golden Gate Park and Presidio areas of San Francisco and could appear within the 2014 LRDP planning area.

Non-native Forest

Non-native forest habitat occurs throughout the Mount Sutro Open Space Reserve (Reserve) on the Parnassus Heights campus site. Dominant tree species are blue gum eucalyptus and Monterey cypress (Monterey cypress are native to California but not to the San Francisco area). Special-status species that could be present in these areas include overwintering monarch butterflies (*Danaus plexippus*), nesting raptors such as red-shouldered hawk (*Buteo lineatus*) and red-tailed hawk, and special-status and common bats. Several avian species are common to eucalyptus and cypress forest, including native species such as American robin, chestnut-backed chickadee (*Poecile rufescens*), pygmy nuthatch (*Sitta pygmaea*), Anna's hummingbird, and California towhee (*Pipilo crissalis*). The non-native eastern gray squirrel (*Sciurus carolinensis*) is also prevalent.

Sensitive Natural Communities, Including Wetlands

The California Natural Diversity Database (CNDDB) reports no sensitive natural community occurrences for the two-quadrangle area containing and surrounding the LRDP planning area (CDFW, 2014). No potentially jurisdictional wetlands are located in area that would be affected by the proposed 2014 LRDP activities.

Wildlife Movement Corridors

Rugged terrain, changes in vegetation, or areas of human disturbance or urban development can fragment wildlife habitats and impede wildlife movement between areas of suitable habitat. This fragmentation creates isolated "islands" of vegetation that may not provide sufficient area to accommodate sustainable populations, and can adversely affect genetic and species diversity. Wildlife movement corridors link habitat areas and mitigate the effects of this fragmentation by allowing animals to move between remaining habitats, in turn allowing depleted populations to be replenished and promoting genetic exchange between separate populations. Due to urban development of the San Francisco peninsula, remaining wildlife habitat is largely isolated to disconnected small parks and open space areas.

The San Francisco Peninsula is an important migratory stopover for birds along the Pacific Flyway—one of the four major migratory routes in North America. Raptors, songbirds, shorebirds and waterfowl stop in San Francisco, including Golden Gate Park, Lake Merced, the Presidio and the Reserve during their fall and spring migrations. Both the Mission Bay and Parnassus Heights campus sites offer suitable and attractive habitat for birds to forage and rest along this migration route. While San Francisco's location on the Pacific Flyway allows the City's open spaces to host transient individuals, it does not constitute a wildlife movement corridor. No wildlife movement corridors are present within the 2014 LRDP planning area.

4.3.1.2 Special-Status Species

Several species in the vicinity of the 2014 LRDP planning area receive protection pursuant to federal and/or State endangered species laws, or CDFW designation as "species of special concern". For the purpose of this EIR, special-status species include:

- Plant and wildlife species listed as rare, threatened, or endangered under the federal or State endangered species acts;
- Species that are candidates for listing under either federal or State law;
- Species formerly designated by the USFWS as species of concern or by the CDFW as species of special concern;[8]
- Species designated as "special animals" by the State;[9]
- Species designated as "fully protected" by the State (there are about 35, most of which are also listed as either endangered or threatened);[10]

[8] A California species of special concern is one that: has been extirpated from the state; meets the state definition of threatened or endangered but has not been formally listed; is undergoing or has experienced serious population declines or range restrictions that put it at risk of becoming threatened or endangered; and/or has naturally small populations susceptible to high risk from any factor that could lead to declines that would qualify it for threatened or endangered status.

[9] Species listed on the current CDFW "special animals" list (January 2011), which includes 898 species. This list includes species that CDFW considers "those of greatest conservation need."

[10] The "fully protected" classification was California's initial effort in the 1960s to identify and provide additional protection to those animals that were rare or faced possible extinction. The designation can be found in the Fish and Game Code.

- Raptors (birds of prey), which are specifically protected by California Fish and Game Code Section 3503.5, thus prohibiting the take, possession, or killing of raptors and owls, their nests, and their eggs;[11] and

- Species, such as candidate species, that may be considered rare or endangered pursuant to Section 15380(b) of the CEQA Guidelines.

A comprehensive list of the special-status plant and animal species that may occur or have the potential to occur within the 2014 LRDP area was developed based on data obtained from the CNDDB, the California Native Plant Society (CNPS) Electronic Inventory, and the USFWS and other biological literature pertaining to the bioregion. It was then determined whether there is a low, moderate, or high potential for species occurrence at the LRDP activities sites based on previous special-status species record locations and current site conditions. These species lists are provided in **Tables 4.3-1** and **4.3-2**.

Special-Status Plants

Table 4.3-1 presents special-status plant species that occur in the regional vicinity (i.e., the San Francisco North and San Francisco South 7.5-minute USGS quadrangles), and their potential to occur in the LRDP planning area. Most special-status plant species are considered to have a low potential to occur at the individual LRDP proposal sites due to the developed nature of most of the 2014 LRDP project locations. This estimation is supported by the lack of native plants and supportive native vegetation communities, and based on the disturbed and heavily managed condition of the LRDP planning area.

Of the campus site locations included in the 2014 LRDP planning area, the Parnassus Heights campus site includes the Reserve; however, the potential for rare plant species in this area is still considered low because the vegetation communities that would support rare plants, such as coastal salt marsh, coastal prairie, valley and foothill grasslands, coastal dunes, and coastal scrub are not prevalent within the Reserve. Coastal triquetrella, a California Rare Plant Rank 1B.2 which occurs on shaded substrate in coastal bluff or coastal scrub communities, and San Francisco gumplant (*Grindelia hirsutula* var. *maritima*), a California Rare Plant Rank of 3.2 which occurs on sandy or serpentine slopes and coastal scrub communities, are the only special-status plants with a moderate potential to occur within the LRDP planning area, and specifically within the vicinity of the Parnassus Heights campus site. Coastal triquetrella has been documented within 0.15 mile of the Parnassus Heights campus site on Tank Hill and south east of the campus site in open spaces near the Douglas Playground, within two miles of the campus site (CDFW, 2014). San Francisco gumplant has been documented at several locations within two miles of the Parnassus Heights campus site, with the closest record on the western slope of Mount Sutro at Laguna Honda (CDFW, 2014).

[11] The inclusion of birds protected by Fish and Game Code Section 3503.5 is in recognition of the fact that these birds are substantially less common in California than most other birds, having lost much of their habitat to development, and that the populations of these species are therefore substantially more vulnerable to further loss of habitat and to interference with nesting and breeding than most other birds. It is noted that a number of raptors and owls are already specifically listed as threatened or endangered by State and federal wildlife authorities.

TABLE 4.3-1
SPECIAL-STATUS PLANT SPECIES REPORTED OR WITH POTENTIAL TO OCCUR NEAR THE UCSF 2014 LRDP AREA

Common Name Scientific Name	Federal Status	State Status	Calif. Rare Plant Rank	Habitat Description / Blooming Period	Potential to Occur in the Action Area
Species Listed or Proposed for Listing					
Presidio Manzanita *Arctostaphylos montana ssp. Ravenii*	FE	CE	1B.1	Open, rocky, serpentine slopes in chaparral, coastal scrub, and coastal prairie. February – March	**Low.** No suitable habitat present.
Marsh sandwort *Arenaria paludicola*	FE	CE	1B.1	Freshwater or brackish marshes and swamps. May – August	**Low.** No suitable habitat present.
Presidio clarkia *Clarkia franciscana*	FE	CE	1B.1	Serpentine outcrops in coastal scrub, and valley and foothill grassland. May – July	**Low.** No suitable habitat present.
Beach layia *Layia carnosa*	FE	CE	1B.1	Sand dunes. March – July	**Low.** No suitable habitat present.
San Francisco lessingia *Lessingia germanorum*	FE	CE	1B.1	Coastal scrub, sandy soils free of competing species. July – November	**Low.** No suitable habitat present.
White rayed pentachaeta *Pentachaeta bellidiflora*	FE	CE	1B.1	Open, dry, rocky slopes and grassy areas, usually on serpentine. March – May	**Low.** No suitable habitat present.
Marin western flax *Hesperolinon congestum*	FT	CT	1B.1	Chaparral and grassland, usually on serpentine barrens. April – July	**Low.** No suitable habitat present.
Robust spineflower *Chorizanthe robusta var. robusta*	FE	--	1B.1	Sandy or gravelly coastal dunes, coastal scrub, cismontane woodland and maritime chaparral. April – September	**Low.** No suitable habitat present.
San Bruno Mountain manzanita *Arctostaphylos imbricada*	--	CE	1B.1	Chaparral and coastal scrub, usually on sandstone outcrops. February – May	**Low.** No suitable habitat present.
Pacific manzanita *Arctostaphylos pacifica*	--	CE	1B.2	Coastal scrub and chaparral. February – April	**Low.** No suitable habitat present.
San Francisco popcorn-flower *Plagiobothrys diffusus*	--	CE	1B.1	Coastal prairie, and valley and foothill grasslands. March – June	**Low.** No suitable habitat present.

TABLE 4.3-1 (Continued)
SPECIAL-STATUS PLANT SPECIES REPORTED OR WITH POTENTIAL TO OCCUR NEAR THE UCSF 2014 LRDP AREA

Common Name Scientific Name	Federal Status	State Status	Calif. Rare Plant Rank	Habitat Description / Blooming Period	Potential to Occur in the Action Area
Federal Species of Concern or State Species of Special Concern					
Adobe sanicle *Sanicula maritima*	--	Rare	1B.1	Moist clay or ultramafic soil in chaparral, coastal prairie, meadows, seeps, and valley and foothill grassland. February – May	**Low.** No suitable habitat present.
Hairless popcorn-flower *Plagiobothrys glaber*	--	--	1A	Coastal salt marshes and alkaline meadows. March – May	**Low.** No suitable habitat present.
Franciscan manzanita *Arctostaphylos franciscana*	--	--	1B.1	Open, rocky, serpentine outcrops in chaparral. February – April	**Low.** No suitable habitat present. This species was believed to be extinct in the wild (although still extant through cultivation), but was rediscovered in Presidio National Park in late 2009.
Blue coast gilia *Gilia capitata* spp. *chamissonis*	--	--	1B.1	Coastal dunes and scrub. April – July	**Low.** No suitable habitat present. Extant population is present within the Presidio of San Francisco.
Kellogg's horkelia *Horkelia cuneata* ssp. *sericea*	--	--	1B.1	Coastal scrub, dunes, and openings of closed-cone coniferous forests. February – July	**Low.** No suitable habitat present.
Rose leptosiphon *Leptosiphon rosaceus*	--	--	1B.1	Coastal bluff scrub. April – July	**Low.** No suitable habitat present.
Fragrant fritillary *Fritillaria liliacea*	--	--	1B.2	On clay, often serpentine derived soils in coastal scrub, grassland, and coastal prairie. February – April	**Low.** No suitable habitat present. Extant population located at Twin Peaks.
Bent-flowered fiddleneck *Amsinckia lunaris*	--	--	1B.2	Coastal bluff scrub, cismontane woodland, and valley and foothill grassland. March – June	**Low.** No suitable habitat present.
Montara manzanita *Arctostaphylos montaraensis*	--	--	1B.2	Slopes and ridges in chaparral and coastal scrub. January – March	**Low.** No suitable habitat present.
Alkali milk-vetch *Astragualus tener* var. *tener*	--	--	1B.2	Alkali flats, flooded grassland, playas and vernal pools. March – June	**Low.** No suitable habitat present; species presumed extirpated in San Francisco.

TABLE 4.3-1 (Continued)
SPECIAL-STATUS PLANT SPECIES REPORTED OR WITH POTENTIAL TO OCCUR NEAR THE UCSF 2014 LRDP AREA

Common Name Scientific Name	Federal Status	State Status	Calif. Rare Plant Rank	Habitat Description / Blooming Period	Potential to Occur in the Action Area
Federal Species of Concern or State Species of Special Concern (cont.)					
Pappose tarplant *Centromadia parryi* ssp. *parryi*	--	--	1B.2	Chaparral, coastal prairie, meadows, seeps, coastal salt marshes and swamps, and vernally mesic, often alkaline, valley and foothill grasslands. May – November	**Low.** No suitable habitat present.
Franciscan thistle *Cirsium andrewsii*	--	--	1B.2	Coastal bluff scrub, coastal prairie, coastal mesic scrub, and broadleaf upland forest; sometimes on serpentine. March – July	**Low.** No suitable habitat present.
San Francisco Bay spineflower *Chorizanthe cuspidata* var. *cuspidata*	--	--	1B.2	Coastal scrub, dunes and grassland. April – July	**Low.** No suitable habitat present.
Point Reyes salty bird's-beak *Chloropyron maritimum* ssp. *palustre*	--	--	1B.2	Coastal salt marshes and swamps. June – October	**Low.** No suitable habitat present.
Compact cobwebby thistle *Cirsium occidentale* var. *compactum*	--	--	1B.2	Coastal scrub, grassland, and dunes. April – June	**Low.** No suitable habitat present.
Round-headed Chinese-houses *Collinsia corymbosa*	--	--	1B.2	Coastal dunes and coastal prairie. April – June	**Low.** No suitable habitat present; species has not been seen in San Francisco for more than 100 years.
San Francisco collinsia *Collinsia multicolor*	--	--	1B.2	On humus-covered soil derived from mudstone in closed-cone coniferous forest and coastal scrub. March – May	**Low.** No suitable habitat present.
Dark-eyed gilia *Gilia millefoliata*	--	--	1B.2	Coastal dunes. April – July	**Low.** No suitable habitat present; species potentially extirpated in San Francisco.
Diablo helianthella *Helianthella castanea*	--	--	1B.2	On rocky soils in broadleaf upland forest, cismontane woodland, coastal scrub, riparian woodland, and valley and foothill grassland. March – June	**Low.** No suitable habitat present.
White seaside tarplant *Hemizonia congesta* ssp. *congesta*	--	--	1B.2	Grassy valleys and hills, often on fallow fields in coastal scrub. April – November	**Low.** No suitable habitat present.

Common Name Scientific Name	Federal Status	State Status	Calif. Rare Plant Rank	Habitat Description / Blooming Period	Potential to Occur in the Action Area
Federal Species of Concern or State Species of Special Concern (cont.)					
Short-leaved evax *Hesperevax sparsiflora* var. *brevifolia*	--	--	1B.2	Sandy bluffs and flats in coastal scrub and coastal dunes. March – June	**Low.** No suitable habitat present.
Arcuate bush mallow *Malacothamnus arcuatus*	--	--	1B.2	Gravelly alluvium in chaparral and cismontane woodland. April – September	**Low.** No suitable habitat present.
Marsh microseris *Microseris paludosa*	--	--	1B.2	Closed-cone coniferous forest, cismontane woodland, coastal scrub, and valley and foothill grassland. August – June	**Low.** No suitable habitat present.
Choris's popcorn-flower *Plagiobothrys chorisianus* var. *chorisianus*	--	--	1B.2	Mesic sites in chaparral, coastal scrub, and coastal prairie. March – June	**Low.** No suitable habitat present.
San Francisco campion *Silene verecunda* ssp. *verecunda*	--	--	1B.2	Mudstone, shale, or serpentine substrates in coastal scrub, coastal prairie, chaparral and valley and foothill grassland. March – June	**Low.** No suitable habitat present.
Santa Cruz microseris *Stebbinsoseris decipiens*	--	--	1B.2	On sandstone, shale or serpentine derived seaward facing slopes in broadleaf upland forest, closed-cone coniferous forest, chaparral, coastal prairie, and coastal scrub. April – May	**Low.** No suitable habitat present.
Coastal triquetrella *Triquetrella californica*	--	--	1B.2	On shaded soil, rocks sand or gravel in dry or moist conditions or in coastal bluff and coastal scrub.	**Moderate.** Documented extant population within 0.1 mile of the Parnassus Heights campus on Tank Hill. Suitable habitat is present within the Mount Sutro Open Space Reserve.
San Francisco owl's clover *Triphysaria floribunda*	--	--	1B.2	Grasslands. April – June	**Low.** No suitable habitat present.
Bristly sedge *Carex comosa*	--	--	2B.1	Lake margins, marshes, swamps, coastal prairie, and valley and foothill grasslands. May – September	**Low.** No suitable habitat present.

SPECIAL-STATUS PLANT SPECIES REPORTED OR WITH POTENTIAL TO OCCUR NEAR THE UCSF 2014 LRDP AREA

Common Name Scientific Name	Federal Status	State Status	Calif. Rare Plant Rank	Habitat Description / Blooming Period	Potential to Occur in the Action Area
Federal Species of Concern or State Species of Special Concern (cont.)					
Oregon polemonium *Polemonium carneum*	--	--	2B.2	Coastal prairie, coastal scrub, lower montane coniferous forest. April – September	**Low.** No suitable habitat present.
San Francisco gumplant *Grindelia hirsutula* var. *maritime*	--	--	3.2	On sandy or serpentine slopes of sea bluffs in coastal scrub, or valley and foothill grasslands. June – September	**Moderate.** Documented in 1987 on the western slope of Mount Sutro in dense coastal scrub habitat. Suitable habitat is present for this species in the Mount Sutro Open Space Reserve.

NOTES:
The "Potential for Effect" category is defined as follows:
High = Species is expected to occur and habitat meets species requirements.
Moderate = Habitat is only marginally suitable or is suitable but not within species geographic range.
Low = Habitat does not meet species requirements as currently understood in the scientific community.

STATUS CODES:

Federal:
FE = Listed as "endangered" under the federal Endangered Species Act
FT = Listed as "threatened" under the federal Endangered Species Act
FSC = NOAA Fisheries designated "species of concern"
FPD = Proposed delisted
FD = Delisted

State:
CE = Listed as "endangered" under the California Endangered Species Act
CT = Listed as "threatened" under the California Endangered Species Act
CSC = California Department of Fish and Wildlife designated "species of special concern"
CFP = California Department of Fish and Wildlife designated "fully protected"
SC = California Department of Fish and Wildlife designated "candidate threatened"
WL = California Department of Fish and Wildlife designated "watch list"
3503.5 = Eggs, Nests, and Nestlings Protected under section 3503.5 of the California Department of Fish and Game Code
* = California special animal

California Rare Plant Rank:
List 1A = Plants presumed extirpated in California and either rare or extinct elsewhere
List 1B = Plants rare, threatened, or endangered in California and elsewhere
List 2A = Plants presumed extirpated in California, but more common elsewhere
List 2B = Plants rare, threatened, or endangered in California, but more common elsewhere
List 3 = Plants about which we need more information--a review list
List 4 = Plants of limited distribution--a watch list

TABLE 4.3-2
SPECIAL-STATUS ANIMAL SPECIES REPORTED OR WITH POTENTIAL TO OCCUR NEAR THE UCSF 2014 LRDP AREA

Common Name *Scientific Name*	Federal Status	State Status	Habitat Description	Potential to Occur in the Action Area
Invertebrates				
San Bruno elfin butterfly *Callophrys mossii bayensis*	FE	--	Coastal scrub on rocky outcrops with broadleaf stonecrop (*Sedum spathulifolium*)	**Low.** No suitable habitat present. Three known populations at San Bruno Mountain, Montara, and Pacifica.
Bay checkerspot butterfly *Euphydryas editha bayensis*	FT	--	Serpentine grasslands.	**Low.** No suitable habitat present.
Mission blue butterfly *Plebejus icarioides missionensis*	FE	--	Grassland with *Lupinus albifrons, L. Formosa*, and *L. varicolor.*	**Low.** Suitable habitat present at Twin Peaks. Species unlikely to occur within the plan area.
Callippe silverspot butterfly *Speyeria callippe callippe*	FE	--	Found in native grasslands with *Viola pedunculata* as larval food plant.	**Low.** No suitable habitat present.
Monarch butterfly *Danaus plexippus*	--	*	Eucalyptus groves (wintering sites).	**Moderate.** Several records of this species wintering in eucalyptus groves within San Francisco including Golden Gate Park, the Presidion, Fort Mason, and Telegraph Hill.
Tomales isopod *Caecuditea tomalensis*	--	--	Still-to slow-moving water in vegetated ponds, preferably spring-fed.	**Low.** No suitable habitat present.
Reptiles and Amphibians				
Western pond turtle *Emys marmorata*	--	CSC	Ponds, marshes, rivers, streams, and irrigation ditches with aquatic vegetation. Requires basking sites and suitable upland habitat for egg-laying. Nest sites most often characterized as having gentle slopes (<15%) with little vegetation or sandy banks.	**Low.** No suitable habitat present.
San Francisco garter snake *Thamnophis sirtalis tetrataenia*	FE	SE	Densely vegetated ponds near open hillsides with abundant small mammal burrows.	**Absent.** Species is considered likely extirpated from San Francisco.
California red-legged frog *Rana draytonii*	FT	CSC	Freshwater ponds and slow streams with emergent vegetation for egg attachment.	**Low.** No suitable habitat present.
Birds				
California clapper rail *Rallus longirostris obsoletus*	FE	CE	Salt marsh wetlands along the San Francisco Bay.	**Low.** No suitable habitat present.
Bank swallow *Riparia riparia* (nesting)	--	CT	Vertical banks and cliffs with sandy soil, near water. Nests in holes dug in cliffs and river banks.	**Low.** No suitable habitat present. Known to nest at Fort Funston and forage over Lake Merced.

TABLE 4.3-2 (Continued)
SPECIAL-STATUS ANIMAL SPECIES REPORTED OR WITH POTENTIAL TO OCCUR NEAR THE UCSF 2014 LRDP AREA

Common Name *Scientific Name*	Federal Status	State Status	Habitat Description	Potential to Occur in the Action Area
Birds (cont.)				
Yellow warbler *Dendroica petechia brewsteri*	--	CSC	Nests in dense riparian cover and montane chaparral. Breeding distribution includes the coast ranges and western slopes of the Sierra Nevada. Rare to uncommon in lowland areas.	**Low.** No suitable riparian habitat present.
California black rail *Laterallus jamaicensis coturniculus*	--	CT	Salt and brackish marshes; also in freshwater marshes at low elevations.	**Low.** No suitable habitat present.
Salt marsh common yellowthroat *Geothlypis trichas sinuous*	--	CSC	Forages in various marsh, riparian and upland habitats. Nests on or near the ground in concealed locations.	**Low.** No suitable riparian habitat present.
Alameda song sparrow *Melospiza melodia pusillula*	--	CSC	Salt marshes of eastern and south San Francisco Bay.	**Low.** No suitable habitat present.
San Pablo song sparrow *Melospiza melodia samuelis*	--	CSC	Salt marshes of eastern and north San Francisco Bay.	**Low.** No suitable habitat present.
Double-crested cormorant *Phalacrocorax auritus*	--	WL, 3503.5	Coastal areas and inland lakes in fresh, saline, and estuarine waters.	**Low.** No suitable habitat present. Large nesting colonies are present at Lake Merced.
Cooper's hawk *Accipiter cooperii*	--	3503.5	Nests in riparian areas and oak woodlands, forages at woodland edges.	**Moderate.** Large trees including eucalyptus and Monterey cypress, could support nests for this species.
Sharp-shinned hawk *Accipiter striatus*	--	3503.5	Nests in riparian areas and oak woodlands, forages in open areas	**Moderate.** Large trees including eucalyptus and Monterey cypress, could support nests for this species.
Great horned owl *Bubo virginianus*	--	3503.5	Riparian, coniferous, chaparral and desert habitats.	**Moderate.** Large trees including eucalyptus and Monterey cypress, could support nests for this species.
Red-tailed hawk *Buteo jamaicensis*	--	3503.5	Found in nearly all habitats and elevations.	**Moderate.** Large trees including eucalyptus and Monterey cypress, could support nests for this species.
Red-shouldered hawk *Buteo lineatus*	--	3503.5	Riparian woodlands with swamps and emergent wetlands.	**Moderate.** Large trees including eucalyptus and Monterey cypress, could support nests for this species.
American kestrel *Falco sparverius*	--	3503.5	Frequents generally open grasslands, pastures, and fields; primarily a cavity nester.	**Moderate.** Large trees, including eucalyptus and Monterey cypress, and excavations in telephone poles could support nests for this species.

TABLE 4.3-2 (Continued)
SPECIAL-STATUS ANIMAL SPECIES REPORTED OR WITH POTENTIAL TO OCCUR NEAR THE UCSF 2014 LRDP AREA

Common Name *Scientific Name*	Federal Status	State Status	Habitat Description	Potential to Occur in the Action Area
Birds (cont.)				
Osprey *Pandion haliaetus*	--	3503.5	Habitat varies greatly and usually includes adequate supply of accessible fish, shallow waters, open and elevated nest sites (10-60 feet in height), and artificial structures such as towers. Builds large platform stick nests near or in open waters such as lakes, estuaries, bays, reservoirs, and within the surf zone.	**Low.** No suitable habitat is present.
Great blue heron *Ardea herodias*	--	3503.5	Shallow estuaries and fresh and saline emergent wetlands.	**Low.** No suitable habitat present.
Green heron *Butorides striatus*	--	3503.5	Valley foothill and desert riparian habitats; freshwater emergent wetlands, lacustrine and riverine areas.	**Low.** No suitable habitat present.
California quail *Callipepla californica*	--	3503.5	Shrub, scrub, brush, grasslands, open coniferous and deciduous habitats.	**Moderate.** Suitable habitat is present in the Mount Sutro Open Space Reserve.
Marsh wren *Cistothorus palustris*	--	3503.5	Creates a domed nest of grasses and sedges suspended in dense tulle vegetation. Forages in shrubs near marshes.	**Low.** No suitable habitat is present.
American goldfinch *Carduelis tristis*	--	3503.5	Cismontane foothills; riparian and cropland habitats.	**Present.** Suitable habitat is present.
Purple finch *Carpodacus purpureus*	--	3503.5	Coastal foothills and lowlands; riparian and coniferous habitats.	**Present.** Suitable habitat is present.
Olive-sided flycatcher *Contopus cooperi*	--	3503.5	Forest and woodland habitats.	**Present.** Suitable habitat is present.
Barn swallow *Hirundo rustica*	--	3503.5	Open areas from coastal grassland and shrubland to mixed coniferous forests.	**Present.** Suitable habitat is present.
Cliff swallow *Hirundo pyrrhonota*	--	3503.5	Open areas, grasslands or open forests; desert riparian areas.	**Present.** Suitable habitat is present.
Hooded oriole *Icterus cucullatus*	--	3503.5	Lower elevation riparian areas, palm oases, urban and cropland areas.	**Present.** Suitable habitat is present.
Red crossbill *Loxia curvirostra*	--	3503.5	Coniferous forests.	**Present.** Suitable habitat is present.
Red-breasted nuthatch *Sitta canadensis*	--	3503.5	Coniferous forests.	**Present.** Suitable habitat is present.
Pygmy nuthatch *Sitta pygmaea*	--	3503.5	Coniferous forests and pinyon-juniper habitats.	**Present.** Suitable habitat is present.
Bewick's wren *Thyromanes bewickii*	--	3503.5	Chaparral; also pinyon-juniper woodlands.	**Present.** Suitable habitat is present.
Barn owl *Tyto alba*	--	3503.5	Open areas including chaparral, grassland, riparian, wetlands.	**Present.** Suitable habitat is present.

TABLE 4.3-2 (Continued)
SPECIAL-STATUS ANIMAL SPECIES REPORTED OR WITH POTENTIAL TO OCCUR NEAR THE UCSF 2014 LRDP AREA

Common Name *Scientific Name*	Federal Status	State Status	Habitat Description	Potential to Occur in the Action Area
Birds (cont.)				
Orange-crowned warbler *Vermivora celata*	--	3503.5	Chaparral, coastal scrub, foothill riparian.	**Present.** Suitable habitat is present.
Wilson's warbler *Wilsonia pusilla*	--	3503.5	Foothill riparian areas, thickets.	**Present.** Suitable habitat is present.
Mammals				
Western red bat *Lasiurus blossevillii*	--	CSC	Roosts primarily in trees, 2-40 feet above ground, from sea level up through mixed conifer forests. Prefers habitat edges and mosaics with trees that are protected from above and open below with open areas for foraging.	**Moderate.** Roosting habitat is available in tree/shrub foliage at Mount Sutro Open Space Reserve. Closest occurrence is within 0.5 mile of the Parnassus Heights campus site in Golden Gate Park. In 2009 surveys, this species was found in some San Francisco parks containing water bodies (Krauel, 2009)[12].
Pallid bat *Antrozous pallidus*	--	CSC	Prefers caves, crevices, hollow trees, or buildings in areas adjacent to open space for foraging. Associated with lower elevations in California.	**Low.** Suitable roosting habitat is available in buildings within the plan area. This species was not detected during 2009 surveys in San Francisco parks (Krauel, 2009). Not expected to breed here but may be present on a transient basis.
Townsend's big-eared bat *Corynorhinus townsendii*	--	CSC SC	Throughout California in a wide variety of habitats. Most common in mesic sites. Roosts in the open, hanging from walls and ceilings of rocky areas with caves or tunnels. Roosting sites limited. Extremely sensitive to human disturbance.	**Low.** Suitable roosting habitat is available in buildings within the plan area. This species was not detected during 2009 surveys in San Francisco parks (Krauel, 2009).
Yuma myotis *Myotis yumanensis*	--	--	Optimal habitats are open forests and woodlands with water sources to feed over. Roosts in buildings, trees, mines, caves, bridges, and rock crevices. Maternity colonies active May through July.	**Low.** Roosting habitat is available in tree/shrub foliage at Mount Sutro Open Space Reserve. In 2009 surveys, this species was found in some San Francisco parks containing water bodies (Krauel, 2009).
hoary bat *Lasiurus cinereus*	--	--	Prefers open habitats or habitat mosaics, with access to trees for cover and open areas or habitat edges for feeding. Roosts in dense foliage of medium to large trees. Feeds primarily on moths; requires water.	**Low.** Roosting habitat is available in large-diameter trees at Mount Sutro Open Space Reserve, but this species was not detected during 2009 surveys in San Francisco parks (Krauel, 2009). May be present on a transient basis.

[12] Krauel, J.K., *Foraging Ecology of Bats in San Francisco*, M.S. Thesis, San Francisco State University. Available for review at the San Francisco Planning Department, 1650 Mission Street, Suite 400, in Case File No. 2001.0016E, 2009.

TABLE 4.3-2 (Continued)
SPECIAL-STATUS ANIMAL SPECIES REPORTED OR WITH POTENTIAL TO OCCUR NEAR THE UCSF 2014 LRDP AREA

Common Name *Scientific Name*	Federal Status	State Status	Habitat Description	Potential to Occur in the Action Area
Mammals (cont.)				
American badger *Taxidea taxus*	--	CSC	Open grasslands with loose, friable soils.	**Low.** No suitable habitat present.
Point Reyes jumping mouse *Zapus trinotatus orarius*	--	CSC	Upland areas of bunch grass in marshes in Point Reyes.	**Low.** Project site is south of the known range for this species.

NOTES:
The "Potential for Effect" category is defined as follows:
High = Species is expected to occur and habitat meets species requirements.
Moderate = Habitat is only marginally suitable or is suitable but not within species geographic range.
Low = Habitat does not meet species requirements as currently understood in the scientific community.

STATUS CODES:

Federal:
FE = Listed as "endangered" under the federal Endangered Species Act
FT = Listed as "threatened" under the federal Endangered Species Act
FSC = NOAA Fisheries designated "species of concern"
FPD = Proposed delisted
FD = Delisted

State:
CE = Listed as "endangered" under the California Endangered Species Act
CT = Listed as "threatened" under the California Endangered Species Act
CSC = California Department of Fish and Wildlife designated "species of special concern"
CFP = California Department of Fish and Wildlife designated "fully protected"
SC = California Department of Fish and Wildlife designated "candidate threatened"
WL = California Department of Fish and Wildlife designated "watch list"
3503.5 = Eggs, Nests, and Nestlings Protected under section 3503.5 of the California Department of Fish and Game Code
* = California special animal

SOURCE: USFWS (2014), CDFW (2014), CNPS (2014).

Special-Status Animals

Table 4.3-2 presents special-status wildlife species known to occur in the regional vicinity (i.e., the San Francisco North and San Francisco South quadrangles), and their potential to occur in the LRDP planning area. Of the special-status animals listed in Table 4.3-2, only species classified as having a moderate or high potential for occurrence in the 2014 LRDP planning area were considered in the impact analysis. Species addressed in detail include the following:

- Monarch butterfly
- Special-status birds
- Special-status bats

Aside from breeding birds, special-status wildlife species are not likely to occur within the LRDP campus sites, because most of these areas are highly fragmented and paved or dominated by non-native ornamental or ruderal species, which have poor habitat attributes for wildlife. However, monarch butterflies (*Danaus plexippus*) have been known to overwinter in eucalyptus groves of

San Francisco and the foliage-roosting western red bat has been documented in Golden Gate Park. These species are described in further detail below.

Monarch butterfly. This insect is a California special animal[13] and the butterfly's overwintering sites are tracked by the CNDDB because they are considered vulnerable in the State due to their restricted range (overwintering sites are primarily found only near the coast) and relatively rare distribution in California. This species migrates along the Pacific Coast, and often overwinters in wind-protected groves of trees, such as eucalyptus and Monterey cypress, between October and March. CNDDB documents this species overwintering in the Presidio, Golden Gate Park, Fort Mason, and Telegraph Hill (CDFW, 2014). Parnassus Heights is the only UCSF campus site location with suitable habitat for overwintering monarch aggregations in the 2014 LRDP planning area, however there are no records of such activity within the Mount Sutro Open Space Reserve.

Migratory and special-status birds. Several common migratory birds and native birds could nest in or adjacent to the 2014 LRDP activities sites in trees, shrubs, and buildings. Several raptors are known to nest in San Francisco, including red-tailed hawk, red-shouldered hawk, American kestrel (*Falco sparverius*), Cooper's hawk and great horned owl (*Bubo virginianus*). The federal Migratory Bird Treaty Act (MBTA) and California Fish and Game Code protect raptors and most native migratory birds and breeding birds (see Section 4.3.2.1, below).

Special-status bats. Bat surveys conducted in natural areas and parks in San Francisco found that the three most commonly encountered species are Mexican free-tailed bat (*Tadaridia brasiliensis*), Yuma myotis (*Lasiurus blossevillii*), and western red bat, a California species of concern (Krauel, 2009). Mexican free-tailed bats, which have no special status, are widespread and abundant throughout the natural areas of San Francisco, while Yuma myotis and western red bat appear to be relatively less abundant and are generally restricted to parks with lakes (Krauel, 2009). The western red bat and Yuma myotis may potentially occur in forest edge habitat of the Reserve on the Parnassus Heights campus site. Suitable roosting habitat for these bats includes tree foliage, underneath the exfoliating bark of trees, and in tree cavities. The western red bat has been known to roost in the Strybing Arboretum of Golden Gate Park within 0.5 mile of the Parnassus Heights campus site.

Designated Critical Habitat

The USFWS designates critical habitat for certain species listed by the agency as threatened or endangered. "Critical habitat" is defined in Section 3(5)(A) of the federal Endangered Species Act (ESA) as those lands within a listed species' current range that contain the physical or biological features considered essential to the species' conservation, as well as areas outside the species' current range that are determined to be essential to its conservation. However, activities under the 2014 LRDP are not located within designated critical habitat for any federally listed species.

[13] Species listed on the current CDFW "special animals" list (January 2011), which includes 898 species. This list includes species that CDFW considers "those of greatest conservation need."

4.3.1.3 Wetlands and Other Waters of the United States

There are no wetlands or other waters of the state as defined by Section 404 of the federal Clean Water Act or by the Porter-Cologne Water Quality Control Act, Section 13260 of the California Water Code, within the 2014 LRDP planning area. The East Bowl Corridor on the eastern side of the Reserve and contiguous with the City-owned Interior Greenbelt contains Woodland Creek that may be subject to U.S. Army Corps of Engineers jurisdiction as other waters of the U.S. during storm events when the channel conveys storm water flows. Disturbance to the channel bed, bank or surrounding riparian vegetation would also be subject to CDFW jurisdiction and require a Lake or Streambed Alteration Agreement under Section 1602 of the California Fish and Game Code. Proposed 2014 LRDP activities on the Parnassus Heights campus site would not occur within the vicinity of the channel, and therefore impacts on the channel are not considered further in this analysis.

4.3.2 Regulatory Considerations

This section briefly describes federal, state, and local regulations, permits, and policies pertaining to biological resources and wetlands as they may apply to the proposed 2014 LRDP.

4.3.2.1 Special-Status Species

Federal Endangered Species Act

The federal ESA protects the fish and wildlife species, and their habitats that have been identified by the USFWS or National Marine Fisheries Service (NMFS) as threatened or endangered. The term "endangered" refers to species, subspecies, or distinct population segments that are in danger of extinction through all or a significant portion of their range. The term "threatened" refers to species, subspecies, or distinct population segments that are likely to become endangered in the near future.

The ESA is administered by the USFWS and NMFS. In general, the NMFS is responsible for the protection of ESA-listed marine species and anadromous fishes, whereas listed, proposed, and candidate wildlife, plant species, and fish species are under USFWS jurisdiction. "Take"[14] of listed species can be authorized through either the Section 7 consultation process (for actions by federal agencies) or the Section 10 permit process (for actions by non-federal agencies). Federal agency actions include activities located on federal land or that are conducted by a federal agency, funded by a federal agency, or authorized by a federal agency (including issuance of federal permits and licenses).

Under Section 7 of the ESA, the federal agency conducting, funding, or permitting an action (the federal lead agency) must consult the USFWS and/or NMFS, as appropriate, to ensure that the proposed action will not jeopardize endangered or threatened species or destroy or adversely modify designated critical habitat. If a proposed project "may affect" a listed species or designated

[14] The federal ESA defines the term "take" as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct."

critical habitat, the lead agency is required to prepare a biological assessment evaluating the nature and severity of the expected effect. In response, the USFWS issues a biological opinion determining whether (1) the proposed action may either jeopardize the continued existence of one or more listed species (jeopardy finding) or result in the destruction or adverse modification of critical habitat (adverse modification finding), or (2) will not jeopardize the continued existence of any listed species (no jeopardy finding) or result in adverse modification of critical habitat (no adverse modification finding).

Critical Habitat

Under the ESA, the Secretary of the Interior (or the Secretary of Commerce, as appropriate) formally designates critical habitat for certain federally listed species and publishes these designations in the Federal Register. Critical habitat is not automatically designated for all federally listed species; so many listed species have no formally designated critical habitat.

Critical habitat is defined as the specific areas that are essential to the conservation of a federally listed species, and that may require special management consideration or protection. Critical habitat is determined using the best available scientific information about the physical and biological needs of the species. These needs, or primary constituent elements, include: space for individual and population growth and for normal behavior; food, water, light, air, minerals, or other nutritional or physiological needs; cover or shelter; sites for breeding, reproduction, and rearing of offspring; and habitat that is protected from disturbance or is representative of the historical geographic and ecological distribution of a species. There is no federally designated critical habitat in the LRDP planning area.

California Endangered Species Act

Under the California Endangered Species Act (CESA), the CDFW has the responsibility for maintaining a list of threatened and endangered species (California Fish and Game Code, Section 2070). The CDFW also maintains a list of "candidate species," which are species formally noticed as being under review for addition to either the list of endangered species or the list of threatened species. In addition, the CDFW maintains lists of "species of special concern," which serve as watch lists.

The CESA prohibits the take of plant and animal species designated by the Fish and Game Commission as either threatened or endangered in the State of California. "Take" in the context of the CESA means to hunt, pursue, kill, or capture a listed species, as well as any other actions that may result in adverse impacts when attempting to take individuals of a listed species. The take prohibitions also apply to candidates for listing under the CESA. However, Section 2081 of the CESA allows the CDFW to authorize exceptions to the state's take prohibition for educational, scientific, or management purposes.

Pursuant to the requirements of the CESA, an agency reviewing a proposed project within its jurisdiction must determine whether any State-listed endangered or threatened species could be present on the project area and determine whether the proposed project could have a potentially

significant impact on such species. In addition, the CDFW encourages informal consultation on any proposed project that could affect a candidate species.

California Native Plant Protection Act

State listing of plant species began in 1977 with the passage of the California Native Plant Protection Act (NPPA), which directed the CDFW to carry out the legislature's intent to "preserve, protect, and enhance endangered plants in this state." The NPPA gave the California Fish and Game Commission the power to designate native plants as endangered or rare and to require permits for collecting, transporting, or selling such plants. The CESA expanded on the original NPPA and enhanced legal protection for plants. The CESA established threatened and endangered species categories, and grandfathered all rare animals—but not rare plants—into the act as threatened species. Thus, three listing categories for plants are employed in California: rare, threatened, and endangered.

Special-Status Natural Communities

Special-status natural communities are identified as such by the CDFW's Natural Heritage Division and include those that are naturally rare and those whose extent has been greatly diminished through changes in land use. The CNDDB tracks 135 such natural communities in the same way that it tracks occurrences of special-status species: information is maintained on each site in terms of its location, extent, habitat quality, level of disturbance, and current protection measures. The CDFW is mandated to seek the long-term perpetuation of the areas in which these communities occur. While there is no statewide law that requires protection of all special-status natural communities, CEQA requires consideration of the potential impacts of a project on biological resources of statewide or regional significance.

Federal Migratory Bird Treaty Act

The federal MBTA (United States Code, Title 16, Section 703, Supplement I, 1989) prohibits taking, killing, possessing, or trading in migratory birds, except in accordance with regulations prescribed by the Secretary of the Interior. This act encompasses whole birds, parts of birds, and bird nests and eggs. *Take* is defined in the federal Endangered Species Act as "…harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect any threatened or endangered species." Harm may include significant habitat modification where it actually kills or injures a listed species through impairment of essential behavior (e.g., nesting or reproduction). Therefore, for projects that would not result in the direct mortality of birds, the MBTA is generally also interpreted in CEQA analyses as protecting active nests of all species of birds that are included in the "List of Migratory Birds" published in the Federal Register in 1995. With respect to nesting birds, while the MBTA itself does not provide specific take avoidance measures, a set of measures sufficient to demonstrate take avoidance have been developed over time by USFWS and CDFW. Since these measures are typically required as permitting conditions by these agencies, they are often incorporated as mitigation measures for projects during the environmental review process, unless the project as proposed incorporates and is consistent with these protections. These requirements include preconstruction nesting bird surveys and establishment of appropriate buffers from construction if active nests are found.

California Fish and Game Code

Under Section 3503 of the California Fish and Game Code, it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by the code or any regulation made pursuant thereto. Section 3503.5 of the code prohibits take, possession, or destruction of any birds in the orders Falconiformes (hawks) or Strigiformes (owls), or of their nests and eggs. Code Sections 3511 (birds), 4700 (mammals), 5050 (reptiles and amphibians), and 5515 (fish) allow the designation of a species as fully protected. This is a greater level of protection than is afforded by CESA. Except for take related to scientific research, all take of fully protected species is prohibited**.**

Wetlands and Other Waters of the United States

Wetlands are ecologically complex habitats that support a variety of both plant and animal life. The federal government defines and regulates wetlands and other waters in Section 404 of the Clean Water Act as "areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support (and do support, under normal circumstances) a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 CFR 328.3[b] and 40 CFR 230.3).

Under normal circumstances, the federal definition of wetlands requires the presence of three identification parameters: wetland hydrology, hydric soils, and hydrophytic vegetation. Examples of wetlands include freshwater marsh, seasonal wetlands, and vernal pool complexes that have a hydrologic link to other waters of the United States. Other waters of the U.S. include unvegetated waters of streams, lakes and ponds.

The Porter-Cologne Water Quality Control Act Section 13260 of the California Water Code requires "any person discharging waste, or proposing to discharge waste, in any region that could affect the waters of the state to file a report of discharge (an application for waste discharge requirements)." Under the Porter-Cologne Water Quality Control Act definition, the term "waters of the state" is defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." Although all waters of the United States that are within the borders of California are also waters of the state, the converse is not true—in California, waters of the United States represent a subset of waters of the state. Therefore, the State of California through each of nine Regional Water Quality Control Boards retains authority to regulate discharges of waste into any waters of the state, regardless of whether the U.S. Army Corps of Engineers has concurrent jurisdiction under Clean Water Act Section 404.

4.3.2.2 Applicable Local Plans and Policies

This section discusses plans or policies developed by UCSF pertaining to biological resources. UCSF is not subject to local land use regulation whenever using land under its control in furtherance of its educational mission. However, it is UCSF policy to be generally consistent with applicable local regulations to the extent feasible. UCSF and City plans and regulations that are relevant to the biological resources impacts analysis are summarized below.

UCSF Mount Sutro Open Space Reserve Management Plan

During the development of the 1996 UCSF LRDP, the UCSF Community Advisory Group advised that the plan include recommendations for a maintenance and restoration program for the Mount Sutro Open Space Reserve's vegetation and hiking trails. This management plan was developed in 2001 to provide a framework for protecting, enhancing, and restoring the Reserve while maintaining a balance between neighborhood and University interests. Seven planning principles inform the management plan and are listed, below.

- Ensure Public Safety and Property Protection
- Improve the Health of the Forest
- Protect and Expand Native Plants
- Enhance Wildlife Habitat Values
- Maintain Scenic Quality
- Improve Public Access
- Implement Resource Management Plan

The 2001 Management Plan continues to serve as a guide for maintenance and restoration of the Reserve. In recognition of the need to maintain ongoing dialogue with the community regarding the management of the Reserve, UCSF initiated a new round of community meetings in 2009 - 2010. The process resulted in identifying demonstration project areas and specific management actions for those demonstration areas. Proposed management activities at that time included thinning the forest, native plant restoration and enhancement, conversion planting (removal of non-native trees and plants and conversion to native species) in select areas and construction of new trails. A UCSF Mount Sutro Management Draft Environmental Impact Report that analyzed the proposed management activities was prepared and published in January, 2013. Based on feedback on those proposed activities, and in light of the elevated fire danger resulting from California's periodic drought conditions, UCSF retained a professional forester to help develop a plan for the Reserve that focused on reducing the danger of wildfire. Proposed hazard reduction measures, consistent with best management practices applied throughout California in forests located near urban areas, were developed and presented to the community in November, 2013. As of this writing, UCSF is carefully considering the public feedback received to date—responding to both previous forest management proposals and to the proposed fire hazard reduction measures presented in November, 2013—to determine the best path forward. Proposed trails are now being analyzed as part of proposed activities under the 2014 LRDP and are described in this EIR in Section 3.8.1.

San Francisco Public Works Code

The San Francisco's Urban Forestry Ordinance (Article 16 of the Public Works Code) protects San Francisco's street trees, significant trees, and landmark trees regardless of species. The ordinance protects the following three categories of trees, which are defined as follows:

> A **street tree** is "any tree growing within the public right-of-way, including unimproved public streets and sidewalks, and any tree growing on land under the jurisdiction of the Department [of Public Works]" as defined in Section 802 of the ordinance. Section 806b

requires entities (other than the Department of Public Works) to obtain a permit from the department prior to removing any street trees.

A **significant tree** is defined in Section 810A of the ordinance as any tree: (1) located on property under the jurisdiction of the Department of Public Works or on privately owned property with any portion of its trunk within 10 feet of the public right-of-way, and (2) that satisfies at least one of the following criteria: (a) a diameter at breast height in excess of 12 inches, (b) a height in excess of 20 feet, or (c) a canopy in excess of 15 feet. Any entity other than the Department of Public Works must obtain a permit to remove significant trees according to the process described in Section 806b.

A **landmark tree** is any tree that: (1) has been nominated as such by a member of the public, a landowner, the San Francisco Planning Commission, the Board of Supervisors, or the Historic Preservation Commission, (2) the Urban Forestry Council (within the San Francisco Department of the Environment) has subsequently recommended as a landmark tree, and (3) is designated a landmark tree by ordinance approved by the Board of Supervisors. According to Section 810 of the ordinance, nominated trees undergoing review are protected according to the same standards as designated landmark trees until the review process is completed.

Permits are required for planting or removing street trees and significant trees, and protection measures are required for these trees if construction work would occur within the trees' dripline. Activities under the 2014 LRDP are not anticipated to affect protected trees.

Standards for Bird-Safe Buildings

The San Francisco Planning Department adopted *Standards for Bird-Safe Buildings* in 2011, adding Planning Code Section 139 (San Francisco Planning Department, 2011). These standards guide the use and types of glass and façade treatments, wind generators and grates, and lighting treatments. The standards impose requirements for bird-safe glazing and lighting in structures or at sites that represent a hazard to birds and provide information on educational and voluntary programs related to bird hazards. The standards define two types of bird hazards. "Location-related hazards" are buildings located inside of, or within a clear flight path of less than 300 feet from, an Urban Bird Refuge.[15] Such buildings require treatment when new buildings are constructed; additions are made to existing buildings; or existing buildings replace 50 percent or more of the glazing within the "bird collision zone."[16] The standards require implementation of the following treatments for façades facing, or located within, an Urban Bird Refuge:

- No more than 10 percent untreated glazing is allowed on building façades within the bird collision zone.
- Lighting must be shielded, and no uplighting is permitted. No event searchlights are permitted.

[15] An Urban Bird Refuge is defined in the Standards for Bird-Safe Buildings as: any area of open space two acres or larger that is dominated by vegetation, including vegetated landscaping, forest, meadows, grassland, water features, or wetlands; open water; and some green rooftops.

[16] The "bird collision zone" is that portion of the building that begins at grade and extends upward for 60 feet.

- Sites are not permitted to use horizontal access windmills or vertical access wind generators that do not appear solid.

"Feature-related hazards" include building- or structure-related features that are considered potential "bird traps" regardless of location (e.g., glass courtyards, transparent building corners, or clear glass walls on rooftops or balconies). Structures that include these elements must treat 100 percent of these elements in the building with bird safe glazing.

Pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation, including City of San Francisco General Plan policies regarding protection of biological resources. 2014 LRDP activities would not be subject to the above standards, although UCSF could voluntarily consider such policies in the design of campus buildings.

4.3.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

e) Conflict with any applicable policies protecting biological resources?

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other applicable habitat conservation plan?

g) Exceed the LRDP EIR standard of significance by damaging or removing heritage or landmark trees or native oak trees of a diameter specified in a local ordinance?

After evaluation of the activities proposed by the 2014 LRDP, the Initial Study concluded that all LRDP proposals would clearly result in no impact or a less-than-significant impact at the Mission Bay, Mount Zion and Mission Center campus sites. At the Parnassus Heights campus site the Initial Study concluded that all LRDP proposals would result in no impact or a less-than-significant impact, with the exception of criteria a) and d).

For the purposes of this EIR, the word "substantial" as used in the significance criteria above is defined by the following three principal components:

- Magnitude and duration of the impact (e.g., substantial/not substantial)
- Uniqueness of the affected resource (rarity)
- Susceptibility of the affected resource to disturbance

4.3.4 Analysis Methodology

Impacts on biological resources are evaluated based on the likelihood that special-status species, sensitive habitats, wildlife corridors, and protected trees are present within the 2014 LRDP planning area (as described in Section 4.7.1, *Setting*), and the likely effects that activities under the 2014 LRDP including construction, operation, and maintenance might have on these resources. Special-status resources that have no or low potential to occur in the 2014 LRDP planning area (as presented in Tables 4.7-1 and 4.7-2) are not considered in the impact analysis.

4.4 Cultural Resources

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Cultural Resources impacts. 2014 LRDP Cultural Resources effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures*. Cultural Resources effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures*, Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.4.1 Regional Setting

The prehistoric (2500 BC to 1500 AD) occupation and use of the San Francisco Bay Area is complex, and understanding it is complicated by the rapid development of the Bay Area during the California Gold Rush that likely contributed to the destruction of many archaeological sites that may have existed or rendered those sites inaccessible due to surface cover. On the basis of archaeological data from Bay Area sites that have survived to the present and from ethnographic sources, archaeologists know that prehistoric life-ways in the Bay Area involved subsistence hunting and gathering. Seasonally, parties went out from villages to temporary camps within their territory to hunt and gather mussels, shellfish, salmon, seals, land mammals, and plant foods, typically acorns. Protohistoric (1550s to 1770s) and historic (1770s to present-day) land uses by native peoples is better understood, but still complicated by displacement of the native peoples, and European American development of the region.

"Costanoan" is a term is originally derived from a Spanish word designating the coastal peoples of Central California. Today Costanoan is used as a linguistic term that references to a larger language family spoken by distinct sociopolitical groups that spoke at least eight languages (as different as Spanish is from French) of the same Penutian language group. This group refers to themselves as "Ohlone." While traditional anthropological literature portrayed the Ohlone peoples as having a static culture, today it is better understood that many variations of culture and ideology existed within and between villages. Static descriptions of separations between native cultures of California made it an easier task for ethnographers to describe past behaviors, but this masks Native adaptability and self-identity. California's Native Americans never saw themselves as members of larger "cultural groups," as described by anthropologists. Instead, they saw themselves as members of specific villages, perhaps related to others by marriage or kinship ties, but viewing the village as the primary identifier of their origins. The Ohlone once occupied a large territory from San Francisco Bay in the north to the Big Sur and Salinas Rivers in the south. All of UCSF's existing sites are within Ohlone territory.

Initial European exploration of the San Francisco peninsula began in 1769 and lasted until 1810. During this period, a number of Spanish expeditions penetrated the territory occupied by the Ohlone peoples. Between 1769 and 1776, forays led by Portola, Ortega, Fages, Fages and Crespi,

Anza (two expeditions), Rivera, and Moraga were carried out. Favorable reports led to the founding of seven missions in the region between 1770 and 1797.

In the spring of 1776, the site of San Francisco was chosen by Juan Batista Anza for the establishment of a mission and military post. Later that same year, the Mission San Francisco de Asís (also known as Mission Dolores) and Presidio de San Francisco were officially dedicated and Jose Joaquin Moraga (Anza's lieutenant) took formal possession in the name of King Carlos III.

The Spanish annexation and colonization of Alta California, as manifested in the religious-military mission system, produced profound changes in the cultures of the indigenous population. The missions resettled and concentrated the aboriginal hunter-gatherer population into agricultural communities. The concentration of population, coupled with the indigenous people's lack of immunity to European diseases, caused the tribes to be decimated by common diseases which were generally not fatal to Europeans. It has been estimated that the Ohlone population declined from 10,000 or more in 1770 to less than 2,000 in 1832. Today, the Ohlone still have a strong presence in the San Francisco Bay Area, and are highly interested in their historic and prehistoric past.

Mexico established jurisdiction over Alta California in April of 1822. During the Mexican Period (1822–1848), control over this remote area by the central and local Mexican authorities was never strong. California became part of the United States as a consequence of the U.S. victory over Mexico in the Mexican War. The territory was formally ceded in the treaty of Guadalupe Hidalgo in 1848, and was admitted as a state in 1850.

Prior to the discovery of gold at Sutter's Mill on January 24, 1848, development in San Francisco consisted of the Spanish/Mexican facilities (i.e., the Presidio and Mission) and a small settlement known as Yerba Buena situated on the shores of the cove by the same name. The inhabitants of Yerba Buena were predominantly non-Spanish, English-speaking immigrants (e.g., U.S. or British citizens). Sometime before the Gold Rush, the inhabitants of Yerba Buena officially changed the name of their settlement to San Francisco. Following the discovery of gold, San Francisco transformed quickly from an isolated hamlet into a bustling center of commerce. After the discovery of gold, the population of San Francisco grew from 375 people in 1847 to 2,000 by February 1849, and by the end of 1849, there may have been as many as 20,000 people living in the City (CCSF, 2011).

Silver discoveries, including the Comstock Lode in 1859, further drove rapid population growth. Entrepreneurs sought to capitalize on the wealth generated by the Gold Rush by founding Wells Fargo in 1852 and the Bank of California in 1864. Development of the Port of San Francisco and the establishment in 1869 of overland access to the Eastern U.S. rail system via the newly completed Pacific Railroad helped make San Francisco and the Bay Area a center for trade. The first cable cars carried San Franciscans up Clay Street in 1873. As rows of Victorian houses began to take shape throughout the city, civic leaders campaigned for a spacious public park, resulting in plans for Golden Gate Park. San Franciscans built schools, churches, theaters, and all the hallmarks of civic life. The Presidio developed into the most important American military

installation on the Pacific coast. By 1890, San Francisco's population approached 300,000, making it the eighth largest city in the U.S. at the time.

The great earthquake and fire of 1906 destroyed nearly all of downtown San Francisco, killed approximately 3,000 people, and left more than half of the city's population of 400,000 homeless. Refugees settled temporarily in makeshift tent villages in Golden Gate Park, the Presidio, on the beaches, and elsewhere. Many fled permanently to the East Bay. Rebuilding after the earthquake was rapid and by the time the city hosted the Panama-Pacific International Exposition in 1915, the city had been reborn. Development of the western portions of San Francisco accelerated during this period, with the establishment of the Western Addition, the Ingleside, Richmond, and Sunset Districts.

It was also during this period San Francisco built some of its most important infrastructure. Civil Engineer Michael O'Shaughnessy was hired by San Francisco Mayor James Rolph as chief engineer for the city in September 1912 to supervise the construction of the Twin Peaks Reservoir, the Stockton Street Tunnel, the Twin Peaks Tunnel, the San Francisco Municipal Railway, the Auxiliary Water Supply System, and new sewers. San Francisco's streetcar system, of which the J, K, L, M, and N lines survive today, was pushed to completion by O'Shaughnessy between 1915 and 1927. It was the O'Shaughnessy Dam, Hetch Hetchy Reservoir, and Hetch Hetchy Aqueduct that would have the largest effect on San Francisco. An abundant water supply enabled San Francisco to develop into the city it has become today.

San Francisco also undertook two great civil engineering projects, simultaneously constructing the San Francisco – Oakland Bay Bridge and the Golden Gate Bridge, completing them in 1936 and 1937 respectively.

During World War II, the Hunters Point Naval Shipyard became a hub of activity, and Fort Mason became the primary port of embarkation for service members shipping out to the Pacific Theater of Operations. The explosion of jobs drew many people to the area, especially African Americans from the South. After the end of the war, many military personnel returning from service abroad and civilians who had originally come to work decided to stay. Numerous physical and demographic changes occurred to San Francisco after the war to accommodate the huge post-war population increase. Today, the city has a population of over 800,000 people.

With thousands of buildings and structures in San Francisco, some of which date to the earliest days of the Mission Period and the Gold Rush, there are numerous historic sites and districts which convey the city’s historic significance as the West Coast’s preeminent city. Currently, San Francisco contains approximately 175 properties listed in the National Register of Historic Places, well over a thousand buildings and structures listed in or eligible for listing in the California Register of Historical Resources, approximately 50 California State Historical Landmarks, approximately 260 locally-designated historical landmarks, and 11 locally-designated historic districts (NoeHill, 2014).

4.4.1.1 University of California, San Francisco

One of the world's leading health sciences universities, the University of California, San Francisco (UCSF), dates its founding to 1864, when South Carolina surgeon Hugh Toland founded a private medical school in San Francisco.

The college prospered, and Toland sought to affiliate with the University of California, which had opened its campus in Berkeley in 1868. UC President Daniel Coit Gilman, who strongly supported science education, set a precedent for the young university by affiliating in 1873 with both Toland Medical College and the California College of Pharmacy. Eight years later, the UC Regents added a dental college.

The three Affiliated Colleges — also called UC departments — were located at various sites in San Francisco, and after several years there was strong interest in bringing them together. San Francisco Mayor Adolph Sutro donated 13 acres on a site overlooking Golden Gate Park — known today as Parnassus Heights — and the new Affiliated Colleges buildings opened in fall 1898.

When the great San Francisco earthquake destroyed much of San Francisco and the city's medical facilities in April 1906, more than 40,000 people took shelter and sought treatment in a tent city in Golden Gate Park, where makeshift outdoor hospitals were set up. The Affiliated Colleges, located on the hill above the encampment in what was then the far western section of the city, suddenly were situated close to a significant population. Faculty sprung into action treating those injured from the earthquake and subsequent fire.

One of the Affiliated Colleges buildings at Parnassus Heights was renovated as a facility for inpatients, outpatients and dental services, and opened in April 1907 with 75 beds.

With this new facility came the need to recruit nurses and the opportunity to train nursing students. In 1907, the UC Training School for Nurses was established, adding a fourth professional school to the Affiliated Colleges. To make room for expanded clinical services and instruction on Parnassus, the medical college basic science departments — pathology, anatomy and physiology — moved to the Berkeley campus.

Over the next 50 years, leaders of the Affiliated Colleges and UC moved forward with an eye to establishing an institution with a national reputation. They improved the curriculum, upgraded admission requirements, expanded research and clinical programs, and built new facilities.

In 1964, the institution, operating under the name University of California, San Francisco Medical Center, was given full administrative independence, becoming the ninth campus in the UC system and the only one devoted exclusively to the health sciences (UCSF, 2014).

4.4.2 Regulatory Considerations

4.4.2.1 Federal

The National Register of Historic Places (National Register) is the official U.S. government list of properties that have architectural, historical, or cultural significance at the national, state, or local level. The National Register is administered by the National Park Service, an agency of the U.S. Department of the Interior. The National Register lists sites, buildings, structures, objects, and districts that possess historic, architectural, engineering, archaeological, or cultural significance at the local, regional, state, or national level. Listing of a property in the National Register does not prohibit demolition or alteration of that property, but does denote that the property is a resource worthy of recognition and protection. The National Register includes four criteria under which a structure, site, building, district, or object can be considered significant for listing. These include:

- **Criterion A (Event):** Resources that are associated with events that have made a significant contribution to the broad patterns of our history
- **Criterion B (Person):** Resources that are associated with the lives of persons significant in our past
- **Criterion C (Design/Construction):** Resources that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master
- **Criterion D (Information Potential):** Resources that have yielded, or may be likely to yield, information important in prehistory or history

4.4.2.2 State

The Office of Historic Preservation (OHP) maintains the California Register of Historical Resources (California Register). The California Register includes properties that are listed or are formally determined eligible for listing in the National Register of Historic Places; State Historical Landmarks; and eligible Points of Historical Interest. Other resources that may be eligible for the California Register, and which require nomination and approval for listing by the State Historic Resources Commission, include resources contributing to the significance of a local historic district, individual historical resources, historical resources identified in historic resources surveys conducted in accordance with OHP procedures, historic resources or districts designated under a local ordinance consistent with the procedures of the State Historic Resources Commission, and local landmarks or historic properties designated under local ordinance. Under CEQA, a cultural resource is considered significant if it is at least 45 years old and meets any of the criteria described below:

- **Criterion A:** Resources that are associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage
- **Criterion B:** Resources that are associated with the lives of persons important in our past
- **Criterion C:** Resources that embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possess high artistic values

- **Criterion D:** Resources that have yielded or may be likely to yield information important in prehistory or history

The fact that a resource is not listed in, or determined to be eligible for listing the California Register, not included in a local register of historic resources, or identified in a historical resources survey does not preclude a lead agency from determining that the resources may be an historical resource (CEQA Guidelines Section 15064.5(a)(4)).

The OHP maintains the Historical Resources Information System (formerly known as the California Archaeological Inventory) through 11 information centers throughout the state. The Northwest Information Center (NIC), which includes San Francisco County within its jurisdiction, is a repository for archaeological site records and other information on cultural resources, including the National Register and the California Inventory of Historical Resources and Points of Historic Interest lists. Upon request, the NIC conducts searches of its records to determine whether any cultural resources are known to exist in or near the subject property.

4.4.2.3 Local

Article 10 of the San Francisco Planning Code contains measures to identify structures or landmarks that have historical, architectural, or aesthetic merit. These structures are recorded in a list that is approved by the San Francisco Historic Preservation Commission and the San Francisco Board of Supervisors, and includes all structures on federal and state lists. Applications to construct, alter, or demolish structures that have been deemed to have significant merit require approval by the Historic Preservation Commission and in the case of applications involving multiple approvals such as a conditional use authorization, the Planning Commission before issuance of a permit.

The San Francisco General Plan contains policies governing the preservation of historic architectural resources that are considered to be locally significant. The General Plan Urban Design Element addresses: (1) preservation of landmarks designated by the City; (2) enhancement of the original character of older buildings when remodeling; and (3) respecting the character of older nearby development in the design of new buildings.

4.4.3 Significance Standards

This EIR assesses environmental impacts based on the significance criteria contained in Appendix G of the CEQA Guidelines as well as from the criteria in the University of California CEQA Handbook, including LRDP or Program EIR criteria to incorporate local and regional standards. For purposes of this EIR, the 2014 LRDP would have a significant effect on the environment if it would exceed the criteria listed below:

a) Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5?

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

d) Disturb any human remains, including those interred outside of formal cemeteries?

The significance standards for the first two impact criteria are further explained and defined below. CEQA Guidelines Section 15064.5(b)(1) defines a significant effect as one that would materially impair the significance of a historical resource. According to CEQA Guidelines Section 15064.5(b)(2), material impairment of a resource's historic significance could result if the project would:

- Demolish or materially alter in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in, the California Register of Historical Resources;

- Demolish or materially alter in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to local ordinance or resolution (PRC Section 5020.1[k]), or its identification in a historical resources survey meeting the requirements of PRC Section 5024.1(g) unless a preponderance of evidence establishes that the resource is not historically or culturally significant; or

- Demolish or materially alter in an adverse manner those physical characteristics of a resource that convey its historical significance and that justify its eligibility for its inclusion in the California Register, as determined by the lead agency. Generally, a project that follows the Secretary of the Interior's guidelines will be considered mitigated to a less than significant level, according to CEQA Guidelines Section 15064.5(b)(3).

Generally, a project that follows the Secretary of the Interior's guidelines will be considered mitigated to a less than significant level, according to CEQA Guidelines Section 15064.5(b)(3).

CEQA Guidelines Section 15064.5(c) applies to effects on archaeological sites. Effects on non-unique archaeological resources are not considered significant. Regarding unique archaeological resources, lead agencies may require that reasonable efforts be made to permit such resources to be preserved in place or left in an undisturbed state. To the extent that unique archaeological resources are not preserved in place or not left undisturbed, mitigation measures to protect such resources are required (PRC Section 21083.2 [c]). Additionally, mitigation measures may be imposed to make provisions for archaeological sites accidentally discovered during construction. Generally, with the imposition of mitigation measures, effects on archaeological resources would be reduced to an insignificant level.

4.4.4 Analysis Methodology

The UCSF campus sites have undergone cultural resources analyses in the form of archival research by qualified archaeologists and architectural historians. The historic architectural resource analysis was completed by qualified architectural historians who visited the four affected UCSF campus sites in this EIR to take photographs and review historical documentation on the buildings and structures (including previous environmental reviews), and complete archival

research. The information gathered was used to evaluate whether impacts would occur to historic or cultural resources due to the proposed 2014 LRDP activities. For each potential impact, the analysis compares the net impact to the standards of significance and determines the impact's level of significance under CEQA. If the impact would be significant, the analysis identifies feasible mitigation measures that would eliminate the impact or reduce it to a less-than-significant level. If the impact cannot be reduced to a less-than-significant level after implementation of feasible mitigation measures, then the impact would remain significant and unavoidable.

4.5 Geology, Soils and Seismicity

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Geology, Soils and Seismicity impacts. 2014 LRDP Geology, Soils and Seismicity effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Geology, Soils and Seismicity effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.5.1 Regional Setting

The LRDP planning area is located on the northern tip of the San Francisco Peninsula, within the Coast Ranges geologic province. The Coast Ranges is a northwest-trending series of mountain ranges and valleys that was created through tectonic forces associated with the plate margin. San Francisco Bay, which was formed within a shallow, regional structural depression, is the predominant feature, separating smaller northern and southern mountain ranges. Much of the Coast Range province is composed of marine sedimentary and volcanic rocks that form the Franciscan Complex, located east of the San Andreas Fault. The general geologic setting of the city is characterized by bedrock hills bounded by broad valleys and underlain by unconsolidated deposits. The Franciscan Complex generally consists of graywacke (sandstone), shale, chert, greenstone, and melange; in certain places, serpentine, an asbestos-containing rock-type, is found within the shale matrix. Bedrock outcrops in hilly areas account for approximately 24% of the land surface in San Francisco. The region west of the San Andreas Fault is underlain by a mass of basement rock known as the "Salinian Block." This block contains igneous rocks,[17] Tertiary-age (up to 65 million years old) marine sandstone, and various metamorphic rocks[18] believed to have originated some 350 miles to the south. The Salinian Block has been moving northward along the west side of the San Andreas Fault.

4.5.1.1 Local Soils

Soils at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites vary among the sites but very generally include a combination of fill, silty clays, clays, sands, and loams with the upland soils tending to be shallower and richer in clay (Helley and Lajoie, 1979). For example, soils at the Mission Center site were characterized as 13 to 20 feet of artificial fill underlain by 20 to 50 feet of soft Bay Mud materials (Shannon & Wilson, 1970). Soils at the Mission Bay campus contain varying thicknesses of artificial fill and bay mud (Harding ESE, 2001). The Parnassus campus soils, similar to the soils at Mount Zion are in general shallower and also include dune sand deposits (Rutherford & Chekene, 2006). Fill material is variable in its soil properties and especially within the Mission Bay campus which includes rubble from the 1906 earthquake.

[17] Igneous rocks are those that form from molten magma, such as granite.
[18] Metamorphic rocks are sedimentary or volcanic rocks altered by prolonged heating and deformation.

4.5.1.2 Geologic Hazards

Expansive Soils

Expansive soils possess a "shrink-swell" behavior. Shrink-swell is the cyclic change in volume (expansion and contraction) that occurs in fine-grained clay sediments from the process of wetting and drying. Structural damage may occur over a long period of time, usually the result of inadequate soil and foundation engineering or the placement of structures directly on expansive soils. Expansive soils occur in the upper 5 feet of undisturbed soil. Campus sites that have undergone development have reworked or removed any expansive soils that were previously present. Similarly, development of large structures proposed under the 2014 LRDP would necessarily require that any shallow expansive soils be reworked or removed during excavation, grading, and construction. Furthermore, previous geotechnical investigations did not identify expansive soils as a geologic hazard for the Mission Bay, Parnassus Heights or Mount Zion campus sites.

Soil Erosion

Erosion is the wearing away of soil and rock by processes such as mechanical or chemical weathering, mass wasting, and the action of waves, wind, and underground water. Soils containing high amounts of silt or clay can be easily erodable, while sandy soils are less susceptible. Excessive soil erosion can eventually damage building foundations and roadways. In developed urban areas, erosion potential is highest during construction and typically reduced once the soil is graded and covered with concrete, structures, asphalt or well established landscaping. Vegetated areas in non-developed areas such as the Mt. Sutro Open Space Reserve can be made more susceptible to erosion through the creation of trails.

Differential Settlement

Loose, soft soils composed of sand, silt, and clay have the potential, if not properly engineered, to settle after a building or other load is placed on the surface. Differential settlement of the loose soils generally occurs slowly, but over time may amount to more than most structures can tolerate. The weak and compressible nature of the underlying soils and the unpredictable performance of artificial fill provide poor support for structure and infrastructure. Differential settlement can damage buildings and their foundations, roads, and rail lines and result in breakage of underground pipes.

Landslide Hazards

The susceptibility of land (slope) failure is dependent on the slope and geology as well as the amount of rainfall, excavation, or seismic activities. A landslide is a mass of rock, soil, and debris displaced down-slope by sliding, flowing, or falling. In San Francisco, a major earthquake could cause movement of active slides or could trigger new slides in the same general areas of previous slides. This potential exists only at the Parnassus Heights campus site, which is located on steep hills underlain by Franciscan rocks, a type of rock that is susceptible to landslides. However, according to a previous geotechnical investigation, the deposits at the Parnassus Heights campus

site are from the Merced and Colma Formations, which consist of unconsolidated sand, silt, and clay. These soils have fair to good stability under seismic conditions (URS Consultants, 1974). More recently, a slope stability assessment conducted in 2006 provided a qualitative assessment of the slope stability potential of upland deposits on Mt. Sutro showing some isolated areas of instability.

4.5.1.3 Regional Faults

The San Francisco Bay Area contains both active and potentially active faults and is considered a region of high seismic activity (**Table 4.5-1** and **Figure 4.5-1**).[19] The USGS Working Group on California Earthquake Probabilities determined that there is a 63% likelihood of one or more earthquakes of Richter magnitude (M) 6.7 or higher in the San Francisco Bay Area between now and 2037 (USGS, 2008). While the Richter magnitude is a measure of the energy released in an earthquake, intensity is a measure of the ground-shaking effects at a particular location. The estimated maximum moment magnitudes[20] shown in Table 4.5-1 represent *characteristic* earthquakes on particular faults. Ground movement during an earthquake can vary depending on the overall magnitude, distance to the fault, focus of earthquake energy, and type of geologic material. The composition of underlying soils, even those relatively distant from faults, can intensify ground shaking.

The Modified Mercalli (MM) intensity scale (**Table 4.5-2**) is commonly used to measure earthquake effects due to ground shaking. The Modified Mercalli values for intensity range from MM-I (earthquake not felt) to MM-XII (damage nearly total); intensities ranging from MM-IV to X could cause moderate to significant structural damage.[21] In the City and County of San Francisco, maximum ground-shaking intensity resulting from an earthquake generated on the San Andreas fault, discussed below, is anticipated to range between strong (MM-VII) to violent (MM-IX), depending upon specific location. A small southwest portion of the county could experience very violent (MM-X) ground-shaking intensities (ABAG, 2003a).

San Andreas

The San Andreas Fault Zone is a major structural feature in the region and forms a boundary between the North American and Pacific tectonic plates, extending from the Salton Sea in Southern California near the border with Mexico to north of Point Arena, where the fault trace

19 An "active" fault is defined by the State of California as a fault that has had surface displacement within Holocene time (approximately the last 11,000 years). A "potentially active" fault is defined as a fault that has shown evidence of surface displacement during the Quaternary (last 1.6 million years), unless direct geologic evidence demonstrates inactivity for all of the Holocene or longer. This definition does not, of course, mean that faults lacking evidence of surface displacement are necessarily inactive. "Sufficiently active" is also used to describe a fault if there is some evidence that Holocene displacement occurred on one or more of its segments or branches (Hart, 2007).

20 Moment magnitude is related to the physical size of a fault rupture and movement across a fault. The Richter magnitude scale reflects the maximum amplitude of a particular type of seismic wave. Moment magnitude provides a meaningful physical measure of the size of a faulting event. The concept of "characteristic" earthquake means that we can anticipate, with reasonable certainty, the actual earthquake that can occur on a fault.

21 The damage level represents the estimated overall level that will occur for various MM intensity levels. However, the damage will not be uniform. Some buildings will experience substantially more damage, and others will experience substantially less damage. Not all buildings perform identically in an earthquake. The age, material, type, method of construction, size, and shape of a building all affect its performance.

TABLE 4.5-1
ACTIVE FAULTS IN THE VICINITY OF SAN FRANCISCO

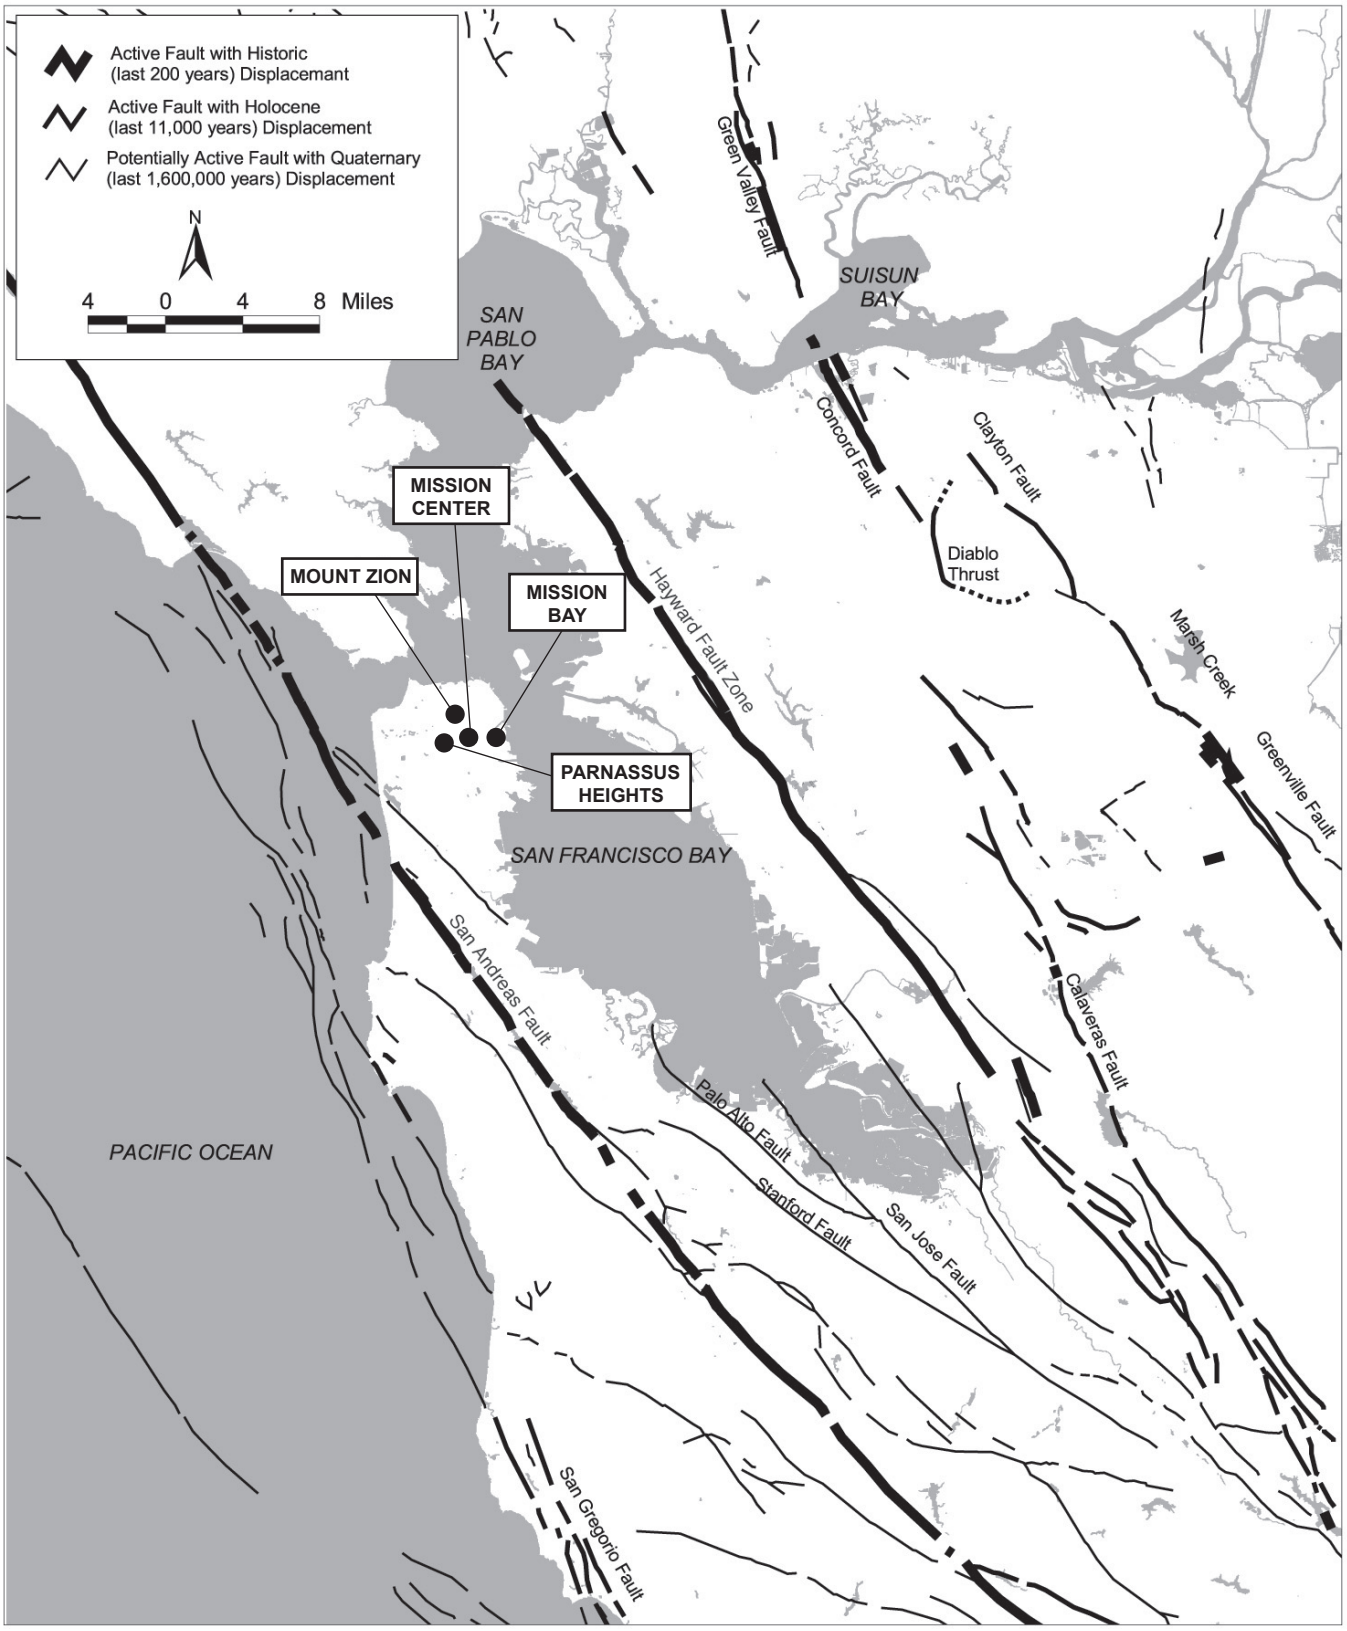
Fault	Distance and Direction from San Francisco County[a]	Recency of Movement	Fault Classification[b]	Historical Seismicity, Richter Magnitude[c]	Maximum Moment[d] Magnitude Earthquake
San Andreas	<1 mile west	Historic (1906; 1989 ruptures) Holocene	Active	M 7.1, 1989 M 8.25, 1906 M 7.0, 1838 Many <M 6	7.9
Hayward	10 miles east	Historic (1836; 1868 ruptures) Holocene	Active	M 6.8, 1868 Many <M 4.5	7.1
San Gregorio–Hosgri	12 miles southwest	Holocene – Late Quaternary	Active	Many M 3–M 6.4	7.3
Rodgers Creek	25 miles northeast	Historic Holocene	Active	M 6.7, 1898 M 5.6, M 5.7, 1969	7.0
Calaveras	25 miles east	Historic (1861 rupture) Holocene	Active	M 5.6–M 6.4, 1861 M 4–M 4.5 swarms 1970, 1990	6.8
Concord–Green Valley	25 miles east	Historic (1955) Holocene	Active	Historic active creep	6.9

[a] Fault distance is referenced from the fault's closest point to the county of San Francisco (excluding Treasure Island). Actual fault distance from specific project locations may therefore vary from those listed.
[b] Refer to footnote 3 of this section, previous.
[c] Richter magnitude (M) and year for recent and/or large events. The Richter magnitude scale reflects the maximum amplitude of a particular type of seismic wave.
[d] Refer to footnote 4, previous, for a definition of moment magnitude. The maximum moment magnitude earthquake, derived from the joint CGS/USGS Probabilistic Seismic Hazard Assessment for the State of California, 1996. CGS OFR 96-08 and USGS OFR 96-706).

SOURCES: Hart (2007); Jennings (2010); and Peterson et al. (1996)

extends out into the Pacific Ocean. The main trace of the San Andreas fault through the Bay Area trends northwest through the Santa Cruz Mountains and the eastern side of the San Francisco Peninsula. Near San Francisco, the San Andreas fault trace is located immediately offshore north of Colma, and continues northwest through the Pacific Ocean approximately six miles due west of the Golden Gate Bridge.

The San Andreas Fault Zone was the source of two major seismic events in recent history that resulted in widespread damage through the San Francisco region: the 1906 San Francisco earthquake (M 8.25), and the more recent 1989 Loma Prieta earthquake (M 7.1). The Loma Prieta earthquake caused serious damage to elevated freeway structures in San Francisco and resulted in the collapse of a panel on the upper deck of the Bay Bridge. The Loma Prieta earthquake was considerably smaller than the postulated maximum earthquake for the region, yet caused serious damage, demonstrating the tremendous impact that earthquakes can have on transportation systems in the city.



UCSF Long Range Development Plan Environmental Impact Report

Figure 4.5-1
Active and Potentially Active
Bay Area Earthquake Faults

TABLE 4.5-2
MODIFIED MERCALLI INTENSITY SCALE

Intensity Value	Intensity Description	Average Peak Acceleration[a], g
I	Not felt except by a very few persons under especially favorable circumstances.	< 0.0017 g
II	Felt only by a few persons at rest, especially on upper floors on buildings. Delicately suspended objects may swing.	< 0.014 g
III	Felt noticeably indoors, especially on upper floors of buildings, but many people do not recognize it as an earthquake. Standing motor cars may rock slightly, vibration similar to a passing truck.	< 0.014 g
IV	During the day felt indoors by many, outdoors by few. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.	0.014–0.039 g
V	Felt by nearly everyone, many awakened. Some dishes and windows broken; a few instances of cracked plaster; unstable objects overturned. Disturbances of trees, poles may be noticed. Pendulum clocks may stop.	0.039–0.092 g
VI	Felt by all, many frightened and run outdoors. Some heavy furniture moved; and fallen plaster or damaged chimneys. Damage slight.	0.092–0.18 g
VII	Everybody runs outdoors. Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable in poorly built or badly designed structures; some chimneys broken. Noticed by persons driving motor cars.	0.18–0.34 g
VIII	Damage slight in specially designed structures; considerable in ordinary substantial buildings, with partial collapse; great in poorly built structures. Panel walls thrown out of frame structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned. Sand and mud ejected in small amounts. Changes in well water. Persons driving motor cars disturbed.	0.34–0.65 g
IX	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb; great in substantial buildings, with partial collapse. Buildings shifted off foundations. Ground cracked conspicuously. Underground pipes broken.	0.65–1.24 g
X	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations; ground badly cracked. Rails bent. Landslides considerable from riverbanks and steep slopes. Shifted sand and mud. Water splashed (slopped) over banks.	> 1.24 g
XI	Few, if any, (masonry) structures remain standing. Bridges destroyed. Broad fissures in ground. Underground pipelines completely out of service. Earth slumps and land slips in soft ground. Rails bent greatly.	> 1.24 g
XII	Damage total. Practically all works of construction are damaged greatly or destroyed. Waves seen on ground surface. Lines of sight and level are distorted. Objects are thrown upward into the air.	> 1.24 g

[a] One "g," the acceleration due to gravity, is 980 centimeters per second. Any object undergoing a 1.0 g acceleration would move from rest to a speed of 9.8 meters per second (32.2 feet per second) in 1.0 second, by which time it would have traveled 4.9 meters (16.1 feet).

SOURCES: CGS (2003)

4.5.1.4 Seismic Hazards

Surface Fault Rupture

Seismically induced ground rupture is defined as the physical displacement of surface deposits in response to an earthquake's seismic waves. The magnitude, sense, and nature of fault rupture can vary for different faults or even along different strands of the same fault. Ground rupture is considered more likely along active faults, which are referenced in Table 4.5-1. None of the UCSF campus sites are located on or immediately adjacent to a known active or potentially active fault. Parnassus Heights, the closest campus site to an active fault is approximately four miles east of the San Andreas fault.

Ground Shaking

Strong ground shaking from a major earthquake could affect San Francisco during the next 30 years. Earthquakes on the active faults (listed in Table 4.5-1) are expected to produce a range of ground-shaking intensities. Ground shaking may affect areas hundreds of miles distant from an earthquake's epicenter. Historic earthquakes have caused strong ground shaking and damage in the San Francisco Bay Area, the most recent being the M 7.1 Loma Prieta earthquake. The epicenter was approximately 50 miles southeast of San Francisco, but this earthquake nevertheless caused strong ground shaking for about 20 seconds and resulted in varying degrees of structural damage throughout the Bay Area.

The 1906 San Francisco earthquake, with a Richter magnitude of 8.25 and an estimated moment magnitude of 7.9, produced strong (MM-VIII) to violent (MM-IX) shaking intensities (ABAG, 2003b). The 1989 Loma Prieta earthquake, with a Richter magnitude of 7.1 and an estimated moment magnitude of 6.9, produced very strong (MM-VIII) shaking intensities (ABAG, 2003b).

Liquefaction

Liquefaction is a phenomenon whereby unconsolidated and/or near saturated soils lose cohesion as a result of severe shaking. The rapid loss of soil shear strength during strong earthquake shaking results in a temporary fluid-like behavior of the soil. Four kinds of ground failure commonly result from liquefaction: lateral spread, flow failure, ground oscillation, and loss of bearing strength. A *lateral spread* is a horizontal displacement of surficial blocks of sediments resulting from liquefaction in a subsurface layer that occurs on slopes ranging between 0.3% and 3% and commonly displaces the surface by several meters to tens of meters. *Flow failures*, occurring on slopes greater than 3% are primarily liquefied soil or blocks of intact material riding on a liquefied subsurface zone. *Ground oscillation* occurs on gentle slopes when there is liquefaction at depth and no lateral displacement. Soil units that are not liquefied may pull apart from each other and oscillate on the liquefied zone. The *loss of bearing strength* can occur when the underlying soil loses strength and liquefies. Liquefaction and associated failures can damage foundations, disrupt utility service, and cause damage to roadways and buildings with shallow foundations. Structures can settle, tip, or even become buoyant and "float" upwards.

Liquefaction can occur in areas characterized by water-saturated, cohesionless, granular materials at depths less than 50 feet. The depth to groundwater influences the potential for liquefaction along the margin of San Francisco Bay, in that sediments need to be saturated to have a potential for liquefaction (Helley and LaJoie, 1979). Hazard maps compiled by ABAG depict liquefaction hazards for areas throughout the Bay Area (ABAG, 2003b). According to these maps based on California Geologic Survey data, the Mission Bay and Mission Center campus sites are in an area with a high potential to experience liquefaction. The Parnassus Heights and Mount Zion campus sites are not underlain by liquefiable sediments and are not located within the Seismic Hazard Zones for potential liquefaction.

Earthquake-Induced Settlement

Settlement of the ground surface can be accelerated and accentuated by earthquakes. During an earthquake, settlement can occur as a result of the rapid compaction and settling of subsurface materials (particularly loose, noncompacted, and variable sandy sediments) due to the rearrangement of soil particles during prolonged ground shaking. Settlement can occur both uniformly and differentially (i.e., where adjoining areas settle at different rates). Areas are susceptible to differential settlement if underlain by compressible sediments, such as poorly engineered artificial fill or Bay Mud. Given the geologic setting of the Mission Bay campus site and to some extent the Mission Center campus site, these areas could be subjected to earthquake-induced settlement. Due to the shallow depth of bedrock and coarse nature of sediments, The Parnassus Heights and Mount Zion campus sites are unlikely to experience as great of earthquake induced settlement.

Earthquake-Induced Landslides

A major earthquake could cause movement of active slides or could trigger new slides in the same general areas of previous slides at the Parnassus Heights campus site. Due to the gently sloping to relatively flat topography, earthquake-induced landslides would not be a hazard at the Mission Bay, Mount Zion, or Mission Center campus sites.

4.5.2 Regulatory Considerations

4.5.2.1 Federal

Earthquake Hazards Reduction Act

The Earthquake Hazards Reduction Act was enacted in 1997 to "reduce the risks to life and property from future earthquakes in the United States through the establishment and maintenance of an effective earthquake hazards and reduction program." To accomplish this, the Act established the National Earthquake Hazards Reduction Program (NEHRP). This program was significantly amended in November 1990 by NEHRP, which refined the description of agency responsibilities, program goals, and objectives.

NEHRP's mission includes improved understanding, characterization, and prediction of hazards and vulnerabilities; improvement of building codes and land use practices; risk reduction through

post-earthquake investigations and education; development and improvement of design and construction techniques; improvement of mitigation capacity; and accelerated application of research results. The NEHRP designates the Federal Emergency Management Agency (FEMA) as the lead agency of the program and assigns it several planning, coordinating, and reporting responsibilities. Programs under NEHRP help inform and guide planning and building code requirements such as emergency evacuation responsibilities and seismic code standards such as those to which the proposed project would be required to adhere.

4.5.2.2 State

California Building Code

The California Building Code (CBC) has been codified in the California Code of Regulations (CCR) as Title 24, Part 2. Title 24 is administered by the California Building Standards Commission, which, by law, is responsible for coordinating all building standards. Under state law, all building standards must be centralized in Title 24 or they are not enforceable. The purpose of the CBC is to establish minimum standards to safeguard the public health, safety, and general welfare through structural strength, means of egress facilities, and general stability by regulating and controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of all building and structures within its jurisdiction. The 2013 CBC is based on the 2012 International Building Code (IBC) published by the International Code Conference. In addition, the CBC contains necessary California amendments, which are based on reference standards obtained from various technical committees and organizations such as the American Society of Civil Engineers (ASCE), the American Institute of Steel Construction (AISC), and the American Concrete Institute (ACI). ASCE Minimum Design Standards 7-05 provides requirements for general structural design and includes means for determining earthquake loads as well as other loads (flood, snow, wind, etc.) for inclusion into building codes. The provisions of the CBC apply to the construction, alteration, movement, replacement, and demolition of every building or structure or any appurtenances connected or attached to such buildings or structures throughout California.

The earthquake design requirements take into account the occupancy category of the structure, site class, soil classifications, and various seismic coefficients which are used to determine a Seismic Design Category (SDC) for a project as described in Chapter 16 of the CBC. The SDC is a classification system that combines the occupancy categories with the level of expected ground motions at the site and ranges from SDC A (very small seismic vulnerability) to SDC E (very high seismic vulnerability and near a major fault). Design specifications are then determined according to the SDC in accordance with Chapter 16 of the CBC. Chapter 16, Section 1613 provides earthquake loading specifications for every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their supports and attachments, which shall be designed and constructed to resist the effects of earthquake motions in accordance with ASCE 7-05. Chapter 18 of the CBC covers the requirements of geotechnical investigations (Section 1803), excavation, grading, and fills (Section 1804), load-bearing of soils (1805), as well as foundations (Section 1808), shallow foundations (Section 1809), and deep foundations (Section 1810). Chapter 18 also describes analysis of expansive soils and the

determination of the depth to groundwater table. For Seismic Design Categories D, E, and F, Chapter 18 requires analysis of slope instability, liquefaction, and surface rupture attributable to faulting or lateral spreading, plus an evaluation of lateral pressures on basement and retaining walls, liquefaction and soil strength loss, and lateral movement or reduction in foundation soil-bearing capacity. It also addresses mitigation measures to be considered in structural design, which may include ground stabilization, selecting appropriate foundation type and depths, selecting appropriate structural systems to accommodate anticipated displacements, or any combination of these measures. The potential for liquefaction and soil strength loss must be evaluated for site-specific peak ground acceleration magnitudes and source characteristics consistent with the design earthquake ground motions.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act was developed to protect the public from the effects of strong ground shaking, liquefaction, landslides, or other ground failure, and from other hazards caused by earthquakes. This act requires the State Geologist to delineate various seismic hazard zones and requires cities, counties, and other local permitting agencies to regulate certain development projects within these zones. Before a development permit is granted for a site within a seismic hazard zone, a geotechnical investigation of the site must be conducted and appropriate mitigation measures incorporated into the project design. The CGS has completed seismic hazard mapping for portions of California most susceptible to liquefaction, ground shaking, and landslides, including San Francisco.

Office of Statewide Health Planning and Development

UCSF's hospitals fall under the jurisdiction of the *Alfred E. Alquist Hospital Facilities Seismic Safety Act (Alquist Seismic Safety Act*) and Senate Bill 1953 (SB 1953), an amendment of the *Alquist Seismic Safety Act*, passed in 1994. The *Alquist Seismic Safety Act* and subsequent bill require all hospital facilities to comply with seismic safety building standards as defined by the Office of Statewide Health Planning and Development (OSHPD).

OSHPD is responsible for carrying out the provisions of SB 1953. A department of the California Health and Human Services Agency, OSHPD's primary goals include assessing California's healthcare infrastructure, managing the healthcare workforce, providing healthcare outcomes information to the public, insuring healthcare facilities development loans, and running the Hospital Seismic Safety Program, which enforces building seismic safety. The Hospital Building Safety Board further advises the director of the OSHPD on the administration of SB 1953 and acts as a board of appeals for hospital seismic safety issues.

SB 1953 was adopted in part so that, after a major earthquake or disaster, hospital facilities can continue to provide care to their current occupants as well as any new patients that might arrive after the event. During and after the 1994 Northridge earthquake, hospitals that were compliant with SB 1953 sustained minimal structural damage and continued to function. Hospitals that were not compliant sustained major damage and had to be abandoned (OSHPD, 2001).

All of UCSF's hospital buildings must meet certain OSHPD standards. If a building is to remain classified as an acute-care hospital facility[22] and thus be compliant with SB 1953, the owner of the building must do the following:

- Complete seismic evaluations with in accordance with the Seismic Evaluation Procedures as specified in SB 1953
- Prepare a comprehensive plan and schedule for how each building will become compliant with SB 1953, within three years of the evaluation
- Submit the report and a compliance plan to OSHPD for review and approval (California State Senate, 1994).

In the process of compliance, OSHPD and a hospital building owner evaluate both nonstructural components (communications, medical gas, etc.) and structural components (actual building structure) of acute-care hospital facilities that might sustain damage during a seismic event. Nonstructural components are put into a Nonstructural Performance Category (NPC), and structural components are put into a Structural Performance Category (SPC). Thus, each acute-care facility is assigned a NPC rating and an SPC rating. The hospital building owner must first submit a hospital evaluation report to OSHPD indicating preliminary SPC and NPC ratings that the owner believes represent the seismic safety of each building.

OSHPD then inputs the ratings into its database for review. SPC and NPC ratings are separately evaluated. In the SPC/NPC evaluation process, OSHPD and affiliated engineers examine structural drawings and submitted reports of any necessary hospital. These evaluations may include an onsite visit by the area compliance officer and/or the district structural engineer. After the evaluation process, OSHPD either confirms or changes the rating. The hospital then receives guidance from OSHPD on how upgrades can continue.

SPC and NPC ratings are defined as follows:

- **Structural Ratings**

  ***SPC-0*:** No rating was reported to OSHPD.

  ***SPC-1*:** These buildings have a high risk of collapse in an earthquake, and are a significant safety hazard to the public. These buildings had to be retrofitted, replaced, or removed from acute care classification by January 1, 2008.

  ***SPC-2*:** These buildings are in compliance with pre-1973 California Building Code, but are not in compliance with the Alquist Act. These buildings do not pose a significant safety hazard, but might not be functional after a strong earthquake. These buildings must be compliant with the Alquist Act by January 1, 2030 or removed from acute care classification.

[22] An acute-care hospital provides emergency services and general medical and surgical treatment for acute disorders rather than long-term residential care for chronic illness.

***SPC-3*:** These buildings are compliant with the Alquist Act. These buildings might sustain structural damage and might not be able to provide care after an event, but they have been constructed or reconstructed under OSHPD building permits. They can be used to January 1, 2030 and beyond.

***SPC-4*:** These buildings are compliant with the Alquist Act. These buildings may sustain structural damage and might not be able to provide care after an event, but they have been constructed or reconstructed under OSHPD building permits. They can be used to January 1, 2030 and beyond.

***SPC-5*:** These buildings are compliant with the Alquist Hospital Facilities Seismic Safety Act. These buildings are reasonably capable of providing care after an event, and they have been constructed or reconstructed under OSHPD building permits. They can be used to January 1, 2030 and beyond.

- **Nonstructural Ratings**

  ***NPC-0*:** No rating was reported to OSHPD.

  ***NPC-1*:** Basic systems used in life safety and care are not properly anchored, and will not survive an earthquake event. Communications, emergency power, medical gas, and fire alarm systems must be anchored by January 1, 2002.

  ***NPC-2*:** Communications systems, emergency power supplies, bulk medical gas systems, fire alarm systems, and emergency lighting and exit signs are properly anchored.

  ***NPC-3*:** Basic systems used in life safety and care are properly anchored in critical areas of the hospital. If there is not significant structural damage, basic emergency medical care should be able to continue.

  ***NPC-4*:** All architectural, mechanical, electrical systems, components and equipment, and hospital equipment are properly anchored. If there is not significant structural damage and problems with water and sewer systems, basic emergency medical care should be able to continue.

  ***NPC-5*:** All basic systems used in life safety and care are properly anchored. In addition, the building has water and wastewater holding tanks (integrated into the plumbing system) and an on-site fuel supply that will last through 72 hours of acute care operations. Radiological service can also continue.

In general, low scores mean hospital building systems are not prepared for a disaster, and high scores mean hospital building systems are prepared. Both of these scores are considered when the building is determined to be in compliance with SB 1953. If the building is not in compliance with SB 1953 based on these scores, seismic retrofit regulations (Division III-R) are applied to the building to help in its retrofit. Replacing older hospitals with modern hospitals is intended to increase the score of UCSF's medical facilities.

OSHPD has established a timeframe that hospital building owners can use to schedule upgrades on their facilities. If this timeframe is followed, all buildings can be brought into compliance with SB 1953 by the deadline of January 1, 2030. A schematic of this timeframe is found in **Table 4.5-3**.

TABLE 4.5-3
TIMEFRAME FOR COMPLIANCE WITH SB 1953

Timeframes	Structural/Nonstructural Performance Category
January 1, 2002	SPC-1 / NPC-2 or greater
January 1, 2020	SPC-2 / NPC-3 or greater
January 1, 2030 deadline (this is considered full compliance)	SPC-3 / NPC-5

SOURCE: OSHPD (2013)

University of California Policy on Seismic Safety

The University of California's *Seismic Safety Policy* originally developed in 1975 and last updated August 26, 2011[23] requires that all buildings and facilities where University operations and activities occur be acquired, built, maintained, and rehabilitated to an acceptable level of earthquake safety. The purpose of this policy is to incorporate current earthquake engineering practices to provide an acceptable level of earthquake safety for students, employees, and the public who occupy University buildings and other facilities, at all locations of University operations and activities to the maximum extent feasible.

This policy requires the University to lease, license, acquire, build, maintain, repair and rehabilitate buildings and other facilities to provide an acceptable level of earthquake safety for students, employees, and the public who occupy those buildings and other facilities, to the maximum extent feasible using present earthquake engineering practices and University resources, at all locations where University operations and activities occur within the United States. Feasibility shall be determined by weighing practicality and the cost of protective measures against severity and probability of injury resulting from seismic occurrences.

This policy thus addresses the following topics:

A. Survey of Existing Buildings and Other Facilities;
B. Interim Use Plans;
C. Program for Abatement of Seismic Hazards of Existing Buildings and Other Facilities;
D. Seismic Rehabilitation Standards;
E. Post Earthquake Response;
F. Standards for New Construction and Renovation;
G. Independent Seismic Peer Review;
H. Special Considerations; and
I. Standards for Lease, License, Acquisition by Purchase or other Title Transfer.

[23] This policy is periodically updated and the most recent version can be found at http://ucop.edu/real-estate-services/resources/seismic-safety-policy/index.html.

4.5.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a.i) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

a.ii) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?

a.iii) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction?

a.iv) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?

b) Result in substantial soil erosion or the loss of topsoil?

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994) (California Building Code), creating substantial risks to life or property?

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

f) Exceed the LRDP EIR standard of significance by exposing people to structural hazards in an existing building rated Level V (Poor), or Level VI (Very Poor), under the University's seismic performance rating system, or substantial nonstructural hazards?

4.5.4 Analysis Methodology

This analysis evaluates the potential effects related to geology, soils, and seismicity from implementation of the 2014 LRDP. Construction-related effects that could potentially occur during construction activities, would generally be limited to the potential for erosion or causing slope instability. Geologic conditions vary across the UCSF campus sites and therefore all proposed construction must be able to overcome site specific hazards in order to reduce potential impacts. Overall, compliance with regulatory requirements (primarily the California Building Code) and the UC *Seismic Safety Policy* for these activities would ensure that impacts would be less than significant.

4.6 Greenhouse Gas Emissions

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Greenhouse Gas (GHG) Emissions impacts. 2014 LRDP GHG Emissions effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* GHG Emissions effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.6.1 Regional Setting

Gases that trap heat in the atmosphere are referred to as GHGs because they capture heat radiated from the earth, similar to a greenhouse. The accumulation of GHGs has been implicated as a driving force for global climate change. Definitions of climate change vary between and across regulatory authorities and the scientific community, but in general can be described as the changing of the earth's climate caused by natural fluctuations and anthropogenic activities (i.e., activities relating to, or resulting from the influence of, human beings) that alter the composition of the global atmosphere.

"Global warming" and "global climate change" are the terms used to describe the increase in the average temperature of the earth's near-surface air and oceans since the mid-20th century and its projected continuation. Warming of the climate system is now considered to be unequivocal (IPCC, 2007), with global surface temperature increasing approximately 1.33 degrees Fahrenheit (°F) over the last 100 years. Continued warming is projected to increase global average temperature between 2 and 11°F over the next 100 years.

Natural processes and human actions have been identified as the causes of this warming. The International Panel on Climate Change (IPCC) concludes that variations in natural phenomena such as solar radiation and volcanoes produced most of the warming from pre-industrial times to 1950 and had a small cooling effect afterward. After 1950, however, increasing GHG concentrations resulting from human activity such as fossil fuel burning and deforestation have been responsible for most of the observed temperature increase. These basic conclusions have been endorsed by more than 45 scientific societies and academies of science, including all of the national academies of science of the major industrialized countries.

Increases in GHG concentrations in the earth's atmosphere are thought to be the main cause of human-induced climate change. GHGs naturally trap heat by impeding the exit of solar radiation that has hit the earth and is reflected back into space. Most GHGs occur naturally and are necessary for keeping the earth's surface inhabitable.[24] However, increases in the concentrations of these gases in the atmosphere during the last 100 years have decreased the amount of solar

[24] www.ipcc.ch/report/ar5/

radiation that is reflected back into space, intensifying the natural greenhouse effect and resulting in the increase of global average temperature.

4.6.1.1 Sources of Greenhouse Gas Emissions

Individual projects contribute to the cumulative effects of climate change by emitting GHGs during demolition, construction, and operational phases. The primary GHGs associated with land use development projects are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). Although the presence of the primary GHGs in the atmosphere is naturally occurring, CO_2, CH_4, and N_2O are largely emitted from human activities, accelerating the rate at which these compounds accumulate in the earth's atmosphere.

CO_2 is the "reference gas" for GHG emissions, meaning that emissions of total GHGs are typically reported in "carbon dioxide equivalent" (CO_2e). Emissions of CO_2 are largely byproducts of fossil fuel combustion, whereas methane results from offgassing associated with agricultural practices and landfills. Other GHGs, with much greater heat-absorption potential than CO_2, include hydrofluorocarbons (HFCs), perfluorocarbons, and sulfur hexafluoride, and are generated in certain industrial processes.

There is international scientific consensus that human-caused increases in GHGs have contributed, and will continue to contribute, to global warming, although there is uncertainty concerning the magnitude and rate of the warming. Potential global warming impacts in California may include a decrease in snowpack, sea level rise, more extreme heat days per year, more high ozone days, increased frequency and intensity of wildfires, and more drought years (CNRA, 2009). Secondary effects may include impacts on agriculture, water resources, changes in disease vectors, and changes in habitat and biodiversity.

The California Air Resources Board (CARB) estimated that in 2011 California produced about 448 million gross metric tons (about 494 million U.S. tons) of CO_2e. The CARB found that transportation is the source of 38% of the state's GHG emissions, followed by industrial sources at 21% and electricity generation (both in-state and out-of-state) at 19%. Commercial and residential fuel use (primarily for heating) accounted for about 10% of GHG emissions (CARB, 2013).

In the Bay Area, fossil fuel consumption in the transportation sector (on-road motor vehicles, off-highway mobile sources, and aircraft) and the industrial/ commercial sector were the two largest sources of GHG emissions, each accounting for about 36% of the Bay Area's 95.8 million metric tons of CO_2e (105.4 million U.S. tons) emissions in 2007. Industrial and commercial electricity and fossil fuel consumption (including office and retail) were the second largest contributors of GHG emissions with about 34% of total emissions. Electricity generation accounts for approximately 16% of the Bay Area's GHG emissions, followed by residential fuel usage (e.g., home water heaters, furnaces) at 7%, off-road equipment at 3%, and agriculture at 12%. Among industrial sources, oil refining currently accounts for more than 40% of GHG emissions, or approximately 15% of the total Bay Area GHG emissions (BAAQMD, 2010).

4.6.1.2 Effects of Human Activity on GHG Emissions

Fossil fuel combustion, especially for the generation of electricity and powering of motor vehicles, has led to substantial increases in CO_2 emissions (and thus substantial increases in atmospheric concentrations). In 1994, atmospheric CO_2 concentrations were found to have increased by nearly 30 percent above pre-industrial (c. 1860) concentrations.

There is international scientific consensus that human-caused increases in GHGs have contributed and will continue to contribute to global warming. Global warming impacts in California may include, but are not limited to, loss in snow pack, sea level rise, more extreme heat days per year, more high ozone days, more large forest fires, and more drought years. Secondary effects are likely to include the displacement of thousands of coastal businesses and residences, impacts on agriculture, changes in disease vectors, and changes in habitat and biodiversity. As CARB's *Climate Change Scoping Plan* noted, the legislature in enacting Assembly Bill (AB) 32 found that global warming would cause detrimental effects to some of the state's largest industries, including agriculture, winemaking, tourism, skiing, commercial and recreational fishing, forestry, and the adequacy of electrical power generation. The *Climate Change Scoping Plan* states as follows (CARB, 2011): "The impacts of global warming are already being felt in California. The Sierra snowpack, an important source of water supply for the state, has shrunk 10 percent in the last 100 years. It is expected to continue to decrease by as much as 25 percent by 2050.

4.6.1.3 Impacts of Climate Change

Ecosystem and Biodiversity Impacts

Climate change is expected to have effects on diverse types of ecosystems, from alpine to deep-sea habitat (U.S. EPA, 2008a). As temperatures and precipitation change, seasonal shifts in vegetation would occur; this could affect the distribution of associated flora and fauna species. As the range of species shifts, habitat fragmentation could occur, with acute impacts on the distribution of certain sensitive species. The IPCC states that "20 percent to 30 percent of species assessed may be at risk of extinction from climate change impacts within this century if global mean temperatures exceed 3.6 to 5.4°F relative to pre-industrial levels" (IPCC, 2007). Shifts in existing biomes could also make ecosystems vulnerable to encroachment by invasive species. Wildfires, which are an important control mechanism in many ecosystems, may become more severe and more frequent, making it difficult for native plant species to repeatedly re-germinate. In general terms, climate change is expected to put a number of stressors on ecosystems, with potentially catastrophic effects on biodiversity.

Human Health Impacts

Climate change may increase the risk of vector-borne infectious diseases, particularly those found in tropical areas and spread by insects such as malaria, dengue fever, yellow fever, and encephalitis (U.S. EPA, 2008b). Cholera, which is associated with algal blooms, could also increase. While these health impacts would largely affect tropical areas in other parts of the world, effects would also be felt in California. Warming of the atmosphere would be expected to increase smog and particulate pollution, which could adversely affect individuals with heart and respiratory problems,

such as asthma. Extreme heat events would also be expected to occur with more frequency and could adversely affect sensitive receptors. Finally, the water supply impacts and seasonal temperature variations expected as a result of climate change could affect the viability of existing agricultural operations, making the food supply more vulnerable.

4.6.2 Regulatory Considerations

4.6.2.1 Federal Regulations

Supreme Court Ruling on California Clean Air Act Waiver

The United States Environmental Protection Agency (U.S. EPA) is the federal agency responsible for implementing the Clean Air Act (CAA). The U.S. Supreme Court ruled on April 2, 2007 that CO_2 is an air pollutant as defined under the CAA, and that the U.S. EPA has the authority to regulate emissions of GHGs. However, there are no federal regulations or policies regarding GHG emissions applicable to the proposed 2014 LRDP. (See discussion of Assembly Bill [AB] 1493 in Section 4.9.2.2, State Regulations, below, for more information on the California Clean Air Act [CCAA] waiver.)

United States Environmental Protection Agency Actions

In response to the issue of climate change, the U.S. EPA has taken actions to regulate, monitor, and potentially reduce GHG emissions. The U.S. EPA and the National Highway Traffic Safety Administration have taken coordinated steps to enable the production of a new generation of clean vehicles, through reduced GHG emissions and improved fuel use from on-road vehicles and engines.

Final Endangerment and Cause or Contribute Findings for Greenhouse Gases under the Clean Air Act

On December 9, 2009, the U.S. EPA Administrator signed two distinct findings regarding GHGs under Section 202(a) of the CAA, which states that the U.S. EPA Administrator should regulate and develop standards for "emission[s] of air pollution from any class or classes of new motor vehicles or new motor vehicle engines, which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." The final rule was effective January 14, 2010. The rule addresses two distinct findings: Endangerment Finding and Cause or Contribute Finding.

Under the Endangerment Finding, the Administrator found that the current and projected concentrations of the six key GHGs (i.e., CO_2, CH_4, N_2O, HFCs, perflurorocarbons, and sulfur hexafluoride) in the atmosphere threaten the public health and welfare of current and future generations. Under the Cause or Contribute Finding, the Administrator found that the combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to GHG pollution which threatens public health and welfare.

4.6.2.2 State Regulations

The CARB is the state agency responsible for coordination and oversight of state and local air pollution control programs in California and for implementing the California Clean Air Act (CCAA), adopted in 1988. With the passage of AB 32, the CARB was also given broad responsibility for promulgating regulations designed to achieve the general goals of AB 32. (For a discussion of AB 32, see "Assembly Bill 32 and the California Climate Change Scoping Plan" below.)

Various statewide and local initiatives have been introduced to reduce the state's contribution to GHG emissions. However, because every nation emits GHGs and thus makes an incremental cumulative contribution to global climate change, cooperation on a global scale will be required to reduce the rate of GHG emissions to a level that can effectively slow or stop the human-caused increase in average global temperatures and associated changes in climatic conditions.

Assembly Bill 1493

In 2002, then-Governor Gray Davis signed AB 1493, which required that the CARB develop and adopt, by January 1, 2005, regulations that achieve "the maximum feasible reduction of GHGs emitted by passenger vehicles and light-duty trucks and other vehicles determined by CARB to be vehicles whose primary use is noncommercial personal transportation in the state."

To meet the requirements of AB 1493, the CARB approved amendments to the California Code of Regulations (CCR) in 2004, adding GHG emissions standards to California's existing standards for motor vehicle emissions. Amendments to CCR Title 13, Sections 1900 and 1961 (13 CCR 1900, 1961), and adoption of Section 1961.1 (13 CCR 1961.1), require automobile manufacturers to meet fleet-average GHG emissions limits for all passenger cars, light-duty trucks within various weight criteria, and medium-duty passenger vehicle weight classes (i.e., any medium-duty vehicle with a gross vehicle weight [GVW] rating of less than 10,000 pounds and which is designed primarily for the transportation of persons), beginning with model year 2009. For passenger cars and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 pounds or less, the GHG emission limits for model year 2016 are approximately 37% lower than the limits for the first year of the regulations, model year 2009. For light-duty trucks with an LVW of 3,751 pounds to a GVW of 8,500 pounds, as well as for medium-duty passenger vehicles, GHG emissions will be reduced approximately 24% between 2009 and 2016.

Because the Pavley standards (named for the bill's author, state Senator Fran Pavley) would impose stricter standards than those under the federal CAA, California applied to the U.S. EPA for a waiver under the CAA; this waiver was initially denied by the Bush administration in 2008, but as noted above, in 2009 the U.S. EPA granted the waiver. California has agreed to cooperate with the federal GHG and Corporate Average Fuel Economy standards under development so that there will be a single national standard.

Executive Order S-3-05

In 2005, in recognition of California's vulnerability to the effects of climate change, then-Governor Schwarzenegger established Executive Order S-3-05, which sets forth a series of target dates by

which statewide GHGs emissions would be progressively reduced: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce GHG emissions to 1990 levels; and by 2050, reduce GHG emissions to 80% below 1990 levels (CARB, 2008).

Assembly Bill 32 and the California Climate Change Scoping Plan

In 2006, the California legislature passed AB 32 (California Health and Safety Code Division 25.5, Sections 38500, et seq.), also known as the Global Warming Solutions Act. AB 32 requires CARB to design and implement emission limits, regulations, and other measures, such that feasible and cost-effective statewide GHG emissions are reduced to 1990 levels by 2020.

Pursuant to AB 32, CARB adopted a Scoping Plan in December 2008, outlining measures to meet the 2020 GHG emissions target. In order to meet the target, California must reduce its GHG emissions by 30% below projected 2020 business –as-usual emissions levels, or about 15% from 2008 levels (CARB, 2010). The Scoping Plan estimates a reduction of 174 million metric tons of CO_2e (about 191 million U.S. tons) from state measures that address the transportation, energy, agriculture, forestry, and high global warming potential sectors (see **Table 4.6-1**). CARB has identified an implementation timeline for the GHG reduction strategies in the Scoping Plan (CARB, 2008). Some measures may require new legislation to implement, some will require subsidies, some have already been developed, and some will require additional effort to evaluate and quantify. Additionally, some emissions reductions strategies may require their own environmental review under CEQA or the National Environmental Policy Act (NEPA).

The AB 32 Scoping Plan anticipates that local government actions will also result in reduced GHG emissions. CARB recommends a GHG reduction target of 15% below "current" levels (2008) for local jurisdictions and notes that success in reducing emissions relies on local governments' land use planning and urban growth decisions because local governments have primary authority to plan, zone, approve, and permit land development to accommodate population growth and the changing needs of their jurisdictions.

The Scoping Plan relies on the requirements of Senate Bill (SB) 375 (discussed below) to implement the carbon emission reductions anticipated from land use decisions. SB 375 was enacted to align local land use and transportation planning to further achieve the state's GHG reduction goals. SB 375 requires regional transportation plans (RTPs), developed by Metropolitan Planning Organizations (MPOs), to incorporate a "sustainable communities strategy" that would achieve GHG emission reduction targets set by CARB. SB 375 also includes provisions for streamlined CEQA review for some infill projects, such as transit-oriented development. SB 375 would be implemented over the next several years. The Metropolitan Transportation Commission (MTC) is responsible for developing RTPs for the Bay Area. MTC's 2013 RTP will be its first plan subject to SB 375.

Executive Order S-1-07

Executive Order S-1-07, signed by then-Governor Schwarzenegger in 2007, proclaimed that the transportation sector is the main source of GHG emissions in California, at over 40% of statewide

TABLE 4.6-1
GREENHOUSE GAS REDUCTIONS FROM AB 32 SCOPING PLAN SECTORS

GHG Reduction Measures By Sector		GHG Reductions (in million metric tons of CO_2e)
Transportation		62.3
Electricity and Natural Gas		49.7
Industry		1.4
Landfill Methane Control Measure (Discrete Early Action)		1.0
Forestry		5.0
High Global Warming Potential GHGs		20.2
Additional Reductions Needed to Achieve the GHG Cap		34.4
	Total	**174.0**
Other Recommended Measures		
Government Operations		1.0 - 2.0
Agriculture- Methane Capture at Large Dairies		1.0
Methane Capture at Large Dairies		1.0
Additional GHG Reduction Measures		
Water		4.8
Green Buildings		26.0
High Recycling/ Zero Waste • Commercial Recycling • Composting • Anaerobic Digestion • Extended Producer Responsibility • Environmentally Preferable Purchasing		9.0
	Total	**42.8 - 43.8**

NOTES:
CO_2e = carbon dioxide equivalent

emissions. The order established a goal of reducing the carbon intensity of transportation fuels sold in California by a minimum of 10% by 2020. It also directed CARB to determine whether this Low Carbon Fuel Standard could be adopted as a discrete, early-action measure after meeting the mandates in AB 32. CARB adopted the Low Carbon Fuel Standard on April 23, 2009.

Senate Bills 1078 and 107 and Executive Orders S-14-08, S-21-09 and S-13-08

SB 1078 (Chapter 516, Statutes of 2002) requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20% of their supply from renewable sources by 2017. SB 107 (Chapter 464, Statutes of 2006) changed the target date to 2010. In November 2008, then-Governor Schwarzenegger signed Executive Order (EO) S-14-08, which expands the state's Renewable Portfolio Standard to 33% renewable power by 2020. In September 2009, then-Governor Schwarzenegger continued California's commitment to the Renewable Portfolio Standard by signing EO S-21-09, which directs CARB under its AB 32

authority to enact regulations to help the state meet its Renewable Portfolio Standard goal of 33% renewable energy by 2020.

Governor Arnold Schwarzenegger signed EO S-13-08 on November 14, 2008. The order called on state agencies to develop California's first strategy to identify and prepare for expected climate impacts. As a result the *2009 California Climate Adaptation Strategy (CAS)* report was developed to summarize the best known science on climate change impacts in the State to assess vulnerability and outline possible solutions that can be implemented within and across State agencies to promote resiliency. The State is also developing an Adaptation Planning Guide (APG) to provide a decision-making framework intended for use by local and regional stakeholders to aid in the interpretation of climate science and to develop a systematic rationale for reducing risks caused or exacerbated by climate change. The State's third major assessment on climate change explores local and statewide vulnerabilities to climate change, highlighting opportunities for taking concrete actions to reduce climate-change impacts.

Senate Bill 1368

SB 1368 (September 2006) is a companion bill of AB 32 that required the California Public Utilities Commission (PUC) to establish a greenhouse gas emission performance standard for baseload generation from investor-owned utilities. The California Energy Commission (CEC) was required to establish a similar standard for local publicly owned utilities. These regulations (20 CCR 2900) established in 2007 prohibit utilities from entering into long-term contracts with any baseload power plant that would emit more than the equivalent GHG performance of a typical combined cycle natural-gas-fired plant. The legislation ensures that all new contracts for electricity provided to California, including imported electricity, must be generated from plants that meet the standards set by the PUC and the CEC.

Senate Bill 97

SB 97, signed in August 2007, acknowledges that climate change is a prominent environmental issue requiring analysis under CEQA. This bill directed the Governor's Office of Planning and Research (OPR) to prepare, develop, and transmit to the California Natural Resources Agency guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions, as required by CEQA, no later than July 1, 2009. The California Natural Resources Agency was required to certify or adopt those guidelines by January 1, 2010. On December 30, 2009, the Natural Resources Agency adopted the state CEQA Guidelines amendments, as required by SB 97. These state CEQA Guidelines amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in draft CEQA documents. The amendments were reviewed by the Office of Administrative Law and became effective March 18, 2010.

Senate Bill 375

In addition to policy directly guided by AB 32, the legislature in October 2008 passed SB 375, which provides for regional coordination in land use and transportation planning and funding to help meet the AB 32 GHG reduction goals. SB 375 aligns regional transportation planning efforts, regional GHG emissions reduction targets, and land use and housing allocations. SB 375

requires RTPs developed by the state's 18 MPOs to incorporate a "sustainable communities strategy" (SCS) that will achieve GHG emission reduction targets set by the CARB. In the Bay Area, the MTC is the MPO. SB 375 also includes provisions for streamlined CEQA review for some infill projects such as transit-oriented development.

The Association of Bay Area Governments (ABAG), the MTC, BAAQMD, and San Francisco Bay Conservation and Development Commission (BCDC) have developed the "Plan Bay Area" as the region's long-range plan for sustainable land use, transportation, and housing pursuant to SB 375. Plan Bay Area is intended to respond to requirements of SB 375, which requires the regional transportation plan to contain a SCS that integrates land use planning and transportation planning and identifies where the region's population will be housed. Plan Bay Area was adopted on July 18, 2013 and is the first published plan subject to SB 375.

CARB, in consultation with MPOs, has provided each affected region with reduction targets for GHGs emitted by passenger cars and light trucks in the region for the years 2020 and 2035. These reduction targets will be updated every 8 years, but can be updated every 4 years if advancements in emissions technologies affect the reduction strategies to achieve the targets. CARB is also charged with reviewing each MPO's SCS or alternative planning strategy (APS) for consistency with its assigned targets. If MPOs do not meet the GHG emissions reduction targets, transportation projects would not be eligible for funding.

This bill also extends the minimum time period for the Regional Housing Needs Allocation cycle from 5 years to 8 years for local governments located within an MPO that meets certain requirements. City and county land use policies (including general plans) are not required to be consistent with the RTP (and associated SCS or APS). However, new provisions of CEQA and the CEQA Guidelines create incentives for qualified projects that are consistent with an approved SCS or APS, categorized as "transit priority projects."

4.6.2.3 Local Regulations

Bay Area Air Quality Management District Climate Protection Program

The BAAQMD is the primary agency responsible for air quality regulation in the 9-county San Francisco Bay Area Air Basin (SFBAAB). The BAAQMD established a climate protection program to reduce pollutants that contribute to global climate change and affect air quality in the SFBAAB. The climate protection program includes measures that promote energy efficiency, reduce vehicle miles traveled, and develop alternative sources of energy, all of which assist in reducing emissions of GHGs and in reducing air pollutants that affect the health of residents. The BAAQMD also seeks to support current climate protection programs in the region and to stimulate additional efforts through public education and outreach, technical assistance to local governments and other interested parties, and promotion of collaborative efforts among stakeholders. In June 2010, the BAAQMD adopted revised CEQA significance thresholds for GHG emissions. These recently adopted GHG significance thresholds are discussed in detail in Section 5.9.4.2, Approach to Analysis, below.

BAAQMD CEQA Guidelines and Thresholds

In June 2010, the BAAQMD issued its CEQA Air Quality Guidelines, replacing former guidelines adopted in December 1999, and adopted new thresholds of significance to assist lead agencies in determining when potential air quality impacts would be considered significant under CEQA. Updated in May 2011, these guidelines include recommendations for analytical methodologies to determine air quality impacts and identify mitigation measures that can be used to avoid or reduce air quality impacts, including for GHGs (BAAQMD, 2011).

The *BAAQMD CEQA Guidelines* is an advisory document and local jurisdictions are not required to utilize the methodology outlined therein. The document describes the criteria that BAAQMD uses when reviewing and commenting on the adequacy of environmental documents. It recommends thresholds for use in determining whether projects would have significant adverse environmental impacts, identifies methodologies for predicting project emissions and impacts, and identifies measures that can be used to avoid or reduce air quality impacts. BAAQMD adopted new thresholds of significance (BAAQMD thresholds) on June 2, 2010, to assist lead agencies in determining when potential air quality impacts would be considered significant under CEQA. BAAQMD also released new *CEQA Guidelines* in May 2011, which advise lead agencies on how to evaluate potential air quality impacts with the adopted new thresholds of significance.

On March 5, 2012, the Alameda County Superior Court issued a judgment finding that BAAQMD had failed to comply with CEQA when it adopted its 2010 thresholds of significance. However, in August 2013 the First District Court of Appeal issued a full reversal of the Superior Court ruling, upholding the 2010 thresholds of significance. In November 2013, the California Supreme Court granted limited review of the Court of Appeal's decision, and the matter is currently pending there. Nonetheless, the 2011 thresholds are based on substantial evidence provided by BAAQMD (BAAQMD, 2009), and have been accepted by the Regents of the University of California for use in this EIR.

The threshold for stationary sources is 10,000 metric tons of CO_2e per year (i.e., emissions above this level may be considered significant). For non-stationary sources, four separate thresholds have been established:

- Compliance with a Qualified Greenhouse Gas Reduction Strategy (i.e., if a project is found to be out of compliance with a Qualified Greenhouse Gas Reduction Strategy, its GHG emissions may be considered significant); or
- 1,100 metric tons of CO_2e per year (i.e., emissions above this level may be considered significant); or
- 4.6 metric tons of CO_2e per service population (SP) per year (i.e., emissions above this level may be considered significant). "Service population" is the sum of residents plus employees expected for a development project.; or
- For General Plans, 6.6 metric tons of CO_2e per service population (SP) per year (i.e., emissions above this level may be considered significant). This threshold should only be applied to general plans. Other plans, e.g. specific plans, congestion management plans, etc., should use the project-level threshold of 4.6 CO_2e/SP/year.

For quantifying a project's GHG emissions, BAAQMD recommends that all GHG emissions from a project be estimated, including a project's direct and indirect GHG emissions from operations. Direct emissions refer to emissions produced from onsite combustion of energy, such as natural gas used in furnaces and boilers, emissions from industrial processes, and fuel combustion from mobile sources. Indirect emissions are emissions produced offsite from energy production and water conveyance due to a project's energy use and water consumption. BAAQMD has provided guidance on detailed methods for modeling GHG emissions from proposed projects (BAAQMD, 2012). The above stated thresholds apply only to operational emissions. To date, the BAAQMD has not adopted numeric thresholds for the assessment of construction-related emissions. Nonetheless, construction-related GHG emissions resulting from 2014 LRDP proposals are estimated and disclosed in this EIR.

University of California

Policies and Plans of the UC Regents and University of California Office of the President (UCOP)

In 2007, the Chancellor of UCSF signed the *American College and University President's Climate Commitment* (ACUPCC) to complete an emissions inventory, set target dates and interim milestones for becoming climate-neutral,[25] take steps to reduce GHG emissions, and prepare public progress reports (American College, 2007). As an intermediate target, UCOP established the goals of reducing GHG emissions to 2000 levels by 2014; 1990 levels by 2020; and achieving climate neutrality as soon as possible after reaching the 2014 and 2020 reduction targets. More recently, UCSF committed to achieving climate neutrality by the year 2047.[26] These goals pertain to Scope 1 and Scope 2 emissions of the six Kyoto greenhouse gases originating from sources specified in the ACUPCC,[27] as well as Scope 3 emissions from business airline travel and commuting by UCSF staff and students. The Regents' policy specifies that these goals will be pursued while maintaining the primary research and education mission of the University.

As outlined in UCSF's *Climate Action Plan* of December 2009, the UC President adopted the *Policy on Sustainable Practices* in 2007, which committed UC to implementing actions intended to minimize the University's impact on the environment and reduce the University's dependence on non-renewable energy. The policy was most recently revised in November 2013, and now covers the areas of green building, clean energy, transportation, climate protection, sustainable operations, waste reduction and recycling, environmentally preferable purchasing, sustainable foodservice, and sustainable water systems. The UC *Policy on Sustainable Practices* will continue to be updated over time.[28]

[25] Climate neutrality for UCSF is defined as the University having a net-zero impact on the Earth's climate; it will be achieved by minimizing GHG emissions as much as possible and using other measures to mitigate the remaining GHG emissions (*UCSF Climate Action Plan*, December 2009).

[26] This is the current commitment made under the ACUPCC and the goal that is referenced in UCSF's Annual Progress Report to the UC Regents.

[27] The six greenhouse gases identified in the Kyoto Protocol/ACUPCC are carbon dioxide, methane, nitrous oxide, sulfur hexafluoride, hydrofluorocarbons, and perfluorocarbons.

[28] The current version of the Policy is available at: http://sustainability.universityofcalifornia.edu/policy.html

In addition the *Policy on Sustainable Practices* sets the following requirements and goals relevant to GHG emissions reduction:

- Requires each campus to develop a long-term strategy for voluntarily meeting the requirements of California's Global Warming Solutions Act of 2006 (AB 32);
- Instructs campuses to aim for climate neutrality as soon as possible after achieving 2014 and 2020 reduction targets;
- Requires 20 percent better energy performance than Title 24 (policy maintained as Title 24 is revised) for new construction and renovations, and strives to achieve 30%;
- Requires new laboratory buildings to meet Labs21 Environmental Performance Criteria (EPC);
- All new construction and major renovations projects must meet a minimum standard of LEED-NC Silver and strive for LEED NC Gold when possible;
- The University will use energy efficiency retrofits to reduce system-wide energy consumption by 10% or more, from 2000 baseline, by 2014;
- Renovation projects greater than $5 million that do not quality for LEED-NC must be certified under LEED-CI;
- Renovation projects that require 100% equipment replacement, and 50% non-shell areas, must achieve LEED Silver at a minimum and strive for Gold;
- Each campus will submit one pilot LEED-EBOM building for certification by July 1, 2014;
- University system will provide up to 10 MW capacity of on-site renewable energy by 2014 (approximately 1 MW per UC campus);
- Develop goals for reducing transportation related GHG's and report on progress annually;
- Expand Transportation Demand Management (TDM) programs and projects;
- Divert 50% solid waste by 2008, 75% by 2012, and achieve zero waste by 2020 (defined as diverting 95% or more of municipal solid waste);
- Develop a Water Action Plan and reduce water consumption by 20% by 2020;
- All new buildings achieve at least two points in LEED NC Water Efficiency category;
- Maximize procurement of environmentally preferable products and services; and
- Purchase 20% sustainable food products by 2020.

The UC President has set a goal for UC to become carbon neutral by 2025 and purchase only clean energy (UCOP, 2013). This goal has not been formally adopted by the Regents, but UC is actively working on the President's initiative to be the first major research university to achieve carbon neutrality, involving four efforts:

- Create a shared service center, which both owns electricity-generation resources and purchases long-term forward contracts, and which will manage the supply of wholesale electricity to campuses eligible for direct access.

- Continue energy-efficient projects and expand them to include small- to medium-scale renewable energy sources at all campus sites, and seek additional funding sources for these projects.

- Effectively manage the purchase of natural gas to mitigate risk tolerance to price changes, develop renewable natural gas (biogas) and purchase biogas contracts through outside producers.

- Manage allowances and offsets; comply with California's cap-and-trade program and other environmental attribute programs; and generate new funds to support projects resulting in GHG emission reductions.

University of California San Francisco

UCSF has a robust sustainability program covering sustainability activities across the entire campus and medical center. Through its Office of Sustainability, UCSF has created work groups addressing sustainability in the following areas, most of which have direct implications for GHG emissions: Carbon Neutrality, Zero Waste, Water Conservation, Sustainable Food, Toxics Reduction, Green Procurement, Green Buildings, and Sustainable Operations.

UCSF's Sustainability Governance consists of the Academic Senate Sustainability Committee and the Chancellor's Advisory Committee on Sustainability (CACS). The Academic Senate Sustainability Committee identifies faculty recommendations on improving sustainability at UCSF. The charge of the CACS is to:

- Annually examine UCSF's effect on the environment from a comprehensive perspective;
- Evaluate existing UCSF policies, procedures, and programs that affect the environment;
- Serve as a coordinating body for groups or individuals concerned with sustainability issues;
- Advise selected work groups in the development and implementation of UCSF's sustainability initiatives and goals; and
- Support reduction of greenhouse gas emissions to 1990 levels by 2020.

UCSF includes a Sustainability Dashboard on its Living Green web site that includes performance metrics for multiple issue areas including GHG emissions. UCSF also publishes an annual sustainability report on its web site.[29]

UCSF Climate Action Plan (2009)

As part of implementing the UC *Sustainable Practices Policy*, UCSF has developed a Climate Action Plan, a long-term strategy for voluntarily meeting the State of California's goal for reducing GHG emissions to 1990 levels by 2020, pursuant to AB 32. The Climate Action Plan also addresses the UCOP goals of reducing GHG emissions to 2000 levels by 2014; and attaining

[29] Annual Sustainability Reports are available on the UCSF LivingGreen web site: http://sustainability.ucsf.edu/

climate neutrality[30] as soon as possible after achieving the 2014 and 2020 reduction targets. GHG emissions inventories are included for the years 1990, 2000, 2008, and 2011. The Climate Action Plan forecasts future emissions and assesses the impact of UCSF sustainability policies and programs on future GHG emissions and the prospects for achieving GHG reduction goals. The Climate Action Plan concludes that UCSF is expected to meet the goal of reducing GHG emissions to 2000 levels by 2014, but that the goal of reducing 1990 levels by 2020 would not likely be met without the use of additional reduction measures or carbon offsets.

UC Strategic Energy Plan

The UC Strategic Energy Plan (SEP) was prepared in 2008 for all UC campuses, to fulfill a goal of UC's Policy on Sustainable Practices to implement energy efficiency projects in existing buildings. The UCSF portion of the SEP analyzes energy use and GHG trends, and identifies potential energy efficiency retrofit projects at all buildings over 50,000 square feet at UCSF (primarily lighting, HVAC, commissioning and central plant measures). Energy savings, GHG emissions savings, and financial returns are estimated for hundreds of projects, which are grouped into Tier 1 (high priority) and Tier 2 (longer term planning) projects based on their energy savings and financial payback. The SEP project list is intended to be regularly updated by each campus to evaluate the feasibility of additional energy-saving measures.

Transportation Demand Management

UCSF employs an aggressive Transportation Demand Management (TDM) program that includes an extensive shuttle system, among other alternative transportation opportunities. Based on UCSF's 2013 employee commute survey, 66 percent of the campus population commutes by means other than driving alone. In 2011, UCSF received the Gold level award for the Best Workplace for Commuters. Key features of UCSF's existing TDM program include the following:

- 60 shuttles serving 17 locations, with over 2.3 million passengers per year
- 33 vanpools that travel as far as Sacramento and operate using the Green Road Safety System, which improves fuel consumption and safety
- 62 reserved carpool stalls at various sites
- Marin Commute Club buses with about 55 daily riders who live in Marin and Sonoma Counties to the north of San Francisco
- 18 City CarShare vehicles with dedicated parking spaces, along with 1,500 UCSF members who can use these vehicles by scheduling their use on-line
- A fleet of 43 low-emitting alternative-fuel and hybrid vehicles, including cars, shuttles, golf carts, and trucks
- 18 electric-vehicle charging stations at Parnassus Heights, Mount Zion, and Mission Bay, with plans for another 20 at Mission Bay in the Owens Street Garage and 10 at other locations

[30] The Climate Action Plan defines climate neutrality as having a net zero impact on the Earth's climate, to be achieved by minimizing GHG emissions as much as possible and using carbon offsets or other measures to mitigate the remaining GHG emissions.

- Over 1,900 UCSF users of the ZimRide online carpool matching program
- 972 bicycle parking spaces with another 100 planned at Mission Bay, as well as bike racks on shuttles, a cyclist shower program that allows bicyclists to use UCSF showers at a discount, and other bicycle-related benefits
- Bay Area Bike Share station at Mission Bay (due to begin construction in late 2014), where members will have access to bicycles (and a regional network of stations) provided by the Bay Area Air Quality Management District
- More than 400 off-street motorcycle parking stalls in garages and surface parking lots
- An "emergency ride home" program to encourage use of alternative modes of transportation
- Clipper Card (public transit pass) sales at easily accessible locations, including through UCSF's website
- Close to 1,800 UCSF employees that participate in a pretax transit program, which saved UCSF employees over $700,000 on public transit commute costs in 2013

Annual GHG Inventory Reporting

UC *Sustainability Practices Policy* requires each campus to report a GHG emissions inventory to an independent reporting organization. UCSF reported calendar year 2008 Scope 1 and Scope 2 emissions[31] to the California Climate Action Registry (CCAR). UCSF currently reports its annual Scope 1 and Scope 2 GHG emissions inventory to The Climate Registry (TCR). The most recent inventory reported to TCR was for calendar year 2012. UCSF emissions inventories reported to outside agencies are verified by accredited independent auditors.

Since 2008 UCSF has also been required to report its annual Scope 1 emissions from the Parnassus Heights Central Utility Plant (PCUP) to the California Air Resources Board (CARB) under the AB 32 Reporting Rule. UCSF tracks and reports its progress towards meeting its GHG emissions goals in its Annual Sustainability Report. UCSF also reports to the UC Regents annually on its progress in meeting the goals in the UC *Sustainable Practices Policy*.[32]

4.6.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

b) Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?

[31] For more information on UCSF's Scope 1, Scope 2 and Scope 3 GHG emissions, see "UCSF GHG Emissions Inventory and Forecasts" later in this document.

[32] The University of California system-wide Annual Sustainability Reports are available at: http://sustainability.universityofcalifornia.edu/reports.html

4.6.4 Analysis Methodology

4.6.4.1 Approach

This analysis uses both a quantitative and a qualitative approach. The quantitative approach is used to address the first significance criterion: Would the 2014 LRDP proposals generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment? The quantitative efficiency threshold proposed by BAAQMD in its 2009 document *Revised Draft Options and Justification Report for California Environmental Quality Act Thresholds of Significance* is 4.6 metric tons of CO_2e per service population annually for projects or Plans, other than a General Plan. If the 2014 LRDP activities would exceed this threshold then it would be considered to have a cumulatively considerable contribution of GHG emissions and a cumulatively significant impact on climate change.

Because the quantifiable thresholds developed by BAAQMD in its Justification Report were formulated based on AB 32 and California Climate Change Scoping Plan reduction targets for which its set of strategies were developed to reduce GHG emissions statewide, a project cannot exceed the numeric BAAQMD efficiency threshold of 4.6 metric tons of CO_2e per service population annually without also conflicting with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs (The state Climate Change Scoping Plan). Thus, if the 2014 LRDP proposals exceed the numeric threshold and results in a significant cumulative impact, it would also result in a significant cumulative impact with respect to plan, policy, or regulation consistency, even though the 2014 LRDP proposals may incorporate measures and have features that would reduce its contribution to cumulative GHG emissions.

4.6.4.2 Methods

Potential impacts are assessed by modeling the estimated CO_2 emissions generated by the 2014 LRDP construction activities and operations, using the CalEEMod version 2013.2.2 land use emissions model, and comparing modeled emissions to the significance thresholds. Model data and additional assumptions are included in Appendix E of this EIR.

Area and indirect sources (as opposed to transportation sources) associated with the 2014 LRDP proposals would primarily result from electrical usage, water and wastewater transport (the energy used to pump water and wastewater to and from the 2014 LRDP development), and solid waste generation. GHG emissions from electrical usage are generated when energy consumed on the campus sites is generated by fuel combustion. GHG emissions from water and wastewater treatment and transport are also indirect emissions resulting from the energy required to transport water from its source and the energy required to treat wastewater and transport it to its treated discharge point. Solid waste emissions are generated when the increased waste generated by a project are taken to a landfill to decompose. GHG emissions from electrical usage, water and wastewater conveyance, and solid waste were also estimated using CalEEMod.

4.6.4.3 Cumulative Approach

Both BAAQMD and the California Air Pollution Control Officers Association consider GHG impacts to be exclusively cumulative impacts (BAAQMD, 2011; CAPCOA, 2008); as such, assessment of significance is based on a determination of whether the GHG emissions from a project represent a cumulatively considerable contribution to the global atmosphere.

4.7 Hazards and Hazardous Materials

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Hazards and Hazardous Materials impacts. 2014 LRDP Hazards and Hazardous Materials effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Hazards and Hazardous Materials effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.7.1 Regional Setting

4.7.1.1 Introduction

Materials and waste may be considered hazardous if they are poisonous (toxicity), can be ignited by open flame (ignitability), corrode other materials (corrosivity), or react violently, explode or generate vapors when mixed with water (reactivity). The term "hazardous material" is defined in law as any material that, because of quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment.[33] In some cases, past industrial or commercial uses on a site can result in spills or leaks of hazardous materials and petroleum causing contamination of underlying soil and groundwater. Federal and state laws require that soils and groundwater having concentrations of contaminants such as lead, gasoline, or industrial solvents that are higher than certain acceptable levels must be handled and disposed as hazardous waste during excavation, transportation, and disposal. The California Code of Regulations (CCR), Title 22, Sections 66261.20–24 contains technical descriptions of characteristics that would cause a soil to be classified as a hazardous waste.

Medical waste can also be considered a hazardous waste and is generated or produced as a result of diagnosis, treatment, or immunization of human beings or animals and the production or testing of biological materials. Generally, medical waste can be classified as either a biohazardous waste or a sharps waste.[34,35] Cultures, blood and blood products, tissues, and body parts are all considered medical waste. The transportation and disposal of medical waste is closely regulated under Section 118215 of the California Medical Waste Management Program.[36] In addition, operation of airborne medical transport can also pose a risk to human health and safety. The use of hazardous materials and disposal of hazardous wastes are subject to numerous laws and regulations at all levels of government (see Regulatory Setting below).

33 California, Health and Safety Code, Chapter 6.95, Section 25501(o).
34 The term "biological materials" means medicinal preparations made from living organisms and their products, including but not limited to, serums, vaccines, antigens and anti-toxins.
35 The term "sharps waste" refers to any device having acute rigid corners, edges, or proturbences capable of cutting or piercing, including, but not limited to, hypodermic needles and broken glass items (such as pipettes and vials) contaminated with biohazardous waste.
36 California Medical Waste Management Act, California Health and Safety Code Sections 117600-118360.

4.7.1.2 Generation and Disposal of Hazardous Materials and Waste

Various hazardous materials are commonly transported, stored, used, and disposed of in activities such as construction, industry (both light and heavy), dry cleaning, film processing, landscaping, automotive maintenance and repair, and common residential/commercial maintenance activities. The use, transport, storage and disposal of hazardous materials is regulated by the United States Environmental Protection Agency (EPA), California EPA (Cal/EPA) including five boards, departments and offices: Air Resources Board, Department of Pesticide Regulation, Department of Toxic Substances Control (DTSC), Office of Environmental Health Hazard Assessment (OEHHA), and State Water Resources Control Board (SWRCB). In addition, the Department of Public Health Center for Environmental Health and other local regulatory agencies closely monitor businesses and industry in the control of hazardous materials. Hazardous materials require special methods of disposal, storage, and treatment, and any unintentional release of hazardous materials requires an immediate response to protect human health and safety, and/or the environment. Improper disposal can harm the environment and people who work in the waste management industry.

Generators of hazardous waste fall into two categories: large-quantity generators (LQGs) and small-quantity generators (SQGs). An LQG is defined as a person or facility generating more than 1,000 kilograms (kg) (2,200 pounds) of hazardous waste per month. An SQG is defined as generating greater than 100 kilograms and less than 1,000 kg of hazardous waste per month. LQGs include industrial and commercial facilities, such as manufacturing companies, petroleum refining facilities, and other heavy industrial businesses.

LQGs must comply with general federal and state requirements for managing hazardous waste. LQGs need an EPA identification number that is used to monitor and track hazardous waste activities. SQGs include facilities such as service stations, automotive repair, dry cleaners, and medical offices. The regulatory requirements for SQGs are less stringent than the requirements for LQGs. However, SQGs must also obtain an EPA identification number, which must be used for traceability on all hazardous waste documentation.

Pursuant to federal law, all such generators must register with EPA for record-keeping and recording. The EPA Unified Program consolidates, coordinates, and makes consistent the administrative requirements, permits, inspections, and enforcement activities of six environmental and emergency response programs related to hazardous materials and hazardous waste. The state agencies responsible for these programs set the standards for their program while local governments implement the standards. (Cal/EPA) oversees the implementation of the program as a whole. The Unified Program is implemented at the local level by 84 government agencies certified by the Secretary of Cal/EPA. These Certified Unified Program Agencies (CUPAs) have typically been established as a function of a local environmental health or fire department.

The CUPA is the local administrative agency that coordinates the following six programs regulating hazardous materials and hazardous wastes:

- Hazardous Materials Release Response Plans and Inventories (Business Plans)

- California Accidental Release Prevention (CalARP) Program
- Underground Storage Tank Program
- Aboveground Petroleum Storage Act (APSA) Program
- Hazardous Waste Generator and Onsite Hazardous Waste Treatment (tiered permitting) Programs
- California Uniform Fire Code: Hazardous Material Management Plans and Hazardous Material Inventory Statements

For the City of San Francisco the local CUPA is the San Francisco Department of Public Health.

4.7.1.3 Transportation of Hazardous Materials and Waste

Transportation of hazardous materials and hazardous waste is carried out by individuals or entities that move hazardous materials and waste from one site to another by highway, rail, water, or air (see 40 CFR 260.10). This includes transporting hazardous waste from a generator's site to a facility that can recycle, treat, store, or dispose of the waste. It can also include transporting treated hazardous waste to a site for further treatment or disposal. Transportation of hazardous materials is required by law to occur in accordance with the Hazardous Waste Manifest System which is a set of forms, reports, and procedures that track hazardous waste from the time it leaves the generator facility until it reaches the waste management facility that receives it.

Transportation of hazardous materials by truck and rail is regulated by the United States Department of Transportation (USDOT). The USDOT regulations establish criteria for safe handling procedures. Federal safety standards are also included in the California Administrative Code. The California Health Services Department regulates the haulers of hazardous waste. According to the USDOT, Office of Hazardous Materials Safety's (OHMS) most recent Biennial Report on Hazardous Materials Transportation, highway transportation accounts for the largest share of incidents, deaths, and injuries associated with hazardous materials transportation. Rail accounts for the next largest portion, followed by air and water modes of transport. Highway incidents also account for the largest share of economic damage among modes of transport. While hazardous waste incidents account for a small percentage of overall highway incidents, the impact of those incidents can be more significant due to the nature of the material(s) involved. Specific programs have been developed by various responsible agencies to limit or prevent the impact to human health and the environment when hazardous materials/waste incidents occur.

In California, unless specifically exempted, it is unlawful for any person to transport hazardous wastes unless the person holds a valid registration issued by the DTSC. The DTSC maintains a list of active registered hazardous waste transporters throughout California. Shipments of hazardous materials and wastes include a wide variety of chemicals, such as petroleum products, medical waste, and radioactive materials. Each movement of hazardous materials/wastes implies a degree of risk, depending on the material being moved, the mode of transport, and numerous other factors. On a tonnage basis, petroleum products make up the majority—more than 80 percent—of hazardous material moved around the state.

Aside from rail and pipeline, hazardous materials transported within the San Francisco Bay Area region use many of the same freeways, arterials, and local streets as other traffic. This creates a risk of accidents and associated release of hazardous materials for other drivers and for people along these routes, as does the use of rail modes for hazardous materials shipments.

4.7.1.4 Potential Presence of Hazardous Materials in Soil and Groundwater

Hazardous materials, including but not limited to pesticides and herbicides, heavy metals, volatile organic compounds, oil and gas, may be present in soil and groundwater in areas where land uses have resulted in leaking fuel or chemical storage tanks or other releases of hazardous materials have occurred or where artificial fill has been placed. Land uses that typically involve the handling of hazardous materials include commercial or industrial operations, as well as agricultural areas where soils may contain pesticides and herbicides.

Various federal, State, and local regulatory agencies maintain lists of hazardous materials sites where soil and/or groundwater contamination is known or suspected to have occurred, typically as a result of leaking storage tanks or other spills. These facilities are readily identified through regulatory agency database searches, such as the State Water Board GeoTracker online database, the Cal/EPA DTSC Envirostor online database, and several other federal, State and local regulatory agency databases.

4.7.1.5 Naturally Occurring Asbestos

Asbestos is not a formal mineralogical term, but rather a commercial and industrial term historically applied to a group of silica-containing minerals that form long, very thin mineral fibers, which generally form in bundles, and were once widely used in commercial products.[37] Commercial-grade asbestos was highly regarded for its high tensile strength, flexibility, and resistance to heat, chemicals, and electricity. However, mounting evidence in the 20th century indicated that inhalation of asbestos fibers caused respiratory diseases that have seriously affected many workers who were working closely with asbestos. Once disturbed, microscopic fibers can become airborne and then lodged in the lungs. Exposure to asbestos has been linked to numerous serious health problems and diseases, including asbestosis, lung cancer, and mesothelioma.

Naturally occurring asbestos (NOA) includes minerals described as asbestos that are found in place in their natural state, such as in bedrock or soils. Natural occurrences of asbestos are of concern due to potential exposures to the tiny fibers that can become airborne if asbestos-bearing rocks are disturbed by natural erosion or human activities such as road building, excavations, and other ground disturbing activities. In California, concern over potential public exposure to NOA has led to guidance documents and various regulations for NOA. In 1986, asbestos was identified as a toxic air contaminant by the California Air Resources Board (ARB). In 1990, the ARB issued an

[37] United States Geological Survey, Reported Historic Asbestos Mines, Historic Asbestos Prospects, and Other Natural Occurrences of Asbestos in California, Open File Report 2011-1188, 2011.

Airborne Toxic Control Measure (ATCM), which prohibited the use of serpentine aggregate for surfacing if the asbestos content was 5 percent or more.

Government agency and general public concerns about public health resulting from exposure to asbestos led to new regulations and guidance regarding NOA:

- In July 2000, the ARB adopted amendments to the existing ATCM prohibiting the use or application of serpentine, serpentine-bearing materials and asbestos-containing ultramafic rock for covering unpaved surfaces unless it has been tested using an approved asbestos bulk test method and determined to have an asbestos content that is less than 0.25 percent. These amendments took effect on November 13, 2001.

- In July 2001, the ARB adopted a new ATCM for construction, grading, quarrying, and surface mining operations in areas with serpentine or ultramafic rocks. This ATCM became effective on November 19, 2002.

- In October 2000, the Governor's Office of Planning and Research issued a memorandum providing guidance to Lead Agencies in analyzing the impacts of naturally occurring asbestos on the environment through the California Environmental Quality Act (CEQA) review process.

- In November 2000, the California Department of Real Estate added a section to subdivision forms that included questions related to NOA on property proposed for development.

- In 2004, as part of its school-site review program, the California Department of Toxic Substances Control's School Property Evaluation and Cleanup Division released interim guidance on evaluating NOA at school sites.

Overall, 53 of the 58 California counties, including San Francisco County, contain reported asbestos occurrences and/or ultramafic rocks such as serpentinite that can contain asbestos fibers.[38] In general, NOA fibers do not pose a threat unless disturbed and/or introduced into the air as fugitive dust.

4.7.1.6 Schools

CEQA Guidelines require EIRs to assess whether a project would emit hazardous air emissions or involve the handling of extremely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school (see CEQA Sections 21151.2 and 21151.4; Appendix G of the CEQA Guidelines). Children are particularly susceptible to long-term impacts from emissions of hazardous materials from roadways near schools as well as high-volume motor vehicle travel on roadways through residential areas. There are numerous schools located throughout San Francisco and DTSC has created the School Property Evaluation and Cleanup Division that is responsible for assessing, investigating, and cleaning up proposed school sites. The Division ensures that selected properties are free of potential exposure to contamination either as a result of past land uses or current neighboring uses. Through the environmental review process, DTSC ensures protection of children, staff and the environment from the potential effects of exposure to hazardous materials.

[38] Ibid.

4.7.1.7 Emergency Services

The California Emergency Management Agency (Cal EMA) was established as part of the Governor's Office on January 1, 2009, merging the duties, powers, purposes, and responsibilities of the former Governor's Office of Emergency Services with those of the Governor's Office of Homeland Security. Cal EMA is responsible for the coordination of overall State agency response to major disasters in support of local government. The Agency is responsible for assuring the State's readiness to respond to, and recover from, all hazards—natural, man-made, and war-caused emergencies and disasters—and for assisting local governments with emergency preparedness, response, recovery, and hazard mitigation efforts (California Emergency Management Agency, 2011).

Each county has a local Office of Emergency Services (OES), which coordinates with the State during emergency situations. When local and mutual aid resources are exhausted, the State coordinates its emergency resources through its State Operations Center in Sacramento and its multiple Emergency Operations Centers (EOC) throughout the region.

In coordination with the local OES, jurisdictions house EOCs, which are command centers where emergency service providers (many from the local OES) meet and coordinate response, recovery, and resources during disasters. The following functions are performed in the EOC, as necessary:

- Receiving and disseminating warnings;
- Managing emergency operations;
- Developing emergency response and recovery policies;
- Collecting intelligence from, and disseminating information to, the various EOC representatives, and assuring coordination between the Field Operations Center locations, building managers, and departmental safety representatives throughout the regional system;
- Coordinating information with Cal EMA, the Federal Emergency Management Agency, and other appropriate outside agencies;
- Preparing intelligence/information summaries, situation reports, operation progress reports and other reports as required;
- Preparing incident action plans;
- Maintaining general and specific maps, information display boards, and other data pertaining to emergency operations;
- Continuing analysis and evaluation of all data pertaining to emergency operations; and
- Controlling and coordinating, within established policy, the operations and logistical support of resources committed to the EOC.

4.7.1.8 Wildland Fire

The California Department of Forestry and Fire Protection has identified urban areas considered at risk as a fire-threatened community as part of the Wildland Urban Interface program. With

California's extensive urban Wildland-Urban Interface situation, the list of communities extends beyond just those adjacent to Federal lands. There are 874 communities currently on the Communities at Risk List, including San Francisco.

While all of California is subject to some degree of fire hazard, there are specific features that make certain areas more hazardous. The California Department of Forestry and Fire Protection (CAL FIRE) is required by law to map areas of significant fire hazards based on fuels, terrain, weather, and other relevant factors (Public Resources Code 4201-4204 and Government Code 51175-89). CAL FIRE has developed a fuel ranking assessment methodology that assigns ranks (moderate, high, and very high) based on expected fire behavior for unique combinations of topography and vegetative fuels under a given severe weather condition (including wind speed, humidity, and temperature). In general, the susceptibility for high and very high wildfires dramatically increases in the late summer and early autumn as vegetation dries out, decreasing plant moisture content and increasing the ratio of dead fuel to living fuel (URS, 2008). Common causes of wildfires include arson and negligence. According to mapping for the City of San Francisco's Hazard Mitigation Plan, only the Parnassus Heights campus site is located in an area considered to be a high to very high potential for wildfire (URS, 2008). This determination is based on expected fire behavior for unique combinations of topography and vegetative fuels under a given severe weather condition and is initially based on an assigned fuel model combined with topography. Final rankings are based on the amount of fuel present (URS, 2008).

4.7.2 Regulatory Considerations

4.7.2.1 Federal

The primary federal agencies with responsibility for hazardous materials management include the EPA, U.S. Department of Labor Occupational Safety and Health Administration (Fed/OSHA), and the USDOT. Federal laws, regulations, and responsible agencies are summarized in **Table 4.7-1** and are discussed in detail in this section.

State and local agencies often have either parallel or more stringent rules than federal agencies. In most cases, state law mirrors or overlaps federal law and enforcement of these laws is the responsibility of the state or of a local agency to which enforcement powers are delegated. For these reasons, the requirements of the law and its enforcement are discussed under either the state or local agency section.

Federal Aviation Administration

The Federal Aviation Administration (FAA) is the USDOT agency charged with (1) regulating air commerce to promote its safety and development; (2) achieving the efficient use of navigable airspace of the United States; (3) promoting, encouraging, and developing civil aviation; (4) developing and operating a common system of air traffic control and air navigation for both civilian and military aircraft; and (5) promoting the development of a national system of airports.

TABLE 4.7-1
FEDERAL LAWS AND REGULATIONS RELATED TO HAZARDOUS MATERIALS MANAGEMENT

Classification	Law or Responsible Federal Agency	Description
Hazardous Materials Management	Community Right-to-Know Act of 1986 (also known as Title III of the Superfund Amendments and Reauthorization Act (SARA)	Imposes requirements to ensure that hazardous materials are properly handled, used, stored, and disposed of and to prevent or mitigate injury to human health or the environment in the event that such materials are accidentally released.
Hazardous Waste Handling	Resource Conservation and Recovery Act of 1976 (RCRA) Hazardous and Solid Waste Act	Under RCRA, the USEPA regulates the generation, transportation, treatment, storage, and disposal of hazardous waste from "cradle to grave." Amended RCRA in 1984, affirming and extending the "cradle to grave" system of regulating hazardous wastes. The amendments specifically prohibit the use of certain techniques for the disposal of some hazardous wastes.
Hazardous Materials Transportation	U.S. Department of Transportation (DOT) U.S. Postal Service (USPS)	DOT has the regulatory responsibility for the safe transportation of hazardous materials. The DOT regulations govern all means of transportation except packages shipped by mail (49 CRF). USPS regulations govern the transportation of hazardous materials shipped by mail.
Occupational Safety	Occupational Safety and Health Act of 1970	Fed/OSHA sets standards for safe workplaces and work practices, including the reporting of accidents and occupational injuries (29 CFR).
Radioactive Materials[a]	Atomic Energy Act	Administered by the Nuclear Regulatory Commission, the act regulates the use and control of radioactive material.[b]
Biosafety Standards[c]	The National Institutes of Health, and the Centers for Disease Control and Prevention (CDC)	Operated under the U.S. Department of Health and Human Services, these agencies establish standards for working with biohazardous materials.
Structural and Building Components (Lead-based paint, PCBs, and asbestos)	Toxic Substances Control Act (TSCA) U.S. EPA	Regulates the use and management of PCBs in electrical equipment, and sets forth detailed safeguards to be followed during the disposal of such items. The USEPA monitors and regulates hazardous materials used structural and building components and affects on human health.

[a] U.S. Nuclear Regulatory Commission, Atomic Energy Act of 1954, as amended, http://www.nrc.gov/about-nrc/governing-laws.html, accessed January 7, 2009.
[b] Radioactive material is any material or combination of materials that spontaneously emit ionizing radiation.
[c] A hazardous biologic material is any potentially harmful biologic material (including infectious agents, oncogenic viruses, and recombinant DNA) or any material contaminated with a potentially harmful biologic material.

SOURCE: ESA, 2009

The FAA's Heliport Design Advisory Circular (AC 150/53990-2A) and Federal Aviation Regulations (FAR) Part 77, Objects Affecting Navigable Airspace, define the final approach and takeoff area (FATO) and safety areas for helipads. Clear approach and takeoff areas that extend well beyond the landing pad must exist in order to permit the establishment of the helipad; and these areas must be maintained clear of obstructions for operations to continue.

4.7.2.2 State

In January 1996, Cal/EPA adopted regulations implementing a Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program). The program has six elements: hazardous waste generators and hazardous waste on-site treatment; underground storage tanks; aboveground storage tanks; hazardous materials release response plans and inventories; risk management and prevention programs; and Unified Fire Code hazardous materials management plans and inventories. The plan is implemented at the local level. The Certified Unified Program Agency (CUPA) is the local agency that is responsible for the implementation of the Unified Program (CA EPA, 2009). In San Francisco, the San Francisco Department of Public Health is the designated CUPA for all businesses.

Hazardous Materials Management

The California Hazardous Materials Release Response Plans and Inventory Law of 1985 (Business Plan Act) requires that any business that handles hazardous materials prepare a Hazardous Materials Business Plan, which must include the following:[39]

- Details, including floor plans, of the facility and business conducted at the site;
- An inventory of hazardous materials that are handled or stored on site;
- An emergency response plan; and
- A safety and emergency response training program for new employees with annual refresher courses

Hazardous Waste Handling

DTSC regulates the generation, transportation, treatment, storage, and disposal of hazardous waste. State and federal laws require detailed planning to ensure that hazardous materials are properly handled, used, stored, and disposed of, and, in the event that such materials are accidentally released, to prevent or to mitigate injury to health or the environment. Laws and regulations require hazardous materials users to store these materials appropriately and to train employees to manage them safely.

Under the federal Resource Conservation and Recovery Act of 1976 (RCRA), whose responsibilities are described in Table 4.7-1, individual states may implement their own hazardous waste programs in lieu of RCRA, as long as the state program is at least as stringent as federal RCRA requirements. In California, the DTSC regulates the generation, transportation, treatment, storage, and disposal of hazardous waste. The hazardous waste regulations establish criteria for identifying, packaging, and labeling hazardous wastes; prescribe management standards for hazardous waste; establish permit requirements for hazardous waste treatment, storage, disposal, and transportation; and identify hazardous wastes that cannot be disposed of in landfills.

[39] "Hazardous Materials Release Response Plans and Inventory Law," California Health and Safety Code, Chapter 6.95.

Hazardous Materials Transportation

The State of California has adopted USDOT regulations for the intrastate movement of hazardous materials. State regulations are contained in Title 26 of the California Code of Regulations (CCR). In addition, the State of California regulates the transportation of hazardous waste originating in the state and passing through the state (26 CCR). Both regulatory programs apply in California (State of California, 2007).

The two state agencies that have primary responsibility for enforcing federal and state regulations and responding to hazardous materials transportation emergencies are the California Highway Patrol (CHP) and the California Department of Transportation (Caltrans).

The CHP enforces hazardous material and hazardous waste labeling and packing regulations to prevent leakage and spills of material in transit and to provide detailed information to cleanup crews in the event of an accident. Vehicle and equipment inspection, shipment preparation, container identification, and shipping documentation are all part of the responsibility of the CHP, which conducts regular inspections of licensed transporters to assure regulatory compliance. Caltrans has emergency chemical spill identification teams at as many as 72 locations throughout the state that can respond quickly in the event of a spill.

Common carriers of hazardous waste are licensed by the CHP, pursuant to California Vehicle Code Section 32000. Every type of hazardous waste package used by a hazardous materials shipper must undergo tests that imitate some of the possible rigors of travel. While not every package must be put through every test, most packages must be able to be: kept under running water for a time without leaking; dropped, fully loaded, onto a concrete floor; compressed from both sides for a period of time; subjected to low and high pressure; and frozen and heated alternately.

Medical Waste

Within the regulatory framework of the Medical Waste Management Act, the Medical Waste Management Program of the California Department of Health Services (CDHS) ensures the proper handling and disposal of medical waste by permitting and inspecting medical waste offsite treatment facilities and transfer stations throughout the state. The CDHS also oversees all medical waste transporters. UCSF, as a state agency, works with San Francisco Department of Public Health to ensure the Medical Waste Management Program is enforced.

Occupational Safety

The California Occupational Safety and Health Administration (Cal/OSHA) assumes primary responsibility for developing and enforcing workplace safety regulations in California. Because California has a federally approved OSHA program, it is required to adopt regulations that are at least as stringent as those found in Title 29 of the Code of Federal Regulations (CFR). Cal/OSHA standards are generally more stringent than federal regulations.

Cal/OSHA regulations (8 CCR) concerning the use of hazardous materials in the workplace require employee safety training, safety equipment, accident and illness prevention programs, hazardous

substance exposure warnings, and emergency action and fire prevention plan preparation. Cal/OSHA enforces hazard communication program regulations, which contain training and information requirements, including procedures for identifying and labeling hazardous substances, and communicating hazard information relating to hazardous substances and their handling. The hazard communication program also requires that Materials Safety Data Sheets (MSDSs) be available to employees, and that employee information and training programs be documented. These regulations also require preparation of emergency action plans (escape and evacuation procedures, rescue and medical duties, alarm systems, and training in emergency evacuation).

State laws, like federal laws, include special provisions for hazard communication to employees in research laboratories, including training in chemical work practices. Specific, more detailed training and monitoring is required for the use of carcinogens, ethylene oxide, lead, asbestos, and certain other chemicals listed in 29 CFR. Emergency equipment and supplies, such as fire extinguishers, safety showers, and eye washes, must also be provided and maintained in accessible places.

Cal/OSHA (8 CCR), like Fed/OSHA (29 CFR) includes extensive, detailed requirements for worker protection applicable to any activity that could disturb asbestos-containing materials, including maintenance, renovation, and demolition. These regulations are also designed to ensure that persons working near maintenance, renovation, or demolition activity are not exposed to asbestos.

Radioactive Materials

Pursuant to the federal Atomic Energy Act, which requires states to assume responsibility for the use, transportation, and disposal of low-level radioactive material and for the protection of the public from radiation hazards, the Radiologic Health Branch (RHB) of the CDHS administers the state's Radiation Control Law, which governs the storage, use, transportation, and disposal of sources of ionizing radiation (radioactive material and radiation-producing equipment). Radioactive material regulations require registration of sources of ionizing radiation, licensing of radioactive material, and protection against radiation exposure. The RHB also regulates the transportation of radioactive materials and disposal of radioactive waste. Users of radioactive materials must maintain detailed records regarding the receipt, storage, transfer, and disposal of such materials (RHB, 2009). State regulations concerning radioactive substances are included in 17 CCR. The regulations specify appropriate use and disposal methods for radioactive substances, as well as worker safety precautions and worker health monitoring programs. Radioactive materials at WHHS are regulated under its Radioactive Material License issued by the RHB.

Biosafety Standards

Similar to federal laws, state laws establish standards for working with biohazardous materials. A hazardous biologic material is any potentially harmful biologic material (including infectious agents, oncogenic viruses, and recombinant DNA) or any material contaminated with a potentially harmful biologic material. The National Institutes of Health and the Centers for Disease Control and Prevention operate under the U.S. Department of Health and Human Services and establish standards for working with biohazardous materials.

Emergency Response

California has developed an emergency response plan to coordinate emergency services provided by federal, state, and local government and private agencies. Responding to hazardous materials incidents is one part of this plan. The plan is administered by the State Office of Emergency Services, which coordinates the responses of other agencies, including Cal EPA, CHP, the Department of Fish and Game, the San Francisco Bay Regional Water Quality Control Board, and the San Francisco Fire Department (SFFD). The SFFD provides first response capabilities, if needed, for hazardous materials emergencies within the 2014 LRDP area.

Structural and Building Components

Asbestos

State laws and regulations prohibit emissions of asbestos from asbestos-related manufacturing, demolition, or construction activities; require medical examinations and monitoring of employees engaged in activities that could disturb asbestos; specify precautions and safe work practices that must be followed to minimize the potential for release of asbestos fibers; and require notice to federal and local governmental agencies prior to beginning renovation or demolition that could disturb asbestos. Asbestos represents a human health risk when asbestos fibers become airborne (friable) and are inhaled into the lungs.

The Bay Area Air Management District (BAAQMD) is vested by the California legislature with authority to regulate airborne pollutants, including asbestos, through both inspection and law enforcement, and is to be notified ten days in advance of any proposed demolition or abatement work. Notification includes the names and addresses of operations and persons responsible; description and location of the structure to be demolished/altered including size, age, and prior use, and the approximate amount of friable asbestos; scheduled starting and completion dates of demolition or abatement; nature of planned work and methods to be employed; procedures to be employed to meet BAAQMD requirements; and the name and location of the waste disposal site to be used. The BAAQMD randomly inspects asbestos removal operations and will inspect any removal operation about which a complaint has been received. Cal/OSHA regulates asbestos removal to ensure the health and safety of workers removing asbestos containing materials (ACM) and also must be notified of asbestos abatement activities.

Section 19827.5 of the California Health and Safety Code requires that local agencies not issue demolition or alteration permits until an applicant has demonstrated compliance with notification requirements under applicable federal regulations regarding hazardous air pollutants, including asbestos.

Asbestos abatement contractors must follow state regulations contained in 8 CCR 1529 and 8 CCR 341.6 through 341.14 where there is asbestos-related work involving 100 square feet or more of ACMs. Asbestos removal contractors must be certified by the Contractors Licensing Board of the State of California. The owner of the property where abatement is to occur must have a hazardous waste generator number assigned by and registered with the DTSC in Sacramento. The applicant and the transporter of the waste are required to file a hazardous waste manifest that details the transportation of the material from the site and its disposal.

Polychlorinated Biphenyls (PCBs)

As previously discussed, PCBs are organic oils formerly used in many types of electrical equipment and in fluorescent lighting ballasts. PCBs are highly persistent in the environment and are toxic. In 1979, the USEPA banned the use of PCBs in most new electrical equipment and began a program to phase out certain existing PCB-containing equipment. The use and management of PCBs in electrical equipment is regulated pursuant to the Toxic Substances Control Act (40 CFR). Fluorescent lighting ballasts that contain PCBs, regardless of size and quantity, are regulated as hazardous waste and must be transported and disposed of as hazardous waste.

Lead and Lead-Based Paint

The California Code of Regulations, Title 22, considers waste soil with concentrations of lead to be hazardous if it exceeds a total concentration of 1,000 parts per million (ppm) and a soluble concentration of 5 ppm.[40] Both the federal and California OSHAs regulate all worker exposure during construction activities that involve lead-based paint. The Interim Final Rule found in 29 CFR Part 1926.62 covers construction work where employees may be exposed to lead during such activities as demolition, removal, surface preparation for re-painting, renovation, clean up and routine maintenance. The OSHA-specified method of compliance includes, among other things, respiratory protection, protective clothing, housekeeping, hygiene facilities, medical surveillance, and training.

Aboveground and Underground Storage Tanks

The State Water Resources Control Board (SWRCB) administers the Aboveground storage tank (AST) program. Facilities that store petroleum in a single tank greater than 1,320 gallons or facilities that store petroleum in ASTs or containers with a cumulative storage capacity of greater than 1,320 gallons are subject to SWRCB regulations. The AST Program requires that the owners or operators file a storage statement, pay a facility fee, and prepare and implement a federal Spill Prevention Control and Countermeasure (SPCC) Plan. The SPCC Plan must discuss the procedures, methods, and equipment in place at the facility to prevent discharges of petroleum from reaching navigable waters. AST oversight is provided by the San Francisco Department of Public Health, in accordance with the CUPA Program.

State laws governing underground storage tanks (UST) specify requirements for permitting, construction, installation, leak detection monitoring, repairs, release monitoring, corrective actions, cleanup, and closure. The San Francisco Department of Public Health and the SFFD are the local agencies designated to permit and inspect USTs and to implement applicable regulations.

Heliports and Helipads

Caltrans' Division of Aeronautics (DOA) issues permits for all heliports in the State of California. Heliports must meet the FAA's FATO standards in order to obtain a Caltrans operating permit, in addition to complying with Title 21 CCR, Airports and Heliports, which is based upon the FAA's Advisory Circular on Heliport Design.

[40] Susceptible of being dissolved, especially in water.

California Office of Statewide Health Planning and Development

The Office of Statewide Health Planning and Development (OSHPD) is a department of the California Health and Human Services Agency. OSHPD serves as the regulatory building agency for all hospitals and nursing homes in California (OSHPD, 2009). Its primary goal in this regard is to ensure that patients in these facilities are safe in the event of an earthquake or other disaster, and to ensure that the facilities remain functional after such an event in order to meet the needs of the community affected by the disaster.

4.7.2.3 Local

San Francisco

The City and County of San Francisco has enacted local regulations to address the potential to encounter hazardous materials in the soil and hazardous building materials, and to ensure the safe handling of hazardous materials and hazardous wastes. The following sections of the San Francisco Health Code, implemented by the San Francisco Department of Public Health (DPH) as the Hazardous Materials Unified Program Agency and briefly summarized below, would apply to the potential to encounter hazardous materials in the soil, and the use of hazardous materials under project sites:

- Article 22A (Analyzing the Soils for Hazardous Waste, known as the Maher Ordinance) requires that projects located in certain specified areas that would involve disturbance of more than 50 cubic yards of soil prepare a site history report to identify whether past site uses may have caused contamination, conduct soil testing for the presence of the potentially hazardous constituents, prepare a soils analysis report, and prepare a Site Mitigation Plan (if contamination is identified). The specified areas included land located bayward of the historic high tide line, areas currently or previously zoned industrial, areas currently or previously with industrial land uses, areas within 150 feet of Highway 101, Interstate 80, or Interstate 280, areas of Bay fill, areas within 100 feet of know hazardous waste site (Geotracker/Envirostor), and areas within 100 feet of an underground storage tank. If hazardous materials remain in the soil or groundwater, approval of the Site Mitigation Plan by the DPH may be conditioned upon submittal of a Risk Management Plan, Health and Safety Plan, and possibly a Cap Maintenance Plan to prevent exposure to hazardous materials in soil or groundwater after construction of the project. Upon completion of site mitigation, the site owner must submit certification that the project has received certification or verification from the appropriate state or federal agency that mitigation is complete. As master developer for the former redevelopment area, the Mission Bay Development Group (MBDG) is responsible for obtaining Maher site clearance from SFPDH for the University's Mission Bay parcels. The entire waterfront from Aquatic Park to Pier 80 is located bayward of the historic high tide line, and the DPH may also require compliance with Article 22A at sites westward of the historic high tide line if the DPH has reason to believe that hazardous materials may be present in the soil at the property.

- Article 21 (Hazardous Materials) provides for safe handling of hazardous materials in the city. It requires any person or business that handles, sells, stores, or otherwise uses specified quantities of hazardous materials to keep a current certificate of registration and to implement a hazardous materials business plan (HMBP). Threshold quantities are 500 pounds for solids, 55 gallons for liquids, and 200 cubic feet for compressed gases.

Every business that must implement an HMBP must also obtain a certificate of registration certifying that the HMBP meets the requirements of Article 21. This article also specifies requirements for the installation and operation of underground storage tanks, reporting of unauthorized releases, and closure of permitted facilities.

- Article 21A (Risk Management Plan) requires any business that handles, sells, stores, or otherwise uses regulated substances[41] in quantities exceeding specified threshold amounts to register with the DPH and prepare a Risk Management Plan. The Risk Management Plan must be submitted to the DPH before a Certificate of Occupancy can be issued.

- Article 22 (Hazardous Waste) provides for safe handling of hazardous wastes in the City. It authorizes the DPH to implement the state hazardous waste regulations, including authority to conduct inspections and document compliance.

Lead-Based Paint

Work that could result in the disturbance of lead-based paint must comply with Section 3425 of the San Francisco Building Code, Work Practices for Lead-Based Paint on pre-1979 Buildings and Steel Structures. Where there is any work that may disturb or remove lead-based paint on the exterior of any building built prior to December 31, 1978, Section 3425 requires specific notification and work standards and identifies prohibited work methods and penalties.

Section 3425 applies to the exterior of all buildings or steel structures on which original construction was completed prior to 1979 (which are assumed to have lead-based paint on their surfaces, unless demonstrated otherwise through laboratory analysis), and to the interior of residential buildings, hotels, and child care centers. The ordinance contains performance standards, including establishment of containment barriers, at least as effective at protecting human health and the environment as those in the U.S. Department of Housing and Urban Development Guidelines (the most recent Guidelines for Evaluation and Control of Lead-Based Paint Hazards) and identifies prohibited practices that may not be used in disturbances or removal of lead-based paint. Any person performing work subject to the ordinance shall, to the maximum extent possible, protect the ground from contamination during exterior work; protect floors and other horizontal surfaces from work debris during interior work; and make all reasonable efforts to prevent migration of lead paint contaminants beyond containment barriers during the course of the work. Cleanup standards require the removal of visible work debris, including the use of a High Efficiency Particulate Air Filter (HEPA) vacuum following interior work.

The ordinance also includes notification and signage requirements. Prior to the commencement of work, the responsible party must provide written notice to the director of the San Francisco Department of Building Inspection (DBI) indicating the address and location of the project; the scope of work, including specific location; methods and tools to be used; the approximate age of the structure; anticipated job start and completion dates for the work; whether the building is residential or nonresidential, owner-occupied or rental property; the dates by which the responsible party has or will fulfill any tenant or adjacent property notification requirements; and the name, address,

[41] Regulated substances include those regulated under Section 68.130 of Title 40 of the Code of Federal Regulations, or those identified as an extremely hazardous substance in Appendix A of Part 355 of Title 40 of the Code of Federal Regulations, and those identified in Chapter 6.95, Article 2 of the California Health and Safety Code.

telephone number, and pager number of the party who will perform the work. Further notice requirements include signage when containment is required, requirements for signage when containment is required, notice to occupants, availability of pamphlet related to protection from lead in the home, and Early Commencement of Work (Requested by Tenant). The ordinance contains provisions regarding inspection and sampling for compliance by the DBI and enforcement, and describes penalties for non-compliance with the requirements of the ordinance.

4.7.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Regarding the criterion e), after evaluation of the activities proposed by the LRDP, the Initial Study concluded that implementation of the 2014 LRDP would clearly result in no impact or a less-than-significant impact at all campus sites. Therefore, this criterion is not discussed further in the EIR.

4.7.4 Analysis Methodology

This analysis evaluates the potential effects related to hazards and hazardous materials from implementation of the 2014 LRDP, including impacts from operation and construction related effects. Construction-related effects would be impacts that could occur during construction activities, including the potential for a release of hazardous materials during relocation of existing

tenants, the potential for a release of hazardous materials during construction, potential exposure to hazardous materials in soil, and potential exposure to hazardous building materials. Overall, compliance with regulatory requirements for these activities would ensure that hazardous materials impacts would be less than significant, as described.

URS Corporation, *San Francisco Hazard Mitigation Plan, Wildfire Hazard Area*, September 2008.

4.8 Hydrology and Water Quality

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Hydrology and Water Quality impacts. 2014 LRDP Hydrology and Water Quality effects are discussed in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures.* Hydrology and Water Quality effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures,* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.8.1 Regional Setting

4.8.1.1 Fluvial Hydrology and Stormwater Management

With the primary exception of parklands, much of the City of San Francisco is urbanized and covered in impermeable surfaces. There are few daylighted streams within the City, though topographic drainages in some park areas may have ephemeral surface flows during storms. Rainfalls rapidly produce surface runoff that is routed into a combined sewer system (CSS).

The CSS is a network of pipes and tunnels that convey combined stormwater and sanitary sewage flows, referred to as combined sewer discharge, to City wastewater treatment plants. During non-storm conditions, the City's CSS collects and treats up to 80 million gallons per day (MGD) of wastewater, primarily municipal sewage. The CSS routes flows to two treatment plants: the Southeast Treatment Plant in the Bayview/Hunters Point neighborhood, and the Oceanside Treatment Plant east of the Great Highway near the San Francisco Zoo. The Southeast plant receives approximately 80% of the combined wastewater and stormwater flows, including flows from the Mount Zion and Mission Center campus sites, and discharges them to San Francisco Bay. The Oceanside plant treats the remaining 20% of flows from the west side of the city, including wastewater from the Parnassus Heights campus site[42], and discharges them to the Pacific Ocean. During rainstorms, these facilities can collect and treat more than 500 million gallons per day (MGD) of combined inflows. These plants normally employ a minimum of secondary treatment to the combined inflows, before discharging the effluent. However, depending on individual storm characteristics and timing, the treatment plants can be overwhelmed, which results in discharge of minimally treated flows to the Bay and/or Ocean. Such overflows are expected to occur one to ten times per year (Gresgson, 2011).

The Mission Bay area, including the Mission Bay campus site, was formerly connected to the combined storm drain / sewer system. This system was separated in 2011 and stormwater flows are now discharged to San Francisco Bay.

[42] Due to campus topography, about half of the overland stormflow from the Parnassus Heights campus site goes to the Southeast plant.

Flooding

Mean annual rainfall for north central San Francisco (Richmond District gage) is 20.0 inches (WRCC, 2014). The rainy season for San Francisco's Mediterranean-type climate normally extends from October through March. Substantial floods occur in response to Pacific frontal-system storms of 3-5 days duration, with nested bursts of high-intensity rainfall. For the higher elevation zones of the City, such as Mount Sutro above Parnassus Heights, flooding is localized and occurs periodically due to obstructed storm drains, plugged catch basin inlets or undersized drain segments.

The Federal Emergency Management Agency (FEMA) is in the process of preparing Flood Insurance Rate Maps (FIRMs) for the City and County of San Francisco (CCSF).[43] FIRMs identify areas that are subject to inundation during a flood having a 1-percent chance of occurrence in a given year (also known as a "base flood," "100-year flood," or "1 percent annual chance flood"). FEMA refers to an area that is at risk from a 100-year flood as a special flood hazard area.

FEMA has delayed publication of a final FIRM until a more detailed analysis of flood hazards is completed. In 2008, the City agreed to join the National Flood Insurance Program (POSF, 2008). FEMA approved San Francisco's application for participation in the National Flood Insurance Program in April 2010, meaning that homeowners, renters, and business owners in the City are now eligible to purchase federally subsidized flood insurance for their property. The City Administrator's Office and the San Francisco Department of Emergency Management are also working to identify potential hazard mitigation projects that may be eligible for FEMA grants.

4.8.1.2 Water Quality

Central San Francisco Bay

Various contaminants are transported into the San Francisco Bay by sources that include urban uses, industrial outfalls, municipal wastewater outfalls, municipal stormwater, upstream farming, upstream historic and current mining discharges, legacy pollutants,[44] and various other sources.

Water depths along the San Francisco waterfront and piers are relatively shallow and suspended sediment loads are strongly influenced by nearshore discharges and wind- and wave-generated sediment disruption; they likely are similar to the higher sediment concentrations typically found near the bottom of the Bay or in other shallow environments.

---

43 In September 2007, FEMA issued a preliminary FIRM of San Francisco for review and comment by the City. The City submitted comments that year, and FEMA anticipated publishing a revised preliminary FIRM by 2012, after completing a more detailed analysis of flood hazards associated with San Francisco Bay as requested by Port and City staff. FEMA will finalize the FIRM and publish it for flood insurance and floodplain management purposes after reviewing comments and appeals related to the revised preliminary FIRM. As of August 2014, final FIRM maps for San Francisco are still not available on the FEMA web page. https://msc.fema.gov/webapp/wcs/stores/servlet/mapstore/homepage/MapSearch.html

44 Legacy pollutants are water quality constituents that are considered harmful to human health or the environment, that were historically emitted by industry or other human activities, and that are in general banned or significantly restricted from current usage. Examples include mercury, lead, PCBs, and DDT.

Pollutants enter the Central San Francisco Bay primarily through runoff, combined sewer overflows, stormwater discharges, spills and leaks, and remobilization of contaminants from sediment into the overlying water column. The San Francisco Bay Regional Water Quality Control Board (RWQCB) listed the Central Bay as an impaired water body, as defined under Section 303(d) of the Clean Water Act (discussed in Section 4.8.2, Regulatory Considerations, below), that does not meet water quality standards, implementation of pollution control technology at point sources of pollution.

Central San Francisco Bay and Mission Creek at China Basin near the Mission Bay campus site are identified as impaired water bodies under Section 303(d) of the Clean Water Act (see Section 4.8.2.2 below).

4.8.2 Regulatory Considerations

4.8.2.1 Federal Regulations

Clean Water Act – Water Quality

In 1972, the Clean Water Act (CWA) established the basic structure for regulating discharges of pollutants into the waters of the U.S. and gave the U.S. Environmental Protection Agency (U.S. EPA) the authority to implement pollution control programs such as setting wastewater standards for industries. The CWA sets water quality standards for contaminants in surface waters. The statute employs a variety of regulatory and non-regulatory tools to reduce direct pollutant discharges into waterways, finance municipal wastewater treatment facilities, and manage polluted runoff. The U.S. EPA has delegated responsibility for implementation of portions of the CWA, including water quality control planning and programs, in California to the State Water Resources Control Board and the nine RWQCBs. Water quality standards applicable to the project are listed in the *Water Quality Control Plan for the San Francisco Bay Basin* (Basin Plan), discussed further below under State Regulations in Section 4.8.2.2.

Executive Order 11988 and National Flood Insurance Program

Under Executive Order 11988, FEMA is responsible for management of floodplain areas, which are defined as the lowland and relatively flat areas adjoining inland and coastal waters subject to a one percent or greater chance of flooding in any given year. Also, FEMA administers the National Flood Insurance Program, which requires that local governments covered by federal flood insurance pass and enforce a floodplain management ordinance that specifies minimum requirements for any construction within the one percent annual chance flood zone. FEMA prepares FIRMs that are used to identify areas prone to flooding.

4.8.2.2 State Regulations

California Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Division 7 of the California Water Code) provides for protection of the quality of all waters of the State of California for use and

enjoyment by the people of California. The act also establishes provisions for a statewide program for the control of water quality, recognizing that waters of the State are increasingly influenced by interbasin water development projects and other statewide considerations, and that factors such as precipitation, topography, population, recreation, agriculture, industry, and economic development vary regionally within the State. The statewide program for water quality control is therefore administered most effectively on a local level with statewide oversight. Within this framework, the act authorizes the SWRCB and regional boards to oversee the coordination and control of water quality within California.

San Francisco Bay Water Quality Control Plan (Basin Plan)

San Francisco Bay waters are under the jurisdiction of the San Francisco Bay RWQCB which established regulatory standards and objectives for water quality in the Bay in the *Water Quality Control Plan for the San Francisco Bay Basin*, commonly referred to as the Basin Plan (RWQCB, 2010). The Basin Plan identifies existing and potential beneficial uses for surface waters and provides numerical and narrative water quality objectives designed to protect those uses. The preparation and adoption of water quality control plans is required by the California Water Code (Section 13240) and supported by the federal CWA. Because beneficial uses, together with their corresponding water quality objectives, can be defined per federal regulations as water quality standards, the Basin Plan is a regulatory reference for meeting the State and federal requirements for water quality control. Adoption or revision of surface water standards is subject to the approval of the USEPA.

Total Maximum Daily Loads

Under Section 303(d) of the Federal CWA, states must present the USEPA with a list of "impaired water bodies," defined as those water bodies that do not meet water quality standards. As discussed in the Setting section above under Water Quality, the San Francisco RWQCB has listed the Central Bay portion of the San Francisco Bay as well as Mission Creek as impaired water bodies (RWQCB, 2007), and as required by the CWA requires the development of Total Maximum Daily Loads (TMDLs) to improve water quality of impaired water bodies.

NPDES Waste Discharge Regulations

Section 402 of the federal CWA established the National Pollutant Discharge Elimination System (NPDES) program to protect the water quality of receiving Federal waters. The NPDES program requires all facilities that discharge pollutants into waters of the United States to obtain a permit. The permit provides two levels of control – technology-based limits and water-quality-based limits – to control discharge of pollutants for the protection of water quality. Technology-based limits are based on the ability of dischargers in the same category of industry to treat wastewater, while water quality-based limits are required if technology-based limits are not sufficient to provide protection of the water body. Water quality-based effluent limitations required to meet water quality criteria in the receiving water are based on criteria specified in the National Toxics Rule, the California Toxics Rule, and the Basin Plan. NPDES permits must also incorporate TMDL wasteload allocations when they are developed.

The regulations initially focused on municipal and industrial wastewater discharges in 1972, followed by stormwater discharge regulations, which became effective in November 1990. NPDES permits for wastewater and industrial discharges specify discharge prohibitions and effluent limitations and also include other provisions (such as monitoring and reporting programs) deemed necessary to protect water quality. In California, the SWRCB and the RWQCBs implement and enforce the NPDES program.

Construction General Stormwater Permit (SWRCB Order No. 2009-09-DWQ)

For stormwater discharges associated with construction activity in the state of California, the SWRCB has adopted the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities, Order No. 2009-0009-DWQ (Construction General Stormwater Permit) in order to avoid and minimize water quality impacts attributable to construction activities. The Construction General Stormwater Permit became effective on July 1, 2010 and expires on September 2, 2014; it applies to all projects where construction activity disturbs one or more acres of soil. Construction activities subject to this permit includes clearing, grading, and disturbances to the ground, such as stockpiling or excavation. The Construction General Stormwater Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP), which includes and specifies best management practices (BMPs) designed to prevent pollutants from contacting stormwater and keep all products of erosion from moving offsite into receiving waters. Routine inspection of all BMPs is required under the provisions of the Construction General Stormwater Permit. In addition, the SWPPP must contain a visual monitoring program, a chemical monitoring program for non-visible pollutants, and a sediment monitoring plan if the site discharges pollutants directly into a water body listed as impaired under the CWA's Section 303(d) list for sediment.

The Construction General Stormwater Permit is implemented and enforced by the San Francisco Bay RWQCB, which administers the stormwater permitting program for the program area. Dischargers are required to submit a notice of intent (NOI) and permit registration documents (PRDs) in order to, at the discretion of the SWRCB, obtain coverage under this Construction General Stormwater Permit. Dischargers are responsible for notifying the relevant RWQCB of violations or incidents of non-compliance, as well as for submitting annual reports identifying deficiencies of the BMPs and how the deficiencies were corrected.

Phase II General Stormwater Permit (SWRCB Order No. 2003-0005-DWQ)

In 2003 the SWRCB adopted the General Permit for the Discharge of Storm Water from Small Municipal Separate Storm Sewer System (MS4s), SWRCB Order No. 2003-0005-DWQ (Phase II General Stormwater Permit). A revised permit applying to the MS4 at UCSF was approved in 2013. The revised Phase II General Permit requires UCSF to develop, implement and enforce a Storm Water Management Plan/Program (SWMP) by July 2016 that is designed to minimize the discharge of pollutants into receiving waters; identify appropriate stormwater treatment practices with measurable performance criteria; and ensure that the program includes provisions to address six minimum measures to promote pollutant load reduction. These measures are public education, public participation and involvement, illicit discharge detection and elimination, construction site runoff control, post-construction runoff control and pollution prevention and good housekeeping.

The revised Phase II permit also requires that by July 2015, plans for UCSF projects that create and/or replace (including projects with no net increase in impervious footprint) more than 2,500 square feet of impervious surface include the following:

- Site design measures such as porous pavement, setbacks, and impervious area disconnections to reduce project site runoff
- Low-Impact Design (LID) standards to effectively reduce runoff and pollutants from the project site, including:
  - Source control measures such as permanent and/or operational source control measures at loading docks, fuel dispensing areas, pools, and other areas;
  - Numeric sizing criteria for stormwater retention and treatment; and
  - Stormwater treatment measures and baseline hydromodification management measures

Oceanside and Southeast Plant Permits

The City and County of San Francisco operates the Oceanside and Southeast Water Treatment Plants and their related transport and outfall facilities under the regulatory provisions in NPDES Permits No. CA0037681 and CA0037664, and the Waste Discharge Requirements (WDRs) cited in Orders No. R2-2009-0062 and R2-2008-0007, respectively (RWQCB, 2008 and 2009). These Orders stipulate protocols for the monitoring of dry and wet weather Water Treatment Plant influent and effluent and limitations on sampled constituents of concern. The Southeast Water Treatment Plant also maintains a pretreatment program for CSS flows.

4.8.2.3 Local Regulations

In 2013, UCSF was designated by the SWRCB as a Phase 2 non-traditional MS4 (State Water Quality Board Order 2013-0001-DWQ) because its campus facilities (with the exception of the Mission Bay campus site) feed into the City's CSS. Elsewhere in the City, stormwater discharges to the CSS are governed by the SFPUC *Stormwater Design Guidelines* (SFPUC, 2010). Practically speaking, UCSF manages its stormwater in a way that is consistent with the guidelines (Franke, 2014), but the guidelines are not enforceable on UCSF campus sites due to their coverage under the Phase 2 MS4.

San Francisco Floodplain Management Ordinance

As noted above in Section 4.8.1, *Regional Setting*, in 2008 the City agreed to join the National Flood Insurance Program (NFIP). As a condition for joining the NFIP, the City adopted the Floodplain Management Ordinance, which requires new or substantially improved structures in designated flood hazard areas be protected against flood damage, and prohibits uses that would increase flood risks. In general, the Floodplain Management Ordinance requires the first floor of structures in flood zones to be constructed above the floodplain or to be flood-proofed. (CCSF, 2011)

4.8.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a) Violate any water quality standards or waste discharge requirements?

b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off site?

d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site?

e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

f) Otherwise substantially degrade water quality?

g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?

i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

j) Inundate by seiche, tsunami, or mudflow?

4.8.4 Analysis Methodology

This analysis evaluates the potential effects on hydrology and water quality from implementation of the 2014 LRDP, including effects from construction and operation. Construction-related effects on hydrology and water quality include direct impacts that could occur during demolition, renovation, and construction activities, including contributions to combined sewer flows. In addition, indirect impacts on water quality could occur as a result of increased campus growth and the conversion of undeveloped areas to developed areas.

Overall, compliance with regulatory requirements for these activities and implementation of project-specific plans prepared for the 2014 LRDP would ensure that both direct and indirect water quality-related effects would be minimized. Operational impacts of the 2014 LRDP are related to stormwater runoff at the campus sites and similarly, compliance with regulatory requirements would ensure that water quality effects related to stormwater runoff would be reduced.

4.9 Land Use and Planning

This section presents the Regional Setting, Regulatory Considerations, Significance Standards, and Analysis Methodology for the evaluation of Land Use and Planning impacts. 2014 LRDP Land Use effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Land Use effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.9.1 Regional Setting

While the regional setting for the 2014 LRDP is the San Francisco Bay Area, the changes proposed by the LRDP would occur at campus sites located entirely within the City of San Francisco, a relatively dense urban environment that is built out in most areas. Few large tracts of vacant or underused land are available for new development. San Francisco consists of a number of neighborhoods, each with its own unique physical characteristics and mix of land uses.

4.9.2 Regulatory Considerations

The 2014 LRDP is a comprehensive land use plan intended to guide growth and other physical changes at UCSF in order to achieve its academic, research and clinical missions through 2035. The 2014 LRDP will establish general types of campus development and land uses to support projected on-campus population and research growth at UCSF, and to facilitate expanded and new program initiatives. It provides objectives to guide decisions for future facilities to meet needs over the next 20 years and projects the quantities and uses of new building space needed during this time frame. The 2014 LRDP includes land use or "functional zone" maps for its major campus sites, Parnassus Heights, Mission Bay, and Mount Zion, which will guide the location of future capital construction and infrastructure development. Following public review, the EIR and 2014 LRDP will be submitted to the Regents for their approval. Upon adoption by the Regents, this 2014 LRDP will replace UCSF's 1996 LRDP, as amended.

The LRDP also references community planning principles that formalize UCSF's commitment to communicate with neighbors regarding its space needs and potential future development, in order to identify potential community concerns that may arise from UCSF's physical development prior to the time that individual projects are brought forward for approval.

Pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation. However, UCSF reviews local land use policies as planning guidelines and includes those policies that are germane to the analysis of land use impacts in this EIR.

In 1987, the City and UCSF entered into a *Memorandum of Understanding* (MOU) to foster harmonious relations between the City and UCSF regarding the growth and development of UCSF facilities within the City's boundaries. The MOU describes the responsibilities of the City and UCSF for the oversight of their respective land uses and the development, maintenance and use of physical facilities, including methods of communication and consultation regarding UCSF's proposed development.

UCSF consults with the City when planning new development, especially if improvements are being proposed within City rights-of-way adjacent to campus sites. In addition, it is UCSF's intent to adhere substantially, to the extent practicable, to City zoning codes related to building use, height, and bulk limitations; floor area ratios; and parking requirements or restrictions for the purpose of ensuring compatibility with surrounding areas. At the Mission Bay campus site, UCSF development is subject to agreements that were negotiated by UCSF with the City, the City's former Redevelopment Agency and other developers in Mission Bay as part of the *Mission Bay Redevelopment Area North and South Plans* and the subsequent implementation of those Plans.

The major land use planning documents of the City are summarized below.

4.9.2.1 San Francisco General Plan

The *San Francisco General Plan* provides general policies and objectives to guide land use decisions and includes policies that relate to environmental issues. Although the University is constitutionally exempt from land use regulation by local agencies when using its properties to further its educational mission, the University strives to be substantially consistent with local policies where feasible. The General Plan contains 10 elements (Commerce and Industry, Recreation and Open Space, Housing, Community Facilities, Urban Design, Environmental Protection, Transportation, Air Quality, Community Safety and Arts) that set forth goals, policies and objectives for the physical development of the City.

4.9.2.2 San Francisco Planning Code

The San Francisco Planning Code regulates development in the City by prescribing the permitted uses and development standards consistent with the land use designations and policies in the *San Francisco General Plan*. The San Francisco Zoning Map defines the locations and boundaries of zoning use, building height and bulk limit districts. Zoning in San Francisco generally consists of multiple layers of districts. Use Districts are the base zoning districts that prescribe permitted land uses and most development standards (except height and bulk). Height and Bulk Districts are mapped separately from Use Districts and prescribe the permitted height and bulk of buildings. In some instances, on top of the Use Districts and Height and Bulk Districts, Special Use Districts (SUDs) are mapped to address particular issues for targeted areas; SUDs provide controls that supersede some or all of the underlying Use Districts to meet certain goals.

4.9.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a) Physically divide an established community?

b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect?

c) Conflict with any applicable habitat conservation plan or natural community conservation plan?

d) Conflict with local land use regulations such that a significant incompatibility is created with adjacent land uses?[45]

Regarding criteria a) and c), after evaluation of the activities proposed by the 2014 LRDP, the Initial Study concluded that implementation of the 2014 LRDP would clearly result in no impact or a less-than-significant impact at all campus sites. Therefore, these criteria are not discussed further in the EIR.

4.9.4 Analysis Methodology

The examination of land use impacts is based on information obtained from the 2014 LRDP; review of published environmental documentation and land use studies of the UCSF campus sites; and review of documents pertaining to land use published by the City of San Francisco, including applicable elements of the General Plan. The analysis discusses whether the 2014 LRDP would be consistent with applicable land use plans and policies that were adopted for the purpose of avoiding or mitigating an environmental effect. Land use policies are policies that pertain to the type, location and physical form of new development. For this analysis, policies "adopted for the purpose of avoiding or mitigating an environmental effect" are considered those that, if implemented and adhered to, would avoid or mitigate physical impacts on the environment. For each potential impact, the analysis compares the impact to the standards of significance listed above and determines the impact's level of significance under CEQA.

[45] Although the standard of significance previously adopted in the 1996 LRDP EIR focused on whether implementation of the 1996 LRDP would "substantially conflict with the use designations, height and bulk, and density restrictions of local zoning," this EIR adopts a different standard of significance that focuses on compatibility with adjacent uses. Given the University's constitutional exemption from local land use regulations and the fact that 2014 LRDP proposals will be implemented on UCSF's four main campus sites, this new standard of significance will provide a more context-sensitive evaluation of land use impacts that takes into account the purpose of the local use, height and bulk, and density restrictions, which is to ensure compatibility with adjacent land uses. This new standard of significance will therefore provide a more informed and accurate analysis of the 2014 LRDP's land use impacts. For example, while the proposed new office/research building at the Mount Zion campus site would exceed the bulk restrictions of the Planning Code, the proposed building would be designed to align with the existing hospital building and located in a setting already built out with other UCSF facilities. Accordingly, although it would technically exceed the local bulk restrictions, it would be compatible with adjacent land uses and would not therefore create a significant land use impact.

4.10 Noise and Vibration

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Noise and Vibration impacts. 2014 LRDP Noise and Vibration effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Noise effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures,* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.10.1 Setting

4.10.1.1 Noise Background

Sound is characterized by various parameters that describe the rate of oscillation (frequency) of sound waves, the distance between successive troughs or crests in the wave, the speed that it travels, and the pressure level or energy content of a given sound. The sound pressure level has become the most common descriptor used to characterize the loudness of an ambient sound, and the decibel (dB) scale is used to quantify sound intensity. Because sound can vary in intensity by over one million times within the range of human hearing, a logarithmic loudness scale is used to keep sound intensity numbers at a convenient and manageable level. Since the human ear is not equally sensitive to all sound frequencies within the entire spectrum, human response is factored into sound descriptions in a process called "A-weighting," expressed as "dBA." The dBA, or A-weighted decibel, refers to a scale of noise measurement that approximates the range of sensitivity of the human ear to sounds of different frequencies. On this scale, the normal range of human hearing extends from about 0 dBA to about 140 dBA. A 10-dBA increase in the level of a continuous noise represents a perceived doubling of loudness. The noise levels presented herein are expressed in terms of dBA, unless otherwise indicated. **Table 4.10-1** shows some representative noise sources and their corresponding noise levels in dBA (HUD, 1985).

Planning for acceptable noise exposure must take into account the types of activities and corresponding noise sensitivity in a specified location for a generalized land use type. Some general guidelines are as follows: sleep disturbance can occur at levels above 35 dBA; interference with human speech begins at about 60 dBA; and hearing damage can result from prolonged exposure to noise levels in excess of 85 to 90 dBA (USEPA, 1974).

Attenuation of Noise

Sound from line sources of noise, such as roadway traffic, attenuates (lessens) at a rate of 3.0 to 4.5 dBA per doubling of distance from the source, based on the inverse square law and the equation for cylindrical spreading of noise waves over hard and soft surfaces.

TABLE 4.10-1
TYPICAL SOUND LEVELS MEASURED IN THE ENVIRONMENT

Examples of Common, Easily Recognized Sounds	Decibels (dBA)	Subjective Evaluations
Near Jet Engine	140	Deafening
Threshold of Pain (Discomfort)	130	
Threshold of Feeling – Hard Rock Band	120	
Accelerating Motorcycle (at a few feet away)	110	
Loud Horn (at 10 feet away)	100	Very Loud
Noisy Urban Street	90	
Noisy Factory	85	
School Cafeteria with Untreated Surfaces	80	Loud
Near Freeway Auto Traffic	60	Moderate
Average Office	50	
Soft Radio Music in Apartment	40	Faint
Average Residence Without Stereo Playing	30	
Average Whisper	20	Very Faint
Rustle of Leaves in Wind	10	
Human Breathing	5	
Threshold of Audibility	0	

NOTE: Continuous exposure above 85 dBA is likely to degrade the hearing of most people. Range of speech is 50 to 70 dBA.

SOURCE: United States Department of Housing and Urban Development, *The Noise Guidebook*, 1985.

Sound from point sources of noise,[46] including stationary mobile sources such as idling vehicles or onsite construction equipment, attenuates at a rate of 6.0 to 7.5 dBA per doubling of distance from the source, based on the inverse square law and the equations for spherical spreading of noise waves over hard and soft surfaces. For the purposes of this analysis, it is assumed that noise from line and point sources to a distance of 200 feet attenuates at rates of between 3.0 and 6.0 dBA per doubling of distance, and the noise from line and point sources at a distance greater than 200 feet attenuates at a rate of 4.5 to 7.5 dBA per doubling of distance, to account for the absorption of noise waves due to ground surfaces such as soft dirt, grass, bushes, and intervening structures (Caltrans, 2013).

Noise Descriptors

Time variations in noise exposure are typically expressed in terms of a steady-state energy level (L_{eq}) that represents the acoustical energy of a given measurement. Successive additions of sound

[46] Point sources and line sources are further defined by the California Department of Transportation (Caltrans) as follows:

> Sound from a small localized source (approximating a "point" source) radiates uniformly outward as it travels away from the source in a spherical pattern. The sound level attenuates or drops off at a rate of 6 dBA for each doubling of the distance (6 dBA/DD). This decrease, due to the geometric spreading of the energy over an ever increasing area, is referred to as the inverse square law. However, highway traffic noise is not a single, stationary point source of sound. The movement of the vehicles makes the source of the sound appear to emanate from a line (line source) rather than a point when viewed over some time interval. This results in cylindrical spreading rather than the spherical spreading of a point source. (Source: Caltrans, 2013.)

to the community noise environment varies from instant to instant requiring the measurement of noise exposure over a period of time to accurately characterize a community noise environment and evaluate cumulative noise impacts. This time-varying characteristic of environmental noise is described using statistical noise descriptors. The most frequently used noise descriptors are summarized below:

L_{eq} The equivalent sound level is used to describe noise over a specified period of time, typically one hour, in terms of a single numerical value. The L_{eq} is the constant sound level, which would contain the same acoustic energy as the varying sound level, during the same time period (i.e., the average noise exposure level for the given time period).

L_{max} The instantaneous maximum noise level for a specified period of time.

L_{50} The noise level that is equaled or exceeded 50 percent of the specified time. This is the median noise level during the specified time.

L_{90} The noise level that is equaled or exceeded 90 percent of the specified time. The L_{90} is often considered the background noise level averaged over the specified time.

DNL Sometimes referred to as Ldn, the Day/Night Average Sound Level is the 24-hour day and night A-weighed noise exposure level, which accounts for the greater sensitivity of most people to nighttime noise by weighting noise levels at night. Noise between 10:00 p.m. and 7:00 a.m. is weighted (penalized) by adding 10 dBA to take into account the greater annoyance from nighttime noise.

CNEL Similar to the DNL, the Community Noise Equivalent Level (CNEL) adds a 5 dBA "penalty" for the evening hours between 7:00 p.m. and 10:00 p.m. in addition to a 10 dBA penalty between the hours of 10:00 p.m. and 7:00 a.m.

Health Effects of Environmental Noise

The World Health Organization (WHO) is perhaps the best source of current knowledge regarding the health effects of noise impacts because European nations have continued to study noise and its health effects, while the United States Environmental Protection Agency all but eliminated its noise investigation and control program in the 1970s. According to WHO, sleep disturbance can occur when continuous indoor noise levels exceed 30 dBA or when intermittent interior noise levels reach 45 dBA, particularly if background noise is low. With a bedroom window slightly open (a reduction from outside to inside of 15 dB), the WHO criteria suggest that exterior continuous (ambient) nighttime noise levels should be 45 dBA or below, and short-term events should not generate noise in excess of 60 dBA. WHO also notes that maintaining noise levels within the recommended levels during the first part of the night is believed to be effective for the ability of people to initially fall asleep (WHO, 1999).

Other potential health effects of noise identified by WHO include decreased performance for complex cognitive tasks, such as reading, attention span, problem solving, and memorization; physiological effects such as hypertension and heart disease (after many years of constant exposure, often by workers, to high noise levels); and hearing impairment (again, generally after long-term occupational exposure, although shorter-term exposure to very high noise levels, for example,

exposure several times a year to concert noise at 100 dBA, can also damage hearing). Finally, noise can cause annoyance and can trigger emotional reactions like anger, depression, and anxiety. WHO reports that, during daytime hours, few people are seriously annoyed by activities with noise levels below 55 dBA or moderately annoyed with noise levels below 50 dBA.

Vehicle traffic and continuous sources of machinery and mechanical noise contribute to ambient noise levels. Short-term noise sources, such as truck backup beepers, the crashing of material being loaded or unloaded, car doors slamming, and engines revving outside a nightclub, contribute very little to 24-hour noise levels but are capable of causing sleep disturbance and severe annoyance. The importance of noise to receptors depends on both time and context. For example, long-term high noise levels from large traffic volumes can make conversation at a normal voice level difficult or impossible, while short-term peak noise levels, if they occur at night, can disturb sleep.

4.10.1.2 Vibration Background

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Several different methods are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe physical vibration impacts on buildings. Typically, groundborne vibration generated by human activities attenuates rapidly with distance from the source of the vibration. Sensitive receptors to vibration include structures (especially older masonry structures), people (especially residents, the elderly, and sick people), and vibration-sensitive equipment.

Another useful vibration descriptor is known as vibration decibels or VdBs. VdBs are generally used when evaluating human response to vibration, as opposed to structural damage (for which PPV is the more commonly used descriptor). Vibration decibels are established relative to a reference quantity, typically 1 x 10^{-6} inches per second (FTA, 2006).

Sources of vibration in the proposed 2014 LRDP area primarily consist of Muni streetcars traveling along Third Street in the vicinity of the Mission Bay campus site. Most motor vehicles and trucks have independent suspension systems that substantially reduce if not eliminate vibration generation, barring discontinuities in the roadway.

4.10.2 Regulatory Considerations

4.10.2.1 Federal Regulations

Federal Aviation Administration

The Federal Aviation Administration (FAA) develops noise exposure maps that use average annual L_{dn} noise contours around the airport as the primary noise descriptor. The FAA states that all land uses are considered compatible when aircraft noise effects are less than 65 decibels (dB) CNEL. San Francisco International Airport is approximately seven miles south, and Oakland International Airport is approximately nine miles east, of the City of San Francisco. The entirety of the City of

San Francisco is outside the 65 dB CNEL noise contour of both airports (SFIA, 2008; OIA, 2008). The Phase 1 Medical Center at Mission Bay currently under construction will have an operational helipad that will generate operational noise. Noise contours for helicopter operations at the Phase 1 Medical Center were developed for the *UCSF Medical Center at Mission Bay EIR* and the *Final Supplemental EIR, UCSF Medical Center at Mission Bay—Residential Sound Reduction Program for Helicopter Operations Supplemental EIR* (UCSF, 2008 and 2009).

4.10.2.2 State Regulations

State regulations include requirements for the construction of new hotels, motels, apartment houses, and dwellings other than detached single-family dwellings that are intended to limit the extent of noise transmitted into habitable spaces. These requirements are collectively known as the California Noise Insulation Standards and are found in Title 24 of the California Code of Regulations.

For limiting noise transmitted between adjacent dwelling units, the noise insulation standards specify the extent to which walls, doors, and floor-ceiling assemblies must block or absorb sound. For limiting noise from exterior sources, the noise insulation standards set forth an interior standard of 45 dBA (L_{dn}) in any habitable room. Where dwelling units are proposed in areas subject to noise levels greater than 60 dBA (L_{dn}) a demonstration of how the units have been designed to meet this interior standard is required. If the interior noise level depends upon windows being closed, the design for the structure must also specify a ventilation or air-conditioning system that provides a habitable interior environment.

4.10.2.3 Local Regulations

UCSF is not subject to local plans, policies, or ordinances whenever using land under its control in furtherance of its educational mission. However, it is UCSF policy to be consistent with such plans, policies or ordinances to the extent feasible. City plans, policies and ordinances that are relevant to noise are summarized below.

San Francisco General Plan

Land Use Compatibility Guidelines for Community Noise

The Environmental Protection Element of the *San Francisco General Plan* contains Land Use Compatibility Guidelines for Community Noise (CCSF, 1996). The City's guidelines indicate exterior noise levels that might be inappropriate for sensitive land uses and would therefore require additional noise insulation considerations beyond standard practices. Though this figure presents a range of noise levels that are considered compatible or incompatible with various land uses, the maximum "satisfactory" noise level is 60 dBA (L_{dn}) for residential and hotel uses; 65 dBA (L_{dn}) for school classrooms, libraries, churches, and hospitals; 70 dBA (L_{dn}) for playgrounds, parks, office buildings, retail commercial uses, and noise-sensitive manufacturing/communications uses; and 77 dBA for other commercial uses such as wholesale, some retail, industrial/manufacturing, transportation, communications, and utilities. If these uses are proposed to be located in areas with noise levels that exceed these guidelines, a detailed analysis of noise reduction requirements will normally be necessary prior to final review and approval.

Noise-Related Policies

The following policies of the *San Francisco General Plan* Environmental Protection Element that relate to noise issues are relevant to the proposed 2014 LRDP:

> ***Policy 10.1*:** Promote site planning, building orientation and design and interior layout that will lessen noise intrusion.
>
> ***Policy 10.2*:** Promote the incorporation of noise insulation materials in new construction. State-imposed noise insulation standards apply to all new residential structures except detached single-family dwellings.
>
> ***Policy 11.1*:** Discourage new uses in areas in which the noise level exceeds the noise compatibility guidelines for that use. New development should be examined to determine whether background and/or thoroughfare noise level of the site is consistent with the guidelines for the proposed use
>
> ***Policy 11.3*:** Locate new noise-generating development so that the noise impact is reduced.

San Francisco Noise Ordinance

In San Francisco, regulation of noise is stipulated in Article 29 of the Police Code (Regulation of Noise), which states that the City's policy is to prohibit unnecessary, excessive, and offensive noises from all sources subject to police power. Sections 2907 and 2908 of Article 29 regulate construction equipment and construction work at night, while Section 2909 provides for limits on stationary-source noise from machinery and equipment. Sections 2907 and 2908 are enforced by the Department of Building Inspection, and Section 2909 is enforced by the Department of Public Health. Summaries of these and other relevant sections are presented below.

Construction Noise

Sections 2907(a) and (b) of the Police Code state that it shall be unlawful for any person, including the City and County of San Francisco, to operate any powered construction equipment, regardless of age or date of acquisition, if the operation of such equipment emits noise at a level in excess of 80 dBA when measured at a distance of 100 feet from such equipment, or an equivalent sound level at some other convenient distance. Exemptions from this requirement include:

- Impact tools and equipment with intake and exhaust mufflers recommended by the manufacturers and approved by the Director of Public Works as best accomplishing maximum noise attenuation; and
- Pavement breakers and jackhammers equipped with acoustically attenuating shields or shrouds recommended by the manufacturers and approved by the Director of Public Works as best accomplishing maximum noise attenuation.

Section 2908 prohibits any person, between the hours of 8:00 p.m. of any day and 7:00 a.m. of the following day, from erecting, constructing, demolishing, excavating for, altering, or repairing any building or structure if the noise level created is in excess of the ambient noise level by 5 dBA at the nearest property line unless a special permit has been applied for and granted by the Director of Public Works.

Operational Noise

Section 2909 establishes a not-to-exceed noise standard for fixed sources of noise, such as building mechanical equipment and industrial or commercial processing machinery. Unlike the California Building Code (Title 24) standard, which is applicable to interior living space only, the standards in Section 2909(a), (b), and (c) are applicable outdoors, at the property line of the affected use, and vary based on the residential or commercial nature of the noise generator's use. For example, the noise limits for commercial and industrial properties provide that no person shall produce or allow to be produced a noise level more than 8 dBA above the local ambient level at the property plane. For residential properties, the noise limits are 5 dBA above the ambient level at any point outside of the property plane of a residential use. The noise limits for public property provide that no person shall produce a noise level more than 10 dBA above the local ambient level at a distance of 25 feet or more on public property.

As is common for noise standards, the permitted noise level for fixed residential interior noise limits identified in Section 2909(d) is lower at night than during the day. For example, maximum noise levels at any sleeping or living room in any dwelling unit located on residential property must not exceed 45 dBA between 10:00 p.m. and 7:00 a.m., and 50 dBA between 7:00 a.m. and 10:00 p.m. None of the noise limits set forth in this section apply to activity for which the City and County of San Francisco has issued a permit that contains noise limit provisions that are different from those set forth in this article. Additionally, the Directors of Public Health, Public Works, or Building Inspection, or the Entertainment Commission, or the Chief of Police may grant variances to noise regulations, over which they have jurisdiction pursuant to Section 2916.

Article 1, Section 47.2 of the Police Code regulates the use of any sound amplifying equipment, whether truck-mounted or otherwise, within the City and County of San Francisco and consists of the following regulations:

1. The only sounds permitted are music or human speech.

2. Hours of operation permitted shall be between 9:00 a.m. and 10:00 p.m.; operation after 10:00 p.m. is permitted only at the location of a public event or affair of general public interest or as otherwise permitted by the Entertainment Commission.

3. Except as permitted by the Entertainment Commission, sound shall not be issued within 450 feet of hospitals, schools, churches, courthouses, public libraries, or mortuaries.

4. No sound truck with its amplifying device in operation shall traverse any one block in the City and County more than four times in any one calendar day.

5. Amplified human speech and music shall not be unreasonably loud, raucous, jarring, or disturbing to persons of normal sensitiveness within the area of audibility, nor louder than permitted in Subsections (6) and (7) hereof.

6. When the sound truck is in motion, the volume of sound shall be controlled so that it will not be audible for a distance in excess of 450 feet from its source; provided, however, that when the sound truck is stopped by traffic, the said sound amplifying equipment shall not be operated for longer than one minute at such a stop.

7. Except as permitted by the Entertainment Commission for public gatherings, in all cases where sound amplifying equipment remains at one location or when the sound truck is not in motion, the volume of sound shall be controlled so that it will not be audible for a distance in excess of 250 feet from the periphery of the attendant audience.

8. No sound amplifying equipment shall be operated unless the axis of the center of any sound reproducing equipment used shall be parallel to the direction of travel of the sound truck; provided, however, that any sound reproducing equipment may be so placed upon said sound truck as to not vary more than 15 degrees on either side of the axis of the center of the direction of travel and, provided further, that radial, nondirectional type of loudspeakers may be used on said sound trucks either alone or in conjunction with sound reproducing equipment placed within 15 degrees of the center line of the direction of travel.

4.10.3 Significance Standards

Would implementation of the proposed 2014 LRDP result in:

a) Exposure of persons to or generation of noise levels in excess of standards established in any applicable plan or noise ordinance, or applicable standards of other agencies?

b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project (including construction)?

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

4.10.4 Analysis Methodology

4.10.4.1 Exposure of Persons to or Generation of Noise in Excess of Established Standards

The first two thresholds of significance examine (1) the extent to which development under the 2014 LRDP would expose people to noise levels that exceed established noise standards or (2) whether development under the 2014 LRDP would generate noise in excess of established noise standards. Because later thresholds address permanent and temporary increases in ambient noise levels in the vicinity of the project site, the evaluation of this threshold focuses on exposure of people within the 2014 LRDP campus sites to noise in excess of established standards.

To assess the extent to which implementation of the 2014 LRDP would expose receptors to noise levels in excess of established standards, future 2014 LRDP activities were evaluated against the policies and programs of the City of San Francisco General Plan Noise Element and the General Plan Guidelines of the State of California. The acceptable noise exposures for land use compatibility published by the State of California, which differ marginally from those of the City of San Francisco, are presented in **Figure 4.10-1**. The noise environment of surrounding land uses proposed under the 2014 LRDP were assessed for compatibility with these standards.

4.10.4.2 Exposure of Persons to or Generation of Groundborne Vibration

Impacts from groundborne vibration during 2014 LRDP construction activities are assessed using vibration damage threshold criteria expressed in PPV for architectural damage. The Caltrans measure of the threshold of architectural damage for conventional sensitive structures is 0.5 in/sec PPV for new residential structures and modern commercial buildings and 0.25 in/sec PPV for historic and older buildings.

Impacts from groundborne vibration during 2014 LRDP construction activities are also assessed for their potential to cause annoyance to adjacent residents. Caltrans vibration annoyance potential criteria characterize vibrations of 0.01 in/sec PPV as "barely perceptible," 0.04 in/sec PPV as "distinctly perceptible," 0.1 in/sec PPV as "strongly perceptible," and 0.4 in/sec PPV as "severe" (Caltrans, 2004).

4.10.4.3 Substantial Permanent Increases in Ambient Noise Levels

The impact assessment of substantial permanent increases in noise levels resulting from development under the 2014 LRDP is based on a combination of existing ambient noise conditions at a given receptor and the incremental increase in noise caused by 2014 LRDP development activities. LRDP development-related noise generally would be associated with increased traffic generation. Guidance on the significance of changes in ambient noise levels is provided by the 1992 findings of the Federal Interagency Committee on Noise (FICON), which assessed the annoyance effects of changes in ambient noise levels resulting from aircraft operations (FICON, 1992). The recommendations are based upon studies that relate aircraft noise levels to the percentage of persons highly annoyed by the noise. The term "annoyance" is a summary measure of the general adverse reaction of people to noise that generates speech interference, sleep disturbance, or interference with the desire for a tranquil environment. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, they are considered applicable to all sources of transportation noise that are described in terms of cumulative noise exposure metrics such as the DNL, as shown in **Table 4.10-2**. The rationale for the Table 4.10-2 criteria is that, as ambient noise levels increase, a small increase in decibel levels is sufficient to cause significant annoyance. The quieter the ambient noise level is, the more the noise can increase (in decibels) before it causes significant annoyance. Thus, the significance of permanent increases in noise levels is evaluated based on the information provided in Table 4.10-2.

Figure 4.10-1
Land Use Compatibility for Community Noise Environment

	Normally Acceptable	Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements
	Conditionally Acceptable	New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features are included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.
	Normally Unacceptable	New construction or development should be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirement must be made and needed noise insulation features included in the design.
	Clearly Unacceptable	New construction or development generally should not be undertaken.

TABLE 4.10-2
MEASURES OF SUBSTANTIAL INCREASE IN TRANSPORTATION NOISE EXPOSURE

Ambient Noise Level Without Project (DNL)	Significant Impact Assumed to Occur if Project Site Development Increases Ambient Noise Levels By:
<60 dB	+ 5.0 dB or more
60-65 dB	+ 3.0 dB or more
>65 dB	+ 1.5 dB or more

NOTES:
DNL = day-night noise level. dB = decibels.

SOURCE: FICON, 1992.

4.10.4.4 Substantial Temporary or Periodic Increases in Noise Levels in the Vicinity of the Campus Sites above Levels Existing without 2014 LRDP Development

Temporary increases in noise levels in the vicinity of a development site are typically the result of site development and construction activities. Assessment of noise from construction activities resulting from development under the 2014 LRDP employs the restrictions established by Sections 2907 and 2908 of the San Francisco Police Code (which also indirectly applies to exposure of people or generation of noise in excess of established standards). These sections of the Police Code limit construction hours. Further, the Police Code prohibits individual pieces of construction equipment from operating at a noise level in excess of 80 dBA at a distance of 100 feet from such equipment. These requirements were used as the basis of analyzing temporary or periodic noise impacts of the proposed development under the 2014 LRDP.

4.10.4.5 Exposure of People to Excessive Airport Noise

The potential for exposure of people to excessive noise from public airports adequately was addressed in the Initial Study and is not evaluated further in this EIR. There are no public airports within two miles of the City and County of San Francisco.

4.10.4.6 Exposure of People to Excessive Noise from Private Airstrip Operations

The only UCSF campus site within two miles of what may be considered a private airstrip is Mission Bay. On completion of the current construction of the Phase 1 Medical Center at Mission Bay, UCSF will operate an active helipad. The proposed UCSF and non-UCSF facilities that would be closest to this helipad will be the proposed buildings constructed under implementation of the 2014 LRDP, including the new housing at the Mission Bay campus site, and existing nearby residential housing. Noise contours for helicopter operations at the Phase 1 Medical Center were developed as part of the analysis of the Phase 1 Medical Center (UCSF 2008 and 2009). The potential for noise exposure to residents of the proposed new housing at the Mission

Bay campus site will be analyzed, considering, among other things, acceptable noise exposures for land use compatibility published by the State of California presented in Figure 4.10-1.

4.11 Population and Housing

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Population and Housing impacts. 2014 LRDP Population and Housing effects are discussed in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures.*

4.11.1 Regional Setting

The City and County of San Francisco would be the primary area affected directly by 2014 LRDP-related population and housing effects. However, effects may extend beyond San Francisco to neighboring counties in the Bay Area. The 2013 UCSF Transportation Commute Survey prepared in support of the LRDP indicates that over half of UCSF students and employees commute from San Francisco, and therefore likely reside in San Francisco. Besides San Francisco, commuters largely travel from four other counties to UCSF campus sites: Alameda, Contra Costa, Marin, and San Mateo. Therefore, the discussion below provides information on San Francisco with additional information on these four counties.

4.11.1.1 Population

In 2010, there were about 805,000 people living in San Francisco. There were approximately 346,000 households in San Francisco, and the average household size was 2.3 persons per household (U.S. Census, 2010). The number of people living in San Francisco increased by about 4% between 2000 and 2010, and during this period the City's population exceeded its prior peak of 780,000 residents recorded in 1951. The City's population in 2013 is estimated to be approximately 825,000, an increase of about 2.5% since 2010 (DOF, 2013). In 2010, the five-county region's population was approximately 4.34 million, an increase of about 5.1% since 2000. The 2013 population for the five-county region is estimated to be 4.44 million, an increase of about 2.3% since 2010 (DOF, 2013).

4.11.1.2 Housing

According to the decennial census, there were 379,900 housing units in San Francisco in 2010 — an increase of 30,400 units since 2000 (U.S. Census, 2010). During the period from 2008 to 2012, San Francisco had an estimated homeowner vacancy rate of 1.4% and rental vacancy rate of 4.3% (U.S. Census, 2012). The five-county region contains a total of approximately 1,742,000 housing units with an average vacancy rate of 6.6%. The estimated household size for the region overall is 2.6 persons per household. San Francisco's population accounts for about 19% of the five-county region's total population. With its housing growth and consistent gains in population over the last 15 years, San Francisco has generally maintained its share of regional population, which represents a marked change from the historical trend of declining regional share.

4.11.1.3 Regional Projections

The Association of Bay Area Governments (ABAG) is the regional planning agency for the nine Bay Area counties and provides projections of future Bay Area population, housing, and employment. In April 2010, ABAG, MTC, the BAAQMD, and the BCDC launched a "One Bay Area" outreach and planning initiative to coordinate efforts among the region's nine counties and 101 towns and cities in the development of an integrated transportation, land use and housing plan. A major effort of the agencies, in partnership with the region's counties, cities and towns, has been the development of "Plan Bay Area" as the region's long-range plan for sustainable land use, transportation and housing. Adopted in July 2013, *Plan Bay Area* is intended to respond to requirements of Senate Bill 375, which requires the Regional Transportation Plan to contain a Sustainable Communities Strategy that integrates land use planning and transportation planning and identifies where the region's population will be housed. The plan will be updated every four years (ABAG, 2013).

Table 4.11-1 shows ABAG's current forecast for San Francisco and the four other counties affected by the LRDP, which was prepared in 2013 for *Plan Bay Area*. The *Plan Bay Area* forecasts show that of the five counties, San Francisco will have the second highest growth in households and jobs over the 2010–2040 planning period. The City's population is expected to increase by 280,490 new residents between 2010 and 2040, which would represent a 35% increase over the City's 2010 population levels. Over the same 30-year period, the five-county region's population is expected to increase by 29%, or by nearly 1.267 million new residents. Household growth is expected to be slightly below population growth, with the number of households in San Francisco increasing by 29% between 2010 and 2040 and households in the five-county region increasing by 26%.

The rate of future job growth in San Francisco is expected to be similar to the rate of population growth. Between 2010 and 2040, San Francisco is expected to add about 191,000 new jobs, which would represent nearly a 34% increase over its 2010 employment levels. Over the same 30-year period, the five-county region's employment is expected to increase by 33%, or by about 685,000 new jobs.

4.11.1.4 University of California, San Francisco

As indicated in Chapter 3, *Project Description*, UCSF currently (2013) has approximately 6,310 students and postdoctoral scholars; 8,090 paid and upaid faculty; and 16,440 full-time equivalent staff.

4.11.2 Regulatory Considerations

Population and housing changes, in and of themselves, are not normally considered to be significant impacts (i.e., substantial, adverse impacts on the physical environment) under CEQA, but CEQA does allow inclusion of these effects as indicators of other impacts. Therefore, this analysis quantifies and describes the magnitude of such potential changes. The potential physical environmental impacts associated with changes in population and housing are analyzed in other sections of this EIR (e.g., transportation, public services, air quality). Direct increases in

TABLE 4.11-1
PLAN BAY AREA FORECAST OF POPULATION, HOUSEHOLDS, AND EMPLOYMENT FOR SAN FRANCISCO AND THE FIVE-COUNTY REGION (2010-2040)

Factor	2010	2040	2010 to 2040	
			Increase	Percent
Population				
San Francisco	805,240	1,085,730	280,490	35%
Alameda	1,510,270	1,987,950	477,680	32%
Contra Costa	1,049,030	1,338,440	289,410	28%
Marin	252,410	285,400	32,990	13%
San Mateo	718,450	904,430	185,980	26%
Five-County Region	4,335,400	5,601,950	1,266,550	29%
Households				
San Francisco	345,810	447,350	101,540	29%
Alameda	545,140	705,330	160,190	29%
Contra Costa	375,360	464,150	88,790	24%
Marin	103,210	112,050	8,840	9%
San Mateo	257,840	315,090	57,250	22%
Five-County Region	1,627,360	2,043,970	416,610	26%
Employment				
San Francisco	568,720	759,500	190,780	34%
Alameda	694,450	947,650	253,200	36%
Contra Costa	344,920	467,390	122,470	36%
Marin	110,730	129,140	18,410	17%
San Mateo	345,200	445,080	99,880	29%
Five-County Region	2,064,020	2,748,760	684,740	33%

NOTE: Numbers may not sum due to rounding

SOURCE: ABAG and MTC, Plan Bay Area: Strategy for a Sustainable Region, Final Forecast of Jobs, Population, and Housing, July 2013.

employment can create secondary impacts, such as an increased demand for housing. This housing demand would be considered a significant effect if the housing demand could not be met with existing or future housing supply within the housing market for new UCSF students and employees. While the development of housing itself would not be a significant adverse impact, construction of housing could create other short-term environmental impacts, such as air quality or noise impacts.

4.11.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

d) Exceed the LRDP EIR standard of significance by creating a demand for housing outside the market area where the facilities or site are located?

Regarding criteria b) and c), the Initial Study concluded that implementation of the 2014 LRDP would clearly result in no impact or a less-than-significant impact. Therefore, these criteria are not discussed further in the EIR.

4.11.4 Analysis Methodology

The analysis estimates the amount of population and related housing needs that would result from implementation of the 2014 LRDP. To evaluate the relative magnitude of the increases in population and housing needs resulting from implementation of the 2014 LRDP, the analysis compares these estimates with growth estimates developed for both the City and the entire five-county region. "Substantial" growth resulting from implementation of the 2014 LRDP is defined as increases in population or employment that are unplanned, i.e., are inconsistent with growth anticipated in planning documents.

4.12 Public Services

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Public Services impacts. 2014 LRDP Public Services effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Public Services effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.12.1 Regional Setting

The study area is defined as the four UCSF main campus sites and surrounding areas for which the 2014 LRDP development activities are proposed and which are relevant to the public services under discussion. The campus sites in the study area include Parnassus Heights, Mission Bay, Mount Zion, and Mission Center.

4.12.1.1 Fire Protection

UCSF does not have its own fire department. The San Francisco Fire Department (SFFD), headquartered at 698 Second Street, provides fire protection and emergency services to the City of San Francisco, as well as to all UCSF facilities within the City. SFFD serves an estimated 1.5 million people within the 49 square miles of the city. Emergency medical transportation to San Francisco hospitals is provided by a dynamically deployed fleet of both public and private ambulance services.

Fire suppression companies are organized into two divisions, which are further divided into nine battalions, located throughout the City (SFFD, 2013b). As of 2013, the SFFD consists of 1,500 firefighting and emergency medical field personnel and resources include 44 Engine companies, 19 Truck companies, a dynamically deployed fleet of Ambulances, two Heavy Rescue Squad units, two Fireboats and multiple special purpose units. The Airport Division is comprised of three firefighting stations and seven companies located at the San Francisco International Airport (SFFD, 2013b).

The San Francisco Public Utilities Commission-City Distribution Division operates and maintains an Auxiliary Water Supply System (AWSS) used for fire protection use only. This high pressure water supply system is distinct and separate from the City's domestic water and fire hydrant system. The AWSS consists of 150 miles of 8- to 20-inch diameters mains, 1,550 special hydrants, a high elevation water reservoir and two large water tanks, emergency saltwater pump stations, and series of underground cisterns. The two AWSS emergency saltwater pumping stations (located at Second and Townsend streets and at Fort Mason) each have a pumping capacity of 10,000 gallons per minute (gpm) to supplement the AWSS with saltwater.

Each UCSF campus site is assigned a designated station that responds to university-related calls.

- **Parnassus Heights campus site:** Station 12, located at 1145 Stanyan Street, 0.5 mile from the campus core.
- **Mission Bay campus site:** Station 8, located approximately 1.5 miles north of the campus site at 36 Bluxome Street.
- **Mount Zion campus site:** Station 10, located 0.5 mile west at 655 Presidio Avenue.
- **Mission Center campus site:** Station 7, located at 2300 Folsom Street, 0.5 mile south of the campus site.

Other stations in proximity to each campus site include:

- **Parnassus Heights:** Station 20 at 285 Olympia Way (1.5 miles); Station 22, at 1290 16th Avenue (1.0 mile); and Station 24 at 100 Hoffman Avenue (2.0 miles).
- **Mission Bay:** Station 29 at 299 Vermont Street (0.8 miles); and Station 37 at 798 Wisconsin Street (1.1 miles).
- **Mount Zion:** Station 5 at 1301 Turk Street (0.9 miles); Station 21 at 1443 Grove Street (0.8) miles; and Station 38 at 2150 California Street (0.8) miles.
- **Mission Center:** Station 6 at 135 Sanchez Street (1.3 miles); Station 29 at 299 Vermont Street (0.8 miles); and Station 36 at 109 Oak Street (1.3 miles).

Table 4.12-1 provides a summary of the staffing and equipment for each of the four designated response stations.

TABLE 4.12-1
SUMMARY OF EXISTING SFFD STAFFING AND EQUIPMENT IN 2014 LRDP AREA

SFFD Designated Fire Station	Staffing per Shift	Total Members	Fire Engines/ Trucks
Parnassus Heights No. 12: Stanyan St./Grattan St.	9	32	E12 T12
Mission Bay No. 8: Bluxome St./4th St.	10	35	E08 T08
Mount Zion No. 10: Presidio Ave./Bush St.	9	32	E10 T10
Mission Center No. 7: Folsom St./19th St.	15	53	E07 T07

Table 4.12-2 summarizes SFFD responses at the four designated response stations in the year from August 2012 to August 2013.

TABLE 4.12-2
SUMMARY OF SFFD RESPONSES FOR FIRE STATIONS IN PROJECT AREA (AUGUST 2012 TO AUGUST 2013[a])

SFFD Fire Station No.	Fire Responses	Medical Responses	Total Responses
12	1,278	2,521	3,799
8	2,039	6,179	8,218
10	1,975	3,200	5,175
7	3,144	11,335	14,479

SOURCE: San Francisco Fire Department, 2014.

Fire Support Standards

Emergency calls for fire and medical services at UCSF campus sites are routed to the SFFD for dispatching. Response times generally reflect the seriousness of the call. As of 2013, the SFFD has a response time goal for the first arriving unit of 5:00 minutes, while actual response times averaged 4:52 minutes (SFFD, 2013b).

4.12.1.2 Police Services

University of California Police Department

The UC Police Department (UCPD) provides police protection services for University of California properties and facilities that comprise UCSF. The UCPD is responsible for approximately 38,600 patients, visitors, students, faculty, staff and affiliates. Headquartered at 654 Minnesota Street, just south of the Mission Bay campus site, the UCPD employs approximately 120.5 authorized staff. UCPD headquarters is approximately 4 miles from Parnassus Heights, 0.25 miles from Mission Bay, and 4.1 miles from Mount Zion. UCPD operates a patrol station at both the Parnassus Heights and Mission Bay campus sites, and UCPD has offices in the Mission Center building.

The UCPD is comprised of the Field Services Division, which provides police and investigative services, the Technical Services Division, the Professional Standards Division, and the Homeland Security and Emergency Management Division.

As of 2012, the service ratio of police personnel to UCSF population is 1.9 sworn police officers per 1,000 persons (UCPD, 2012). Police officers patrol by car, bicycle and on foot to maintain high-profile, proactive and preventive public safety services (UCPD, 2014). In 2012, UCSF police responded to 49,883 calls for service and processed 313 arrests. UCSF police also conducts Community Oriented Policing and Problem Solving (COPPS) activities, in which the police work with community members to fight crime, of which 3,094 activities were conducted in 2012 (UCPD, 2012).

San Francisco Police Department

The San Francisco Police Department (SFPD) is responsible for police protection services in the City and County of San Francisco. The UCPD has a mutual-aid agreement with the SFPD to provide cooperative assistance within a 1-mile radius of each UCSF campus site. A memorandum of understanding between the UCPD and the SFPD establishes that UCPD has exclusive jurisdiction over police service on UCSF properties. Depending on the nature of the emergency, the UCPD may request assistance from the SFPD (UCSF, 2005).

SFPD is comprised of the Patrol Division, Airport Division, Investigations Division, Homeland Security Department, and Administrative Division. The Patrol Division is divided into the Metro Division and the Golden Gate Division, which oversee ten separate districts. The Golden Gate Division districts encompass the Parnassus Heights, Mission Bay, and Mount Zion campus sites.

The Mission Center campus site falls within the jurisdiction of the Metro Division and is located in the Mission District, headquartered at 630 Valencia Street. The Parnassus Heights campus site is located in the Park District, headquartered at 1899 Waller Street. The Mount Zion campus site is located in the Richmond District, headquartered at 461 6th Avenue. The Mission Bay campus site is located within the Bayview District, headquartered at 201 Williams Street.

In 2011, the City broke ground on a new Public Safety Building in Mission Bay, located at Third Street and Mission Rock Street, which is scheduled to be operational in late 2014. The Public Safety Building will house a new fire station and also serve as the new home of the SFPD Headquarters and Southern District Station.

The SFPD is mandated by the City Charter to maintain a sworn staff of 1,971, excluding officers assigned to the San Francisco International Airport and officers not available for field duty (e.g., due to on-duty injuries, temporary modified duty, medical leave, and administrative leave). During 2012, the Department averaged 1,644 total full-duty sworn officers (SFPD, 2012). In 2012, the SFPD changed how it assigned its officers to ensure adequate staff would be available to provide minimum safety services, as well as to staff special events and deploy officers to meet unexpected needs when services require “all hands,” such as during the month of October 2012 when multiple major events were held in the city. Throughout 2012, days off were cancelled and/or shifts modified in order to meet the needs of the SFPD (SFPD, 2012). In order to address the anticipated retirement of over 100 sworn officers in mid-2013, the SFPD drafted a six-year hiring plan, approved by the Mayor, which will return the SFPD to its Charter-mandated staffing level of 1,971 sworn officers (SFPD, 2012).

San Francisco Sheriff’s Department

The San Francisco Sheriff’s Department (SFSD) manages the San Francisco County Jail and protects City-owned critical infrastructure. In addition, the SFSD augments law enforcement at the request of the SFPD.

California Highway Patrol

The California Highway Patrol (CHP) provides law enforcement services on state highways including the San Francisco-Oakland Bay Bridge. The San Francisco CHP station is located at 455 Eighth Street in San Francisco.

4.12.1.3 Public Schools

San Francisco Unified School District

The San Francisco Unified School District (SFUSD) operates San Francisco's public schools. During the 2011–2012 academic year, the SFUSD managed 115 schools (73 elementary schools, 16 middle schools, 18 high schools, six alternative schools, and two continuation schools), with a total enrollment of approximately 56,200 (EDP, 2014).

In general, student enrollment within the SFUSD has steadily decreased since the late 1990s. However, enrollment has begun to increase since reaching a low of approximately 55,100 during the 2007–2008 academic year (CDE, 2014). The SFUSD anticipates that elementary school enrollment will grow due to the large birth rates earlier in the decade. Middle school enrollment is anticipated to rise as well, but remain below current enrollment in 2013. High school enrollment will experience a continuous decline through 2013 due to the declining births of the 1990s (SFUSD, 2014). There are multiple schools that serve each campus site; the current enrollment and historic enrollment trends are discussed below.

Schools serving the area around the Parnassus Heights campus site include Alice Fong Yu Alternative School (K-8) at 1541 12th Avenue, Clarendon Alternative Elementary School (K-5) at 500 Clarendon Avenue, Grattan Elementary School (K-5) at 165 Grattan Street, Everett Middle School (6-8) at 450 Church Street, and Mission High School (9-12) at 3750 18th Street. Enrollment at Alice Fong Yu Alternative School has increased steadily over the last decade from 486 students to 574 students during the 2012-13 school year. Clarendon Alternative Elementary School experienced a steady decrease with a low of 528 students during the 2008-09 academic year, then reaching 585 students in 2012-13. Over the last decade, Grattan Elementary School has increased significantly from 254 students to 390 students in 2012-13, with rapid growth over 5 percent per year from 2007 to 2010. Everett Middle School has generally declined in enrollment, from 588 to a low point of 341 students during the 2010-11 school year, at which point, enrollment began to increase reaching 406 in 2012-13. Enrollment at Mission High School has fluctuated over the years, with a high of 978 students and a low of 835 students, and currently has 927 students enrolled (EDP, 2014).

Schools serving the area around the Mission Bay campus site include Bessie Carmichael/Filipino Education Center School (K-5) at 375 Seventh Street and 824 Harrison Street (6-8), Daniel Webster (elementary) located at 465 Missouri Street, and International Studies Academy at 655 De Haro Street. Enrollment at Bessie Carmichael averaged fewer than 400 students during the 1990s through the 2004–2005 academic year, when the school served kindergarten through 5th grades. Grades 6 through 8 were subsequently added to the school during the period from 2005 through 2008. Approximately 648 students are enrolled for the 2012–2013 academic year.

Enrollment at Daniel Webster also declined during the early 2000s, but has steadily increased since 2007–2008. Approximately 262 students are enrolled for the 2012–2013 academic year. Around 400 students are currently enrolled at International Studies Academy (EDP, 2014).

Schools serving the area around the Mount Zion campus site include Dr. William L. Cobb Elementary School (PK-5) at 2725 California Street, Rosa Parks Elementary School (K-5) at 1501 O'Farrell Street, Theodore Roosevelt Middle School (6-8) at 460 Arguello Boulevard, and Raoul Wallenberg Traditional Alternative High School (9-12) at 40 Vega Street. Dr. William L. Cobb Elementary School has fluctuated in enrollment over the last decade from 195 students to a low of 167; in the 2012-13 school year when 201 students were enrolled. Rosa Parks Elementary School increased significantly from 246 students to 369 students in the 2006-07 school year, at which point, enrollment growth slowed; 411 students were enrolled from 2012-13. Theodore Roosevelt Middle School has steadily decreased over the years from 787 students in 2003-04 to 710 students from 2012-13. Raoul Wallenberg Traditional Alternative High School has remained relatively consistent since 2003, with a low of 613 students enrolled and a current enrollment around 637 students (EDP, 2014).

Schools serving the area around the Mission Center campus site include Marshall Elementary School (K-5) at 1575 Fifteenth Street**,** Everett Middle School (6-8) at 450 Church Street, Mission High School (9-12) at 3750 Eighteenth Street, and John O'Connell High School (9-12) at 2355 Folsom Street. Marshall Elementary decreased from 228 students to 214 students in 2006-07 and then increased to 249 students by 2012-13. As discussed above, Everett Middle School has generally declined in enrollment, from 588 in 2003-04 to 406 in 2012-13, and Mission High School has fluctuated over the years from a high of 978 students and a low of 835 students. John O'Connell High School has decreased significantly over the last decade from 932-students in 2003-04 to 449 students in 2012-13.

As discussed in Section 3, *Project Description*, Block 14 of the Mission Bay campus site is currently reserved for use by the SFUSD as a public school site. Per the agreements through which the Mission Bay campus site was acquired by the Regents, the SFUSD has until 2027 to request conveyance of the 2.4-acre site for use as a school. If the SFUSD does not request Block 14 during that timeframe, UCSF may then develop Block 14 for its own use after the necessary planning, environmental review, and amendment of the LRDP.

4.12.1.4 Parks

Effects on local and regional parks are discussed in Section 4.13, *Recreation*.

4.12.2 Regulatory Considerations

4.12.2.1 California Master Mutual Aid Agreement

The California Master Mutual Aid Agreement is a framework agreement between the State of California and local governments for aid and assistance by the interchange of services and facilities, including but not limited to fire, police, medical and health, communication, and transportation

services and facilities to cope with the problems of rescue, relief, evacuation, rehabilitation, and reconstruction.

Fire Regulations

All projects undertaken at UCSF are subject to the approval of the State Fire Marshal and compliance with California Health and Safety Code Sections 13000 et seq. which sets forth State fire regulations concerning building standards (as set forth in Title 24 of the California Building Code), fire protection and notification systems, fire protection devices (such as fire extinguishers and smoke alarms), high-rise building and child care facility standards, and fire suppression training. California Fire Code Section 403.2 addresses public safety for both indoor and outdoor gatherings, including emergency vehicle ingress and egress, fire protection, emergency medical services, public assembly areas and the directing of both attendees and vehicles (including the parking of vehicles), vendor and food concession distribution, and the need for the presence of law enforcement and fire and emergency medical services personnel at the event. The Fire Marshal's office has review and approval authority over all development proposals on the UCSF campus sites.

Police Regulations

As noted above, the UCPD has a mutual-aid agreement with the SFPD to provide cooperative assistance within a 1-mile radius of each UCSF campus site. A memorandum of understanding between the UCPD and the SFPD establishes that UCPD has exclusive jurisdiction over police service on UCSF properties (UCSF, 2005).

Projects implemented under the 2014 LRDP would be required to comply with applicable rules of the California Office of Statewide Health Planning & Development (OSHPD) with respect to the incorporation of security features in standard building design plans.

Schools

The University is not subject to fee requirements such as those paid by developers pursuant to California Government Code Sections 53080, 65995, and 66001.

4.12.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

   i) Fire protection?
   ii) Police protection?
   iii) Schools?
   iv) Parks?
   v) Other public facilities?

4.12.4 Analysis Methodology

Implementation of the proposed 2014 LRDP could have a significant impact if (1) it would require the construction of new or physically altered governmental facilities in order to maintain acceptable levels of public services, and (2) the construction or alteration of such facilities would result in one or more substantial adverse impacts on the environment.

In general, development that would occur on UCSF campus sites under the 2014 LRDP would increase demand for public services. While some impacts would result from on-campus activities, such as new buildings requiring additional fire coverage, other impacts would occur with the increase in population in surrounding communities.

While the 2014 LRDP includes space at the Mission Bay campus site that may be considered for UCSF police services in the future, the potential for impacts on public services is analyzed at the program level. With respect to specific projects, UCSF would determine the appropriate level of environmental review when more detailed plans become available.

Public service providers that would be affected by the changes in the 2014 LRDP were consulted to determine if new facilities would need to be built, or existing facilities would need to be expanded, in order to maintain current levels of service, including response times, service ratios and other performance objectives. If new or altered public service facilities are determined to be required to serve the 2014 LRDP planning area, then the analysis evaluates whether construction of such facilities would have a substantial adverse physical impact on the environment. For example, if the SFPD determined that a new police station would be required to be constructed to maintain adequate service levels for law enforcement, the impact analysis would evaluate whether construction or operation of the new police station would have significant impacts on the physical environment.

For purposes of the impact analysis, it is assumed that all temporary and permanent improvements would be designed and constructed in compliance with all applicable building and fire codes, which include requirements for fire alarms, security systems, smoke detectors, sprinkler systems, fire extinguishers, and the number and location of exits.

4.13 Recreation

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Recreation impacts. 2014 LRDP Recreation effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Recreation effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.13.1 Regional Setting

In addition to UCSF, additional agencies that own and manage recreation facilities on and near the UCSF campuses include: the San Francisco Recreation and Park Department, and the agencies that manage the Mission Bay Park System.

4.13.1.1 UCSF Recreation Facilities

Parnassus Heights

The Parnassus Heights campus site features three primary areas with open space and recreation opportunities. The campus has several plazas of various sizes, including Saunders Court, which is considered the primary designed open space on campus. In addition, the Millberry Fitness and Recreation Center is the primary recreational facility for students, staff, and neighbors of the Parnassus Heights campus site. The Center offers a full gym, indoor pool, spinning studio, and fitness classes.

Mount Sutro Open Space Reserve

The University-owned Mount Sutro Open Space Reserve consists of 61 acres of largely undeveloped forest located near the geographical center of San Francisco. The Reserve is surrounded by the UCSF campus to the north and northwest, and by urban residential neighborhoods to the south, east and west. In addition, the Interior Greenbelt natural area, owned by the City and County of San Francisco, is adjacent to the east side of Reserve. The Reserve is open to the general public.

Mission Bay

Koret Quad is located near the center of the Mission Bay campus site, and serves as a public plaza and open space, with large lawn areas surrounded by shade trees. The Bakar Fitness and Recreation Center is located in the center of campus, in the William J. Rutter Center complex, and offers a variety of indoor and outdoor athletic activities for students, faculty, staff, and the public.

4.13.1.2 City and County of San Francisco

The San Francisco Recreation and Park Department (SFRPD) maintains more than 200 parks, playgrounds, and open spaces throughout the City. The City's park system also includes 15 recreation centers, nine swimming pools, and five golf courses, as well as tennis courts, ball diamonds, athletic fields and basketball courts. The SFRPD manages the Marina Yacht Harbor, Candlestick Park, the San Francisco Zoo, and the Lake Merced complex. In total, the SFRPD currently owns and manages roughly 3,400 acres of parkland and open space. Together with other City properties and state and federal open space properties within the City, about 5,250 acres of recreational resources (consisting of a variety of parks, walkways, landscaped areas, recreational facilities, playing fields, and unmaintained open areas) serve San Francisco (SFPD, 2011).

Within San Francisco, publicly accessible open spaces and recreational facilities are categorized according to their size and particular amenities as serving the City, district, neighborhood, or sub-neighborhood (a smaller area within an established neighborhood). Several larger open space areas, including Golden Gate Park (1,017 acres), the Lake Merced complex (700 acres; including the 368-acre lake) and John McLaren Park (317 acres) comprise about one half of the total City-owned acreage in recreational use. Unlike neighborhood facilities, these larger facilities provide programs, activities and recreational opportunities that serve the City as a whole.

In addition to the larger open spaces, SFRPD land comprises more than 100 parks and recreational facilities (both outdoor and indoor), which function mainly for neighborhood use. These smaller facilities are primarily used by residents in the immediate surrounding area and are categorized by size and intended service area. District-serving parks are generally larger than 10 acres and have a service area consisting of a three-eighths-mile radius around the park, while neighborhood-serving parks are generally one to 10 acres and have a service area of one-quarter mile. Sub-neighborhood-serving open spaces, often referred to as mini parks, are too small to accommodate athletic facilities and have a service area of one-eighth of a mile.

4.13.1.3 National Parks

The Golden Gate National Recreation Area (GGNRA) includes over 80,000 acres and more than two dozen natural, historic, and cultural sites interspersed throughout the San Francisco and Bay Area from northern San Mateo County to southern Marin County and parts of San Francisco. The GGNRA includes Muir Woods National Monument, Alcatraz, the Presidio of San Francisco, and the Marin Headlands, among other sites.

4.13.2 Regulatory Considerations

4.13.2.1 UCSF Physical Design Framework

The UCSF *Physical Design Framework* describes the vision for the physical development of UCSF campus sites, serving as the foundation for the planning and designing of future projects. The *Physical Design Framework* includes a goal to expand the open space network at the Parnassus Heights campus site by renovating Saunders Court, creating new open spaces and

accommodating a wider variety of activities. For the Mission Bay campus site, the framework includes goals to complete the Open Space Network, and enhance the Campus Core (Koret Quad).

4.13.2.2 Mission Bay Campus Master Plan and Design Guidelines

The Mission Bay Campus Master Plan and Design Guidelines provides the framework for the development of the UCSF Mission Bay campus site, including 160,000 gsf of support space allocated to outdoor recreation, fitness, childcare and food services.

4.13.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

b) Include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?

4.13.4 Analysis Methodology

This analysis focuses on (1) how the implementation of the 2014 LRDP would affect the demand for regional and City parks and recreational facilities in the vicinity of the LRDP planning area, and (2) the impacts of construction of recreational facilities under the proposed 2014 LRDP. Consideration is given to whether the 2014 LRDP includes features that would reduce the demand for off-site recreation and park services (e.g., on-site recreation facilities or land dedication).

4.13.4.1 Assessment of Impacts to Existing On-Campus Recreation Facilities

The analyses of general impacts to on-campus recreation are based on a programmatic, qualitative analysis of whether the 2014 LRDP continues to address maintenance and expansion of such resources. The severity of impacts to recreational facilities is addressed using measurements such as population increase and condition.

4.13.4.2 Assessment of Impacts to Existing Off-Campus Recreation Facilities

Direct impacts resulting from population growth on campus sites with housing (i.e., Parnassus Heights and Mission Bay) would primarily affect campus facilities and adjacent recreation facilities. However, induced growth associated with the 2014 LRDP may result in impacts to surrounding communities and their recreation facilities. Analysis of recreation effects primarily considers such factors as park accessibility, location, maintenance, capacity, and usability.

4.13.4.3 Assessment of Impacts of Proposed Recreational Facilities

The analysis considers the environmental impacts of construction of the recreational facilities proposed by the 2014 LRDP. Impacts of constructing these facilities and, as needed, mitigation measures and other regulatory requirements, are discussed below as well as in other chapters of this EIR as listed in the impact analyses for each campus site.

4.13.5 References

San Francisco Planning Department (SFPD), *Draft Update of the Recreation and Open Space Element*, November 2013. Available online at: http://openspace.sfplanning.org/docs/Recreation_and_Open_Space_Element_NOVEMBER_2013.pdf, accessed on February 5, 2014.

4.14 Transportation and Traffic

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Transportation and Traffic impacts. 2014 LRDP Transportation and Traffic effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Transportation and Traffic effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.14.1 Regional Setting

4.14.1.1 Regional Roadway Network

Regional roadway access to the UCSF campus sites is provided by several major regional freeways and roadways, as discussed below.

Interstate 80 (I-80) is located approximately three miles east of the Parnassus Heights campus site, about one mile northwest of the Mission Bay campus site, about two mile southeast of the Mount Zion campus site, and about half a mile northeast of the Mission Center campus site. I-80 connects San Francisco to the East Bay and other points to the east of the City via the San Francisco-Oakland Bay Bridge.

U.S. Highway 101 (U.S. 101) is located approximately two miles east of the Parnassus Heights campus site, about one mile west of the Mission Bay campus site, about one mile east of the Mount Zion campus site, and one block north of the Mission Center campus site. U.S. 101 connects San Francisco with the Peninsula and the South Bay to the south, and with the North Bay to the north via the Golden Gate Bridge. U.S. 101 connects to I-80 north/northeast of the Mission Bay campus site. Within the northern part of San Francisco, U.S. 101 operates on surface streets (i.e., Van Ness Avenue and Lombard Street).

State Highway 1 (19th Avenue) is located approximately one mile west of the Parnassus Heights campus site, connecting San Francisco to the North Bay via the Golden Gate Bridge and to the South Bay via a connection to I-280 south of the Parnassus Heights campus site. Within the study area, 19th Avenue has six lanes, with left turns prohibited at most intersections.

Interstate 280 (I-280) is located adjacent to the Mission Bay campus site to the west and connects San Francisco to the South Bay. I-280 connects to U.S. 101 south of the Mission Bay campus site. Access to I-280 is provided at the on-and off-ramps at Mariposa and Eighteenth streets.

4.14.1.2 Regional Transit Service

Golden Gate Transit. The Golden Gate Bridge, Highway, and Transportation District operates Golden Gate Transit (GGT), which provides bus and ferry service between the North Bay (Marin and Sonoma counties) and San Francisco. GGT operates 22 commuter bus routes, nine basic bus routes, and 16 ferry feeder bus routes into San Francisco. Bus routes operate at headways of 15 to 90 minutes depending on time and day of week and bus type. Golden Gate Transit also operates ferry service between the North Bay and San Francisco, connecting Larkspur and Sausalito with the Ferry Building during the morning and evening commute periods. Golden Gate Transit riders would need to transfer to Muni to access the Parnassus Heights, Mission Bay, Mount Zion, or Mission Center campus sites.

Alameda-Contra Costa County Transit District (AC Transit). AC Transit operates bus service in western Alameda and Contra Costa Counties, as well as routes to the City of San Francisco and San Mateo County. AC Transit operates 33 "Transbay" bus routes between the East Bay and the Temporary Transbay Terminal, temporarily located at Howard Street and Beale Street. The Temporary Transbay Terminal is accessible from the Parnassus Heights campus site via Muni. The majority of Transbay service is provided only during commute periods in the peak direction of travel, with headways between buses from 15 to 20 minutes. The peak direction of service is into San Francisco during the AM peak period and out of San Francisco during the PM peak period. All-day service is provided on a few lines, with headways of approximately 30 minutes. AC Transit riders need to transfer to Muni to access the Parnassus Heights, Mission Bay, Mount Zion, or Mission Center campus sites.

San Mateo County Transit District (SamTrans). SamTrans operates bus and rail service in San Mateo County. A few SamTrans routes also serve the Temporary Transbay Terminal in downtown San Francisco, including Routes 292, 391, and 397. Route 292 makes San Francisco stops along Potrero Avenue and Mission Street throughout the day. AM peak hour headways are between 10 and 15 minutes, and PM peak hour headways are 20 minutes. Routes 391 and 397 run along Mission Street in San Francisco but stop only at the Temporary Transbay Terminal. Route 391 operates only during the peak travel periods with 15 minute headways; Route 397 is a late night service route with headways of one hour. SamTrans riders need to transfer to Muni or UCSF shuttle to access the Parnassus Heights, Mission Bay, Mount Zion, or Mission Center campus sites.

Bay Area Rapid Transit (BART). BART provides regional commuter rail service between San Francisco and the East Bay (Pittsburg/Bay Point, Richmond, Dublin/Pleasanton and Fremont), as well as between San Francisco and San Mateo County (SFO Airport and Millbrae). Weekday hours of operation are between 4 AM and midnight. During the weekday PM peak period, headways are 5 to 15 minutes along each line. Within San Francisco, BART operates underground along Market Street to Civic Center Station where it turns south through the Mission District towards Daly City. The closest BART station to the Parnassus Heights campus site is the Civic Center BART station, which is accessible via Muni or UCSF shuttle, as are the Mission Bay, Mount Zion, or Mission Center campus sites.

Caltrain. Caltrain provides passenger rail service on the Peninsula between San Francisco and Downtown San Jose with several stops in San Mateo County and Santa Clara County. Limited service is available south of San Jose. Caltrain service headways during the AM and PM peak periods are 10 to 60 minutes, depending on the type of train. The peak direction of service is southbound during the AM peak period and northbound during the PM peak period. Caltrain service terminates at the San Francisco Station at Fourth and King streets (Fourth/ King station). The Fourth/King station is served by local, limited, and express "Baby Bullet" trains that are accessible from the Parnassus Heights, Mission Bay, Mount Zion, or Mission Center campus sites via Muni or UCSF shuttle.

Caltrain is proposing to implement a Modernization Program that will electrify the railway to provide upgraded performance and allow more efficient operations and a higher capacity (scheduled to be complete by 2019). Currently, Caltrain crosses Sixteenth Street at-grade at the intersection of Sixteenth Street/Seventh Street/Mississippi Street. There are currently 10 trains per hour during peak periods, and the Modernization Program will allow the number of trains to increase to 12 trains per hour. Additionally, Caltrain is anticipating a "blended system", with California High Speed Rail trains running alongside Caltrain on the same tracks. The blended system may require a grade separation at Sixteenth/Seventh/Mississippi streets. Electrification of Caltrain (and the associated improved travel times and frequencies), as well as the introduction of High Speed Rail, may improve transit access for the Mission Bay campus site.

4.14.1.3 UCSF Transportation Demand Management Plan (TDM)

There are many different factors that determine how people travel to/from work, including home location, work shifts, access to transit, and travel incentives and disincentives (e.g., how convenient or costly it is to park). A TDM program is a set of policies and programs that include incentives, information, and education to encourage employees to commute to work by modes other than driving alone. The UCSF TDM program includes strategies that emphasize alternative commuting options, such as public transit, private shuttle service, biking, walking, and carpooling. The key elements of the UCSF TDM program are summarized in **Table 4.14-1**.

4.14.1.4 UCSF Shuttle System

The core element of UCSF's TDM plan is the shuttle service that UCSF operates throughout San Francisco. The shuttle system fleet (currently 60 shuttles) provides service between transit facilities, remote parking lots, the various UCSF campus sites, and UCSF-affiliated hospitals / medical centers within the City. The primary shuttle routes serve the Parnassus Heights, Mission Bay, Mission Center, San Francisco General Hospital, Mount Zion and Laurel Heights campus sites. Service includes 13 fixed-route lines and two on-demand evening services. Fixed-route shuttle headways are generally between 15 to 25 minutes, and most routes operate between 6:00 AM and 9:00 PM, Monday through Friday. The two on-demand services operate both weekday and weekend nights. Riders can request on-demand service within a pre-defined border around the Parnassus Heights and Mission Bay campus sites by calling UCPD dispatch. All shuttle buses are equipped with bike racks, and many are equipped with WiFi. The service is free for UCSF faculty, staff, students, patients, and visitors.

TABLE 4.14-1
EXISTING UCSF TDM PROGRAM ELEMENTS

TDM Strategy	Description
Annual Transportation Survey	Annual employee and student survey to learn more about travel to, from, and within UCSF campus sites
Bicycle Racks	Total of approximately 970 bike stalls distributed throughout campus sites with capacity exceeding demand, with one exception – Parnassus Heights campus site
Showers and Lockers	Showers and lockers are provided at various campus sites, which can be used by bicyclists
Bicycle Permits	Free bicycle permits are provided, allowing free access to enclosed bicycle parking facilities; free tire repair kits; bike fix-it stations available at Parnassus and Mission Bay campus sites; discounted SF Bike Coalition membership.
Shuttle	UCSF shuttle system serving all main campus sites
Priced Permit Parking	UCSF offers over 30 varieties of parking permits to employees, students and departments. The price of individual permits range from $20 to $161 per month. Departmental permits are $266 per month. A limited number of permits are issued per year and are distributed based on a prioritization hierarchy
Priced Visitor Parking	UCSF offers short-term visitor parking. Both hourly and daily rates are available
City Carshare	UCSF staff and students qualify for personal memberships at a discounted rate; 18 City Carshare vehicles are available at various campus sites.
Pre-Tax Program	The Pre-Tax program allows employees to reduce their public transit and non-UCSF vanpool costs by about one-third. The program works by allowing participants to deduct up to $125 per month from their paycheck without paying payroll taxes on this income
Carpool Parking	Preferential parking for UCSF employees with a valid carpool permit
Zimride	UCSF-specific Zimride (ride sharing) website
Emergency Ride Home	Employees who need an emergency ride home can be reimbursed up to $50 for a transit, taxi or rental car trip
Telecommuting Policy	Determined by job position/requirements and Department
Vanpool Program	The vanpool program requires a minimum of eight participants per vanpool. The driver participates for free and the riders pay about $240 per month per person, Currently, there are 33 vanpools that travel throughout the Bay Area, and as far as Sacramento.

SOURCE: UCSF Staff, 2013

The seated per-vehicle capacity of the shuttle buses (Blue, Tan, Black, Purple, Green, Pink, Bronze, Yellow, Lime, Red, Grey, Gold and VA lines) varies from 22 to 33 persons. The capacity utilization of the shuttle program is as follows: four lines (Grey, Blue, Gold, and Black) operate above 100 percent capacity during the AM peak period, the Tan line operates above 100 percent capacity in the midday period, and five lines (Bronze, Tan, Gold, Grey, and Black) operate above 100 percent capacity during the PM peak period. Of these instances, the highest ridership was found on the Grey and Blue lines in the AM peak period, and the Yellow and Tan lines in the PM peak period, where capacity utilization is above 120 percent for one or more hours. The following UCSF shuttle lines operate below 50 percent capacity during part or all of the day:

- Lime line during all times but the PM peak;
- Black, Gold, and Tan lines during the evening;
- Grey line midday; and
- Purple line during all times.

4.14.2 Regulatory Considerations

UCSF is situated on land that is owned or controlled by the Regents of the University of California. As such, UCSF generally is exempted by the federal and state constitutions from compliance with local land use regulations, including general plans and zoning. Specifically, transportation improvements or modifications required to mitigate impacts of the 2014 LRDP to roadways under the authority of the City of San Francisco would be responsibility of the City, and would need to be approved by the applicable City agencies. However, as stated in Section 3.4.1.1, it is a LRDP objective that UCSF consults and coordinates on a regular basis with the City (e.g., the Planning Department, Municipal Transportation Agency, Department of Public Works, and Office of Community Investment and Infrastructure) when planning new development, especially if improvements are being proposed within City rights-of-way adjacent to campus sites.

4.14.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a) Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

e) Result in inadequate emergency access?

f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

g) Exceed the applicable LRDP EIR standard of significance by causing substantial conflict among autos, bicyclists, pedestrians, and transit vehicles?

Regarding criterion c), after evaluation of the activities proposed by the 2014 LRDP, the Initial Study concluded that 2014 LRDP activities would clearly result in no impact or a less-than-significant impact at all campus sites. Therefore, this criterion is not discussed further in the EIR.

4.14.3.1 Analysis Methodology

Below is a list of thresholds of significance used by UCSF to assess whether the 2014 LRDP would result in significant impacts to the transportation network.

Traffic

Signalized Intersections – a significant impact would occur if:

- LRDP traffic causes intersection LOS D or better to deteriorate to LOS E or F.
- LRDP traffic causes intersection LOS E to deteriorate to LOS F.
- LRDP increases traffic by five percent on critical movements operating at LOS E or F of an intersection operating at LOS E or F under Existing conditions.

Unsignalized Intersections – a significant impact would occur if:

- LRDP traffic causes the LOS at the worst approach to deteriorate from LOS D or better to LOS E or F and Caltrans signal warrants would be met.
- LRDP traffic causes Caltrans signal warrants to be met when the worst approach is already operating at LOS E or F.
- LRDP adds traffic to an intersection that operates at LOS E or F under Existing conditions and makes a considerable contribution (five percent on critical approaches operating at LOS E or F) to the worsening of the average delay per vehicle and Caltrans signal warrants would be met.

Cumulative – a significant impact would occur if:

- LRDP would make a considerable contribution to the deterioration of intersection conditions (LOS E or F) if LRDP-generated traffic contributes five percent or more to the critical movements operating at LOS E or F under cumulative conditions.

Transit

The LRDP would have a significant effect on the environment if project demand for public transit causes the need for development or expansion of mass transit facilities, the development of which would cause significant environmental impacts.

Pedestrians and Bicycles

The LRDP would have a significant effect on the environment if it would cause a substantial conflict among autos, bicyclists, pedestrians, and transit vehicles.

Loading

The LRDP would have a significant effect on the environment if it would result in a loading demand during the peak hour of loading activities that could not be accommodated within proposed on-site loading facilities or within convenient on-street loading zones, or if it created

potentially hazardous conditions or significant delays affecting traffic, transit, bicycles, or pedestrians.

Parking

LRDP-generated parking demand that is not met by the project is not considered significant.

Construction

Construction-related impacts generally would not be considered significant due to their temporary and limited duration.

4.15 Utilities and Service Systems

This section presents the Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for the evaluation of Utilities and Service System impacts. 2014 LRDP Utilities and Service System effects are discussed in Chapter 5, *2014 LRDP –Impacts and Mitigation Measures.* Utilities and Service System effects resulting from 2014 LRDP proposals at each of the four affected campus sites are discussed in Chapter 6, *Parnassus Heights – Impacts and Mitigation Measures,* Chapter 7, *Mission Bay – Impacts and Mitigation Measures*, Chapter 8, *Mount Zion – Impacts and Mitigation Measures* and Chapter 9, *Mission Center – Impacts and Mitigation Measures*.

4.15.1 Regional Setting

4.15.1.1 Water Supply and Infrastructure

Existing and Planned Future Water Supply

The San Francisco Public Utilities Commission (SFPUC) provides regional water services to approximately 2.6 million people in San Francisco, Santa Clara, Alameda, San Mateo, and Tuolumne Counties, including all of the City and County of San Francisco. About 85% of the water delivered to SFPUC customers comes from Tuolumne River water stored in Hetch Hetchy Reservoir in the Sierra Nevada, and the remaining 15% comes from runoff in the Alameda and Peninsula watersheds captured in reservoirs located in San Mateo and Alameda Counties, supplemented with local groundwater and recycled water. The regional water system conveys Tuolumne River water to the Bay Area and blends it with local runoff before supplying its customers with potable water. The system includes over 280 miles of pipelines, over 60 miles of tunnels, 11 reservoirs, 5 pump stations, and 2 water treatment plants, and currently delivers a total of approximately 219 million gallons of water per day (mgd) to its customers (SFPUC, 2013).

The SFPUC serves water to both retail and wholesale customers, with about one third of its water supplies for retail customers (primarily located in San Francisco), including the 2014 LRDP area.[47] Retail customers include the residents, businesses, and industries within the City as well as other customers such as the Town of Sunol, San Francisco International Airport, and the Lawrence Livermore National Laboratory, among others. Within the City, the SFPUC provides distribution and storage for water and fire protection for the local water system; this system includes 10 reservoirs, 8 water tanks, 17 pump stations, and approximately 1,250 miles of transmission lines and water mains. For its retail customers, the SFPUC supplements its supplies from the regional water system, which provides more than 97% of the supply, with a small portion of local groundwater and recycled water (less than 3%). In 2010, available supply for retail customers, including in-City users, was 83.2 mgd (SFPUC, 2010).

[47] In addition to retail demand, the SFPUC provides water to 27 wholesale customers in San Mateo, Alameda, and Santa Clara Counties by contractual agreement. The wholesale customers receive about two-thirds of the SFPUC's regional water system supply. Under the 2009 Water Supply Agreement among the SFPUC and wholesale customers, wholesale customers are assured 184 mgd of supply and retail customers are assured 81 mgd of supply through 2018 during normal hydrologic years. As reported in the SFPUC's 2010 *Urban Water Management Plan*, wholesale customers used about 149.5 mgd in 2010.

In 2008, the SFPUC adopted the Water System Improvement Program (WSIP), a multi-billion dollar capital program, to improve and enhance water quality, seismic reliability, delivery reliability, and water supply of the regional water system. Since then, the SFPUC has been implementing numerous WSIP projects—which are now in various stages, ranging from planning and construction to fully operational facilities—and moving towards achieving the WSIP objectives. Included in the WSIP projects are local water supply projects to diversify the retail water supply sources to meet the future water needs of its retail customers.

The SFPUC plans to augment local supplies for its retail customers by extracting up to 4 mgd of groundwater from new wells in the Westside Groundwater Basin located on the west side of the City; this project is anticipated to provide an additional 1 mgd of water supply upon initial startup in mid-2016, up to 3 mgd during Phase 1, and up to 4 mgd total by the end of Phase 2. In addition, the SFPUC has plans to provide an additional 4.0 mgd of recycled water through the Westside and Eastside Recycled Water Projects, primarily for landscape irrigation, toilet flushing and industrial uses, which in turn would increase the availability of potable water for retail customers. With implementation of these projects, total retail supply is anticipated to be 83.5 mgd in 2015 and to increase to 90.3 mgd by 2035 during normal hydrologic years (SFPUC, 2013).

Dry Year Water Supplies

The above water supply estimates are based on typical years with normal (i.e., average or above average) precipitation. However, in any given year, the amount of water available to the SFPUC is constrained by hydrology, physical facilities, and institutional parameters that allocate the water supply of the Tuolumne River. Due to these constraints, the SFPUC is dependent on local reservoir storage to maximize the reliability of its water supplies, particularly during dry years, when stored water from wet years can be used (SFPUC, 2011). Local water supply sources, including local groundwater and recycled water, are very important during dry years.

During a prolonged drought, the water supplies from the regional water system would be curtailed, and the SFPUC has adopted a Water Shortage Allocation Plan that outlines procedures for allocating water from the regional system among its retail and wholesale customers. The allocation methodology depends on the extent and duration of the shortage. **Table 4.15-1** summarizes the existing and future SFPUC retail water supplies during normal and representative dry years.

TABLE 4.15-1
EXISTING AND PLANNED FUTURE SFPUC RETAIL WATER SUPPLIES
(million gallons per day)

Hydrologic Year Type	2010	2015	2035
Normal Year, existing sources	83.2	83.5	83.5
Normal Year, existing + planned future sources	83.2	83.5	90.3
Years 2 and 3 of Multiple Dry Years	--	82.0	88.8

SOURCE: SFPUC, 2013

Existing and Projected Water Demand

Water use within San Francisco is currently below historical consumption levels, and both total consumption and per capita water use have generally been declining since the mid-1970s. In 2012, SFPUC retail water use was 77.8 mgd, comprised of 72.8 mgd of in-City retail use and 5.0 mgd of suburban retail use (SFPUC, 2013).

In summer 2012, the San Francisco Planning Department updated its Land Use Allocation (LUA) for the Association of Bay Area Governments (ABAG) Sustainable Community Strategy Jobs-Housing Connections Scenario. The revised LUA projects an additional 11,235 dwelling units and 35,068 jobs in 2035 over the previous LUA projections from 2009 considered in the SFPUC's *2010 Urban Water Management Plan* (UWMP). The SFPUC thus concluded that its 2010 UWMP did not account for every project requiring a water assessment within San Francisco. Therefore, this EIR does not rely on the 2010 UWMP for determining impacts on the water supply system, but rather uses updated information developed by the SFPUC in 2013.

Because the SFPUC will not be preparing an update to the UWMP until 2015, the SFPUC developed a Water Availability Study (WAS) during the interim period to document current and projected water supplies compared to projected demands associated with this updated growth projection. As a result of the updated growth projections discussed in the WAS, the SFPUC anticipates total retail demand to increase to 83.7 mgd in 2015 and 84.2 mgd in 2035 (SFPUC, 2013).

Table 4.15-2 summarizes the existing and projected future water SFPUC retail customer water demands and shows the breakdown of in-City and suburban customer demands.

TABLE 4.15-2
EXISTING AND PROJECTED FUTURE SFPUC RETAIL WATER DEMANDS
(million gallons per day)

Retail Customer	2012	2015	2035
In-City (in San Francisco)	72.8	78.1	78.6
Suburban (outside San Francisco)	5.0	5.6	5.6
Total Retail Demand	77.8	83.7	84.2

SOURCE: SFPUC, 2011 and 2013

According to the recently published UCSF *2014 Water Action Plan*, the average water demand for UCSF during the three-year period of 2007 to 2010 was 226,024,565 gallons per year (excluding the UCSF Medical Center). The Parnassus Heights and Mission Bay campus sites consumed about 119 million gallons and 66 million gallons per year during this three-year period, respectively (UCSF, 2014).

Water Supply and Demand Comparison

As described above, in 2010, available water supply for SFPUC retail customers was 83.2 mgd, which is more than enough to meet the 2012 demand of 77.8 mgd.

In 2015, the SFPUC estimates water supplies for retail customers of 83.5 mgd in a normal hydrologic year, and a retail demand of 83.7 mgd; this indicates a deficit of about 0.2 mgd for that year. By 2035, however, the SFPUC anticipates that there will be 90.3 mgd of water supply available to retail customers from existing and planned future water sources; this would more than meet the estimated 84.2 mgd of water demand (SFPUC, 2013).

According to the WAS, the SFPUC can meet the future demands of its retail customers in normal years, single dry years, and multiple dry year events, with the exception of 2015, which is prior to full implementation of new supplies under the WSIP. The deficit for 2015 in a normal year represents less than a 0.25% shortfall, and during a multiple dry year event represents a 2.0% shortfall; these small percentage shortfalls can generally be managed through voluntary conservation measures or, if necessary, rationing. However, based on current trends of decreasing retail demand—as evidenced by the 2011–2012 demand of 77.8 mgd — the projected 2015 demand may be overly conservative (that is, actual demand may be lower than projected). Regardless, between now and 2015, the SFPUC has procedures in place to meet retail customer water demands over a range of hydrologic conditions, and, if determined to be necessary, the SFPUC could impose delivery reductions or rationing, or it could purchase additional water from the regional water system.

4.15.1.2 Wastewater Collection and Treatment / Stormwater

The SFPUC maintains and operates a combined sewer system (CSS) that serves most of San Francisco, including all UCSF sites. This system collects stormwater runoff and wastewater flows in the same network of pipes. It conveys flows to facilities where they are treated prior to discharge through outfalls into the Bay or Pacific Ocean. The Mission Bay area, including the Mission Bay campus site, was formerly connected to the CSS. This system was separated in 2011 and stormwater flows are now discharged to San Francisco Bay. Discharges are regulated under National Pollutant Discharge Elimination System (NPDES) permits from the California Regional Water Quality Control Board (RWQCB), San Francisco Bay Region.

The collection system consists of about 976 miles of underground pipes throughout the City, which is divided into an eastern and western basin. In the eastern basin, average dry weather flows of 63 mgd are directed to the Southeast Water Pollution Control Plant (SEWPCP) located on Phelps Street, south of Islais Creek on the eastern waterfront. The SEWPCP receives flows from the Mission Bay, Mount Zion and Mission Center campus sites and about half of the stormwater from the Parnassus Heights campus site. Sewage flows from the Parnassus Heights campus site are directed to the Oceanside Water Pollution Control Plant (OWPCP) east of the Great Highway near the San Francisco Zoo. The SEWPCP has a dry weather capacity of 84.5 mgd, and all dry weather flows receive secondary treatment before being discharged to San Francisco Bay through the Pier 80 outfall, which has a capacity of 110 mgd. Flows from the western basin are directed to the OWPCP and discharged by gravity approximately four miles offshore in the Pacific Ocean. During wet weather the OWPCP provides primary treatment for flows up to 65 mgd and secondary treatment to a maximum flow rate of 43 mgd (SFPUC, 2010).

During wet weather, up to 150 mgd of wet weather flows receive secondary treatment at the SEWPCP. The SEWPCP can also treat up to an additional 100 mgd to a primary treatment standard plus disinfection. Up to an additional 150 mgd of wet weather flows receive primary treatment plus disinfection at the North Point Wet Weather Facility, located on the north side of the City at 111 Bay Street, which operates only during wet weather. Treated effluent from this facility is discharged through four deep water outfalls, approximately 800 feet from the bay shoreline. Two of the deep water outfalls terminate at the end of Pier 33 and two terminate at the end of Pier 35 on the northeastern Bay shore.

The CSS includes storage and transport boxes that, during wet weather, retain the combined stormwater and sewage flows that exceed the capacities of the SEWPCP and the North Point Wet Weather Facility for later treatment. The transport boxes connect to 29 combined sewer outfalls to the Bay. When rainfall intensity results in combined flows that exceed the total capacity of the SEWPCP, the North Point Wet Weather Facility, and the storage and transport structures, the excess flows are discharged through the combined sewer discharge structures in compliance with NPDES permits. Citywide, discharges from these discharge structures receive "flow-through treatment," which is similar to primary treatment, to remove settleable solids and floatable materials. Wet weather flows are intermittent throughout the rainy season, and combined sewer overflow events vary in nature and duration depending largely on the intensity of individual rainstorms.

4.15.1.3 Solid Waste Collection and Disposal

According to the California Integrated Waste Management Act of 1989 (AB 939), San Francisco is required to adopt an integrated waste management plan, implement a program to reduce the amount of waste disposed, and have its waste diversion performance periodically reviewed by the California Department of Resources Recycling and Recovery (CalRecycle). In 2012, San Francisco sent approximately 455,000 tons of solid waste to landfills, up from 447,000 tons in 2011 (CalRecycle, 2014). San Francisco diverted more than 80% of waste material from landfill disposal in 2011 through recycling, composting, and reuse (CCSF, 2012).

Beginning with the 2007 jurisdiction annual reports, diversion rates were no longer used to measure compliance with AB 939. With the passage of SB 1016 in 2006 (the Per Capita Disposal Measurement System), per capita disposal rates are instead measured to determine if a jurisdiction's efforts are meeting the intent of AB 939. The City's per resident disposal target rate is 6.6 pounds per person per day (PPD), and its per employee disposal target rate is 10.6 PPD. In 2012, which is the most recent date for which data are available, the measured disposal rate was 2.9 PPD for residents and 4.2 PPD for employees, thereby meeting the City's target rates (CalRecycle, 2014).

More than 80% of solid waste generated in San Francisco is transported to the Altamont Landfill in Alameda County. The Altamont Landfill has a permitted peak maximum daily disposal of 11,150 tons per day and accepted 1.06 million tons in 2009, down from 1.31 million tons in 2005. The landfill has an estimated remaining capacity of approximately 46 million cubic yards or 74% of its permitted capacity. The estimated closure date of the landfill is 2025 (CalRecycle, 2014).

In 1988, San Francisco contracted for the disposal of 15 million tons of solid waste at the Altamont Landfill. The City contract with the Altamont Landfill expires in 2015. Through August 1, 2009, the City had used approximately 12.5 million tons of this contract capacity. The City projects that the remaining contract capacity will be reached no sooner than August 2014. In 2009, the City announced that it could award its landfill disposal contract to a Recology subsidiary for shipment of solid waste by truck and rail to the Recology Ostrom Road Landfill in Yuba County. This facility has an expected closure date of 2066 with a total design capacity of over 41 million cubic yards. The City is also considering the Recology Hay Road Landfill in Solano County as a disposal site and is currently conducting environmental review of this location. The ultimate determination with respect to future landfill contracting will be made by the Board of Supervisors on the basis of solid waste planning efforts being undertaken by the City's Department of the Environment.[48]

UCSF Facilities Management is responsible for implementing the UC *Policy on Sustainable Practices* solid waste goal of zero waste by 2020 (not including waste from the Medical Center). In 2012, the diversion rate was 63%.

4.15.1.4 Electricity and Natural Gas

Electrical and natural gas service is provided to northern and central California, including San Francisco, by Pacific Gas and Electric Company (PG&E). In 2012-2013, UCSF purchased 6,871,248 therms of natural gas from PG&E and used 41,560,148 kilowatt hours of electricity.

The majority (67%) of UCSF's 2008 electricity purchases from the state grid came from PG&E. The 2008 PG&E power mix consisted of non-emitting nuclear generation (22%), large hydroelectric facilities (16%) and renewable resources (14%), such as wind, geothermal, biomass and small hydro. The remaining portion came from natural gas (39%), coal (8%), and other fossil-based resources (1%).

The remainder of UCSF's electricity purchases come from a UC system-wide direct access supplier, currently Sempra Energy, and the Western Area Power Administration (WAPA)[49]. In order to "green" the direct access supply of electricity, UCSF along with the other UC campuses served under the direct access contract have purchased renewable energy certificates equal to approximately 18% of the direct access electricity supply. These certificates guarantee that renewable energy equal to 18% of the direct access load is placed on the grid on behalf of the Universities (UCSF, 2009).

[48] San Francisco is currently participating as a responsible agency in the environmental review process that Yuba County has begun for the Recology Ostrom Road Green Rail and Permit Amendment Project and to conduct CEQA review of San Francisco's proposal to enter into one or more new agreements with Recology. On March 28, 2013, Yuba County and San Francisco entered into a Cooperative Agreement to designate Yuba County as the lead agency for this project and to outline their cooperative efforts concerning environmental review.

[49] While WAPA does not provide a generation source breakdown to specific users, its primary supply is from hydropower (approximately 90%). http://ww2.wapa.gov/sites/western/Pages/default.aspx

The Parnassus Heights campus site has a central utility plant (PCUP) which serves the campus site buildings, including three Medical Center buildings: Moffitt Hospital, Long Hospital and the Ambulatory Care Center. The plant includes a cogeneration system which provides electricity to the whole Parnassus Heights campus site. The PCUP also produces steam, which is distributed throughout the campus site, and chilled water, which is distributed to University buildings on the south side of Parnassus Avenue. The cogeneration system comprises two combustion turbines burning natural gas and nominally generating 5 megawatts each.

The Mission Bay campus site has a central utility plant on Block 16 that serves four research buildings through a steam / chilled water distribution system. The Mount Zion campus site has a central boiler plant that serves five hospital buildings on the main block.

4.15.2 Regulatory Considerations

Urban Water Management Plan

In 1983, the California Legislature enacted the Urban Water Management Planning Act (California Water Code Sections 10610 through 10656). The act states that every urban water supplier that provides water to 3,000 or more customers, or that provides over 3,000 acre-feet of water annually, should make every effort to ensure reliable water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry years. The act describes the contents of the Urban Water Management Plan as well as how urban water suppliers should adopt and implement the plans. The plan must be updated at least every five years on or before December 31 in years ending in five and zero. The provisions of the Urban Water Management Plan for the SFPUC are described above.

Water Supply Assessment

The State of California adopted Senate Bill 610 (SB 610) effective January 1, 2002. SB 610 requires cities and counties, when evaluating large development and redevelopment projects, to request an assessment of the availability of water supplies from the water supply entity that will provide water to a project. The Water Supply Assessment (WSA) is performed in conjunction with the land use approval process associated with a project and must include an evaluation of the sufficiency of the water supplies available to the water supplier to meet existing and future demands, including the demand for a project over a 20-year time period that includes normal, single-dry, and multiple dry years.

When a new development project is accounted for in the demand projections of an UWMP, the WSA can refer to the UWMP and no further analysis is necessary. As described in Section 4.15.1, above, the SFPUC allows for all development projects requiring a WSA under SB 610 to rely solely on the SFPUC's adopted UWMP without having to prepare individual WSAs. However, because the SFPUC will not be preparing an update to the UWMP until 2015, a Water Availability Study was prepared by the SFPUC during the interim period. This study documented current and projected water supplies compared to projected demands associated with growth not covered in the UWMP in order to satisfy the requirement for the preparation of a WSA.

Water Code Section 10910 and 14 CCR 15155 (entitled "City or County Consultation with Water Agencies") apply only to cities and counties. Water Code Section 10910(a) states: "Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part." Although these requirements do not specifically apply to UCSF, or the University of California, UCSF voluntarily requested a WSA be prepared following the requirements of SB 610 for informational purposes for the net new development proposed under the 2014 LRDP.

RWQCB Permits

The Porter-Cologne Water Quality Control Act authorizes the SWRCB, which, in turn, delegated certain authority to the several Regional Water Quality Control Boards (RWQCB) to issue and enforce NPDES permits. In addition, the SWRCB develops water quality standards and performs other functions to protect California's waters. The RWQCBs, pursuant to their delegated powers, carry out the SWRCB regulations and standards as well as issue and enforce permits. In 2003, the SWRCB adopted the General Permit for the Discharge of Storm Water from Small Municipal Separate Storm Sewer System (MS4s). A revised permit applying to the MS4 at UCSF was adopted in 2013 and requires UCSF to develop, implement and enforce a Storm Water Management Plan/Program (SWMP) by July 2016. See Section 4.8, *Hydrology and Water Quality*, for further discussion of NPDES permits.

Assembly Bill 939 and Senate Bill 1016

The California Integrated Waste Management Act of 1989, or Assembly Bill 939, established the Integrated Waste Management Board, required the implementation of integrated waste management plans, and mandated that local jurisdictions divert at least 50% of all solid waste generated (from 1990 levels), beginning January 1, 2000, and divert at least 75% by 2010. Projects that would have an adverse effect on waste diversion goals are required to include waste diversion mitigation measures to assist in reducing these impacts to less-than-significant levels. With the passage of Senate Bill 1016 (the Per Capita Disposal Measurement System) in 2006, only per capita disposal rates are measured to determine if a jurisdiction's efforts are meeting the intent of Assembly Bill 939.

UCSF Water Conservation Plan

The UCSF 2014 Water Action Plan (WAP) is the blueprint for reaching a per capita 20% reduction in water consumption by 2020. The WAP fulfills the UC *Policy on Sustainable Practices* requirement regarding Sustainable Water Systems and outlines the path to achieving UCSF's contribution to UC President Janet Napolitano's goal to reduce per capita water use by 20% throughout the UC system by 2020. UCSF has made substantial progress towards reaching its goals having reduced per capita consumption 4.4% by the end of fiscal year 2012-2013. Initial projects that contributed to this reduction include the recycling of condensed steam and recycling excess filtered water from laboratories. Additional projects that UCSF is implementing include replacing older and wasteful restroom fixtures with high and ultra-high efficiency fixtures;

retrofitting or replacing water consuming equipment such as walk-in boxes, sterilizers, and autoclaves; eliminating once-through cooling devices; reducing continuous flow; and addressing leaks (UCSF, 2014).

On January 17, 2014 the Governor announced an emergency drought declaration for the State and asked each State agency to reduce their water consumption by 20% over the next year. In response to the declaration and the Governor's Office request for the University to take immediate actions, President Napolitano presented the UC Chancellors with drought response measures to reduce short-term water consumption to the extent possible on their respective campuses (UCOP, 2014). In response to the President's letter, UCSF has committed to the following strategic actions to reduce water use:

- Accelerate and expand leak detection program and/or install "report a leak" stickers to engage the campus community.
- Reduce research/agricultural water consumption.
- Implement an education outreach water conservation campaign targeting office, laboratories, and student housing.
- Provide incentives for paying customers that reduce water and fee hikes for users that do not.
- Prioritize energy efficiency retrofit and deferred maintenance projects that also result in water savings.
- Incorporate water-saving guidelines for new facilities into the Campus Standards and Design Guide. (UCSF, 2014)

4.15.3 Significance Standards

Would implementation of the proposed 2014 LRDP:

a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

e) Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

g) Comply with applicable federal, state, and local statutes and regulations related to solid waste?

h) Result in the wasteful, inefficient and unnecessary consumption of energy (see CEQA Statutes Section 21100(b)(3))?

i) Exceed the LRDP EIR standard of significance by requiring or resulting in the construction of new electrical or natural gas facilities, which would cause significant environmental effects?

4.15.4 Analysis Methodology

The environmental impact analysis for utilities and service systems begins with an assessment of existing utility use and infrastructure services at the main UCSF campus sites. The projected demands for utilities and infrastructure services generated are then calculated and compared to existing usage to determine the net increase resulting from implementation of the 2014 LRDP. Typically, utility assessments focus on supply, treatment or generation capacity and distribution or collection infrastructure requirements. For each potential impact, the analysis compares the net increase resulting from implementation of the 2014 LRDP against the significance criteria set forth above. If the impact would be significant, the analysis identifies feasible mitigation measures that would eliminate the impact or reduce it to a less-than-significant level. If the impact cannot be reduced to a less-than-significant level after implementation of all feasible mitigation measures, then it would remain significant and unavoidable.

CHAPTER 5
2014 LRDP – Impacts and Mitigation Measures

5.0 Components of the 2014 LRDP

5.0.1 Introduction

This LRDP EIR evaluates the environmental impacts of the proposed 2014 Long Range Development Plan of UCSF, which has been prepared to guide the physical development of the campus to accommodate increases in enrollment and academic and research activities at UCSF to meet the projected educational and research demand through the year 2035.

This chapter provides a program-level analysis of the proposed 2014 LRDP, evaluates the effects of maximum growth that could occur throughout all of the UCSF major campus sites under the proposed LRDP through 2035, and identifies the LRDP-level mitigation measures to reduce the potential significant effects from implementation of the 2014 LRDP.

In addition, this EIR also analyzes a number of specific development proposals at a program-level or at a project-level in Chapters 6, 7, 8 and 9. The analysis of these development proposals at the project-level is intended to provide sufficient detail to permit project approval and implementation following certification of the EIR. The program-level 2014 LRDP mitigation measures in this chapter also may be applicable to 2014 LRDP proposals at the campus sites.

The LRDP plans for projected campus growth of approximately 2.39 million gsf by 2035, to accommodate approximately an additional 600 students and 11,000 employees. Although it is not proposed as part of the 2014 LRDP, the EIR analysis assumes that the Phase 2 Medical Center at Mission Bay would be constructed during the LRDP horizon. Therefore, the projected campus growth analyzed in the EIR is 3.18 million gsf.

The EIR identifies and uses “standard” LRDP-level mitigation measures that apply to many (but not necessarily all) impacts of the proposed actions. This approach simplifies and shortens the presentation of impacts and mitigation measures in the four campus site chapters that follow. Some of these measures apply to all sites, while some are site-specific. Some apply to all projects and some must be customized for each project.

5.0.2 Major Components of the 2014 LRDP

5.0.2.1 Functional Zones

The LRDP contains land use maps, or "functional zone" maps for UCSF's three main campus sites: Parnassus Heights, Mission Bay and Mount Zion. The maps reflect the proposed geographical organization of the predominant land use functions at these campus sites, and they provide guidance for capital construction and infrastructure development to accommodate a building program for campus growth. The functional zones and their predominant and secondary uses are described in Table 3-1 in Chapter 3, *Project Description*. The functional zones are generally consistent with UCSF building space categories, except that Instruction space is distributed throughout the Research, Clinical and Support zones. There are also functional zones for Housing, Open Space and Parking (structured).

5.0.2.2 Space Program

The LRDP plans for projected campus growth of approximately 2.39 million gsf by 2035. Most of this space is allocated into the following major use categories: Instruction, Research, Clinical, Support and Housing.

5.0.2.3 Average Daily Population

The estimated UCSF average daily population across all campus sites, including patients and visitors, was approximately 39,420 in 2013. At LRDP horizon in 2035 (which includes the Phase 2 Medical Center at Mission Bay), total population is projected to reach approximately 56,420, an increase of about 17,000.

5.0.3 Other LRDP Programs and Policies

5.0.3.1 Greenhouse Gas Reduction Strategy

As part of implementing the UC *Policy on Sustainable Practices*, UCSF has developed a Climate Action Plan, a long-term strategy for voluntarily meeting the State of California's goal for reducing greenhouse gas (GHG) emissions to 1990 levels by 2020, pursuant to the *California Global Warming Solutions Act of 2006* (AB 32). In addition, as part of the 2014 LRDP, UCSF proposes a Greenhouse Gas Reduction Strategy to provide streamlined analysis under CEQA for future development projects. The GHG Reduction Strategy, includes two categories of GHG reduction measures: those to which UCSF is currently committed to in terms of funding and/or implementation (called "Tier 1" measures), and those that are in the planning stages (called "Tier 2" measures). Tier 2 measures chiefly involve the expansion or intensification of the Tier 1 measures. The implementation of the GHG Reduction Strategy to a large degree involves improving the energy efficiency of existing buildings on UCSF campus sites and incorporating green building standards into the designs of future buildings. Renovations of existing buildings would likely be limited primarily to building interiors with no resulting adverse environmental effects. These types of activities would generally be considered to be part of normal, routine maintenance operations of the University and would not be subject to environmental review

under CEQA. The environmental effects of the construction of new buildings by UCSF during the 2014 LRDP planning horizon are analyzed in the relevant sections of this EIR. Incorporation of green building standards into the design of proposed buildings would have beneficial effects, such as reduced energy and water demand. The GHG Reduction Strategy also includes a proposed solar photovoltaic (PV) energy installation at the Mission Bay Hospital, as well as other PV projects at other undetermined UCSF locations. Because the design of this installation on the Mission Bay campus site has not been completed, the specific characteristics of this possible facility cannot be analyzed at this time. Subsequent CEQA review may be necessary once the design of this or any other PV facility become available. Other GHG reduction strategies include increasing the University's purchase of green electricity and biogas, reducing vehicle trips, and expanding the University's fleet of fuel-efficient and alternative-fuel vehicles. The physical effects of these measures are primarily limited to the land use decisions the University is making as part of the LRDP. These decisions include increasing on-site campus amenities (such as child care, food services, and recreation/fitness facilities) and housing for faculty and students in order to reduce vehicle trips. Any physical environmental effects resulting from the University's land use decisions and building program are analyzed in the applicable sections of this EIR.

5.0.3.2 Transportation Demand Management Program

To minimize traffic generated by UCSF current and planned facilities, UCSF proposes to implement more robust Transportation Demand Management (TDM) measures. These include enhancing the City CarShare and UCSF's carpool programs, expanding bicycle parking and access to showers and lockers, promoting ridesharing participation, and, with new campus development, enhancing the shuttle system. Similar to the GHG Reduction Strategy, the TDM Program could result in physical environmental effects across multiple campus sites. As with the GHG Reduction Strategy, these effects are analyzed in the appropriate sections of this EIR, primarily in Section 5.14, *Transportation and Traffic Impacts of the 2014 LRDP*.

5.0.4 Proposals under the 2014 LRDP

The 2014 LRDP is driven by the need to comply with the requirements of the *Alquist Seismic Safety Act* and subsequent amendments, the UC *Policy on Seismic Safety*, UC's *Policy on Sustainable Practices* and the 1976 Regents' Resolution regarding the Parnassus Heights campus site space ceiling, as well as a number of other state and local policies.

To support and achieve its missions, UCSF proposes to grow where growth can be reasonably accommodated at its currently owned sites: primarily at Mission Bay, to a limited extent at Mount Zion, and if needed, in a new building at Mission Center. While most of this growth is proposed to be accommodated in new buildings, a portion would be met through better utilization of existing space through implementation of a new UCSF-wide space policy, renovation of obsolete labs and repurposing of vacant and underutilized space. It is also envisioned that new space would be developed to accommodate a greater density of occupants than in the past for greater space efficiency and higher utilization.

A primary focus of the LRDP is to address Senate Bill 1953 (SB 1953), which mandates that all inpatient facilities in the State of California meet more stringent seismic regulations by 2030. The opening of the first phase of the Medical Center at Mission Bay in 2015 will provide opportunities at the Parnassus Heights and Mount Zion campus sites to re-occupy (or "backfill") space that will be vacated when programs and occupants relocate to the new Medical Center at Mission Bay. Many of the highly complex adult clinical programs will remain at Parnassus Heights. Mount Zion will be developed into an ambulatory care center and outpatient hub. Both the Parnassus Heights and Mission Bay campus sites will provide inpatient, outpatient, research and administrative functions, as well as campus housing. All four schools—Dentistry, Medicine, Nursing and Pharmacy, as well as the Graduate Division—will remain at the Parnassus Heights campus site. To meet the SB 1953 mandate at Parnassus Heights, UCSF proposes to decommission inpatient care in Moffitt Hospital by the 2030 SB 1953 deadline, build a new hospital addition to Long Hospital and reconfigure its inpatient and outpatient programs across the three major campus sites. To meet housing demand and reduce commute traffic, UCSF also proposes additional campus housing at the Parnassus Heights and Mission Bay campus sites where demand for housing is greatest. More housing at both campus sites would make it possible to realign students, postdoctoral scholars and faculty to live where they attend classes or work. Other campus facilities would be developed, including more child care space where it is most needed, indoor and outdoor recreation and fitness facilities, shuttle support facilities, retail and more and enhanced open space areas.

The LRDP sets overall guidelines for the facilities needed to serve the projected activities of UCSF through 2035. The 2014 LRDP proposes an additional 2.39 million gsf of space at LRDP horizon in 2035. Of this new space, roughly 1.5 million gsf would be built at the Mission Bay campus site. Thus, most of the potential environmental effects resulting from implementation of the 2014 LRDP would occur at the Mission Bay campus site.

The LRDP considers how the campus sites and buildings will be used, the amount of building space needed (in gsf), and the resulting populations at UCSF campus sites. Population campus-wide, including patients and visitors, is projected to be approximately 56,420 in 2035. Population is projected to increase by approximately 600 at the Parnassus Heights campus site, 1,600 at Mount Zion and 500 at Mission Center by 2035. The average daily population at the Mission Bay campus site would increase by about 17,000 at the LRDP horizon.

The LRDP, by assigning uses and a space program at each campus site, directs the growth and change that is projected to occur at each site during the lifetime of the LRDP. Specifically, the LRDP proposes that the major physical changes due to these programs would occur only at four campus sites: Parnassus Heights, Mission Bay, Mount Zion and Mission Center. These interrelated aspects of the LRDP will be implemented, in part, by undertaking a step-wise series of individual "proposals": 1) at Parnassus Heights to demolish buildings to reduce existing building space, to renovate two existing buildings to make office and new housing space available, and by 2030, to decommission and reuse Moffitt Hospital and build a new hospital addition to Long Hospital; 2) at Mount Zion to demolish existing buildings on the main block to make room for a new office and research building; 3) at Mission Bay, to construct new housing,

office, research and clinical buildings, as well as infrastructure and, 4) at Mission Center, to construct a new office building and garage.

These LRDP actions proposed at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites naturally group into four general categories – 1) demolition, 2) renovation and re-use of existing structures, 3) construction of new facilities, and 4) circulation, open space, and utilities/infrastructure proposals – that are convenient ways to organize and consider the physical actions that would occur with the implementation of the 2014 LRDP. These LRDP proposals, grouped in four categories, are:

2014 LRDP Demolition Proposals[1]

- Surge (PH)
- Woods (PH)
- Medical Research 4 (PH)
- Laboratory of Radiobiology (PH)
- Proctor (PH)
- Environmental Health and Safety (PH)
- Koret Vision Research (PH)
- Langley Porter Psychiatric Institute (LPPI) and support structures (PH)
- Hellman (MZ)
- Harold Brunn Institute (Brunn) (MZ)
- Dialysis Center (MZ)
- 2255 Post (or retrofit) (MZ)

2014 LRDP Renovation Proposals

- UC Hall (PH)
- Millberry Union towers (PH)
- Moffitt Hospital (PH)
- Faculty Alumni House seismic retrofit (PH)
- Fifth Avenue houses conversion to faculty housing (PH)
- Main Hospital (MZ)
- 2255 Post Street (or demolition) (MZ)

2014 LRDP Construction Proposals

- New Hospital Addition (PH)
- New Faculty Housing at Fifth and Parnassus avenues (PH)
- New Faculty Housing on Proctor site (PH)
- New Housing on Block 15 (MB)
- Develop Additional Research Capacity on Blocks 16, 18A, 23A, 25B, 33 and 34 (MB)

[1] PH = Parnassus Heights campus site; MB = Mission Bay campus site; MZ = Mount Zion campus site; MC = Mission Center campus site.

- Phase 1 Medical Center at Mission Bay – Cancer outpatient building (MB)
- Phase 2 Medical Center at Mission Bay (MB)
- New parking structures on Blocks 18, 33/34, and 38 (MB)
- Office/Research building (MZ)
- Office building and parking facility (MC)

2014 LRDP Circulation, Open Space, and Utilities/Infrastructure Proposals

- Parnassus Avenue Streetscape Plan (PH)
- Saunders Court renovation (PH)
- Mount Sutro Open Space Reserve trails (PH)
- Medical gas storage tanks (PH)
- Diesel fuel storage tank replacement (PH)
- Retaining wall (PH)
- Block 15 pump station upgrade (MB)

2014 LRDP Proposal Construction Time Frames

Activities to implement the 2014 LRDP proposals would occur between 2015 and the LRDP horizon in 2035, as presented in **Table 5-1**, below. The 2014 LRDP proposals are generally anticipated to occur within four sequential time frames shown in this table. They are grouped here by type of activity within each five- to six-year time frame; however, their order does not indicate a proposed sequence for the activities within each time frame. The actual sequence of these activities would be determined by UCSF based on program needs and funding.

Note that there could be delays between the demolition of any given structure and the start of construction of a new building at that site. Regardless of the cause, there could be a period of time when the demolition site would remain vacant. Specific potential environmental effects of such delays are discussed in Sections 5.1, *Aesthetics*, and 6.1 for the Parnassus Heights campus site and Section 8.1 for the Mount Zion campus site. In the event that baseline environmental conditions change because of along delay between demolition and new construction, they would be analyzed under CEQA.

TABLE 5-1
LRDP PROPOSAL CONSTRUCTION TIME FRAMES

Proposal Category	Proposal Title	Square Feet / Number of Dwelling Residential Units
2015 - 2019		
Demolition	Medical Research 4 (PH)	12,300 gsf
Demolition	Laboratory of Radiobiology (PH)	18,200 gsf
Demolition	Woods (PH)	3,900 gsf
Demolition	Surge (PH)	11,400 gsf
Demolition	Hellman, Brunn, and Dialysis Center (MZ)	85,000 gsf
Renovation	UC Hall-Phase 1 (PH)	74,700 gsf/105 units
Renovation	Faculty Alumni House (PH)	7,400 gsf
Renovation	Main Hospital (MZ)	--
Construction	Housing at Fifth and Parnassus Avenues (PH)	48,400 gsf/45 units
Construction	Block 15 (MB)	418,200 gsf
Construction	Block 33 (MB)	275,000 gsf
Construction	Block 33/34 Parking Garage (MB)	167,500 gsf
Construction	Cancer outpatient (MB)	124,500 gsf
Construction	Office/Research building (MZ)	257,300 gsf[2]
Other	Parnassus Avenue Streetscape Plan-Phase 1 (PH)	--
Other	Mount Sutro Open Space Reserve trails (PH)	--
Other	Medical gas storage tanks (PH)	--
Other	Retaining wall (PH)	--
2020 -2024		
Demolition (or Renovation)	2255 Post Street (MZ)	7,450 gsf
Construction	Block 23A (MB)	232,200 gsf
Construction	Block 34 (MB)	225,000 gsf
Construction	Block 18 Parking Garage -Phase 1 (MB)	271,000 gsf
Construction	Office building (MC)	100,000 gsf
Construction	Parking Garage (MC)	95,000 gsf
Other	Parnassus Avenue Streetscape Plan-Phase 2 (PH)	--
Other	Saunders Court renovation (PH)	--
2025-2030		
Demolition	Langley Porter Psychiatric Institute and support structures (PH)	111,100 gsf
Construction	New Hospital Addition (PH)	308,000 gsf
Construction	Block 16 (MB)	377,400 gsf[3]
Construction	Block 25B (MB)	323,000 gsf

2 An additional 78,000 gsf of parking may be developed either underground or off-site.
3 Alternatively, Block 16 may include one research and/or office building and a central utility plant totaling approximately 289,000 gsf.

TABLE 5-1 (Continued)
LRDP PROPOSAL CONSTRUCTION TIME FRAMES

Proposal Category	Proposal Title	Square Feet / Number of Dwelling Residential Units
2031 -2035		
Demolition	Proctor (PH)	9,900 gsf
Demolition	Koret Vision Research (PH)	43,000 gsf
Demolition	Environmental Health and Safety (PH)	6,200 gsf
Renovation	UC Hall-Phase 2 (PH)	68,300 gsf/64 units
Renovation	Millberry Union towers (PH)	46,600 gsf/83 units
Renovation	Moffitt Hospital (PH)	378,700 gsf
Construction	Proctor housing (PH)	30,400 gsf/32 units
Construction	Block 18A (MB)	193,000 gsf
Construction	Block 18 Parking Garage-Phase 2 (MB)	271,000 gsf
Construction	Phase 2 Medical Center at Mission Bay (MB)	793,500 gsf
Construction	Block 38 Parking Garage (MB)	up to 1,300 parking spaces

5.1 Aesthetics Impacts of the 2014 LRDP

The Initial Study prepared for the 2014 LRDP determined that there are no scenic highways in the vicinity of the Parnassus Heights, Mission Bay, Mount Zion or Mission Center campus sites. Therefore, no impact to scenic resources would result from implementation of the 2014 LRDP.

Buildings proposed for demolition at the Parnassus Heights campus site are mostly low-rise structures, and are generally obscured from public views by surrounding buildings and/or trees and other vegetation. Although the demolition of LPPI would alter the view of that site on the north slope of Mount Sutro, its loss would not adversely affect the scenic vista of the Parnassus Heights campus site since its removal would allow for more expansive views of Mount Sutro. The Mount Zion campus site and surrounding neighborhood are located on land that is relatively flat, and offer no scenic vistas; therefore, demolition of proposed buildings would have no effect on a scenic vista.

The Initial Study prepared for the 2014 LRDP concluded that demolition and renovation proposals at the Parnassus Heights and Mount Zion campus sites would not substantially degrade the existing visual character or quality of those respective campus sites.

None of the open space or utilities proposals at the Parnassus Heights campus site has the potential to have a substantial adverse impact on scenic vistas, visual character or quality, street-level winds or shadows in public open spaces.

Impact AES-LRDP-1: Implementation of the 2014 LRDP would not have a substantial adverse effect on a scenic vista. (Less than Significant)

New growth proposed by the 2014 LRDP would occur at the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites. Besides the New Hospital Addition, other development proposed at the Parnassus Heights campus site include possible faculty housing at the Proctor site and at 1414 Fifth Avenue/735 Parnassus Avenue. The proposed New Hospital Addition would be adjacent to and visible from Parnassus Avenue, and due to the combination of the elevation of the hillside site and the height of the proposed hospital, would also be visible from a number of distant public view locations, including from Golden Gate Park to the north of the campus site. Development of 2014 LRDP proposals at the Parnassus Heights campus site is discussed in Section 6.1.

Growth proposed under the 2014 LRDP at the Mission Bay campus site would occur on Blocks 15, 16, 18, 23, 25, 33, and 34 as well as the cancer outpatient building adjacent to the Phase 1 Medical Center at Mission Bay. In addition, for purposes of the EIR analysis, Phase 2 of the Medical Center is assumed to be constructed by 2035. Building designs on the North Campus (Blocks 15, 16, 18, 23, and 25) would be in accordance with the *Mission Bay Campus Master Plan and Design Guidelines* (CMPDG). Future development of the East Campus (Blocks 33 and 34), per agreement with the City under a Memorandum of Understanding (MOU), would be consistent with the *Mission Bay South Redevelopment Area Plan "Design for Development"* guidelines, and other design criteria specified in the MOU. The *Mission Bay South*

Redevelopment Area Plan "Design for Development" designated view corridors along street alignments in Mission Bay to preserve the orientation and visual linkages to the San Francisco Bay and Mission Creek, to nearby hills, the Bay Bridge and the downtown skyline; and to preserve orientation and visual linkages that provide a sense of place within Mission Bay. Continued development of the Medical Center at Mission Bay would be consistent with the development standards set forth in the MOU with the City for that site. The MOU for the Medical Center at Mission Bay modified the CMPDG guidelines and included specific standards pertaining to building height, bulk, setbacks, stepbacks, streetwall height, view corridors, streetscapes, and signage. Therefore, as discussed further in Section 7.1, new growth proposed at the Mission Bay campus site under the 2014 LRDP would not result in an adverse effect on scenic vistas.

Growth proposed at the Mount Zion campus site by the 2014 LRDP would include a new office/research building on the site currently occupied by the Hellman, Harold Brunn Institute and Dialysis Center buildings. Growth proposed under the 2014 LRDP at the Mission Center campus site includes a new office building and parking facility. As discussed in Sections 8.1 and 9.1, respectively, proposed development at the Mount Zion or Mission Center campus sites would not result in an adverse effect on scenic vistas.

In conclusion, no adverse effects on scenic vistas would result from growth proposed by the 2014 LRDP; therefore, the impact would be less than significant.

Mitigation: None required.

Impact AES-LRDP-2: Implementation of the 2014 LRDP would not degrade the existing visual character or quality of UCSF campus sites and surrounding area. (Less than Significant)

As discussed above under Impact AES-LRDP-1, growth proposed under the 2014 LRDP at the Parnassus Heights campus site includes two small residential buildings and the New Hospital Addition. Growth proposed under the 2014 LRDP at the Mission Bay campus site would occur on Blocks 15, 16, 18, 23, 25, 33 and 34 as well as the Phase 2 of the Medical Center at Mission Bay and the cancer outpatient building. The proposed office/research building at the Mount Zion campus site would be built on the east side of the main block where the Hellman, Harold Brunn Institute (Brunn) and Dialysis Center buildings are currently located. Growth proposed under the 2014 LRDP at the Mission Center campus site includes a new office building and parking facility.

Although changes in appearance at all four campus sites would be noticeable, new development proposed under the 2014 LRDP would be built in accordance with UCSF's *Physical Design Framework* and *Facilities Design Guidelines* and would comply with the 2014 LRDP's goals regarding Building and Public Realm Design. New buildings would be sited within the appropriate functional zone at each respective campus site. The Mount Zion campus site is the only location where there might be an interim condition in which a site (Hellman, Brunn, and/or Dialysis Center) remains vacant for a period of time after demolition of existing building(s) and

prior to construction of a proposed new building. The vacant site may be used on a temporary basis as parking and could include fencing and screening.

New buildings proposed at the Mission Bay campus site would also comply with the CMPDG. Proposed development on Blocks 33 and 34 would follow the *Mission Bay South Redevelopment Area Plan "Design for Development"* guidelines regarding building height, bulk, setbacks, maximum tower floorplate and other design matters. Continued development of the Medical Center at Mission Bay would be consistent with development standards set forth in the MOU with the City of San Francisco for that site, which extended the CMPDG guidelines to the Medical Center site and modified them to include specific standards pertaining to building height, bulk, setbacks, stepbacks, streetwall height, view corridors, streetscapes, and signage.

UCSF design guidelines would ensure that the final building designs respond to the form of adjacent buildings (e.g., in terms of massing and height) and the overall urban context of the campus sites and surrounding neighborhoods. Because proposed buildings would be visually similar to existing uses on and adjacent to each respective campus site, they would not substantially degrade the visual character of the campus sites and surroundings.

Therefore, effects to the existing visual quality and character of UCSF's campus sites and their surrounding areas from implementation of the 2014 LRDP would be less than significant.

Mitigation: None required.

Impact AES-LRDP-3: Implementation of the 2014 LRDP could result in flood lighting during nighttime construction activities that would adversely affect nighttime views in the area. (Potentially Significant)

Although construction operations are generally expected to take place during the day, some activities could be conducted at night to reduce noise, vibration or other effects on daytime office or research uses. To enable construction at night, flood lighting would be required. The use of night lighting would have the potential to disturb residents in neighborhoods near construction sites, and potentially also affect nighttime views. Night lighting of construction sites would be temporary and would cease upon completion of construction. Campus-wide implementation of **Mitigation Measure AES-LRDP-1** would reduce the impact of nighttime work lighting to a less than significant level.

> **Mitigation Measure AES-LRDP-1:** UCSF shall require a condition in construction contracts that flood or area lighting for construction activities be placed and directed so as to avoid potential disturbances to adjacent residences or other uses.
>
> **Significance after Mitigation:** Less than Significant

Impact AES-LRDP-4: Implementation of the 2014 LRDP could create new sources of substantial light or glare that would adversely affect day or nighttime views in the area. (Potentially Significant)

Development proposed under the 2014 LRDP could increase ambient light levels due to light dispersion from the new buildings. Increases in night lighting could affect nighttime views on campus sites or in the surrounding neighborhoods. New light sources could include street lights, illuminated signage, exterior safety lighting and light emitted from building windows. Glare could be generated from reflective building materials. Because specific architectural features and building materials of the new buildings have yet to be determined, the proposed improvements have the potential to include reflective surfaces, such as metal and glass. The resultant glare could affect nearby residents, pedestrians and passing motorists. **Mitigation Measure AES-LRDP-2** would be implemented campus-wide to reduce the impact to a less than significant level. By employing appropriate design standards and minimizing the quantity of reflective material used in new construction, light and glare impacts and impacts to views related to lighting could be reduced to less-than-significant levels.

> **Mitigation Measure AES-LRDP-2:** Minimize light and glare resulting from new buildings through the orientation of the building, use of landscaping materials and choice of primary facade materials. Design standards and guidelines to minimize light and glare shall be adopted for the new buildings, including:
>
> - Reflective metal walls and mirrored glass walls shall not be used as primary building materials for facades.
> - Installation of illuminated building signage shall strive to be consistent with City Planning Code sign standards for illumination and/or UCSF design guidelines.
> - Exterior light fixtures shall be configured to emphasize close spacing and lower intensity light. Light fixtures shall use luminaries that do not direct the cone of light towards off-campus structures.
> - Design parking structure lighting to minimize off-site glare.
>
> **Significance after Mitigation:** Less than Significant

Impact AES-LRDP-5: Implementation of the 2014 LRDP could create street-level winds that could be hazardous to pedestrians in the area. (Potentially Significant)

Development proposed under the 2014 LRDP would have a significant effect if it would result in pedestrian-level wind speeds that exceed the hazardous level established by San Francisco Planning Code Section 148. While shorter buildings typically have little to no effect on the wind, unless they are very wide or are exposed on an open site, structures taller than 100 feet have the potential to alter wind speeds at ground level. Siting of large structures or large groups of structures can change wind flows by speeding up the wind at some locations and slowing it elsewhere in the vicinity. Large structures placed in a windy site can be expected to change or divert street-levels winds so as to alter the number and duration of Hazard Criterion exceedances. In general, implementation of **Mitigation Measure AES-LRDP-3** would reduce street-level wind impacts resulting from growth proposed by the 2014 LRDP to less than significant levels.

Discussion of site-specific wind effects resulting from implementation of the 2014 LRDP at the Parnassus Heights, Mission Bay and Mount Zion campus sites, where some LRDP proposals could exceed a height of 100 feet, is presented in Sections 6.1, 7.1 and 8.1, respectively.

> **Mitigation Measure AES-LRDP-3:** Proposed buildings that would exceed 100 feet in height shall be evaluated by a qualified wind consultant to determine the potential of the design to cause a wind hazard as defined in City Planning Code Section 148. If a hazard cannot be judged unlikely, the design shall be wind tested to verify compliance with the hazardous wind criterion of City Planning Code Section 148. Wind tunnel testing would provide site- and design-specific information pertaining to potential wind effects. Feasible means of eliminating or reducing wind hazards include modulating facades through architectural devices (e.g., articulation, variation of planes and building heights, etc.); incorporating building setbacks/terraces into building designs; and, landscaping in appropriate locations (e.g., using plantings to create wind screens). If preliminary wind testing indicates that the building design would increase pedestrian-level wind hazards, UCSF shall modify the proposed building or develop other measures to eliminate increases in hazardous pedestrian-level wind effects.
>
> **Significance after Mitigation:** Less than Significant

Impact AES-LRDP-6: Implementation of the 2014 LRDP could substantially reduce sunlight or significantly increase shadows in public open space areas. (Potentially Significant)

Development proposed under the 2014 LRDP could cast shadows on public open space under the control of the San Francisco Recreation and Park Department, which could potentially conflict with protection of such spaces as established by the City's Sunlight Ordinance (Section 295 of the Planning Code). Section 295 prohibits the issuance of building permits for structures or additions to structures greater than 40 feet in height that would shade property under the jurisdiction of or designated to be acquired by the Recreation and Park Commission, during the period from one hour after sunrise to one hour before sunset, unless the Planning Commission, following review and comment by the general manager of the Recreation and Park Department in consultation with the Recreation and Park Commission, determines that such shade would have an insignificant impact on the use of such property. Section 295 provides exceptions for buildings 40 feet or less in height and for buildings that replace shadow from previously existing structures. In general, implementation of **Mitigation Measure AES-LRDP-4** would reduce shadow impacts on public open space areas resulting from growth proposed by the 2014 LRDP to less than significant levels.

Discussion of site-specific shadow effects resulting from implementation of the 2014 LRDP at the Mount Zion campus site is presented in Section 8.1.

> **Mitigation Measure AES-LRDP-4:** UCSF shall assure that final building designs would not increase shadow on Recreation and Park Department property between one hour after sunrise and one hour before sunset, in such a way that the use of the property would be adversely affected.
>
> **Significance after Mitigation:** Less than Significant

5.2 Air Quality Impacts of the 2014 LRDP

The Initial Study prepared for the 2014 LRDP determined that none of the LRDP proposals would result in the creation of objectionable odors.

BAAQMD Plan-Level Impact Guidelines

The Bay Area Air Quality Management District (BAAQMD) has published Air Quality Guidelines that contain CEQA methodologies for addressing land use plan-level impacts, as well as addressing the impacts of subsequent individual projects. Most appropriate for evaluating the 2014 LRDP, the plan-level impact evaluation guidance identifies four topics for consideration:

- Criteria pollutants and precursor emissions
- Greenhouse gases
- Local community risks and hazards, and
- Odor impacts

The plan-level greenhouse gas impacts of the 2014 LRDP are addressed separately in Section 5.6 with respect to the Greenhouse Gas Reduction Strategy. The remaining topics, and the consistency with the 2010 Clean Air Plan for the San Francisco Bay Area Air Basin, are addressed below.

In addition, following the discussion of these three plan-level impact topics are impact discussions quantitatively addressing the total construction-related and operational emissions at all four campus sites that could result from implementation of the 2014 LRDP.

2014 LRDP Plan-Level Impacts

Impact AIR-LRDP-1: Implementation of the 2014 LRDP would be consistent with the primary goals of the Bay Area Clean Air Plan (CAP) and would not fundamentally conflict with the CAP because the LRDP demonstrates reasonable efforts to implement control measures contained in the CAP. (Less than Significant)

The most recently adopted air quality plan for the San Francisco Bay Area Air Basin is the 2010 Clean Air Plan (CAP). The 2010 CAP is a road map that demonstrates how the San Francisco Bay Area will achieve compliance with the state ozone standards as expeditiously as practicable and how the region will reduce the transport of ozone and ozone precursors to neighboring air basins. In determining consistency with the 2010 Clean Air Plan, this analysis considers whether the project would: (1) support the primary goals of the CAP, (2) include applicable control measures from the CAP, and (3) avoid disrupting or hindering implementation of control measures identified in the CAP. To meet the primary goals, the CAP recommends specific control measures and actions. These control measures are grouped into various categories and include stationary and area source measures, mobile source measures, transportation control measures, land use measures, and energy and climate measures. The CAP recognizes that to a great extent, community design dictates individual travel mode, and that a key long-term control strategy to

reduce emissions of criteria pollutants, air toxics, and greenhouse gases from motor vehicles is to channel future Bay Area growth into urban communities where goods and services are close at hand, and people have a range of viable transportation options. To this end, the 2010 Clean Air Plan includes 55 control measures aimed at reducing air pollution in the Air Basin.

The 2014 LRDP contains a number of new measures and broadens existing measures that would serve to support the primary goals of the CAP. Primary among these is the continued implementation and enhancement of UCSF's Transportation Demand Management program.

Key features of UCSF's existing TDM program include the following:

- 60 shuttles serving 17 locations, with over 2.3 million passengers per year
- 33 vanpools that travel as far as Sacramento and operate using the Green Road Safety System, which improves fuel consumption and safety
- 62 reserved carpool stalls at various sites
- Marin Commute Club buses with about 55 daily riders who live in Marin and Sonoma Counties to the north of the city
- 18 City CarShare vehicles, along with 1,500 UCSF members who can use these vehicles by scheduling their use on-line
- A fleet of 43 low-emitting alternative-fuel and hybrid vehicles, including cars, shuttles, golf carts, and trucks
- 18 electric-vehicle charging stations at Parnassus Heights, Mount Zion, and Mission Bay, with plans for another 20 at Mission Bay in the Owens Street Garage and 10 at other locations
- Over 1,900 UCSF users of the ZimRide online carpool matching program
- 972 bicycle parking spaces with another 100 planned at Mission Bay, as well as bike racks on shuttles, a cyclist shower program that allows bicyclists to use UCSF showers at a discount, and other bicycle-related benefits
- Bay Area Bike Share station at Mission Bay, where members would have access to bicycles provided by the Bay Area Air Quality District
- Over 400 off-street motorcycle parking stalls in garages and surface parking lots
- An "emergency ride home" program to encourage use of alternative modes of transportation
- Clipper Card (public transit pass) sales at easily accessible locations, including through UCSF's website
- Close to 1,800 employees participate in the pretax transit program that has saved UCSF employees over $700,000 on public transit commute costs in 2013

Key Goals of the proposed LRDP that address reduced vehicle trip generation and are consistent with the goals of the CAP include:

- Enhance UCSF's Transportation Demand Management program and encourage its faculty, staff and students to use alternative modes of travel to driving alone to campus sites.
- Reduce congestion and truck deliveries to campus sites through transportation improvement measures.
- Direct, aesthetic, and experiential pedestrian connectivity is stressed in the UCSF 2010 Physical Design Framework and will be considered as buildings and open space are developed.
- The needs of pedestrians on public streets, particularly Parnassus Avenue at Parnassus Heights, Fourth Street at Mission Bay, and Sutter Street at Mount Zion, that pass through campus sites and have UCSF shuttle and Muni stops, are given the greatest consideration.

The campus sites' infill location and proximity to transit reduces the distance that students and patients would drive in motor vehicles. Also, the 2014 LRDP area is located in direct proximity to the nearby employment hubs. The Mission Bay Area is also designated as a priority development area with respect to the Sustainable Communities plan developed for the Bay Area pursuant to SB 375, a measure implemented to reduce emissions through the planning process.

Table 5-2 identifies those five categories of Transportation Control Measures (TCMs) that local agencies should implement through local plans to be considered in conformance with the 2010 CAP. A review of the TCM's in Table 5-2 indicates that these measures lend themselves to application to large-scale land use development projects and would be addressed by UCSF's TDM Program, which would apply to development under the LRDP.

TABLE 5-2
TRANSPORTATION CONTROL MEASURES IN THE 2010 CLEAN AIR PLAN

1.	Improve Transit Services (TCM A)
2.	Improve System Efficiency (TCM B)
3.	Encourage Sustainable Travel Behavior (i.e., voluntary employer-based trip reduction program)(TCM C)
4.	Support Focused Growth (Bicycle and Pedestrian friendliness) (TCM D)
5.	Implement Pricing Strategies (TCM E)

SOURCE: BAAQMD, 2010.

Because UCSF would continue to implement and expand transportation control measures consistent with the 2010 CAP, implementation of the 2014 LRDP proposals would not be considered to fundamentally conflict with the 2010 CAP and would be considered to have a less-than-significant air quality impact with regard to TCM implementation.

Mitigation: None required.

Impact AIR-LRDP-2: The 2014 LRDP would provide sufficient buffer distances between sensitive land uses and those land uses associated with toxic air contaminants (TACs) such as freeways, high traffic roadways and stationary sources. (Less than Significant)

The BAAQMD plan-level impact guidance recommends addressing localized exposure to TACs though provision of adequate buffers between sources and receptors. Exposure to TACs is a localized impact. These potential local impacts would occur from the implementation of one or more of the proposals listed in Section 5.0.4, above, and described in more detail in Chapter 3, *Project Description*. These potential local impacts are assessed quantitatively for each of the four campus sites, based on formal health risk assessments that consider the sources of TACs, their location with respect to new or proposed sensitive receptors and the prevailing meteorology of San Francisco.

The BAAQMD's *CEQA Air Quality Guidelines* include standards and methods for determining the significance of health risk impacts for new receptors introduced by a project. The method for determining health risk requires the review of health risk from permitted sources and major roadways in the vicinity of a project (i.e., within a 1,000-foot radius of the source), then adding the project impacts to determine whether the health risk thresholds for new receptors are exceeded.

As detailed in the impact analyses in Sections 6.2, 7.2, 8.2 and 9.2 of this EIR, the 2014 LRDP proposals would not result in exposure of sensitive receptors to substantial health risks or localized pollutant concentrations. Consequently, adoption of and development under the 2014 LRDP would provide sufficient buffer distances to ensure that sensitive receptors would not be exposed to substantial health risks or localized pollutant concentrations, and the impact would be less than significant.

Mitigation: None required.

Impact AIR-LRDP-3: Implementation of the 2014 LRDP proposals would provide sufficient buffer distances between sensitive land uses and sources of odors. (Less than Significant)

The proposed project would include residences at the Parnassus Heights and Mission Bay campus sites, which would be considered sensitive receptors with regard to existing odor sources. Residential housing currently exists at both of these campuses.

The BAAQMD identifies odor sources to include:

- Wastewater treatment plants;
- Landfills;
- Confined animal facilities ;
- Composting stations;
- Food manufacturing plants;
- Refineries; and
- Chemical plants.

There are no wastewater treatment plants, landfills, composting facilities, refineries, or chemical plants in the vicinity of either Parnassus Heights or the Mission Bay campus sites. Confined animal facilities exist at both the Parnassus Heights and Mission Bay campus sites. These are

enclosed facilities which are regularly inspected for sanitation and would not be a source of localized odor emissions associated with cattle ranching, zoos or other large-scale animal facilities with open air exposure.

There are no food manufacturing plants in the vicinity of the Parnassus Heights campus site, which is surrounded be residential uses. Land uses in the vicinity of the Mission Bay campus site may include boutique bakeries in the Dogpatch area to the southeast, but these are relatively small businesses that would do not generate the types of substantial odors that might be associated with large-scale cooking and processing. The Anchor Brewing Company operates a brewery on Mariposa Street, approximately one half mile to the west of the Mission Bay campus site.

Given that existing sensitive land uses presently exist at and around both campus sites, and the 2014 LRDP would maintain development consistent with present uses within the confines of each campus site, the 2014 LRDP would provide sufficient buffer distances between odor sources and receptors. Therefore, the impact associated with objectionable odors would be less than significant.

Mitigation: None required.

Impact AIR-LRDP-4: Implementation of the 2014 LRDP would result in increased emissions of criteria air pollutants during demolition and construction activities. (Potentially Significant)

Demolition, renovation and construction activities would result in emissions of criteria pollutants from the use of heavy-duty construction equipment, haul truck trips and vehicle trips generated from construction workers traveling to and from the demolition and construction sites. In addition, fugitive dust or PM_{10} emissions would result from demolition, excavation, trenching and other construction activities.

It is assumed that there would be no off-road equipment involved in building renovations and that air emissions would be generated solely by vendor trips bringing materials and construction worker trips.

Implementation of the open space and utility proposals at the Parnassus Heights campus site would require minimal construction equipment and would not be expected to contribute substantially to air emissions.

Demolition, construction and renovation emissions were calculated using the California Emissions Estimator Model (CalEEMod), by grouping construction activities into five- to six-year increments. The construction timeline for proposals is presented in Table 5-1. Modeling assumed construction phasing lengths based on CalEEMod default estimates, which are based on square footage for hospitals, research/office and child care uses and the number of dwelling units for housing. Because specific details of construction are not known, CalEEMod default estimates were also assumed for vendor trips, construction worker trips, and off-road equipment use. All model inputs and outputs are in Appendix E. **Table 5-3** presents the average annual daily construction emissions generated by the 2014 LRDP. Average daily emissions conservatively assume simultaneous construction of all

proposals under each window and are averaged over all the construction days (260 per year) for each window.

TABLE 5-3
ESTIMATED DAILY CONSTRUCTION EMISSIONS
WITHOUT MITIGATION, 2014 LRDP

Years	Estimated Emissions (lbs/day)			
	ROG	NO_x	Exhaust PM_{10}	Exhaust $PM_{2.5}$
2015-2019	**80.86**	**89.52**	4.82	4.47
2020-2024	31.27	48.11	2.59	2.46
2025-2030	21.57	28.11	1.05	0.99
2031-2035	21.01	23.22	0.52	0.50
BAAQMD Considered Construction Threshold	54	54	82	54
Potential Significant Impact?	Yes	Yes	No	No

SOURCE: ESA (Appendix E)

BAAQMD's approach to analysis of construction-related particulate impacts (other than exhaust PM) is to emphasize implementation of effective and comprehensive dust control measures rather than detailed quantification of emissions. BAAQMD considers construction-related fugitive dust impacts of projects to be less than significant if a suite of recommended dust-control measures are implemented. Therefore, campus-wide implementation of BAAQMD-identified Best Management Practices for control of fugitive dust, listed below as **Mitigation Measure AIR-LRDP-1**, would reduce impacts to less than significant levels.

Mitigation Measure AIR-LRDP-1: Best Management Practices for Controlling Particulate Emissions.

The following BAAQMD[4] Best Management Practices for particulate control will be required for all construction activities. These measures will reduce particulate emissions primarily during soil movement, grading and demolition activities but also during vehicle and equipment movement on unpaved project sites

1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.
2. All haul trucks transporting soil, sand, or other loose material off-site shall be covered.
3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
4. All vehicle speeds on unpaved roads shall be limited to 15 mph.

[4] Bay Area Air Quality Management District, CEQA Air Quality Guidelines, Table 8-1, 2012.

5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.

6. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure Title 13, § 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points.

7. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.

8. Post a publically visible sign with the telephone number and person to contact at UCSF regarding dust complaints. This person shall respond and take corrective action within 48 hours. BAAQMD's telephone number shall also be visible to ensure compliance with applicable regulations.

As can be seen in Table 5-3, estimated average daily construction-related exhaust emissions would not exceed the thresholds for particulate matter, but would exceed the NOx and ROG average daily thresholds during the 2015-2019 window if all proposals were to be constructed. While Table 5-3 indicates that these thresholds would not be expected to be exceeded during the subsequent time frames, because sequential phasing of construction projects at all campus sites cannot be assured, this impact would be significant and mitigation is identified to reduce the effects.

Mitigation Measure AIR-LRDP-2: Architectural Coatings.

ROG emissions from the use of architectural coatings shall be reduced by implementing either or both of the following measures if total emissions of ROG exceed 54 pounds per day on average over the construction period:

- Architectural coatings shall be applied over the course of 4 months or longer, in order to reduce daily ROG emissions to below the significance threshold.
- A minimum of 67% of exterior building materials shall be prefinished to reduce ROG emissions.

Mitigation Measure AIR-LRDP-3: Off-Road Equipment Control Measures for NOx.

All off-road equipment greater than 25 hp and operating for more than 20 total hours over the duration of construction activities shall meet the following requirements that will not be fully implemented via regulation until 2018 (i.e., the equipment is available for purchase or rental at present but its use not mandated throughout all fleets until 2018):

a. All off-road equipment shall have:

   i. Engines that meet or exceed either U.S. EPA Tier 3 off-road emission standards, or

   ii. Engines that are retrofitted with an ARB Level 3 Verified Diesel Emissions Control Strategy (VDECS).

Significance after Mitigation: Significant and Unavoidable. Mitigation Measure AIR-LRDP-1: Best Management Practices for Controlling Particulate Emissions will be required for all construction activities to reduce those impacts to less than significant. **Mitigation Measure AIR-LRDP-2: Architectural Coatings** would reduce average daily construction emissions of ROG to less than 54 pounds per day of ROG. **Mitigation Measure AIR-LRDP-3: Off-Road Equipment Control Measures for NOx** would reduce average daily NOx emissions during building construction, but NOx would still exceed the 54 pound per day threshold. For that reason, the impact of increased emissions of criteria air pollutants during demolition and construction activities would be significant and unavoidable.

Impact AIR-LRDP-5: Implementation of the 2014 LRDP would result in increased emissions of criteria air pollutants during operation. (Potentially Significant)

Implementation of the 2014 LRDP would result in an increase in criteria air pollutant and precursor emissions, including ROG, NOx, PM_{10} and $PM_{2.5}$ from a variety of emissions sources, including onsite area sources (e.g., natural gas combustion for space and water heating, landscape maintenance, use of consumer products such as hairsprays, deodorants, cleaning products, etc.) and mobile on-road sources. Operational emissions of criteria pollutants were estimated using the CalEEMod version 2013.2.2 emissions inventory model.

One of the sources of operational emissions would be increased vehicle emissions from additional staff, patients, visitors and residents. Traffic volumes used to estimate vehicle-related emissions were derived from the Transportation Demand Analysis prepared for the 2014 LRDP (Adavant, 2014). Implementation of the 2014 LRDP would generate an estimated 14,412 additional daily vehicle trips. In addition to exhaust emissions, vehicles would also generate PM_{10} and $PM_{2.5}$ from entrained road dust and tire and brake wear.

Emissions would also be generated by natural gas combustion, operation of landscape maintenance equipment, and maintenance application of paint and other architectural coatings.

Table 5-4 presents estimated operational emissions at the LRDP horizon in 2035. As Table 5-4 shows, without mitigation, operational emissions of NOx and ROG would exceed threshold levels, resulting in a significant impact. The primary contributing sources to ROG emissions would be the use of consumer products associated with over 2 million square feet of development, while for NOx emissions, the primary sources are vehicle emissions and natural gas combustion, primarily at the Mission Bay campus site.

Mitigation Measure AIR-LRDP-4: BAAQMD-Suggested Operational Measures.

The following measures identified in the 2012 BAAQMD *CEQA Guidelines* shall be considered for implementation for site-specific development projects if not already in place:

- Provide and maintain secure bike parking (at least one space per 20 vehicle spaces);
- Provide and maintain showers and changing facilities for employees;

TABLE 5-4
ESTIMATED OPERATIONAL EMISSION INCREASES AT LRDP HORIZON YEAR, 2035

Air Pollutant	Estimated Emissions (lbs/day)			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Parnassus Heights campus site	6.34	8.36	2.85	1.28
Mission Bay campus site	130.4	74.40	68.26	21.20
Mount Zion campus site	9.82	7.64	5.66	1.67
Mission Center campus site	3.76	2.94	2.87	0.84
Total	**177.98**	**93.36**	79.64	24.99
Regional Significance Threshold	54	54	82	54
Significant Impact?	Yes	Yes	No	No

SOURCE: ESA, 2014 (see Appendix E).

- Provide information on transportation alternatives to employees;
- Provide and maintain preferential carpool and vanpool parking for non-residential uses;
- Increase building energy efficiency below Title 24 (reduces NOx related to natural gas combustion);
- Require use of electrically powered landscape equipment, where feasible;
- Use low VOC architectural coatings in maintaining buildings;
- Meet California Green Building Code standards in new construction (reduces NO_x related to natural gas combustion);
- Adopt policies supporting infill development;
- Create and enhance landscaped greenway, trail, and sidewalk connections between neighborhoods, commercial areas, activity centers, and parks; and
- Ensure that proposed land uses are supported by a multi-modal transportation system and that the land uses themselves support the development of the transportation system.

Significance after Mitigation: Significant and Unavoidable. Trip generation estimates used in this analysis included adjustments for development scale, density, and diversity of uses, distance to transit and design of the campus sites, as well as a robust number of alternative transportation trips (walk, bike, and transit) and carpooling. Therefore, many key elements of alternative mode strategies have been incorporated into the trip generation assumptions.

Mitigation Measure AIR-LRDP-4 would not result in the 78% reduction necessary (for ROG) or 41% (for NOx) to reduce the impact to a less-than-significant level. This amount of traffic reduction exceeds the best reduction estimates for TDM programs (BAAQMD, 2012b). **Table 5-5** presents emissions assuming a conservative 12% reduction in vehicle miles travelled associated with TDM measures (CAPCOA, 2010). As can be seen from

TABLE 5-5
ESTIMATED MITIGATED OPERATIONAL EMISSION INCREASES AT LRDP HORIZON YEAR, 2035

Air Pollutant	Estimated Emissions (lbs/day)			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Parnassus Heights campus site	6.34	8.36	2.85	1.28
Mission Bay campus site	126.8	62.68	59.89	18.47
Mount Zion campus site	9.41	6.89	4.99	1.48
Mission Center campus site	3.61	2.65	2.53	0.74
Total	**146.16**	**80.58**	70.26	21.97
Regional Significance Threshold	54	54	82	54
Significant Impact?	Yes	Yes	No	No

Table 5-5, emissions of ROG and NOx would still exceed thresholds. Consequently, development under the 2014 LRDP with implementation of feasible mitigation measures would still result in significant environmental effects on air quality and contribute substantially to an existing air quality violation (ozone precursors). Therefore, even with implementation of Mitigation Measure AIR-LRDP-4, the impact would remain significant and unavoidable for emissions of ROG and NOx.

NOx and ROG emissions are a concern as ozone precursors. The health implications of this significant impact would result from the potential to contribute to increased violations of the air quality standards for ozone. As indicated in Table 4.2-1, state and federal standards for ozone have not been exceeded in the past five years of monitoring in San Francisco, so the degree to which a proposal would substantially contribute to a future violation of the ozone standard would be expected to be minimal. Further, the extent to which these significant ozone precursor emissions would result in adverse health effects is not readily quantifiable on a local scale because "by its very nature, air pollution is largely a cumulative impact. No single project is sufficient in size to, by itself, result in nonattainment of ambient air quality standards" (BAAQMD, 2011).

2014 LRDP Development Site-Specific Impacts

Impact AIR-LRDP-6: Implementation of the 2014 LRDP would result in increased emissions of toxic air contaminants that could increase health risks for nearby residents during demolition and construction activities. (Less than Significant)

Construction activities under the 2014 LRDP would produce diesel particulate matter (DPM) and $PM_{2.5}$ emissions due to combustion equipment such as loaders, backhoes, and cranes, as well as haul truck trips. These emissions could result in elevated concentrations of DPM and $PM_{2.5}$ at nearby receptors (both new and existing residences and schools). Hospitals are also considered sensitive receptors but the duration of exposure would be substantially less than that assumed for residential receptors and the resulting risk would therefore be less. These elevated concentrations could lead to an increase in the risk of cancer or other health impacts.

TACs do not have ambient air quality standards, but are regulated by BAAQMD using a risk-based approach based on recommended methodology of the state Office of Environmental Health Hazard Assessment, which has been adopted by BAAQMD. Consequently, a health risk assessment of the development proposals was performed to determine the extent of increased cancer risks and hazard indices at the maximally exposed receptors. The cancer risk to residential receptors assumes exposure occurs 24-hours per day for 350 days per year. Cancer risk to residential receptors is based on the exposure for the duration of the construction period. These cancer risk estimates also incorporate age sensitivity factors (ASFs). This approach provides updated calculation procedures that factor in the increased susceptibility of infants and children to carcinogens as compared to adults. For estimating cancer risks for residential receptors over a 70 year lifetime, the incorporation of the ASFs results in a cancer risk adjustment factor of 1.7.

A summary of the construction-related health impacts related to implementation of the 2014 LRDP at the four campus sites is presented in **Table 5-6**. Detailed assumptions, methodology for the health risk assessment and results are included in the impact analyses in Sections 6.2, 7.2, 8.2 and 9.2 and Appendix E of this EIR. As shown in Table 5-6, construction-related health risks and hazards would be less than significant for each campus location.

TABLE 5-6
SUMMARY OF 2014 LRDP CONSTRUCTION-RELATED HEALTH IMPACTS

Receptor Type	Cancer Risk (per million) persons	Chronic Impact	Acute Impact	$PM_{2.5}$ Concentration ($\mu g/m^3$)
Parnassus Heights Campus Site				
New Residence (adult / child)	0.05/0.59	<0.01	<0.01	<0.01
School Children	0.02	<0.01	<0.01	<0.01
Existing Residence (adult / child)	0.03 / 0.29	<0.01	<0.01	<0.01
Mission Bay Campus Site				
New Residence (adult / child)	0.63 / 7.11	0.01	0.08	0.07
School Children	0.35	0.01	0.01	0.03

BAAQMD Significance Criteria	10	1	1	0.3
Significant Impact?	No	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

Each campus site also operates fume hoods that emit TACs. These fume hood emissions do not require a permit from BAAQMD based on the operating throughput and therefore have not been assigned an existing risk value in BAAQMD databases like permitted sources. However, UCSF maintains an inventory of chemical throughput for each campus site and has prepared health risk assessments relative to fume hood emissions at its major campus locations (Parnassus Heights and Mission Bay). The potential for adverse health risk associated with fume hood emissions under the LRDP is assessed separately for each campus site in Sections 6.2, 7.2, 8.2 and 9.2. The relative risk from fume hoods is not a substantial contribution compared to other existing sources.

Implementation of the proposed 2014 LRDP would result in localized increases in TACs at each campus site from increased daily vehicle trips which are assessed individually for each campus site in Sections 6.2, 7.2, 8.2 and 9.2. Potential localized risk increases from new diesel generators are also addressed in these sections.

5.3 Biological Resources Impacts of the 2014 LRDP

Impact BIO-LRDP-1: Implementation of the 2014 LRDP could have a substantial adverse effect, either directly or through habitat modifications, on species identified as candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service. (Less than Significant)

A comprehensive list of the special-status plant and animal species that may occur or have the potential to occur within the San Francisco North and San Francisco South U.S. Geological Survey quadrangles, which include all UCSF campus sites with 2014 LRDP proposals, was developed based on data obtained from the California Natural Diversity Database (CNDDB), the California Native Plant Society (CNPS) Electronic Inventory, the U.S Fish and Wildlife Service (USFWS) and other biological literature pertaining to the bioregion (see Tables 4.3-1 and 4.3-2 in Section 4.3).

Most of the species identified within these quadrangles are associated with specific habitat types, such as dunes, valley foothill grasslands, chaparral, coastal prairie, coastal bluff scrub, marshes and swamps. None of these habitats is present at the four main campus sites.

Most special-status plant species are considered to have a low potential to occur at the four main campus sites due to the developed nature of these locations. This estimation is supported by the lack of native plants and supportive native vegetation communities, and based on the disturbed and heavily managed condition of the campus sites. Although the Parnassus Heights campus site includes the Mount Sutro Open Space Reserve (Reserve), the potential for rare plant species in the Reserve is considered low because the vegetation communities that would support rare plants, such as coastal salt marsh, coastal prairie, valley and foothill grasslands, coastal dunes, and coastal scrub are not prevalent there.

Aside from breeding birds, special-status wildlife species are not likely to occur within the campus sites because most of these areas are highly fragmented and paved or dominated by non-native ornamental or ruderal species, which have poor habitat attributes for wildlife.

Sensitive species habitat in the vicinity of the Mission Bay campus site is associated with the San Francisco Bay and the China Basin channel. Development proposed at this campus site would not be located on or near aquatic habitat or directly affect aquatic habitat and water-dependent, special-status species that may be present in the China Basin channel.

The CNDDB documents three special-status plant species within one mile of the Mount Zion campus site: Franciscan manzanita (*Arctostaphylos franciscana*), Presidio Manzanita (*Arctostaphaylos Montana* ssp. *ravenii*) and Marin western flax (*Hesperolinon congestum*). None of these species are expected to occur there due to lack of suitable habitat and lack of historic presence.

Monarch butterflies (*Danaus plexippus*) have been known to overwinter in eucalyptus groves of San Francisco and the foliage-roosting western red bat has been documented in Golden Gate Park. Parnassus Heights is the only UCSF campus site with suitable habitat for overwintering monarch aggregations; however, there are no records of such activity within the Reserve. The western red bat and Yuma myotis may potentially occur in forest edge habitat of the Reserve. Suitable roosting habitat for these bats includes tree foliage, underneath the exfoliating bark of trees and in tree cavities. The western red bat has been known to roost in the Strybing Arboretum of Golden Gate Park within 0.5 mile of the Parnassus Heights campus site.

Construction and demolition proposals, as well as open space and utilities activities within and near the Reserve at the Parnassus Heights campus site could have potentially adverse impacts on special-status wildlife and plant species in the Reserve. Discussion of biological resources and potential impacts resulting from implementation of the 2014 LRDP at the Parnassus Heights campus site is presented in Section 6.3.

2014 LRDP proposals at the Mission Bay, Mount Zion or Mission Center campus sites would not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

Mitigation: None required.

Impact BIO-LRDP-2: Implementation of the 2014 LRDP would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service. (Less than Significant)

Implementation of 2014 LRDP proposals would occur at already developed campus sites within an urban setting. Small areas of oak woodland, eucalyptus forest, montane hardwood, non-native annul grassland, lacustine, riparian and freshwater emergent wetland habitat, are present within the City, but not at or in the vicinity of the campus sites for which proposals are included under the 2014 LRDP.

The CNDDB reports no sensitive natural community occurrences for the two-quadrangle area containing and surrounding the 2014 LRDP planning area (CDFW, 2014). The USFWS designates critical habitat for certain species listed by the agency as threatened or endangered. "Critical habitat" is defined in Section 3(5)(A) of the federal Endangered Species Act as those lands within a listed species' current range that contain the physical or biological features considered essential to the species' conservation, as well as areas outside the species' current range that are determined to be essential to its conservation. Proposals under the 2014 LRDP are not located within designated critical habitat for any federally listed species.

Development proposed under the 2014 LRDP would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies or regulations. The impact would be less than significant.

Mitigation: None required.

Impact BIO-LRDP-3: Implementation of the 2014 LRDP would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. (No Impact)

Development proposed under the 2014 LRDP would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means because there are no jurisdictional or non-jurisdictional wetlands mapped or identified on UCSF campus sites. No impact would occur.

Mitigation: None required.

Impact BIO-LRDP-4: Implementation of the 2014 LRDP would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. (Potentially Significant)

The San Francisco Peninsula is an important migratory stopover for birds along the Pacific Flyway—one of the four major migratory routes in North America. Raptors, songbirds, shorebirds and waterfowl stop in San Francisco, including Golden Gate Park, Lake Merced, the Presidio and the Mount Sutro Open Space Reserve on the Parnassus Heights campus site during their fall and spring migrations. Both the Mission Bay and Parnassus Heights campus sites offer suitable and attractive habitat for birds to forage and rest along this migration route.

Bird flights close to man-made structures are at risk of collisions with such structures. Direct effects on migratory as well as resident birds moving through an area could include death or injury if birds collide with lighted structures or other birds attracted to the light, as well as collisions with glass during the daytime. Indirect effects for migratory birds include delayed arrival at breeding or wintering grounds, and reduced energy stores necessary for migration, winter survival, or subsequent reproduction (Gauthreaux and Belser, 2006). It is estimated that, in North America alone, millions of songbirds are killed due to collisions with buildings and other structures each year (Lochhead, 2008). Collisions are currently recognized as one of the leading causes of bird population declines worldwide (Brown et al., 2007).

Daytime collisions occur most often when birds fail to recognize window glass as a barrier. Regardless of overall height, the ground floor and first few stories of buildings present the greatest hazards to most birds; reflections of attractive ground-level features like vegetation draw birds toward glass surfaces and often result in collisions. Recent increases in glass surfaces used to provide more natural light to building interiors can be considered a “biologically significant” issue, potentially affecting the viability of local and regional bird populations (New York Audubon Society, 2007). The San Francisco Planning Department adopted *Standards for Bird-Safe Buildings* in 2011, adding Planning Code Section 139 (San Francisco Planning Department, 2011). However,

as discussed in Section 4.3.2.2 *Applicable Local Plans and Policies*, property owned or leased by the University that is used in furtherance of the University's educational purposes is not subject to local land use regulation, including *San Francisco General Plan* policies regarding protection of biological resources. Nonetheless, an increase in avian collisions attributed to 2014 LRDP proposals at the Parnassus Heights and Mission Bay campus sites would be a significant impact.

Implementation of **Mitigation Measure BIO-LRDP-1: Bird Safe Building Treatments** would reduce potential adverse effects on resident and migrating birds to a less than significant level by requiring design features be incorporated into proposals at the Parnassus Heights and Mission Bay campus sites that would make buildings more visible to birds.

Mitigation Measure BIO-LRDP-1: Bird-Safe Building Treatments.

- Employ glazing options such as use of either fritted glass, Dichroic glass, etched glass, translucent glass, or glass that reflects ultraviolet light in appropriate portions of the building façade.

- Minimize light and glare resulting from new buildings through the orientation of the building, use of landscaping materials and choice of primary façade materials. Design standards and guidelines to minimize light and glare shall be adopted for the new buildings, including: reflective metal walls and mirrored glass walls shall not be used as primary building materials for facades.

Significance after Mitigation: Less than Significant

Mitigation: None required.

Impact BIO-LRDP-5: Implementation of the 2014 LRDP would not conflict with any applicable policies protecting biological resources. (No Impact)

Pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation, including City of San Francisco General Plan policies regarding protection of biological resources. Although UCSF is not subject to City policies and regulations, UCSF strives to be consistent with City standards, where feasible.

Regarding City policies applicable to potential 2014 LRDP effects on birds, the San Francisco Planning Department adopted *Standards for Bird-Safe Buildings* in 2011, adding Planning Code Section 139 (San Francisco Planning Department, 2011). These standards guide the use and types of glass and façade treatments, wind generators and grates and lighting treatments. The standards impose requirements for bird-safe glazing and lighting in structures or at sites that represent a hazard to birds and provide information on educational and voluntary programs related to bird hazards. The standards define two types of bird hazards. "Location-related hazards" are buildings located inside of, or within a clear flight path of less than 300 feet from, an Urban Bird Refuge.[5]

[5] An Urban Bird Refuge is defined in the Standards for Bird-Safe Buildings as: any area of open space two acres or larger that is dominated by vegetation, including vegetated landscaping, forest, meadows, grassland, water features, or wetlands; open water; and some green rooftops.

Such buildings require treatment when new buildings are constructed; additions are made to existing buildings; or existing buildings replace 50 percent or more of the glazing within the "bird collision zone."[6] The standards require implementation of the following treatments for façades facing, or located within, an Urban Bird Refuge:

- No more than 10 percent untreated glazing is allowed on building façades within the bird collision zone.
- Lighting must be shielded, and no uplighting is permitted. No event searchlights are permitted.
- Sites are not permitted to use horizontal access windmills or vertical access wind generators that do not appear solid.

"Feature-related hazards" include building- or structure-related features that are considered potential "bird traps" regardless of location (e.g., glass courtyards, transparent building corners, or clear glass walls on rooftops or balconies). Structures that include these elements must treat 100 percent of these elements in the building with bird-safe glazing.

As noted above under Impact BIO-LRDP-4, UCSF will adopt mitigation that is generally consistent with the City's *Standards for Bird-Safe Buildings* for new construction proposed under the 2014 LRDP. However, as noted above, UCSF is not subject to local policies protecting biological resources. Thus, no conflict would result and no impact would occur.

Mitigation: None required.

Impact BIO-LRDP-6: Implementation of the 2014 LRDP would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan or other applicable habitat conservation plan. (No Impact)

There are no adopted habitat conservation plans, natural community conservation plans or other applicable habitat conservation plans that would be applicable to the 2014 LRDP or any of the proposals included under the LRDP. No impact would occur.

Mitigation: None required.

Impact BIO-LRDP-7: Implementation of the 2014 LRDP would not exceed the LRDP EIR standard of significance by damaging or removing heritage or landmark trees or native oak trees of a diameter specified in a local ordinance. (Less than Significant)

The San Francisco Urban Forestry Ordinance (Article 16 of the San Francisco Public Works Code) was enacted to ensure the protection of trees on private land within and adjacent to public areas. The City of San Francisco currently considers street trees, significant trees and landmark trees as protected. Significant trees are trees within 10 feet of the public right-of-way and are either 20 feet or greater in height, 15 feet or greater in canopy width, or 12 inches or greater in

[6] The "bird collision zone" is that portion of the building that begins at grade and extends upward for 60 feet.

trunk diameter at 4.5 feet above grade. Landmark trees are trees that have received special designation by the San Francisco Board of Supervisors due to species rareness, size, age, structure, ecological contribution, or historical and cultural importance. Proposals under the 2014 LRDP are not expected to affect protected trees; therefore, the impact would be less than significant.

Mitigation: None required.

5.4 Cultural Resources Impacts of the 2014 LRDP

Impact CUL-LRDP-1: Implementation of the 2014 LRDP could result in a substantial adverse change in the significance of historical resources as defined in CEQA Guidelines Section 15064.5. (Potentially Significant)

Renovation activities proposed under the 2014 LRDP could result in adverse changes to historical resources or eligible resources as designated by the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR). Under CEQA, a cultural resource is considered significant if it is at least 45 years old and meets any of the criteria listed by the CRHR. The fact that a resource is not listed in, or determined to be eligible for listing the CRHR, not included in a local register of historic resources, or identified in a historical resources survey does not preclude a lead agency from determining based on substantial evidence that the resources may be an historical resource (CEQA Guidelines Section 15064.5(a)(4)). Listing of a property in the NRHP or CRHR does not prohibit demolition or alteration of that property, but does denote that the property is a resource worthy of recognition and protection.

Public Resources Code Section 5020.1 and CEQA Guidelines Section 15064.5(b)(1) define a significant effect as one that would materially impair the significance of a historical resource. Alteration in an adverse manner of the physical characteristics of a historical resource that conveys its historical significance would be considered a significant impact under CEQA. Generally, a project that follows the Secretary of the Interior's guidelines for historic buildings would be considered mitigated to a less than significant level, according to CEQA Guidelines Section 15064.5(b)(3). Implementation of Mitigation Measure **CUL-LRDP-1** would reduce impacts to a less than significant level.

> **Mitigation Measure CUL-LRDP-1:** Before altering or otherwise affecting a building or structure 50 years old or older, the campus shall retain a qualified architectural historian to record it on a California Department of Parks and Recreation DPR 523 form. Its significance shall be assessed by a qualified architectural historian, using the significance criteria set forth for historic resources under CEQA Guidelines Section 15064.5. For historic buildings, structures or features that do not meet the CEQA criteria for historical resource, no further mitigation is required and the impact is less than significant.
>
> For a building or structure that qualifies as a historic resource, the architectural historian and UCSF shall consider measures that would enable the project to avoid direct or indirect impacts to the building or structure. These could include project redesign or other measures that would avoid altering the building. All rehabilitation work of an historic building or structure shall be conducted in compliance with the *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings*, to the extent feasible. Alterations to cultural landscapes shall be conducted in compliance with the *Secretary of the Interior's Guidelines for Rehabilitating Cultural Landscapes*.
>
> **Significance after Mitigation:** Less than Significant. If it is not feasible to meet the Secretary's Standards, this impact could be a significant and unavoidable impact.

Impact CUL-LRDP-2: Implementation of the 2014 LRDP could result in demolition of historical resources as defined in CEQA Guidelines Section 15064.5. (Significant)

Demolition activities proposed under the 2014 LRDP could result in the loss of historical resources or eligible resources as designated by the NRHP or the CRHR, which would be considered a significant impact under CEQA. Although mitigation is available to reduce the impact, it would not reduce effects to a less than significant level. As noted in CEQA Guidelines Section 15126.4 (b)(2), documentation of an historical resource by way of historic narrative, photographs, or architectural drawings as mitigation for the effects of demolition of the resource will not mitigate the effects to a point where clearly no significant effect on the environment would occur.

> **Mitigation Measure CUL-LRDP-2:** If a significant historic building or structure is proposed for substantial alteration or demolition, UCSF shall ensure that a qualified architectural historian thoroughly documents the building and associated landscaping and setting. Documentation shall include still photography and a written documentary record of the building to the National Park Service's standards of the Historic American Building Survey or Historic American Engineering Record, including accurate scaled mapping and architectural descriptions. If available, scaled architectural plans will also be included. Photos include large-format (4"X5") black-and-white negatives and 8"X10" enlargements. Digital photography may be substituted for large-format negative photography if archived locally. The record shall be accompanied by a report containing site-specific history and appropriate contextual information. This information shall be gathered through site specific and comparative archival research, and oral history collection as appropriate. A copy of the record shall be archived with the UCSF archives, the History Room of the San Francisco Public Library, the Northwest Information Center at Sonoma State University, and the San Francisco Planning Department.
>
> UCSF shall install interpretive materials at or near the site to enhance public awareness in the form of a historical marker, kiosk, or other display that contains historical photos and text about the building's historical significance.
>
> **Significance after Mitigation:** Significant and Unavoidable

The 2014 LRDP proposes to demolish existing buildings at the Parnassus Heights and Mount Zion campus sites. Two of these buildings, Surge at Parnassus Heights and Hellman at Mount Zion, are considered historical resources for CEQA purposes. The 2014 LRDP proposes to renovate and reuse UC Hall, Millberry Union towers and Moffitt Hospital on the Parnassus Heights campus site, and the Main Hospital on the Mount Zion campus site. Both UC Hall and Millberry Union towers are considered historical resources under CEQA. Saunders Court at the Parnassus Heights campus site is proposed to be renovated under the 2014 LRDP. It is considered a significant cultural landscape and presumed to be a historical resource for CEQA purposes. The Mount Sutro Open Space Reserve is considered an historic landscape. Three new trails through the Reserve are proposed by the 2014 LRDP.

Discussion of potential effects to historical resources resulting from identified 2014 LRDP demolition, renovation and open space proposals at the Parnassus Heights and Mount Zion campus sites is presented in Sections 6.4 and 8.4, respectively.

Impact CUL-LRDP-3: Implementation of the 2014 LRDP could result in a substantial adverse change to archaeological resources. (Potentially Significant)

Previous studies and archival research conducted for UCSF have not identified archaeological resources at the Parnassus Heights, Mission Bay or Mount Zion campus sites. Mission Bay is the only campus site near a watercourse or water body, which is where archaeological resources are frequently discovered. However, the Mission Bay area has been substantially altered over time, including the large amount of fill added along the shoreline; therefore, the likelihood of discovering archaeological resources is low. Additionally, these campus sites have been extensively modified over time, and the likelihood of discovering archaeological resources would thus be low. In the unlikely event that archaeological artifacts are discovered during construction at the Parnassus Heights, Mission Bay or Mount Zion campus sites (including grading, excavation, and other earthmoving activities), the following mitigation measure would be implemented:

> **Mitigation Measure CUL-LRDP-3:** Should an archaeological artifact be discovered during project construction and excavation, pursuant to CEQA Guidelines 15064.5 (f), "provisions for historical or unique archaeological resources accidentally discovered during construction" shall be instituted. In the event that any prehistoric or historic subsurface cultural resources are discovered during ground disturbing activities, all work within 100 feet of the resources shall be halted and UCSF shall consult with a qualified archaeologist or paleontologist to assess the significance of the find (per Public Resource Code Section 5024.1, Title 14 CCR, Section 4852 and/or Public Resource Code 21083.2 in the event of a unique archaeological find). If any find is determined to be significant and will be adversely affected by the project, representatives of UCSF and the qualified archaeologist and/or paleontologist shall meet to determine the appropriate avoidance measures or other appropriate mitigation (per CEQA Guidelines 15064.5 (b) and Public Resource Code 21083.2). All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and documented by the qualified archaeologist according to current professional standards (per the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation (48 FR44716)).
>
> **Significance after Mitigation:** Less than Significant

Prehistoric and historic period occupation of the Mission Center campus site suggests a high sensitivity to contain significant archaeological deposits and/or features from both prehistoric and historic-period use and occupation. For discussion of potential impacts to archaeological resources at the Mission Center campus site see Section 9.4.

Impact CUL-LRDP-4: Implementation of the 2014 LRDP could result in a substantial adverse change to paleontological resources. (Potentially Significant)

Review of geological maps and previous analysis suggests that there are no unique paleontological resources or unique geologic features at any campus site. In the event that

paleontological resources are uncovered during the course of construction, implementation of **Mitigation Measure CUL-LRDP-3** would reduce impacts to a less than significant level.

> **Mitigation Measure CUL-LRDP-4:** If paleontological resources, such as fossilized bone, teeth, shell, tracks, trails, casts, molds, or impressions are discovered during ground-disturbing activities, all ground disturbing activities within 50 feet of the find shall be halted until a qualified paleontologist can assess the significance of the find and, if necessary, develop appropriate salvage measures in consultation with UCSF and in conformance with Society of Vertebrate Paleontology Guidelines (SVP, 1995; SVP, 1996).
>
> **Significance after Mitigation:** Less than Significant

Impact CUL-LRDP-5: Implementation of the 2014 LRDP could result in a substantial adverse change to human remains. (Potentially Significant)

There are no known human remains, including those interred outside of formal cemeteries, located at any campus site. In the event of an accidental discovery or recognition of human remains during project excavation and construction, the following mitigation measure would be implemented:

> **Mitigation Measure CUL-LRDP-5:** If the discovery includes human remains, CEQA Guidelines 15064.5 (e)(1) shall be followed:
>
> > In the event of the accidental discovery or recognition of any human remains in any location other than a dedicated cemetery, the following steps should be taken:
> >
> > (1) There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:
> >
> > (A) The coroner of the county in which the remains are discovered must be contacted to determine that no investigation of the cause of death is required, and
> >
> > (B) If the coroner determines the remains to be Native American: (1) the coroner shall contact the Native American Heritage Commission within 24 hours. (2) The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased Native American. (3) The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or
> >
> > (2) Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.
> >
> > (A) The Native American Heritage Commission is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission.

(B) The descendant identified fails to make a recommendation; or

(C) The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the Native American Heritage Commission fails to provide measures acceptable to the landowner.

Significance after Mitigation: Less than Significant

5.5 Geology, Soils and Seismicity Impacts of the 2014 LRDP

The Initial Study prepared for the 2014 LRDP determined that there are no expansive soils on the Parnassus Heights, Mission Bay, Mount Zion or Mission Center campus sites. Therefore, no impact regarding expansive soils would result from implementation of the 2014 LRDP.

The Initial Study also determined that implementation of the 2014 LRDP would not result in the installation of septic tanks or alternative wastewater disposal systems. Therefore, no impacts regarding septic tanks or alternative wastewater disposal systems would result from implementation of the 2014 LRDP.

Impact GEO-LRDP-1: Implementation of the 2014 LRDP could result in adverse effects to people and structures resulting from geologic hazards. (Less than Significant)

Building demolitions under the 2014 LRDP would be essentially unaffected by geologic hazards, while renovation and reuse of existing buildings and all new construction activities could be strongly affected. The four campus sites where development is proposed under the 2014 LRDP are located in a seismically active region that could experience at least one major earthquake (Richter magnitude (M) 6.7 or higher) over the next 30 years. Strong ground shaking at these campus sites could occur during a moderate to severe earthquake occurring on one of the active Bay Area faults near the campus sites.

As described in Section 4.5.2, *Regulatory Considerations,* construction of proposed buildings would require design, site preparation and foundation construction in accordance with the most current version of the California Building Code as well as the seismic standards of SB 1953 and the Office of Statewide Health Planning and Development (OSHPD) requirements for proposed hospital facilities. Geotechnical review of the foundation design of new hospital facilities would be required to adhere to the guidelines presented in *California Geological Survey – Note 48, Checklist for the Review of Engineering Geology and Seismology Reports for California Public Schools, Hospitals, and Essential Services Buildings.* Geotechnical review would include evaluation of slope stability hazards as required by building code requirements. Renovation of existing buildings also would be required to adhere to all applicable seismic requirements as contained in the most recent version of the California Building Code and UC *Policy on Seismic Safety.*

The Mission Bay campus site is within a California Geologic Survey (CGS) Seismic Hazard Zone and the City's Special Geologic Study Area for potential ground failure hazards caused by liquefaction and would therefore be subject to Special Publication 117A. Special Publication 117A includes protocols for the identification of potentially liquefiable materials as well as appropriate requirements to minimize potential damage from liquefaction (e.g., use of edge containment structures, removal of liquefiable soils, dynamic consolidation, injection grouting, etc.).

In general, the Mission Bay campus site contains conditions that present a number of potential geologic hazards including groundshaking, liquefaction, settlement, and differential settlement

largely due to the presence of the underlying materials (i.e., varying thicknesses of loose artificial fill, Bay Mud, older marine clays, and sandy alluvium) (Treadwell & Rollo, 1995). If not addressed appropriately in site preparation and design, the presence of heterogeneous fill materials including building debris, soft compressible Bay Mud, and loose saturated soils would make new structures susceptible to damage from dynamic (earthquake) or static (slow compression of Bay Muds) forces. However, these hazards are commonplace in areas throughout the Bay margins and, as stated above, current code requirements and design practices such as the use of deep foundation systems are effective in reducing potential impacts. Therefore, construction and design in accordance with the most recent version of the California Building Code and CGS Special Publication 117A would reduce potential geotechnical hazards to less than significant levels.

According to the CGS, the Mission Center campus site is also located within a Seismic Hazard Zone for liquefaction indicating a high potential for the presence of soils that could be susceptible to the effects of liquefaction during an earthquake (ABAG, 2014). Due to the location of the site within the seismic hazard zone for liquefaction, construction at the Mission Center campus site would be required to be in compliance with Special Publication 117A which includes measures on the identification and appropriate mitigation of any identified liquefaction hazards. Adherence to these existing regulatory requirements would ensure that seismic hazards are reduced to less than significant levels.

The University's *Policy on Seismic Safety* requires that all buildings and facilities where University operations and activities occur be acquired, built, maintained and rehabilitated to an acceptable level of earthquake safety. The policy requires that new University construction comply with the most stringent seismic building requirements, where they are embodied in the California Building Code or in local regulations. Adherence to this policy as well as other regulatory requirements described in Section 4.5, *Geology, Soils and Seismicity*, would reduce impacts to less than significant levels.

The proposed improvements to the streetscape of Parnassus Avenue on the Parnassus Heights campus site present low risk in terms of their seismic vulnerability, however they would nonetheless be subject to building code requirements, where applicable, as well as City of San Francisco Department of Public Works regulations that would ensure that proven geotechnical preparations and design would reduce potential seismic impacts to less than significant levels.

Finally, 2014 LRDP utilities improvements on the Parnassus Heights campus site and their associated connections to new and existing buildings are required to adhere to regulatory requirements that include measures such as flexible connections that minimize the potential for damage in the event of a substantial earthquake. The improvements are designed to address or eliminate any existing seismic deficiencies.

Mitigation: None required.

Impact GEO-LRDP-2: Implementation of the 2014 LRDP could result in substantial soil erosion or loss of topsoil. (Less than Significant)

The 2014 LRDP demolition of existing structures and new construction activities could expose underlying soils, while renovation and reuse of existing buildings would have essentially no effect. If not managed appropriately, exposed soils could be subject to the effects of wind and water erosion. However, all construction and demolition activities would be required to adhere to best management practices that include appropriate erosion control measures; wind erosion controls are prescribed by BAAQMD construction dust control mitigation measures (described above in Section 5.1.2) and water erosion controls are prescribed by NPDES requirements. Projects sites greater than 1 acre are subject to the National Pollutant Discharge Elimination System (NPDES) and would be required to prepare a Storm Water Pollution Prevention Plan (SWPPP) as part of the Construction General Stormwater Permit. The SWPPP specifies Best Management Practices designed to prevent pollutants from contacting stormwater and keep all products of erosion from moving off-site into receiving waters. UCSF is also considered a Municipal Separate Storm Sewer System as of 2013. This designation requires UCSF to develop, implement and enforce a Storm Water Management Plan/Program (SWMP) by July 2016 designed to minimize the discharge of pollutants into receiving waters; identify appropriate stormwater treatment practices with measurable performance criteria; and ensure that the program includes provisions to address six minimum measures to promote pollutant load reduction. In addition, by July 2015 UCSF projects that create and/or replace 2,500 square feet of impervious surface must include design measures to reduce runoff and low-impact design standards. Construction activities at the Mission Bay campus site would also be conducted in accordance with the Risk Management Plan developed for the campus which addresses measures to minimize erosion and any offsite transport of sediment due to potential legacy contaminant issues. Adherence to these and other regulatory requirements described in Section 4.8, *Hydrology and Water Quality*, would reduce water quality impacts to less than significant levels and the construction mitigation measures in Section 5.1.2, *Air Quality*, would reduce wind erosion impacts to less than significant levels.

The 2014 LRDP installation of the proposed changes to the utilities and infrastructure including the replacement of the underground storage tanks would involve ground disturbing activities which could expose soils to the effects of wind and water erosion. However, all proposed construction activities would be required to adhere to best management practices that protect any exposed soils from erosion. Once construction is complete, all trenches and other areas of excavation would be covered by asphalt, concrete, or vegetated landscaping that would protect soils from the effects of erosion. Therefore, potential impacts related to the utilities and infrastructure projects would be less than significant.

Mitigation: None required.

5.6 Greenhouse Gas Emissions Impacts of the 2014 LRDP

As part of implementing the UC *Policy on Sustainable Practices*, UCSF has developed a Climate Action Plan, a long-term strategy for voluntarily meeting the State of California's goal for reducing greenhouse gas (GHG) emissions to 1990 levels by 2020, pursuant to the *California Global Warming Solutions Act of 2006* (AB 32). In addition, as part of the 2014 LRDP, UCSF proposes a GHG Reduction Strategy to provide streamlined analysis under CEQA for future development projects.

The purpose of developing a "qualified" GHG reduction strategy is to ensure adequate CEQA coverage (under the streamlining provisions of CEQA Guidelines Section15183.5) of GHG analyses for UCSF's 2014 LRDP and future development activities through 2020, and provide the framework for continued CEQA coverage after 2020.

The essential requirements of a qualified greenhouse gas reduction strategy, under CEQA Guidelines Section 15183.5 and as interpreted by BAAQMD[7], include:

- Establish a baseline GHG inventory for 2008 or earlier using accepted accounting protocols;
- Establish a business-as-usual GHG forecast for 2020 based on reasonable assumptions;
- Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the strategy would not be cumulatively considerable;
- Specify GHG reduction measures and performance standards that, when implemented on a project-by-project basis, will collectively achieve the specified emissions target;
- Establish a mechanism to monitor the plan's progress toward achieving the target and to require amendment if the plan is not achieving specified levels; and
- Adopt in a public process following environmental review.

UCSF's existing Climate Action Plan (CAP), dated December 2009, meets many but not all of these requirements. It establishes a 1990 baseline, which in turn informs the 2020 target (consistent with AB 32 and UC Regents policy), forecasts emissions to 2020 and includes a comprehensive set of prescriptive GHG reduction measures. However, the CAP was not adopted in a public process, and it does not include a clear monitoring plan for tracking GHG emissions reductions and adjusting the CAP over time to meet the 2020 target. Also, the CAP does not look beyond 2020 in terms of GHG emissions projections, targets and reduction strategies, whereas the 2014 LRDP planning horizon is 2035. Thus, the CAP cannot be considered a qualified GHG reduction strategy for the LRDP.

[7] See Section 4.3 of BAAQMD's CEQA Guidelines (updated May 2011): http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/BAAQMD%20CEQA%20Guidelines%20May%202011.ashx?la=en
See also BAAQMD's Plan Level Guidance: http://www.baaqmd.gov/~/media/Files/Planning%20and%20Research/CEQA/GHG%20Quantification%20Guidance%20May%202012.ashx?la=en

The following analysis applies a two tiered approach to assessing GHG impacts, consistent with Appendix G of the CEQA Guidelines. In the first tier, GHG emissions related to development at the four affected campus sites under the 2014 LRDP are quantified and assessed relative to thresholds considered by the BAAQMD for impact assessment. In the second tier, a qualitative assessment of the consistency of the 2014 LRDP is undertaken with respect to applicable state and local plans, policies and regulations adopted for the purpose of reducing GHG emissions. Assessment of this second tier of potential GHG impact acknowledges the existing CAP and proposed GHG Reduction Strategy as well as the policies and plans of the UC Regents and University of California Office of the President (UCOP).

Impact GHG-LRDP-1: Implementation of the 2014 LRDP would result in an increase in construction-related greenhouse gas emissions. (Potentially Significant)

Construction activities would result in emissions of criteria pollutants from the use of heavy-duty construction equipment, haul truck trips, and vehicle trips generated from construction workers traveling to and from the site. Demolition and construction-related emissions resulting from implementation of the 2014 LRDP were calculated using the California Emissions Estimator Model (CalEEMod), assuming four discrete construction windows in five year increments.

Construction-related emissions from these project-level elements were calculated using CalEEMod, assuming completion by 2020, 2025, 2030 and 2035. Phasing lengths were based on CalEEMod default estimates which are based on square footage for hospitals, medical office buildings and number of dwelling units for housing. It was assumed that there would be no off-road equipment involved in the renovations of buildings on the Parnassus Heights and Mount Zion campus sites and that air emissions from the renovation of these buildings would be generated solely by vendor trips bringing materials and construction worker trips. Implementation of the open space and utility proposals at the Parnassus Heights and Mission Bay campus sites would require minimal construction equipment and would not be expected to contribute substantially to the emissions estimated below for building demolitions and renovations. All model inputs and outputs are provided in Appendix E.

Table 5-7 presents the annual construction-related GHG emissions generated by the 2014 LRDP for each of the four development windows assumed. Estimated emissions are 2,209 metric tons of carbon dioxide equivalent greenhouse gases (CO_2e) by 2020, an additional 862 metric tons CO_2e by 2025, an additional 1,274 metric tons CO_2e by 2031 and an additional 1,698 metric tons CO_2e in 2035[8]. As discussed earlier, BAAQMD has not established a quantitative threshold relative to construction-related emissions. In lieu of any proposed or adopted thresholds relative to construction-related emissions, these emissions are considered significant unless best management practices are implemented to reduce GHG emissions during construction, as feasible. Consequently, **Mitigation Measure LRDP-GHG-1** is identified to ensure implementation of best management practices during construction.

8 Emissions were calculated assuming construction was performed in the earliest part of the 5-year construction window to assume worst case emission factors for construction equipment and truck trips.

TABLE 5-7
ANNUAL CONSTRUCTION-RELATED GHG EMISSIONS WITHOUT MITIGATION

Emission Source	Emissions (metric tons/year)			
	CO_2	CH_4	N_2O	Total CO_2e
2015-2029	2,209	<1	<1	2,209
2020-2024	860	<1	<1	862
2025-2030	1,271	<1	<1	1,274
2031-2035	1,697	<1	<1	1,698

Project CO_2 emissions estimates were made using CalEEMod v.2013.2.

Mitigation Measure GHG-LRDP-1: Construction-Related GHG Reduction Measures.

The following BAAQMD-suggested measures shall be implemented during demolition and construction activities:

- Use alternative fueled (e.g., biodiesel, electric) construction vehicles/equipment where feasible;
- Use locally sourced building materials for at least 10% of overall materials brought to site; and
- Recycle or reuse at least 50% of construction waste or demolition materials.

Significance after Mitigation: Less than Significant. Implementation of Mitigation Measure GHG-LRDP-1 would ensure that UCSF and its contractors employ feasible, effective measures to reduce GHG emissions during demolition and construction activities. This mitigation measure would therefore reduce this potential impact to less than significant.

Impact GHG-LRDP-2: Implementation of the 2014 LRDP would result in an increase in operational greenhouse gas emissions. (Less than Significant)

Area, Energy, and Indirect Sources. Operational GHG emissions associated with the 2014 LRDP would result from electrical and natural gas usage, water and wastewater transport (the energy used to pump water and wastewater to and from the campus sites) and solid waste generation. GHG emissions from electrical usage are generated when energy consumed by the University is generated by the non-renewable resources of an electrical supplier such as PG&E. GHG emissions from natural gas are direct emissions resulting from on-site combustion for heating and other purposes. GHG emissions from water and wastewater transport are also indirect emissions resulting from the energy required to transport water from its source, and the energy required to treat wastewater and transport it to its treated discharge point. Solid waste-related emissions are generated when the increased waste generated by the 2014 LRDP is disposed in a landfill where it decomposes, producing methane gas.[9]

[9] CH_4 from decomposition of municipal solid waste deposited in landfills is counted as an anthropogenic (human-produced) GHG. (USEPA, 2006).

GHG emissions from electrical usage, natural gas combustion, mobile transportation, water and wastewater conveyance, and solid waste were estimated using the CalEEMod model, and are presented in **Table 5-8**. Default GHG emissions factor for PG&E was adjusted to reflect future reductions envisioned by PG&E[10] as well as to account for the portion of electrical power supplied by the Parnassus Central Utility Plant (PCUP). Based on the estimated on-campus power derived from the PCUP a composite GHG emission factor of 605.78 pounds per megawatt hour (MW-h) was assumed. Electrical and natural gas emissions also assume compliance with UCSF policy to achieve a 20% energy reduction beyond Title 24 requirements. Energy and indirect sources from previous converted uses are subtracted from the LRDP total as are the GHG emissions from energy and indirect sources from demolished uses. Energy use (electrical and natural gas) represents approximately 43% of estimated operational GHG emissions from new development and solid waste generation represents approximately 22% of new development emissions. The relatively high percentage of emissions from energy is the result of the electrical intensity factor assumed by CalEEMod for hospital land uses (6.78 kWh/sf/yr for Title 24 electricity and 5.52 kWh/sf/yr for non-Title 24 electricity).

TABLE 5-8
ANNUAL OPERATIONAL GHG EMISSIONS WITHOUT MITIGATION

Emission Source	Emissions (metric tons/year)			
	CO_2	CH_4	N_2O	Total CO_2e

10 PG&E, Greenhouse Gas Emission Factors: Guidance for PG&E Customers, April 2013.

Mobile Emission Sources

One of the sources of operational emissions would be increased vehicle emissions from additional staff, patients, visitors and residents. Traffic volumes used to estimate vehicle-related emissions were derived from the Transportation Demand Analysis prepared for the LRDP (Adavant, 2014). Implementation of the 2014 LRDP would generate an estimated 14,412 additional daily vehicle trips. GHG emissions from motor vehicle sources were calculated using the CalEEMod. Table 5-8 presents the incremental mobile source GHG emissions associated with the 2014 LRDP, which represent approximately 28% of the total operational GHG emissions from new development.

As shown in Table 5-8, the sum of both direct and indirect GHG emissions resulting from the 2014 LRDP, including emission losses from demolition and renovation would result in an estimated 29,227 metric tons per year of CO_2e.[11] Applying a service population of 12,950 persons associated with the 2014 LRDP (950 new students and 12,000 new faculty and staff) results in emissions of approximately 2.3 metric tons per year of CO_2e/SP. This is below the service population threshold of 4.6 metric tons per year of CO_2e/SP and operational GHG emissions associated with the implementation of the 2014 LRDP across all four campus sites would therefore be a less than significant impact.

Mitigation: None required.

Impact GHG-LRDP-3: Implementation of the 2014 LRDP would not conflict with the AB32 Scoping Plan, the UCSF Climate Action Plan or the UCSF GHG Reduction Strategy (Less than Significant)

Consistency with Assembly Bill 32 and the State of California Climate Change Scoping Plan

The State of California's Climate Change Scoping Plan identifies 39 Recommended Actions (qualitative measures) to address climate change. Of the 39 measures identified, those that would be considered to have the greatest potential applications to the 2014 LRDP would be those actions related to electricity and natural gas use (E), and green building design (GB).

Scoping Plan Actions E-1 and GB-1 together aim to reduce electricity demand by increased efficiency of Utility Energy Programs and adoption of more stringent building and appliance standards. Elements of this action include encouraging construction of zero net energy (ZNE) buildings and implementation of passive solar design, all of which are proposed under the 2014 LRDP.

Proposals under the 2014 LRDP would be designed to meet certain criteria established by UCSF, including a UC-imposed goal of achieving a 20% reduction in building energy demand beyond Title 24 requirements. Achievement of such an energy reduction would demonstrate that the 2014 LRDP proposals would be highly energy, waste and water-efficient.

[11] CO_2e in all calculations include CO_2, CH_4 and N_2O.

Consequently, as proposed development under the 2014 LRDP would implement a variety of green building design measures and use renewable energy sources, it would be consistent with the Recommended Actions of the Climate Change Scoping Plan adopted by CARB to achieve the goals of AB 32.

The UCSF GHG Reduction Strategy is included in Appendix D. The GHG Reduction Strategy meets an important requirement of CEQA Guidelines Section 15183.5(b)(1) as a plan that analyzes cumulative GHG impacts. The GHG Reduction Strategy uses established protocols, methodologies and forecasts of existing and future land uses to quantify existing and projected future GHG emissions within the LRDP area. It also establishes a reduction target based on California State law (AB 32), and lays out policies, actions, and performance standards that UCSF will enact and implement over time to reduce emissions. The GHG Reduction Strategy includes GHG reduction measures that, if fully implemented, would achieve an emissions reductions target that is consistent with and supports the state-mandated reduction target embodied in AB 32.

Therefore, implementation of the 2014 LRDP would not conflict with the GHG reduction measures identified in CARB's AB 32 Scoping Plan.

Consistency with Policies and Plans of the UC Regents and University of California Office of the President (UCOP)

In 2007, the Chancellor of UCSF signed the *American College and University President's Climate Commitment* (ACUPCC)[12] to complete an emissions inventory, set target dates and interim milestones for becoming climate-neutral,[13] take steps to reduce GHG emissions, and prepare public progress reports.

As outlined in UCSF's *Climate Action Plan* of December 2009, UC adopted the President's *Policy on Sustainable Practices* in 2007, which committed UC to implementing actions intended to minimize the University's impact on the environment and reduce the University's dependence on non-renewable energy. The policy was most recently revised in November 2013, and now covers the areas of green building, clean energy, transportation, climate protection, sustainable operations, waste reduction and recycling, environmentally preferable purchasing, sustainable foodservice, and sustainable water systems.

The GHG Reduction Strategy utilizes two approaches to establishing campus-wide GHG emissions targets for 2020 that are consistent with UC Policy on GHG emissions. One approach is based on UCSF's 1990 emissions inventory, while the other is based on UCSF's verified 2008 inventory, using the 15% downward adjustment recommended by CARB to account for emissions growth since 1990. GHG emissions targets for 2035 are established by determining the

12 American College & University, 2007. Text of the American College & University Presidents' Climate Commitment. Available at: www.presidentsclimatecommitment.org/about/commitment

13 Climate neutrality for UCSF is defined as the University having a net-zero impact on the Earth's climate; it will be achieved by minimizing GHG emissions as much as possible and using other measures to mitigate the remaining GHG emissions (*UCSF Climate Action Plan,* December 2009).

midpoint between the state's 2020 target (1990 levels) and 2050 target (80% below 1990 levels), which is 40% below 1990 levels by 2035.

In order to assist with determining project consistency with the GHG Reduction Strategy, a project consistency checklist has been developed. The checklist is intended to provide individual projects the opportunity to demonstrate that they are minimizing GHG emissions, while ensuring that new development at UCSF will achieve its "fair share" of emissions reductions. The GHG Reduction Strategy stipulates a range of prescribed and planned GHG reductions measures for meeting the 2020 GHG reduction target. The project review checklist screens projects for important GHG reduction measures that, when implemented, will provide confidence that the project will not impede UCSF's ability to meet its 2020 GHG emissions target. Future development undertaken pursuant to the 2014 LRDP would be consistent with UCSF and UCOP goals by demonstrating implementation of GHG reduction measures as well as demonstrating that the growth generated by development projects is consistent with the assumptions of the GHG Reduction Strategy and CAP to attain UCSF and UCOP policies and goals.

Since the 2014 LRDP proposals would incorporate stringent design features that would reduce GHG emissions to a minimal level, the 2014 LRDP would remain in compliance with CARB's AB 32 Scoping Plan, the goals and policies of UCSF and UCOP for reducing GHG emissions, and therefore would ensure that the 2014 LRDP's impact on GHGs is less-than-significant.

Mitigation: None required.

Adavant Consulting, Travel Demand Analysis Four Campus Summary: Existing & 2035, February, 2014.

5.7 Hazards and Hazardous Materials Impacts of the 2014 LRDP

The Initial Study prepared for the 2014 LRDP determined that no proposals under the 2014 LRDP would be located within an airport land use plan or within 2 miles of a public airport. Therefore, the potential safety hazards for people residing or working at the Parnassus Heights, Mission Bay, Mount Zion or Mission Center campus sites would not be significant.

Impact HAZ-LRDP-1: Implementation of the 2014 LRDP could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions. (Potentially Significant)

Demolition, Renovation and Construction

Demolition and renovation proposals under the 2014 LRDP at the Parnassus Heights and Mount Zion campus sites may require disturbing older structures and improvements where hazardous building materials such as asbestos, lead-based paint (LBP), polychlorinated biphenyls (PCBs) and mercury may be present. The level of potential impact is dependent upon the age, construction and building materials of each building, as well as contamination received during the life of the structure[14]. Based on the age of existing structures, any of these hazardous building materials could be present that, if disturbed, could expose workers and the public during demolition and renovation activities. Potential exposure to these hazardous building materials and contamination can be reduced through appropriate abatement measures that are legally required by regulation as detailed in Sections 4.7.1 and 4.7.2.

Construction proposals under the 2014 LRDP would require the use of hazardous materials such as fuels, oils, solvents and glues. Inadvertent release of large quantities of these materials into the environment could adversely impact workers, the public, soil, surface waters or groundwater quality. Where applicable (i.e., proposals that disturb more than one acre), the use of construction best management practices implemented as part of a Storm Water Pollution Prevention Plan (discussed further in Section 4.8, *Hydrology and Water Quality*) as required by the National Pollution Discharge Elimination System General Construction Permit would minimize the potential adverse effects to workers, the public, groundwater and soils as described in Section 4.8.2, *Regulatory Considerations.*

San Francisco is among the identified counties where ultramafic bedrock materials are present and have the potential for naturally occurring asbestos fibers, which could be encountered during excavation activities. If present, groundbreaking activities could disturb these fibers causing them to be airborne and potentially adversely affect workers and the public.

[14] For example, laboratories and medical clinics could contain hazardous chemicals in drains or other locations. Either could contain mercury in sink drains due to historic use of mercury thermometers.

The following mitigation measure would ensure that disturbance of underlying materials would not expose workers or the public to naturally occurring asbestos, if present, for any proposed earthwork activities during construction.

> **Mitigation Measure HAZ-LRDP-1:** An Excavation Management Plan shall be prepared by a qualified consultant to include the California Air Resource Board (CARB) Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations to minimize naturally occurring asbestos through the application of best management practices for fugitive dust from construction, grading and excavation operations. Unless site specific testing by a certified laboratory can demonstrate the absence of encountering naturally occurring asbestos, construction specifications shall include implementation of this CARB ATCM.
>
> **Significance after Mitigation:** Less than Significant

Operation

2014 LRDP proposals would include construction of new facilities that would have a range of uses including residential, clinics, laboratories, research and support services. The hazardous materials typically used for the majority of these proposals would be brought onto campus sites packaged in consumer quantities and used in accordance with manufacturer recommendations and in accordance with existing UCSF policies and hazardous materials management plans (e.g., Chemical Hygiene Plan, Online Tag Program for managing hazardous wastes, Environmental Health & Safety Laboratory Safety Design Guide, etc.). Residential uses would likely consist of small quantities of consumer packaged products such as cleaning supplies, paints and other materials that are generally used in accordance with manufacturer recommendations.

The overall quantities of these materials on-site at any one time would not result in large bulk amounts that, if spilled, could cause a significant soil or groundwater contamination issue. Given the required protective measures (i.e., best management practices) and the quantities of hazardous materials typically needed for construction, the threat of exposure to the public or contamination to soil and/or groundwater from construction-related hazardous materials is considered a less than significant impact.

The use, storage and disposal of hazardous materials, including biohazardous waste and low-level radioactive waste, would continue under the 2014 LRDP as part of normal operations and may expand with proposed growth. Any expansion of hazardous materials use, storage and disposal would continue under similar regulatory requirements as existing UCSF policies and hazardous materials management practices as largely documented within the Chemical Hygiene Plan. The Chemical Hygiene Plan is reviewed and updated on an annual basis and includes safety procedures, training requirements, personal protective equipment requirements, signage protocols, emergency response details and disposal guidelines that is in accordance with all federal, state, and local regulatory requirements.

Adherence to current regulatory requirements and UCSF policies and plans would provide sufficient control to minimize potential exposure to hazardous materials to a less than significant level.

Mitigation: None required.

Impact HAZ-LRDP-2: Implementation of the 2014 LRDP could result in hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or waste within one-quarter mile of existing or proposed schools. (Less than Significant)

There are several schools located within one-quarter mile of UCSF campus sites, including a potential San Francisco Unified School District school on Block 14 on the Mission Bay campus site, which is currently reserved for a school site. While there may be net changes in the amount and type of hazardous materials handled, stored, and disposed of, the proposed 2014 LRDP would not result in a substantive change in emissions or handling of hazardous materials and all practices would continue to adhere to federal, state, local and UCSF policies and regulatory requirements. In general, existing hazardous materials use for administrative support services or even research laboratory purposes at UCSF does not involve large enough quantities of hazardous materials or result in emissions that would represent potential health hazards to schools near UCSF campus sites. Adherence to current regulatory requirements and UCSF policies and plans would provide sufficient control to minimize potential exposure to hazardous materials to a less than significant level.

Mitigation: None required.

Impact HAZ-LRDP-3: 2014 LRDP proposals are located on campus sites that are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public. (Potentially Significant)

Two listings for the Parnassus Heights campus site are found on the Geotracker database maintained by the State Water Resources Control Board (SWRCB) for releases of diesel found in subsurface soil (SWRCB, 2014a and SWRCB, 2014b). A release was documented for 315 Parnassus Avenue, an adjacent property to the campus site, and the case was subsequently closed in 1999 indicating that no further action was required. The other release (diesel fuel) on the UCSF campus at 50 Medical Center Way was also closed in 2001. As such, despite being included on a hazardous materials sites list pursuant to Government Code Section 65962.5, there is no indication that any known threat to human health or the environment remains on the Parnassus Heights campus site.

The Mount Zion campus is not found on the Geotracker or EnviroStor databases maintained by the SWRCB and Department of Toxic Substances Control (DTSC) (SWRCB, 2014c and DTSC, 2014). As such, there is no indication that any known threat to human health or the environment is present from historical activities at the Mount Zion campus site.

The entire Mission Bay campus site has a long history of industrial use and a number of environmental investigations, cleanups and removals of underground storage tanks have occurred, many of which are included in the Geotracker database. Although many of these cases have been closed indicating that no further action was required, there is still a potential to encounter previously unidentified contaminants. A Risk Management Plan (RMP) was developed for the Mission Bay

campus site for previous construction efforts and has been effective in reducing potential impacts as a result of past releases of hazardous materials. This document has been periodically amended by the San Francisco Bay Regional Water Quality Control Board (RWQCB). As called for in the RMP, at the onset of each project, UCSF hires a qualified geotechnical/environmental consultant to do soil testing and prepare a site-specific report identifying any necessary remediation. The RMP provides construction protocols and notification procedures that would protect workers, the public, and the environment from any legacy contaminants that may be discovered during groundwater breaking activities.

Considering the past industrial uses of the site, it is also possible for volatile components of subsurface contaminants, if present, to migrate through building foundations exposing residents and visitors to potential soil vapor contamination. Previous studies have identified methane as an issue of concern at the Mission Bay campus site. Working with the RWQCB, BAAQMD, and the San Francisco Department of Public Health on a project by project basis, UCSF installs subsurface engineered control systems to address venting of volatile components of subsurface contaminants, protect public health, and ensure that maximum exposure levels for building occupants are not exceeded. Characterization and risk analysis of any subsurface contaminants would be addressed either through remediation prior to commencement of construction or through design elements such as vapor barriers that would protect future occupants from adverse health effects.

The Mission Center campus site is not found on the EnviroStor database maintained by the DTSC but does contain three cases (i.e., listed as Alioto's Garage, Commercial Building and International Disposal) found on the Geotracker database maintained by the SWRCB (DTSC, 2014 and SWRCB, 2014). The three case listings are classified as closed, indicating that either the identified contamination was minimal or remediated to point such that no further action was warranted (SWRCB, 2014). However, to ensure that potential hazard to the public from residual contamination is minimized, the following mitigation measure shall be required at the Mission Center campus site:

> **Mitigation Measure HAZ-LRDP-2:** Prior to development on the Mission Center campus site, a Soil Management Plan shall be prepared by a qualified environmental consulting firm to reflect current regulatory requirements and risk management protocols that are in accordance with Regional Water Quality Control Board oversight. The Plan shall include measures to address protocols for identifying, handling, and characterizing suspect contaminated soils. Notification and sampling requirements for adequate characterization shall be in accordance with the overseeing agency (RWQCB or SFDEH) and any additional removal or remediation work completed prior to occupancy of the new structure.
>
> **Significance after Mitigation:** Less than Significant

Impact HAZ-LRDP-4: Implementation of the 2014 LRDP would not result in a safety hazard for people residing or working in the vicinity of a private airstrip. (Less than Significant)

The existing facilities at the Mission Bay campus site include a helicopter landing pad (helipad) which will be served by turbine-powered helicopters operated by REACH and Calstar. New

facilities under the 2014 LRDP could potentially expose new residents, visitors, or employees to safety hazards associated with the proximity to this helipad.

As discussed in the EIR for Phase I of the Mission Bay Medical Center, according to National Transportation Safety Board (NTSB), data collected over the period of 1997 through 2006 indicates that turbine-powered helicopters averaged 1.1 fatal accidents per 100,000 flight hours, or approximately one fatal accident per 90,000 hours of flight (Barnett, 2008). Using an average helicopter flight duration of approximately 20 minutes, the accident rate for a turbine helicopter is one fatal accident per 270,000 flights.

The accident rate for medical helicopters is slightly higher when compared with this number and averages approximately 1.8 fatal accidents per 100,000 flights (Barnett, 2008). Using the 20 minute estimate for an average helicopter flight, as assumed above, this equals to approximately one fatal accident per 180,000 flights. This risk is increased where the landing site is unfamiliar to the pilot, which is more common during emergency scene calls and would not be the case for the Mission Bay campus location because all helicopter flights will be pre-arranged between medical facilities and UCSF. Of the 56 fatal accidents in US that involved medical helicopters (1991-2007), four occurred while landing or taking off from a hospital helipad. This rate equals approximately 1 in 2.5 million and is considered a measurable yet very small risk (Barnett, 2008). None of the four fatal helicopter events at a hospital caused any ground deaths to third parties, although in one accident, a hospital security guard who was helping service the helicopter was fatally injured. Moreover, based on the statistics associated with medical helicopter operations since 1991 in the United States, the observed risk to third parties has been negligible.

The helicopter flight operations risk at the Mission Bay campus site would likely be lowered further by the fact that the helipad is located in close proximity to the bay where no physical barriers exist to obstruct views of the approach. Furthermore, REACH and Calstar have performed over 69,000 hours of service in combination, and have suffered one fatal accident, a rate that is consistent with the overall accident rate statistics described above. The accident that occurred did not cause any fatalities on the ground.

Statistics also reveal that helicopter accidents that cause serious injuries to third parties or substantial property damage are also extremely rare. Out of 132 incidents involving medical helicopters from 1991 to 2005,[15] none caused serious injury to a third party and one caused modest damage to a hospital building (Barnett, 2008).[16]

Based on information documenting national helicopter safety patterns provided above, it can be assumed that, while the risk of death or injury to third parties, and risk of property damage to structures near the project site is not zero, this risk is very small. The twelve million medical helicopter flights in the US since 1991 have caused no deaths to third parties in the vicinity of hospitals. Based on this and other statistics noted above, the likelihood of a third party death resulting from the continued operation of the inter-facility transfer operation is also extremely

15 This statistical record was achieved in the course of approximately twelve million medical helicopter flights.
16 One medical flight hit a home after losing visibility en route, causing serious injury to three occupants. But this accident was not close to the destination hospital.

small. As a result, implementation of the 2014 LRDP would have a less than significant impact as to safety for people residing or working in the vicinity of a private airstrip.

Mitigation: None required.

Impact HAZ-LRDP-5: Implementation of the 2014 LRDP would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. (Less than Significant)

Fire protection and emergency response services would continue to be provided to UCSF campus sites by the City of San Francisco Fire Department. The Fire Department delivers emergency and non-emergency services, including rapid assistance for medical, fire or other hazardous situations, to the entire City. Any proposed improvements associated with the 2014 LRDP (including development of Blocks 33 and 34) would be required to ensure that the street system can accommodate emergency response and evacuation. In general, implementation of the 2014 LRDP would not substantively change the circulation plan at UCSF campus sites and all improvements would be designed to ensure appropriate emergency access to and egress from all areas. Additionally, all project-specific designs, including private internal circulation and building site plans, would be subject to review and approval by the City for emergency response and evacuation concerns. UCSF design criteria and existing emergency response requirements are sufficient to ensure that the potential health and safety effects resulting from possible impairment or implementation of any emergency response or evacuation plans would remain a less-than-significant impact.

Mitigation: None required.

Impact HAZ-LRDP-6: Implementation of the 2014 LRDP would not expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands. (Less than Significant)

The California Department of Forestry and Fire Protection has identified urban areas considered at risk as a fire-threatened community as part of the Wildland Urban Interface program. San Francisco is among the 874 communities currently on the Communities at Risk List.

While all of California is subject to some degree of fire hazard, there are specific features that make certain areas more hazardous. The California Department of Forestry and Fire Protection (CAL FIRE) is required by law to map areas of significant fire hazards based on fuels, terrain, weather, and other relevant factors (Public Resources Code 4201-4204 and Government Code 51175-89). According to mapping compiled by the Association of Bay Area Governments (ABAG), of the four UCSF campus sites being evaluated here, only the Parnassus Heights campus site is located in an area considered to be a community at risk while the other three are mapped as urbanized areas (ABAG, 2014).

According to mapping for the City of San Francisco's Hazard Mitigation Plan, the Parnassus Heights campus site, which includes the Mount Sutro Open Space Reserve (Reserve), is located in an area considered to be a high to very high potential for wildfire (URS, 2008). As discussed in the Project Description (Section 3.9.1.1), under a separate process that began prior to the 2014 LRDP, UCSF proposed management activities within the Reserve which were the subject of a Draft EIR published in January 2013. Subsequently, in light of the elevated fire danger resulting from California's current drought conditions, UCSF revised its proposal to focus on reducing the danger of wildfire. It retained a professional forester with a background in firefighting to identify fire hazard reduction measures for the Reserve area. The identified fire hazard reduction measures are consistent with best management practices applied throughout California in forests located near urban areas. At the time of preparation of this document, UCSF is carefully considering the public feedback received to date to determine the best path forward. It is anticipated that the final plan, at a minimum, will include fire hazard reduction measures as recommended by the forester. Those recommendations include thinning of trees and understory in targeted areas near UCSF buildings, neighboring buildings, trails, and Medical Center Way. Any changes to the management activities analyzed in the January 2013 Draft EIR would be reviewed to determine what additional environmental analysis would be needed, if any, to comply with CEQA, separate from the 2014 LRDP and EIR.

2014 LRDP activities would not substantially increase the population at the Parnassus Heights campus site, and would not increase the number of structures within the Reserve. In addition, under a planning process separate from the 2014 LRDP, UCSF is seeking to minimize the wildfire danger within the Reserve. Therefore, the potential impact from exposure of persons or structures to wildland fires attributable to the 2014 LRDP would be less than significant.

Mitigation: None required.

5.8 Hydrology and Water Quality Impacts of the 2014 LRDP

The Initial Study determined that implementation of the 2014 LRDP would not result in substantial depletion of groundwater supplies or interfere with groundwater recharge. Therefore, no impact regarding groundwater would result from implementation of the 2014 LRDP.

Impact HYD-LRDP-1: Implementation of the 2014 LRDP could violate water quality standards or waste discharge requirements or otherwise substantially degrade water quality. (Less than Significant)

New development proposed under the 2014 LRDP would require demolition, excavation, grading and construction activities that would require temporary disturbance of surface soils and removal of existing pavement and sub-surface structures (if present). These activities would expose soil to water runoff as well as entrainment of sediment in the runoff. If dewatering were necessary during construction, the collected water would likely contain suspended sediments and would require settling before discharge to the City's Combined Sewer System (CSS). Sediment in runoff and deposits of soil and related debris from haul truck tires on local streets could increase the amount of sediment entering the storm drains, which could potentially clog drain inlets and reduce the flow capacity of the storm drains. The accumulation of this material could potentially result in increased localized ponding or flooding, particularly after large storm events.

The use of construction equipment as well as the delivery, handling and storage of construction materials and waste could contaminate stormwater that could negatively impact water quality. Potential contaminants include, but are not limited to (CSW/Stuber-Stroeh, 2011):

- Petroleum hydrocarbons and metals from stockpiled soils excavated from the site
- Fuel from storage drums
- Diesel from refueling trucks
- Oils and grease from miscellaneous heavy equipment
- Sewage from portable sanitary facilities
- Sediment from construction generated waste – piles of concrete, rock and debris
- Sediment from rock crushing activities
- Hazardous materials storage-hydraulic oil, motor oil, and lubricating fluid
- Spills and releases of hydrocarbons and related pollutants from routine light maintenance activities such as fluid topping off, and welding and repairing belts and gears of heavy equipment

Polluted stormwater runoff could violate water quality standards and/or waste discharge requirements established in the National Pollutant Discharge Elimination System (NPDES) General Permit for Construction and the NPDES discharge permits for the Southeast and Oceanside Treatment Plants.

In accordance with the Construction General Stormwater Permit, UCSF would be required to prepare and implement a Stormwater Pollution Prevention Plan (SWPPP) for proposed development activities to minimize water quality impacts during construction and demolition. SWPPPs will identify pollutant sources within the construction area and recommend site-specific BMPs regarding control of sediments in runoff and storage and use of hazardous materials to prevent discharge of pollutants into stormwater. Likely BMPs include, but are not limited to:

- Erosion control practices
- Sediment control practices
- Practices to reduce the tracking of sediment onto public and private roads
- Practices to prevent or minimize wind erosion
- Practices to minimize contact with stormwater
- Construction material loading and unloading
- Waste management and disposal
- Stormwater run-on and run-off controls
- Non-stormwater discharges and management
- Maintenance, inspection, and repair of structural controls
- Spill prevention and control
- Post-construction stormwater management
- Development of a Rain Event Action Plan (REAP)
- Construction site monitoring and reporting
- Water quality sampling and analysis

In addition, proposed development activities will need to obtain a water quality certification from the RWQCB for construction activities, which would also require implementation of BMPs and specific measures for the protection of water quality during construction.

The revised MS4 General Permit includes the following provisions for post-construction stormwater management:

- By July 2015, UCSF projects that create and/or replace (including projects with no net increase in impervious footprint) greater than 2,500 square feet of impervious surface must include the following:
    - Site design measures (porous pavement, setbacks, impervious area disconnection) to reduce project site runoff
    - LID design standards to effectively reduce runoff and pollutants from the project site
        - Source control measures including permanent and/or operational source control measures at areas such as loading docks, fuel dispensing areas, pools
        - Numeric sizing criteria for stormwater retention and treatment

  - Stormwater treatment measures and baseline hydromodification management measures

- By July 2016, UCSF shall implement an operation and maintenance program for the post-construction stormwater management measures.

Compliance with the MS4 and SWPPP regulations is expected to protect water quality and help reduce the impacts of the 2014 LRDP proposals to a less than significant level.

Mitigation: None required.

Impact HYD-LRDP-2: Implementation of the 2014 LRDP would not substantially alter the existing drainage pattern of the area in a manner that would result in substantial erosion or siltation on- or off-site, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site. (Less than Significant)

Demolition, renovation and construction activities proposed under the 2014 LRDP would not significantly change the volumes of stormwater runoff or the direction of flows to the CSS. Measures to prevent and minimize erosion and its potential effects on storm drain siltation are addressed under Impact HYD-LRDP-1. The impact would be less than significant.

Mitigation: None required.

Impact HYD-LRDP-3: Implementation of the 2014 LRDP would not generate runoff that would exceed the capacity of existing or planned stormwater drainage systems, or provide substantial additional sources of polluted runoff. (Less than Significant)

As discussed above under Impact HYD-LRDP-2, demolition, renovation and construction activities proposed under the 2014 LRDP would not significantly change the volumes or routing of anticipated stormwater. The proportion of impermeable surfaces at each respective campus site would not significantly change. Measures to protect water quality are described above under Impact HYD-LRDP-1. The impact would be less than significant.

Mitigation: None required.

Impact HYD-LRDP-4: Implementation of the 2014 LRDP would place housing within a 100-year flood hazard area, potentially impede flood flows and potentially expose people to a significant risk of loss, injury or death associated with flooding. (Less than Significant)

The 2014 LRDP proposes new housing at the Parnassus Heights and Mission Bay campus sites. Proposed housing at the Parnassus Heights campus site would not be located within a flood hazard area. As discussed in greater detail in Chapter 7, although portions of the Mission Bay campus site proposed for housing under the 2014 LRDP are within flood hazard areas, UCSF is currently raising ground elevations above the Base Flood Elevation via surcharging to expedite soil settlement and subsequent placement of engineered fill to specified elevations above the

100-year flood level. It is anticipated that these efforts will reduce the effects of flooding on proposed housing to a less than significant level.

Mitigation: None required.

Impact HYD-LRDP-5: Implementation of the 2014 LRDP would expose people or structures to a significant risk of loss, injury or death due to tsunami, seiche or mudflow. (Less than Significant)

The Mount Zion and Mission Center campus sites would not be exposed to tsunami, seiche or mudflow. Similarly, the Parnassus Heights campus site would not be subject to tsunami or seiche. However, much of Mount Sutro is located in a landslide hazard area. This topic is addressed above in Section 5.1.5 and also in Section 6.5.

The Mission Bay campus site would not be subject to mudflow, but portions of the campus site could potentially be inundated by a tsunami or seiche. Impacts to structures would be less than significant with incorporation of specific design features such as seismic structural elements that would increase the resilience of structures to tsunamis or seiches. Impacts to people would be less than significant with implementation of the San Francisco outdoor warning system, which would notify people of an impending tsunami or seiche. See Section 7.8 for further detail regarding potential exposure to tsunami at the Mission Bay campus site.

Mitigation: None required.

Impact HYD-LRDP-6: Implementation of the 2014 LRDP would expose people or structures to an increased risk of loss, injury or death due to flooding from sea level rise. (Less than Significant)

Portions of the Mission Bay campus site are potentially vulnerable to inundation from sea level rise, particularly if higher estimates of sea level rise are validated over time. While various state and local guidelines exist for planning for and anticipating sea level rise, there are currently no legally enforceable engineering or design standards that can be applied to proposed development in vulnerable areas aside from those that are based on existing (i.e. without sea level rise) conditions (e.g. the City's Floodplain Management Ordinance). In addition, there exists no consensus among planners and engineers about how to reconcile uncertainty in anticipated rates of sea level rise with the typical horizons for capital improvement projects and long range development plans such as the 2014 LRDP, with its 20 year time horizon. Discussion of the potential effects and mitigation of sea level rise at the Mission Bay campus site is discussed in Section 7.8.

Mitigation: See Section 7.8.

5.9 Land Use and Planning Impacts of the 2014 LRDP

The Initial Study prepared for the 2014 LRDP determined that implementation of the 2014 LRDP would not physically divide an established community. Therefore, no impact would result regarding physical division of an established community.

The Initial Study also determined that implementation of the 2014 LRDP would not conflict with any applicable habitat conservation plan or natural community conservation plan. Therefore, no impact regarding conflicts with such plans would result from implementation of the 2014 LRDP.

Impact LU-LRDP-1: Implementation of the 2014 LRDP would be consistent with applicable land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental effect. (Less than Significant)

Upon adoption by the Regents, the proposed 2014 LRDP will replace the 1996 LRDP, as amended, and become the applicable campus land use plan for UCSF. Pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation. The University is the only agency with land use jurisdiction over programs and projects proposed at UCSF campus sites by the 2014 LRDP. Therefore, all proposed activities that would be in general conformity with the 2014 LRDP would have no significant land use impacts. However, UCSF also considers the land use policies and zoning regulations of the City when analyzing potential land use impacts under CEQA. The 2014 LRDP is not expected to conflict with those City plans and policies adopted for the purpose of avoiding or mitigating an environmental effect.

Functional Zones

The 2014 LRDP's proposed functional zones are generally consistent with the existing zones at the Parnassus Heights and Mission Bay campus sites. Proposed changes at these campus sites include reclassifying some areas as Housing in order to match uses proposed by the 2014 LRDP and combining the current Campus Community and Logistical Support zones into a single Support zone. Some building sites on the Parnassus Heights campus site would be reclassified as Open Space and would become part of the Mount Sutro Open Space Reserve subsequent to the demolition of existing buildings as proposed by the 2014 LRDP. A new separate Parking zone is proposed for areas of structured parking. Blocks 33 and 34, proposed as the new East Campus at Mission Bay, have not been designated with functional zones by UCSF. As part of the approval of the 2014 LRDP, the Regents also would designate these blocks for Research and Parking.

The Mount Zion campus site would be newly designated with functional zones under the 2014 LRDP. The majority of the campus site is proposed as Clinical, with smaller areas classified as Research and Parking.

The Mission Center campus site has not been designated with functional zones by UCSF. Construction of an additional office building under the 2014 LRDP would be consistent with the existing use on this campus site.

The functional zone changes proposed by the 2014 LRDP do not present land use conflicts with adjacent existing land uses on the Parnassus Heights, Mission Bay or Mount Zion campus sites. See Sections 6.9, 7.9 and 8.9 for detailed discussion of proposed functional zone changes at these respective campus sites. Compatibility between adjacent existing and proposed functional zones was taken into consideration in developing the proposed zones in the 2014 LRDP. Existing land use patterns reflect campus development guided by the planning principles embodied in the previous LRDPs. Therefore, implementation of the 2014 LRDP would have a less-than-significant impact regarding consistency with land use plans and policies adopted for the purpose of avoiding or mitigating an environmental effect.

Consistency with Regents' Resolution

With the 2014 LRDP UCSF is proposing that the Regents update the 1976 Regents' Resolution by modifying the way space and population are monitored at the Parnassus Heights campus site. As discussed in detail in Chapter 6, the 2014 LRDP would be consistent with the space and population commitments for the Parnassus Heights campus site upon adoption by the Regents of the proposed update to the 1976 Regents' Resolution and the impact would be less than significant.

Mitigation: None required.

Impact LU-LRDP-2: The 2014 LRDP would not result in substantial incompatibilities with adjacent land uses. (Less than Significant)

As noted above under Impact LU-LRDP-1, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation. However, UCSF also considers the land use policies and zoning regulations of the City when analyzing potential land use impacts under CEQA. Development proposed by the 2014 LRDP could be accommodated by a variety of building configurations and site plans that would meet the LRDP goals and objectives, and remain responsive to the City's land use plans and policies.

Building renovations proposed by the 2014 LRDP at the Parnassus Heights and Mount Zion campus sites would be limited to the interiors of Moffitt Hospital, UC Hall, Millberry Union towers and the Main Hospital at Mount Zion. No impacts would occur with respect to conflicts with City regulations for these renovations.

Although most new buildings proposed under the 2014 LRDP have not yet been designed, conceptual drawings indicate that proposed buildings would be largely consistent with City Planning Code designations for the building sites, if applicable. However, the proposals for the New Hospital Addition at the Parnassus Heights campus site and the new office/research building at the Mount Zion campus site as currently conceptualized would conflict with Planning Code height and/or bulk regulations for these sites. See Sections 6.9 and 7.9, respectively, for discussion of compatibility of these proposed buildings with adjacent land uses.

In order to meet the SB 1953 mandate at the Parnassus Heights campus site, inpatient uses currently at Moffitt Hospital must be relocated prior to 2030, necessitating the construction of the New Hospital Addition. Therefore, to the extent feasible, UCSF would design the New Hospital Addition to avoid or minimize this conflict with the City's Planning Code, but it would not be possible to replace all clinical uses currently in Moffitt Hospital with a new hospital that complies with the City's zoning regulations for this site. UCSF would also strive to design the proposed building at the Mount Zion campus site to avoid or minimize conflicts with the Planning Code.

Notwithstanding the potential for conflicts with the Planning Code, implementation of the 2014 LRDP would not result in any incompatibility with adjacent land uses. 2014 LRDP development would occur on campus sites already developed with other similar UCSF facilities, with the same or similar land uses.

Mitigation: None required.

5.10 Noise Impacts of the 2014 LRDP

The Initial Study prepared for the 2014 LRDP determined that there are no public use airports within two miles of the Parnassus Heights, Mission Bay, Mount Zion or Mission Center campus sites. Therefore, no impact regarding exposure to excessive noise levels from public use airports would result from implementation of the 2014 LRDP.

The Initial Study also determined that there are no private airstrips within the vicinity of the Parnassus Heights, Mount Zion or Mission Center campus sites. Therefore, no impact regarding excessive exposure to excessive noise levels from private airstrips would result from implementation of the 2014 LRDP at these campus sites.

Impact NOI-LRDP-1: Implementation of the 2014 LRDP would result in increased ambient noise levels during demolition and construction activities. (Potentially Significant)

As noted in the Regional Setting section, the hours that construction activity noise can occur is described in Sections 2908 of the Police Code, known as the San Francisco Noise Ordinance. Although UCSF is not subject to the noise ordinance, it strives to be consistent with it. Section 2908 prohibits any person, between the hours of 8:00 p.m. of any day and 7:00 a.m. of the following day, from erecting, constructing, demolishing, excavating for, altering or repairing any building or structure if the noise level created is in excess of the ambient noise level by 5 dBA at the nearest property line.

Demolition and construction proposed under the 2014 LRDP would require the use of heavy duty off-road construction equipment as well as haul trucks to remove demolition debris. The number of daily truck trips would depend on the pace of demolition. Equipment typically involved with large-scale demolition would include excavators, dozers, loaders and trucks for off-hauling demolition debris. Additionally, a hoe-ram (a back-hoe fitted with a ramming bit) may be used to break up large concrete structures. Construction activities would involve excavation, grading, and earth movement and, potentially, pile driving. **Table 5-9** shows typical noise levels produced by various types of construction equipment typically involved with large-scale construction projects that would occur at a reference distance of 50 feet from the source. Noise levels at and near demolition and construction sites would fluctuate depending on the particular type, number and duration of uses of various pieces of construction equipment at any given time.

Proposed building renovations are assumed to be predominantly interior renovations and would not involve operation of off-road construction equipment other than a small crane or man lift that would not be expected to substantially alter the existing noise environments. Since these activities would be largely conducted within the existing buildings they would not result in significant construction noise impacts.

TABLE 5-9
TYPICAL NOISE LEVELS FROM CONSTRUCTION EQUIPMENT

Construction Equipment	Noise Level (dBA, Leq at 50 Feet)
Dump truck	76
Portable air compressor	78
Concrete mixer (truck)	79
Crane	81
Excavator	81
Dozer	82
Paver	77
Generator	81
Backhoe	78
Pile driver	101
Auger Drill Rig	84

SOURCE: FHWA, 2006.

Implementation of the open space and utility proposals at the Parnassus Heights campus site may also involve limited operations of some types of construction equipment, such as a backhoe. However, the limited scope and duration of operation involved with these activities would not be expected to substantially alter the existing noise environment.

Analysis provided in Sections 6.10, 7.10, 8.10 and 9.10 indicates that noise levels from proposed demolition and construction activities at the four main campus sites could exceed existing noise levels by as much as 19 dBA. Noise levels from proposed demolition activities at the Parnassus Heights and Mount Zion campus sites could exceed 10 dBA over existing levels (a perceived doubling of loudness) during peak demolition activities. Receptors near these demolition sites would also experience noise levels approaching or exceeding a speech-interference threshold of 70 dBA and result in a temporary but significant construction noise impact from demolition activities.

Implementation of **Mitigation Measure NOI-LRDP-1a** and **b** would reduce noise levels associated with demolition and construction activities at the four main campus sites by 5 to 10 dBA. However, it is likely that noise levels in excess of 70 dBA would still occur at some sensitive receptors at the Parnassus Heights and Mount Zion campus sites after mitigation. Consequently, this impact, although temporary, would be significant and unavoidable at the Parnassus Heights and Mount Zion campus sites.

Mitigation Measure NOI-LRDP-1a: Construction Noise Control Measures.

UCSF contractors shall employ site-specific noise attenuation measures during construction to reduce the generation of construction noise. These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by UCSF to ensure that construction noise is consistent with the standards set forth in the City's Noise Ordinance. Measures specified in the Noise Control Plan and implemented during project construction shall include, at a minimum, the following noise control strategies:

- Equipment and trucks used for construction shall use the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds.

- Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible; this could achieve a reduction of 5 dBA. Quieter procedures, such as use of drills rather than impact tools, shall be used where feasible.

- Stationary noise sources shall be located as far from adjacent receptors as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or include other measures.

Mitigation Measure NOI-LRDP-1b: Construction Hours.

Construction hours are restricted to the hours listed in the table below. In rare circumstances, work may need to occur outside of these work hour limits. In such cases, UCSF Community and Government Relations will receive advance notice from the project manager, at least one week in advance as feasible, and will engage the community to identify measures to minimize potential impacts.

Construction Hours

	"Not Noisy" Work[1]		Noisy Work	
	Regular hours	**Extended hours[2]**	**Regular hours**	**Extended hours[1]**
Monday - Friday	7:00 a.m. to 5:00 p.m.	5:00 p.m. to 8:00 p.m.	8:00 a.m. to 5:00 p.m.	
Saturday		8:00 a.m. to 5:00 p.m.		9:00 a.m. to 4:00 p.m.
Sunday		8:00 a.m. to 5:00 p.m.		

1 "Not Noisy" work = 80 decibels or less at 100 feet; "Noisy" work = more than 80 decibels at 100 feet.

2 Extended hours to be considered by UCSF Community and Government Relations with advance notice from the project manager.

Significance after Mitigation: Less than Significant

Impact NOI-LRDP-2: Implementation of the 2014 LRDP would result in increased ambient noise levels during pile-driving activities. (Potentially Significant)

Noise during construction activities could exceed existing daytime noise levels at all four campus sites by as much as 19 dBA. If an impact pile driver were required, it could result in an increase of up to 35 dBA over existing noise levels, resulting in intermittent periods of significant noise increase over existing conditions during the pile installation phase. Implementation of **Mitigation Measure NOI-LRDP-2** would reduce the effects of pile-driving activities

Mitigation Measure NOI-LRDP-2: Pile-Driving Noise-Reducing Techniques and Muffling Devices.

Noise-reducing pile-driving techniques shall be employed during project construction. These techniques shall include:

- Installing cast in place concrete piles. Noise from auger drilling is 17 dBA less than an impact pile driver.
- Vibrating piles into place, and installing shrouds around the pile-driving hammer where feasible.
- Installing intake and exhaust mufflers on pile-driving equipment
- Implement "quiet" pile-driving technology (such as pre-drilling of piles and the use of more than one pile driver to shorten the total pile driving duration).
- Use cushion blocks to dampen impact noise. Cushion blocks are blocks of material that are used with impact hammer pile drivers. They consist of blocks of material placed atop a piling during installation to minimize noise generated when driving the pile. Materials typically used for cushion blocks include wood, nylon and micarta (a composite material).
- At least 48 hours prior to pile-driving activities, UCSF shall notify building owners and occupants within 600 feet of the project site of the dates, hours, and expected duration of such activities.

Significance After Mitigation: Significant and Unavoidable. Mitigation Measure NOI-LRDP-2 would reduce the severity of noise generated by pile-driving activities and reduce the potential annoyance to nearby residents and others who could be disturbed by pile-driving to the extent feasible. If piles can be installed though drilling and cast in place measures then this mitigation measure would result in a less than significant impact.

However, if geotechnical conditions exist such that impact or vibratory pile-driving is required, then construction noise would be significant. Although pile-driving noise would be intermittent and would occur over a short duration, even after mitigation the noise level above the ambient noise level would likely exceed 20 dBA during pile-driving activities, resulting in a significant and unavoidable impact.

Impact NOI-LRDP-3: Implementation of the 2014 LRDP would generate ground-borne vibration during demolition and construction activities. (Less than Significant)

The types of construction and demolition-related activities associated with propagation of ground-borne vibration include pile driving, use of hoe-rams for demolishing large concrete structures and foundations and caisson drilling.

The only demolition activity associated with propagation of ground-borne vibration would be use of hoe-rams for demolishing large concrete structures or foundations. Operation of a hoe ram can result in peak particle velocities (PPV) of up to 0.089 inches per second (in/sec) at a distance of 25 feet (FTA, 2006). The Caltrans threshold of architectural damage for conventional sensitive structures is 0.5 in/sec PPV for new residential structures and modern commercial buildings and

0.25 in/sec PPV for historic and older buildings. As discussed in Sections 6.10 and 7.10, vibration from hoe-ram operation would not exceed the Caltrans criterion for the protection of fragile older buildings, or the criterion for newer buildings at any off campus receptors at the Parnassus Heights or Mount Zion campus sites. Consequently, the demolition proposals under the 2014 LRDP would have a less-than-significant impact to ground-borne vibration.

Of the equipment likely to be used during construction activities, pile driving has the potential to result in the highest levels of ground-borne vibration. Pile driving, if required, could take a number of months, and would occur during daytime hours, consistent with the City's Police Code. Pile driving can result in peak particle velocities (PPV) of up to 1.5 inches per second (in/sec) at a distance of 25 feet (FTA, 2006), but typically results in an average of about 0.644 PPV at that distance. The Caltrans threshold of architectural damage for conventional sensitive structures is 0.5 in/sec PPV for new residential structures and modern commercial buildings and 0.25 in/sec PPV for historic and older buildings. As discussed in Sections 6.10, 7.10, 8.10 and 9.10, vibration from pile driving would not exceed the Caltrans criterion for the protection of fragile older buildings, or the criterion for newer buildings at any off campus receptors.

Consequently, demolition or construction proposals under the 2014 LRDP would have a less-than-significant impact with regard to ground-borne vibration.

Mitigation: None required.

Impact NOI-LRDP-4: Implementation of the 2014 LRDP could cause a long-term increase in ambient noise levels in the vicinity. (Less than Significant)

No long-term noise sources and no long-term noise increases would be associated with demolition proposals at the Parnassus Heights and Mount Zion campus sites under the 2014 LRDP. Renovation proposals at these campus sites may result in subtle increases in roadway traffic, but considered within the context of 2014 LRDP proposals at these sites the roadway noise increase would be less than significant. No new mechanical or other stationary noise sources would be introduced by these renovations. Consequently, operational noise increases due to these renovation proposals would be less than significant.

Long-term noise sources associated with operation of renovated buildings and new buildings would primarily consist of marginal increases in roadway traffic resulting from new and repurposed land use. There will likely be some new mechanical equipment (e.g. heating ventilation and air conditioning) associated with operation of the new buildings. The potential locations of such equipment in not known given that these buildings have not yet been designed. However, such equipment would be operated to conform to the extent feasible with the requirements of the City of San Francisco noise ordinance. Additionally, new mechanical equipment would effectively replace older and potentially noisier HVAC equipment currently existing at buildings that would be demolished.

Operation of buildings proposed under the 2014 LRDP would be considered to generate a significant impact if it resulted in a permanent increase in ambient noise levels greater than 3 dBA in the building vicinity above levels existing without the building for areas already impacted by noise. Noise levels were determined for this analysis using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model and the turning movements provided in the traffic study for the 2014 LRDP, for Existing (2014), Existing Plus LRDP and LRDP horizon year, 2035, conditions. Peak hour intersection turning data from the traffic study were analyzed to evaluate traffic increases and resulting traffic-generated noise increases on roadway links most affected by LRDP -related traffic. The roadway segments analyzed and the results of the noise increases resulting from modeling at each of the four campus sites are presented in Sections 6.10, 7.10, 8.10 and 9.10.

As indicated in the campus site analyses, the increases in traffic noise in the vicinity of the campus sites from the Existing Plus LRDP traffic scenario compared to the Existing traffic scenario would increase peak hour noise levels by less than 3 dBA at all roadway segments.

Overall, long-term increases in ambient noise levels resulting from implementation of the 2014 LRDP would be less than significant.

Mitigation: None required.

Impact NOI-LRDP-5: Implementation of the 2014 LRDP would result in exposure of persons (new residents) to noise levels in excess of standards established in the City of San Francisco General Plan. (Less than Significant)

The 2014 LRDP would renovate and repurpose UC Hall and the Millberry Union towers on the Parnassus Heights campus site to residential uses, and construct new housing on the Proctor site and Fifth and Parnassus avenues, as well as on Block 15 on the Mission Bay campus site, resulting in new sensitive receptors at these locations. Long-term noise monitoring conducted at both campus sites indicates existing exterior noise levels range from 61 to 64 DNL, which is within the "conditionally acceptable" noise exposure category for residential uses as defined by the City of San Francisco General Plan Noise Element (greater than 60 DNL).

A conditionally acceptable noise exposure is defined as one in which new construction or development should be undertaken only after a detailed analysis of noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice. Both UC Hall and the Millberry Union towers have air-handling systems and windows are generally kept closed. Proposed housing units on Block 15 would have air handling systems. Additionally, Section 1207 of the California Building Code (Title 24 of the California Code of Regulations) establishes material requirements in terms of sound transmission class (STC) [17] of 50 for all common interior walls and floor/ceiling assemblies between adjacent dwelling units or between dwelling units and adjacent public area. This requirement would be sufficient to achieve

[17] The STC is used as a measure of a materials ability to reduce sound. The STC is equal to the number of decibels a sound is reduced as it passes through a material.

the additional 1 to 4 dBA of sound reduction necessary to achieve the noise exposure goals of the San Francisco General Plan.

Once operational in 2015, the Phase 1 Medical Center at Mission Bay will include a helipad that will have occasional helicopter operations. Noise contours for helicopter operations at this building were developed as part of the EIR for the UCSF Medical Center at Mission Bay. These contours indicate that the proposed Block 15 housing buildings would be over 500 feet north of the 65 CNEL contour as well as the 5% awakening contour for helicopter operations and therefore, would not be exposed to significant noise from helicopter operations.

Mitigation: None required.

5.11 Population and Housing Impacts of the 2014 LRDP

At publication of the Initial Study for the 2014 LRDP, UCSF had proposed to demolish three Aldea residential buildings containing 42 total residential units on the Parnassus Heights campus site. UCSF now proposes to retain these units. The Initial Study determined that the displacement of existing housing would be a less than significant impact due to the net new number of housing units proposed at LRDP horizon. Therefore, this less than significant impact would not occur with the retention of these housing units. No other existing housing or people would be displaced, necessitating the construction of replacement housing elsewhere, as a result of the 2014 LRDP. Therefore, no impact regarding displacement of existing housing or people would result from implementation of the 2014 LRDP.

Impact POP-LRDP-1: The 2014 LRDP would induce population growth in the San Francisco Bay area, which could create demand for housing outside the market area. (Less than Significant)

The 2014 LRDP would result in population growth in San Francisco or the wider Bay Area through increased employment and student enrollment. The 2014 LRDP would accommodate an increase in employment and students at all campus sites from the current approximately 30,840 to approximately 42,270 by 2035, or an increase of about 11,430.

According to *Plan Bay Area*, approximately 569,000 people worked in San Francisco in 2010. Between 2010 and 2040, San Francisco is expected to add about 191,000 new jobs, which would represent nearly a 34% increase over its 2010 employment levels. The UCSF share of this additional employment (including students) in 2035 would be approximately 6%. The amount of employment growth at UCSF would not add significantly to the amount of employment forecast for San Francisco during this period.

Conservatively assuming that all new UCSF students and employees would be new to San Francisco and the region, the increase in students and employment would result in an increase in the residential population of San Francisco and other communities in the Bay Area. Assuming that future students and employees would make the same residential location decisions as current UCSF employees, approximately half of new students and employees would live in San Francisco. There would also be additional population living in those UCSF employee and student households. Assuming only one UCSF employee per household and based on 2.3 persons per household for San Francisco, the total population in San Francisco associated with UCSF growth under the 2014 LRDP would be about 13,000. The share of the City's 2040 population growth associated with the population growth under the 2014 LRDP would be approximately 5%.

The market area for housing for UCSF employees is the nine county Bay Area. This is the area within which about 98% of UCSF staff resides. Generally, the housing demand associated with employment growth under the 2014 LRDP would be satisfied by the housing that could be added in San Francisco and in other parts of the region. Assuming the current pattern of residential

location preferences, the housing demand in San Francisco associated with UCSF student and employment growth would represent about 6% of the projected household growth—a share that would not trigger shifts of demand to other parts of the region or beyond the regional housing market area.

UCSF currently has 431 residential units on the Mission Bay campus site and 222 units on the Parnassus Heights campus site, with a total of 921 beds. Approximately 852 new units could be developed under the 2014 LRDP on these campus sites, for a total of 1,505 units and 2,083 beds. No residential units exist or are proposed by the 2014 LRDP at the Mount Zion or Mission Center campus sites. Development of additional residential units on the Mission Bay and Parnassus Heights campus sites would allow UCSF to provide more on-campus housing to students, postdoctoral scholars, clinical residents, and faculty near their classrooms and workplaces, thereby reducing demand for off-campus housing in San Francisco and the Bay Area. It also promotes sustainability objectives of the 2014 LRDP by reducing the amount of private vehicle and UCSF shuttle traffic between these and other campus sites. Additional UCSF housing also serves to improve the University's jobs-housing balance and support the City's housing goals.

Implementation of the 2014 LRDP would induce population growth in the Bay Area, but not to the extent that demand for new housing would exceed the capacity of the market area. The impact would be less than significant.

Mitigation: None required.

5.12 Public Services Impacts of the 2014 LRDP

Impact PUB-LRDP-1: Implementation of the 2014 LRDP would not result in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities, need for new or physically altered fire protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives. (Less than Significant)

In 2013, the estimated UCSF population across all sites, including patients and visitors, was approximately 39,420. At LRDP horizon in 2035 (including the Phase 2 Medical Center at Mission Bay), total population is projected to reach approximately 56,420, an increase of about 17,000, the majority of which would be associated with growth proposed by the 2014 LRDP. The population growth due to the 2014 LRDP could result in the need for increased fire protection services at the UCSF campus sites.

The population increase associated with the 2014 LRDP would be minimal in comparison to the population served by the existing fire stations near the Parnassus Heights, Mission Bay, Mount Zion and Mission Center campus sites. The increase in calls for fire protection and medical emergency response would not be substantial in light of the existing demand and capacity for fire protection and emergency medical services in the City. UCSF is located in an urban area and would not extend demand of the San Francisco Fire Department (SFFD) beyond the current limits of its service area. The anticipated population increase associated with implementation of the 2014 LRDP would neither adversely affect SFFD service standards nor require an increase in SFFD staff that would require the construction of new fire protection facilities. In addition, the City is currently constructing a new Public Safety Building at Third Street and Mission Rock Street, which will house a new fire station that will be operational in fall 2014 (SFDOE, 2014). The new station is being constructed to serve all new development at Mission Bay, including the UCSF Mission Bay campus site.

Furthermore, development under the 2014 LRDP would be designed to comply with building and fire codes and include appropriate fire safety measures and equipment, including but not limited to, use of fire retardant building materials, inclusion of emergency water infrastructure (fire hydrants and sprinkler systems), installation of smoke detectors and fire extinguishers, emergency response notification systems and provision of adequate emergency access ways for emergency vehicles.

As such, with implementation of the 2014 LRDP, existing fire stations would be adequate to meet the increases in demand for fire protection and emergency medical response services associated with growth under the 2014 LRDP, and no additional new or physically altered facilities would be necessary. Therefore, implementation of the 2014 LRDP would have a less than significant impact regarding the construction of new or physically altered fire protection facilities.

Mitigation: None required.

Impact PUB-LRDP-2: Implementation of the 2014 LRDP would not result in substantial adverse physical impacts associated with the provision of new or physically altered police facilities, need for new or physically altered police facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives. (Less than Significant)

Population increases due to the 2014 LRDP would result in increased demand for law enforcement services from the UC San Francisco Police Department (UCPD) and the San Francisco Police Department (SFPD).

In 2012, the service ratio of UCPD personnel to UCSF population was 1.9 sworn police officers per 1,000 persons (UCSF, 2012). The increase in daily population at the four campus sites will increase demand on UCPD services; however, it is not anticipated that new facilities would be needed in order to maintain current service levels for the Parnassus Heights, Mount Zion, or Mission Center campus sites. As the Mission Bay campus site grows, it is anticipated that approximately 1,500 square feet will be assigned to UCPD services in a new building on the North Campus, likely on Block 15 or 23. Construction-related impacts of expanding police services at the Mission Bay campus site are analyzed in applicable sections of the EIR, including: Section 7.2, *Air Quality*, Section 7.6, *Greenhouse Gas Emissions*, Section 7.7, *Hazards and Hazardous Materials*, Section 7.8 *Hydrology and Water Quality*, Section 7.10, *Noise*, and Section 7.14, *Transportation and Traffic.*

As discussed in Section 4.14, *Regional Setting*, the UCPD is the sole provider of law enforcement services on UCSF campuses, and their jurisdiction extends in a one mile radius from each campus boundary. While UCPD has a mutual aid agreement with the SFPD, the SFPD is generally only called where an unusual need for assistance is required. Daily campus population growth is not anticipated to substantially increase demand on SFPD services. As noted above under Impact PUB-LRDP-1, the City is currently constructing a new Public Safety Building in Mission Bay that will also become the new SFPD headquarters and as well as the new Southern District Station.

Because construction-impacts from expanding UCPD facilities at the Mission Bay campus site are either less than significant or reduced to less-than-significant through mitigation measures discussed elsewhere in this EIR, and since no new SFPD facilities would be necessary to accommodate increased demand for law enforcement services, implementation of the 2014 LRDP would not result in any significant impacts to police facilities.

Mitigation: None required.

Impact PUB-LRDP-3: Implementation of the 2014 LRDP would not result in substantial adverse physical impacts associated with the provision of new or physically altered public school facilities, need for new or physically altered public school facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives. (Less than Significant)

The estimated number of future students that would be anticipated as a result of proposed residential development under the 2014 LRDP was derived by multiplying the number of students

per dwelling unit (the Student Yield Factor) by the number of proposed dwelling units (852 units). The California State Allocation Board Office of Public School Construction reports that the statewide student yield factor per dwelling unit is 0.5 students for grades K through 6 and 0.2 students for grades 7 through 12, resulting in a unified school district average of 0.7 students per household. Using that yield factor, construction of up to 852 units would result in an increase of approximately 596 new students. However, this is likely over estimated as the potential residents in campus housing would be overwhelmingly graduate students with fewer children than the general population. In addition, many of the proposed dwelling units would be single-occupancy units.

The University sets an occupancy policy for all campus housing that serves as a restriction on the number of potential school age children that could live in UCSF facilities. UCSF currently has 108 children living in student housing at the Parnassus Heights campus site and 67 children at the Mission Bay campus site. At LRDP horizon in 2035 UCSF, estimates that an additional approximately 136 children could potentially reside in UCSF housing on these campus sites.

Schools in the SFUSD would be able to accommodate the potential increase in student population. As such, the 2014 LRDP would have a less than significant impact on the SFUSD and would not require the construction of new or expanded school facilities. Additionally, UCSF has a Contribution Agreement with SFUSD stating that the District has rights to develop a new school site on Block 14 at the Mission Bay campus site until 2027, if it is determined that one is needed to serve future development in the area.

Mitigation: None required.

5.13 Recreation Impacts of the 2014 LRDP

The Initial Study prepared for the 2014 LRDP determined that the potential effects regarding the increased use of parks and other recreational facilities would occur only as a result of implementation of the LRDP proposals at specific campus sites.

The Initial Study determined that population growth at the Parnassus Heights, Mount Zion and Mission Center campus sites would not be substantial; therefore, the demand on existing recreational facilities resulting from an increased population at these campus sites would not result in substantial physical deterioration of such facilities. As there are not currently any recreational facilities proposed at the Mount Zion or Mission Center campus sites, the Initial Study determined that no impacts from constructing recreational facilities would occur at either of these sites.

Impact REC-LRDP-1: Implementation of the 2014 LRDP would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated. (Less than Significant)

Under the 2014 LRDP, residential development of approximately 523 units is proposed at the Mission Bay campus site, which could result in an increased demand for recreational facilities by new residents. It is anticipated that these students and other residents would primarily use the existing on-site campus recreation facilities. The increase in population resulting from the growth at the Mission Bay campus site is small relative to the amount of growth expected to occur in the larger Mission Bay area; as such, development proposed by the 2014 LRDP would not cause a significant increase in demand for recreation services on or near the campus site.

The students, faculty and staff, who commute to the Mission Bay campus site from various other parts of San Francisco and the greater Bay Area, as well as patients and visitors, are primarily served by other recreation facilities near their homes. Presumably, their use of recreational facilities on or near the Mission Bay campus site would be passive in nature and cause minimal increases in demand for recreation services on or near the Mission Bay campus site. As part of the development of the Mission Bay campus site, UCSF is required to construct 8 acres of publicly accessible open space.

As the population of the campus grows over time, the 2014 LRDP acknowledges that campus life improvements would also be necessary, including additional outdoor recreation areas, fitness facilities and open space. It is anticipated that the 2014 LRDP growth assumptions and space needs include adequate space to meet future demand for recreational facilities and open spaces at the Mission Bay campus site.

Mitigation: None required.

Impact REC-LRDP-2: The 2014 LRDP includes new recreational facilities, the construction of which could have an adverse impact on the environment (Less than Significant)

The 2014 LRDP proposes to construct three new trails within the Mount Sutro Open Space Reserve (Reserve) to enhance and improve access for visitors. In general, construction of new trails would require minimal vegetation removal, minor amounts of grading and the installation of new trail markers. The Sunset Trail, proposed on the northwest side of the Reserve, could involve the construction of a stairway. Due to the time-limited nature of construction, construction-related impacts in any single location would be temporary. Mitigation Measures BIO-PH-1a through BIO-PH-1f, which would mitigate potential adverse effects on special-status plants and animals in the Reserve, are presented and discussed in Section 6.3, *Biological Resources.* Compliance with mitigation measures and other construction-related regulatory requirements discussed in other sections of the EIR, including Section 6.2, *Air Quality*; Section 6.3, *Biological Resources*; Section 6.5, *Geology, Soils, and Seismicity*; Section 6.7, *Hazards and Hazardous Materials*; Section 6.8, *Hydrology and Water Quality*; Section 6.10, *Noise*; and Section 6.14, *Transportation and Traffic,* would reduce construction related effects of new recreational facilities to less than significant levels.

The 2014 LRDP proposes the construction of a full-size multi-purpose sports field at the Mission Bay campus site, which would provide outdoor recreation and fitness space between the existing community center and future housing site. Construction activities for the proposed sports field have been evaluated as part of the overall implementation of the 2014 LRDP. Due to the time-limited nature of construction, construction-related impacts in any single location would be temporary. Compliance with mitigation measures and other construction-related regulatory requirements discussed in other sections of the EIR, including Section 7.2, *Air Quality*; Section 7.3, *Biological Resources*; Section 7.5, *Geology, Soils, and Seismicity*; Section 7.7, *Hazards and Hazardous Materials*; Section 7.8, *Hydrology and Water Quality*; Section 7.10, *Noise*; and Section 7.14, *Transportation and Traffic,* would reduce construction related effects of new recreational facilities to less than significant levels.

Mitigation: None required.

5.14 Transportation and Traffic Impacts of the 2014 LRDP

The Initial Study prepared for the 2014 LRDP determined that implementation of the 2014 LRDP will not change existing air traffic volumes or affect existing air traffic patterns that would result in substantial safety risks. Therefore, no further study of air traffic patterns in the EIR is necessary.

2014 LRDP Plan-Level Impacts

Impact TRAF-LRDP-1: Implementation of the 2014 LRDP would be consistent with the primary goals of the City and County of San Francisco (CCSF) with respect to transportation and would not fundamentally conflict with the CCSF's Transit First Policy because the 2014 LRDP demonstrates reasonable efforts to continue transportation services (e.g., the UCSF Shuttles) that encourage alternatives to use of single-occupant automobiles. (Less than Significant)

There are many different factors that determine how people travel to/from work, including home location, work shifts, access to transit, and travel incentives and disincentives (e.g., how convenient or costly it is to park). A Transportation Demand Management (TDM) program is a set of policies and programs that include incentives, information, and education to encourage employees to commute to work by modes other than driving alone. The UCSF TDM program includes strategies that emphasize alternative commuting options, such as public transit, private shuttle service, biking, walking, and carpooling

Key features of UCSF's existing TDM program include the following:

- 60 shuttles serving 17 locations, with over 2.3 million passengers per year
- 33 vanpools that travel as far as Sacramento and operate using the Green Road Safety System, which improves fuel consumption and safety
- 62 reserved carpool stalls at various sites
- Marin Commute Club buses with about 55 daily riders who live in Marin and Sonoma Counties to the north of the city
- 18 City CarShare vehicles, along with 1,500 UCSF members who can use these vehicles by scheduling their use on-line
- A fleet of 43 low-emitting alternative-fuel and hybrid vehicles, including cars, shuttles, golf carts, and trucks
- 18 electric-vehicle charging stations at Parnassus Heights, Mount Zion, and Mission Bay, with plans for another 20 at Mission Bay in the Owens Street Garage and 10 at other locations
- Over 1,900 UCSF users of the ZimRide online carpool matching program

- 972 bicycle parking spaces with another 100 planned at Mission Bay, as well as bike racks on shuttles, a cyclist shower program that allows bicyclists to use UCSF showers at a discount, and other bicycle-related benefits
- Bay Area Bike Share station planned at Mission Bay, where members would have access to bicycles provided by the Bay Area Air Quality District
- Over 400 off-street motorcycle parking stalls in garages and surface parking lots
- An "emergency ride home" program to encourage use of alternative modes of transportation
- Clipper Card (public transit pass) sales at easily accessible locations, including through UCSF's website
- Close to 1,800 employees participate in the pretax transit program that has saved UCSF employees over $700,000 on public transit commute costs in 2013

To minimize traffic generated by UCSF current and planned facilities, UCSF proposes to implement more-robust TDM measures. These measures were developed as part of an internal planning process to identify feasible TDM measures that could reasonably result in a reduction in UCSF-generated single-occupant vehicle (SOV) trips, given UCSF's already low SOV rate.[18] To accomplish this, UCSF would implement some or all of the following in the 2014 LRDP:

- Expand UCSF Vanpool Program (add new vanpools and subsidize costs to attract new riders);
- Develop more-robust UCSF Carpool Matching and convert additional parking spaces to carpool only;
- Enhance existing City CarShare pods on campus sites and participate in the city's new Medical Center Rideshare program;
- Increase supply and access to bicycle parking and showers/lockers;
- Enhance shuttle system with Wi-Fi and Next Bus;
- Limit parking for non-faculty tenants in new housing;
- Gradually increase cost of employee parking over time; and
- Promote flexible work schedules, as possible.

Key Goals of the proposed LRDP that address reduced trip generation and are consistent with the goals of the Transportation Element of the San Francisco General Plan include:

- Enhance UCSF's Transportation Demand Management program and encourage its faculty, staff and students to use alternative modes of travel to driving alone to campus sites.
- Prioritize parking for patients and essential healthcare providers.
- Reduce congestion and truck deliveries to campus sites through transportation improvement measures.

[18] At present, less than 35% of all UCSF-generated trips are by single-occupant vehicle.

- Direct, aesthetic, and experiential pedestrian connectivity is stressed in the UCSF 2010 Physical Design Framework and will be considered as buildings and open space are developed.
- Consider the needs of pedestrians on public streets, particularly Parnassus Avenue at Parnassus Heights, Fourth Street at Mission Bay, and Sutter Street at Mount Zion, that pass through campus sites and have UCSF shuttle and Muni stops.

Because UCSF would continue to implement and expand transportation control measures consistent with CCSF's Transit First Policy, adoption of and development under the 2014 LRDP would not be considered to fundamentally conflict with those goals and would have a less-than-significant impact.

Mitigation: None required.

Impact TRAF-LRDP-2: Implementation of the 2014 LRDP could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during demolition and construction activities. (Potentially Significant)

Implementation of the 2014 LRDP would be spread over the next twenty years and would preserve UCSF's operations during the construction period. The construction of LRDP projects would begin with the demolition of small buildings at the Parnassus Heights campus site in 2015 to the construction of Phase 2 of the UCSF Medical Center at the Mission Bay campus site after 2035.

It is estimated that construction activity associated with the 2014 LRDP would generate an average of as few as 10 truck trips per workday, and as many as 40 truck trips per day (peak construction trip generation of approximately 90 truck trips per workday).

Some construction projects will result in a parking loss due to construction staging and/or restrictions and limit pedestrian access through the duration of construction; however project construction is temporary and will not result in long term impacts.

Construction-related activities would generally occur Monday through Friday, between 7:00 AM and 5:00 PM, and the typical work shift for most construction workers would be from about 7:00 AM to about 3:30 PM. On rare occasions, construction could also occur during extended hours (5:00 PM to 8:00 PM) and on weekends (8:00 AM to 5:00 PM) on an as-needed basis, with advanced notice to neighbors.

It is anticipated that the addition of the construction truck trips, and worker-related vehicle- or transit-trips, potentially would have temporary adverse effects on transportation conditions (i.e., impacts on local intersections or the transit network). Construction workers who drive to the site and potential temporary parking restrictions along building frontages on Parnassus Avenue would cause a temporary increase in parking demand, and/or temporary parking restrictions along building frontages on city streets. Construction workers would park within nearby off-street parking facilities that currently have availability during the day, in satellite parking lots in which

UCSF would lease temporary parking spaces, or in temporary surface parking lots within undeveloped blocks.

Nonetheless, while construction of individual LRDP projects would by definition be temporary, the LRDP would unfold over the course of 20+ years and would require consideration of the effect of construction activities on existing and future transportation facilities (e.g. sidewalks, Muni service and facilities, roadways, bicycle routes, etc.) and existing and future adjacent land uses. Therefore, due to the magnitude of 2014 LRDP development and the need for on-going coordination and monitoring, the 2014 LRDP construction-related transportation impacts would be considered potentially significant. **Mitigation Measure TRAF-LRDP-1** would reduce these impacts to less-than-significant levels.

Mitigation Measure TRAF-LRDP-1: Construction Coordination and Monitoring Measures.

Traffic Control Plan for Construction –In order to reduce potential conflicts between construction activities and pedestrians, transit and autos during construction activities at the four campus sites, UCSF shall require construction contractor(s) to prepare a traffic control plan for major phases of project construction (e.g. demolition, construction, or renovation of individual buildings). UCSF and its construction contractor(s) will meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion, including temporary transit stop relocations (e.g. Parnassus Avenue (Parnassus Heights), Sutter Street (Mount Zion), etc.) and other measures to reduce potential traffic and transit disruption and pedestrian circulation effects during major phases of construction of the 2014 LRDP Projects. For any work within the public right-of-way, the contractor would be required to comply with the City of San Francisco's Regulations for Working in San Francisco Streets (the Blue Book), which establish rules and permit requirements so that construction activities can be done safely and with the least possible interference with pedestrians, bicyclists, transit, and vehicular traffic. [19] In addition to the regulations in the Blue Book, UCSF shall require the construction contractor(s) to comply with all state and federal codes, rules and regulations.

In the event that the construction timeframes of the major phases and other development projects adjacent to UCSF overlap, such as the adjacent proposed development at Mission Bay Blocks 29-32, UCSF shall coordinate with City Agencies through the Transportation Advisory Staff Committee (TASC) and the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation impacts. UCSF, in conjunction with the adjacent developer, shall propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as staggering start and end times, coordinated material drop offs, collective worker parking and transit to job site and other measures.

Reduce SOV Mode Share for Construction Workers – In order to minimize parking demand and vehicle trips associated with construction workers, UCSF shall require the construction contractor to include in the Traffic Control Plan for Construction methods to encourage walking, bicycling, carpooling and transit access to the campus sites by construction workers in the coordinated plan.

[19] The SFMTA Blue Book, 8th Edition (2012), is available online through SFMTA (sfmta.com).

Project Construction Updates for Adjacent Residents and Businesses – In order to minimize construction impacts on access for nearby residences, institutions and businesses, UCSF shall provide nearby residences and adjacent businesses with regularly-updated information regarding project construction, including construction activities, peak construction vehicle activities (e.g., concrete pours), travel lane closures, and lane closures via a newsletter and/or website.

Significance after Mitigation: Less than Significant

2014 LRDP Development Site-Specific Impacts

Impact TRAF-LRDP-3: Implementation of the 2014 LRDP would result in temporary increases in traffic volumes on roadways in the vicinity of each of the four campus sites during demolition and construction activities. (Potentially Significant)

Although the effects of construction and demolition activities on transportation at the campus sites would be considered potentially significant due to the magnitude of development and the need for on-going coordination and monitoring, the implementation of Mitigation Measure TRAF-LRDP-1: Construction Coordination and Monitoring Measures would reduce construction-period impacts to less-than-significant levels, as discussed above under Impact TRAF-LRDP-2.

Mitigation Measure: Implement **Mitigation Measure TRAF-LRDP-1**

Significance after Mitigation: Less than Significant

Impact TRAF-LRDP-4: Implementation of the 2014 LRDP would increase traffic (vehicles, transit ridership, pedestrian and bicycle volumes) on the roadway network that serves each of the four campus sites, as well as increase loading and parking demand. (Less than Significant)

As detailed in the impact analyses in Sections 6.14, 7.14, 8.14 and 9.14 of this EIR, implementation of the 2014 LRDP would not result in significant impacts to traffic, transit, pedestrian, bicycle, loading or parking conditions, and no mitigation measures are required.

5.15 Utilities and Service Systems Impacts of the 2014 LRDP

UCSF is an urban institution with campus sites throughout the City of San Francisco and some locations beyond the city limits. UCSF occupies building space in both owned and leased buildings. Each UCSF site in San Francisco relies on utilities and services provided by the City that surrounds it. At the Parnassus Heights, Mount Zion and Mission Center campus sites, development under the 2014 LRDP would occur as replacement or in-fill on otherwise built-out sites and the necessary City utilities have long been in place with sufficient capacities to serve those sites and the proposed 2014 LRDP development. At the Mission Bay campus site, development under the 2014 LRDP would occur primarily as new construction on vacant land; however, these vacant sites lie within the Mission Bay Redevelopment Area, where development at this scale has been planned by the City and provisioned with utilities and services adequate to serve the planned development. As a result of these actions, potential adverse effects to utilities or services usually are less than significant.

Impact UTIL-LRDP-1: There would be sufficient water supplies available to serve the 2014 LRDP from existing entitlements and resources and no new or expanded water treatment facilities would be required. (Less than Significant)

Under the Water Supply Assessment law (Sections 10910 through 10915 of the California Water Code), urban water suppliers like the San Francisco Public Utilities Commission (SFPUC) must furnish a Water Supply Assessment (WSA) to the city or county that has jurisdiction to approve the environmental documentation for certain qualifying projects (as defined in Water Code Section 10912 (a)) subject to CEQA. While UCSF is not subject to the WSA law, as the lead agency for the 2014 LRDP, UCSF voluntarily requested preparation of a WSA as part of its cooperative planning with the City and to inform the EIR.

UCSF currently occupies approximately 8.04 million gsf in owned space and leased space in San Francisco. By 2035, UCSF's total space would be about 12.37 million gsf, an increase of about 4.33 million gsf. Of this increase, about one-third or 1,482,800 gsf was not previously identified in the SFPUC's 2010 Urban Water Management Plan (UWMP).

As discussed in the WSA, the City currently projects a retail demand in 2035 of 84.2 million gallons per day (mgd), which represents a 3.3 mgd, or 4%, increase over the 2035 demand projections estimated in the UWMP.

The net new water demand associated with growth under the 2014 LRDP is projected to be 0.14 mgd. The total retail demand with inclusion of 2014 LRDP demand is projected to be 84.3 mgd, which represents a 3.4 mgd, or 4%, increase over the 2035 projections. The SFPUC concluded that there are adequate water supplies to serve the 2014 LRDP demand and cumulative retail water demands during normal years, single dry years and multiple dry years over a 20-year planning horizon from 2015 through 2035. In addition, as discussed in Section 4.15.2, UCSF recently published the 2014 Water Action Plan in order to fulfill the UC *Policy on Sustainable*

Practice's goal of reducing the University's per capita water consumption by 20% in 2020. UCSF has also committed to other water use reduction measures in response to the Governor's emergency drought declaration and the UC President's request for immediate implementation of short-term measures. Therefore, water demand anticipated under the 2014 LRDP would be met by available supplies and no new or expanded water treatment facilities would be required; the impact would therefore be less than significant.

Discussion of water supply infrastructure necessary to serve growth resulting from the 2014 LRDP at the Mission Bay campus site is presented in Section 7.15.

Mitigation: None required.

Impact UTIL-LRDP-2: The wastewater treatment provider has adequate capacity to serve UCSF's projected demand resulting from implementation of the 2014 LRDP and no new or expanded wastewater treatment facilities would be required. (Less than Significant)

Assuming wastewater generation as 90% of water usage, the overall increase in wastewater resulting from the 4.33 million gsf increase associated with the 2014 LRDP would be roughly 0.38 mgd.[20] Wastewater flows from the Mission Bay, Mount Zion and Mission Center campus sites represent over 95% of future UCSF flows based on the location of growth proposed under the 2014 LRDP. Wastewater from these three campus sites would be directed to the Southeast Water Pollution Control Plant (SEWPCP). The increase in flows to the SEWPCP from the Mission Bay, Mount Zion and Mission Center campus sites would be approximately 0.01% over existing average dry weather flows of 63 mgd at this facility. Increased wastewater flows from the Parnassus Heights campus site would be approximately 0.02 mgd and would be directed to the Oceanside treatment plant. Therefore, overall wastewater generated at 2014 LRDP horizon would not be substantial and could be met by existing capacity. The 2014 LRDP would not result in a determination by the SFPUC that it has inadequate capacity to serve the projected demand, and the impact would be less than significant.

Discussion of wastewater infrastructure necessary to serve growth resulting from the 2014 LRDP at the Mission Bay campus site is presented in Section 7.15.

Mitigation: None required.

Impact UTIL-LRDP-3: Implementation of the 2014 LRDP would not exceed the wastewater treatment requirements of the Regional Water Quality Control Board. (Less than Significant)

As discussed above under Impact UTIL-LRDP-2, implementation of the 2014 LRDP would increase wastewater flows from the main campus sites, but not to an extent that would cause the SFPUC's combined sewer system to exceed wastewater treatment requirements of the Regional Water Quality Control Board. The impact would be less than significant.

[20] As discussed under Impact UTIL-LRDP-1, water demand associated with one-third of 2014 LRDP growth is 0.14 mgd. Therefore, total water demand of the 2014 LRDP is roughly 0.42 mgd.

Mitigation: None required.

Impact UTIL-LRDP-4: Implementation of the 2014 LRDP would not require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects. (Less than Significant)

The proportion of impermeable surfaces at each respective campus site would not significantly change under development proposed by the 2014 LRDP. All campus site stormwater runoff would be directed to the City's combined sewer system (CSS), except for the Mission Bay campus site where stormwater flows are directed to the Bay. Other than standard pipeline connections and inlets to connect proposed buildings to existing stormwater conveyance facilities, no expansion of storm drainage facilities would be required under the 2014 LRDP. The impact would be less than significant.

Discussion of storm drainage infrastructure necessary to serve growth resulting from the 2014 LRDP at the Mission Bay campus site is presented in Section 7.15.

Mitigation: None required.

Impact UTIL-LRDP-5: UCSF is served by a landfill with sufficient permitted capacity to accommodate solid waste needs resulting from implementation of the 2014 LRDP and would comply with federal, state and local statutes and regulation related to solid waste. (Less than Significant)

Growth proposed under the 2014 LRDP would increase the amount of solid waste generated on UCSF campus sites. Solid waste would be generated during both construction of proposed facilities and during operation of campus sites over the lifetime of the 2014 LRDP. More than 80% of solid waste generated in San Francisco, is transported to the Altamont Landfill in Alameda County. The Altamont Landfill has a permitted peak maximum daily disposal of 11,150 tons per day and has an estimated remaining capacity of approximately 46 million cubic yards or 74% of its permitted capacity. The estimated closure date of the landfill is 2025. As discussed in Section 4.16, the City's contract with the Altamont Landfill expires in 2015. The City may award a future landfill disposal contract to the Recology Ostrom Road Landfill in Yuba County, which has a total design capacity of over 41 million cubic yards and an expected closure date of 2066. The ultimate determination with respect to future landfill contracting will be made by the Board of Supervisors on the basis of solid waste planning efforts being undertaken by the City's Department of the Environment.

Regardless of whether the City renews its contract with the Altamont Landfill, switches to the Ostrom Road Landfill, or selects another facility, UCSF employees, students, visitors and patients would continue to participate in UCSF's recycling and composting programs and other efforts to reduce the solid waste disposal stream. UCSF has consistently increased its landfill diversion rate, rising from 51% in 2009 to 64% in 2013, as it strives to meet the UC *Policy on Sustainable Practices* goal of zero waste by 2020. In addition, **Mitigation Measure GHG-LRDP-1** would

require that contractors recycle or reuse at least 50% of construction waste or demolition materials, thereby further reducing the amount of solid waste sent to area landfills.

Given the existing and anticipated increase in solid waste recycling and the existing and potential future landfill capacities, implementation of the 2014 LRDP would not result in a landfill exceeding its permitted capacity or non-compliance with federal, state, and local statutes and regulations related to solid waste. Therefore, this impact would be less than significant.

Mitigation: None required.

Impact UTIL-LRDP-6: Implementation of the 2014 LRDP would not result in the wasteful, inefficient and unnecessary consumption of energy. (Less than Significant)

Growth proposed under the 2014 LRDP would result in the increased consumption of energy through LRDP horizon in 2035. In 2012-2013, UCSF purchased 6,871,248 therms of natural gas from PG&E and used 41,560,148 kilowatt hours of electricity across all UCSF campus sites, totaling 829,388 million British Thermal Units (Btu) per year.

Construction under the 2014 LRDP would require energy for off-road equipment operation, vendor and construction worker vehicle trips and demolition haul trips. These sources would result in an increased energy demand, primarily for diesel fuel, as shown in **Table 5-10**.

Once constructed, development projects under the 2014 LRDP would increase energy demand for electricity and natural gas as well as gasoline for increased motor vehicle trips. The estimated increase in energy demand from increased operations under the 2014 LRDP also is presented in Table 5-10.

UCSF Energy Conservation

The introduction to CEQA Appendix F states that "The goal of conserving energy implies the wise and efficient use of energy. The means of achieving this goal include: (1) decreasing overall per capita energy consumption, (2) decreasing reliance on fossil fuels such as coal, natural gas and oil, and (3) increasing reliance on renewable energy sources."

Statewide efforts to control GHG emissions in accordance with California's Global Warming Solutions Act of 2006 (AB 32) – which requires the State of California as a whole to reduce GHG emissions to 1990 levels by the year 2020 – also result in progress toward each of these three energy conservation objectives. GHG control measures also seek to reduce per capita energy use and shift the reliance from fossil fuel to renewable energy sources. Meeting AB 32 GHG and climate requirements forces wide-ranging actions that directly and indirectly conserve energy. In addition, a number of other planning and policy practices, as well as measures that reduce other environmental impacts, also act to achieve one or more of these energy conserving objectives.

As well as controlling GHG emissions, the following UC system-wide policies directly and indirectly conserve energy, as described in CEQA Appendix F.

TABLE 5-10
ENERGY DEMAND FOR CONSTRUCTION AND OPERATION OF THE 2014 LRDP[a]

2014 LRDP Component	
Construction[b]	**million British Thermal Units (Btu)/year**
Parnassus Heights	12,200
Mission Bay	230,000
Mount Zion	2,260
Mission Center	5,030
Operation – Parnassus Heights	
Electricity	15,900[c]
Natural Gas	19,500[c]
Motor Vehicles[d]	9,930
Total Operational	45,330
Operation – Mission Bay	
Electricity	118,000
Natural Gas	103,000
Motor Vehicles	95,900
Total Operational	316,900
Operation –Mount Zion	
Electricity[c]	10,200
Natural Gas[c]	4,330
Motor Vehicles	8,450
Total Operational	22,980
Operation – Mission Center	
Electricity	6,310
Natural Gas	1,640
Motor Vehicles	4,050
Total Operational	12,000
Total Operational Energy - 2014 LRDP	397,210

[a] Project construction and operational energy estimates were made using CalEEMod, version 2013.2.
[b] Construction energy occurs over the entire LRDP horizon. A portion of construction energy use is construction worker trips. Some of these trips would be gasoline and not diesel.
[c] Includes demolition losses and renovation losses.
[d] Gasoline powered vehicles assumed. Per Air Resources Board, less than 1% of light duty auto trips in the Bay Area are diesel.

SOURCE: ESA, 2014.

UC Policy on Sustainable Practices

The UC *Policy on Sustainable Practices* sets the following requirements and goals relevant to GHG emissions reduction:

- Requires each campus to develop a long-term strategy for voluntarily meeting the requirements of California's Global Warming Solutions Act of 2006 (AB 32);
- Instructs campuses to aim for climate neutrality as soon as possible after achieving 2014 and 2020 reduction targets;

- Requires 20% better energy performance than Title 24 (policy maintained as Title 24 is revised) for new construction and renovations, and strives to achieve 30%;
- Requires new laboratory buildings to meet Labs21 Environmental Performance Criteria (EPC);
- All new construction and major renovations projects must meet a minimum standard of LEED-NC Silver and strive for LEED-NC Gold when possible;
- The University will use energy efficiency retrofits to reduce system-wide energy consumption by 10% or more, from 2000 baseline, by 2014;
- Renovation projects greater than $5 million that do not quality for LEED-NC must be certified under LEED-CI;
- Renovation projects that require 100% equipment replacement, and 50% non-shell areas, must achieve LEED Silver at a minimum and strive for Gold;
- Each campus will submit one pilot LEED-EBOM building for certification by July 1, 2014;
- University system will provide up to 10 MW capacity of on-site renewable energy by 2014 (approximately 1 MW per UC campus);
- Develop goals for reducing transportation-related GHG's and report on progress annually;
- Expand Transportation Demand Management (TDM) programs and projects;
- Divert 50% solid waste by 2008, 75% by 2012, and achieve zero waste by 2020 (defined as diverting 95% or more of municipal solid waste);
- Develop Water Action Plan and reduce water consumption by 20% by 2020;
- All new buildings must achieve at least two points in LEED NC Water Efficiency category;
- Maximize procurement of environmentally preferable products and services; and
- Purchase 20% sustainable food products by 2020.

UCSF's Sustainability 2.0 (2014-2020) Plan implements the UC *Policy on Sustainable Practices* in the areas of green building, clean energy, transportation, climate protection, sustainable operations, waste reduction and recycling, environmentally preferable purchasing, sustainable foodservice, and sustainable water systems.

UC Carbon Neutrality by 2025

The UC President has set a goal for UC to become carbon neutral by 2025 and purchase only clean energy. This goal has not been formally adopted by the Regents as a policy, but UC is actively working on the President's initiative to be the first major research university to achieve carbon neutrality.

UCSF Climate Action Plan (2009)

As part of implementing the UC *Policy on Sustainable Practices*, UCSF has developed a Climate Action Plan, a long-term strategy for voluntarily meeting the State of California's goal for reducing GHG emissions to 1990 levels by 2020, pursuant to AB 32. The Climate Action Plan

also addresses the UCOP goals of reducing GHG emissions to 2000 levels by 2014; and attaining climate neutrality as soon as possible after achieving the 2014 and 2020 reduction targets. GHG emissions inventories are included for the years 1990, 2000 and 2008. The Climate Action Plan forecasts future emissions and assesses the impact of UCSF sustainability policies and programs on future GHG emissions and the prospects for achieving GHG reduction goals. The Climate Action Plan concludes that UCSF is expected to meet the goal of reducing GHG emissions to 2000 levels by 2014, but that the goal of reducing 1990 levels by 2020 would not likely be met without the use of additional reduction measures or carbon offsets.

UC Strategic Energy Plan

The UC Strategic Energy Plan (SEP) was prepared in 2008 for all UC campuses, to fulfill a goal of the UC *Policy on Sustainable Practices* to implement energy efficiency projects in existing buildings. The UCSF portion of the plan analyzes energy use and GHG trends, and identifies potential energy efficiency retrofit projects at all buildings over 50,000 square feet at UCSF (primarily lighting, HVAC, commissioning and central plant measures). Energy savings, GHG emissions savings and financial returns are estimated for hundreds of projects, which are grouped into Tier 1 (high priority) and Tier 2 (longer term planning) projects based on their energy savings and financial payback. The SEP project list is to be updated regularly by each campus to evaluate the feasibility of additional energy-saving measures.

Annual GHG Inventory Reporting

The UC *Policy on Sustainable Practices* requires each campus to report its GHG emissions inventory to an independent reporting organization. UCSF emissions inventories reported to outside agencies are verified by accredited independent auditors. Since 2008 UCSF has also been required to report emissions from the Parnassus Heights Central Utility Plant to the California Air Resources Board (CARB) under the AB 32 Reporting Rule. UCSF tracks and reports its progress towards meeting its GHG emissions goals in its Annual Sustainability Report. USCF also reports to the UC Regents annually on its progress in meeting the goals in the UC *Policy on Sustainable Practices*.

GHG Reduction Strategy (see Appendix D)

UCSF has prepared a GHG Reduction Strategy, in conjunction with the 2014 LRDP to ensure that the implementation of the LRDP aligns with the UC *Policy on Sustainable Practices*; in particular the policies on greenhouse gases and the requirements of AB 32. The GHG Reduction Strategy, includes two categories of GHG reduction measures: those to which UCSF is currently committed to in terms of funding and/or implementation (called "Tier 1" measures), and those that are in the planning stages (called "Tier 2" measures). Tier 1 measures include the following energy-related strategies:

- ***Strategy EN1: Improve Energy Efficiency of Existing Buildings and Operations.*** Since the early 1990's UCSF has periodically written Strategic Energy Plans (SEPs) to identify and prioritize implementation of campus investments in energy efficiency projects for existing buildings and infrastructure. The SEP considers UCSF facilities 50,000 gsf or larger for application of new efficiency technologies, implementation of best practices and available financial incentive programs. SEP projects cover a wide range of types of

improvements, from changing lighting fixtures to building new power plants. Lighting and HVAC (Heating Ventilation and Air Conditioning) projects are particularly effective at reducing energy usage. While the University continues to expand the use of laboratory fume hoods to minimize health risks, the SEP includes projects for upgrading fume hoods with more energy efficient, high-performance models. Between 2009 and 2013, implementation of SEP projects has saved more than 12,000 MW-h of electricity and more than 1,700,000 therms of natural gas.

- ***Strategy EN2: Green Building Standards.*** The *UC Policy on Sustainable Practices* states that the University incorporates the principles of energy efficiency and sustainability in all capital and renovation projects within budgetary constraints and programmatic requirements. Given the importance of energy efficiency to green building design, the University has set a goal for all new building projects, other than acute-care facilities, to outperform the required provisions Title 24 energy-efficiency standards by at least 20 percent.[21] UCSF is committed to designing and constructing all new buildings (except for laboratory and acute care facilities, addressed separately below) so as to meet a minimum standard of sustainability that is equivalent to a LEED-NC Silver rating, and will continue to strive to achieve a standard equivalent to a LEED-NC Gold rating or higher, within the constraints of program needs and standard budget parameters. Central to its academic mission, research laboratories make up a large percentage of the new space proposed under the 2014 LRDP. These types of facilities contain specialized equipment that consume significantly more energy per square foot than the average building. Given the importance of specifically addressing sustainability in laboratory facilities, UCSF has also committed to designing all new laboratory buildings to a minimum standard equivalent to a LEED-NC Silver rating and the Laboratories for the 21st Century (Labs21) Environmental Performance Criteria (EPC), as appropriate.

- ***Strategy EN3.1: Renewable Energy: On-Site Solar PV.*** UCSF is planning to install a 750 kilowatt (kW) solar photovoltaic (PV) plant at the Medical Center at Mission Bay to be operational by 2020. Other solar PV projects at UCSF are expected to add 1,465 kW over the 20-year LRDP horizon.

Given the continuing and proposed actions by UCSF to decrease overall per capita energy consumption, decrease reliance on fossil fuels, and increase reliance on renewable energy sources, growth under the 2014 LRDP would not result in the wasteful, inefficient use of energy; effects related to energy consumption would not be significant.

Mitigation: None required.

Impact UTIL-LRDP-7: Implementation of the 2014 LRDP could result in the construction of new electrical or natural gas facilities, which could cause significant environmental effects. (Less than Significant)

UCSF is considering a central utility plant (CUP) on a portion of Block 16 on the Mission Bay campus site, potentially using cogeneration technology, as well as a redundant utility distribution loop for steam, chilled water and high-temperature hot water, to help ensure that utility supplies to future buildings on the North Campus are not interrupted should a break or power outage in

[21] Although the Title 24 building code does not apply to hospitals, new UCSF medical facilities must be designed to a LEED-Silver standard or higher, which achieves energy savings similar to Title 24. The Medical Center at Mission Bay is being designed to a LEED-Gold standard.

existing lines occur. Because the design of the CUP has not been completed, the specific operating characteristics of this possible facility cannot be analyzed at this time. Subsequent CEQA review would be necessary once CUP designs become available.

Mitigation: None required.

CHAPTER 6
Parnassus Heights Campus Site – Setting, Impacts and Mitigation Measures

6.0 Introduction

This chapter considers the existing conditions and describes the potential impacts of 2014 LRDP activities proposed at the Parnassus Heights campus site. The functional zones, space program, average daily population at LRDP horizon and proposed LRDP development activities that would occur at the Parnassus Heights campus site were described in detail in Section 3.8.1 of Chapter 3, *Project Description*, and are summarized briefly below. The remaining 15 major sections of this chapter present the site settings and impacts for each of the 15 environmental topics.

6.0.1 Functional Zones

The proposed functional zoning diagram for the Parnassus Heights campus site is shown in **Figure 3-8**, in Chapter 3, *Project Description*. Under the 2014 LRDP, the Housing zone would be enlarged to capture UC Hall and Proctor, which are proposed for housing, from the Instruction and Research zone (which would be reclassified as Research). The Kirkham Child Care Center would be reclassified from Housing to Support. The Environmental Health and Safety Annex on Medical Center Way and the Mechanical Annex (formerly known as Emergency Fire Water Pumphouse and Ammonia Tank) on Parnassus Avenue would be newly classified as Support. The former Campus Community and Logistical Support functional zones would be combined into a single Support zone, with a new, separate Parking zone for structured parking. The sites of the Environmental Health and Safety, Surge and Woods buildings proposed for demolition would be reclassified as Open Space and would become part of the Mount Sutro Open Space Reserve.

6.0.2 Space Program

The LRDP proposes an additional 2.39 million gsf in owned and leased buildings across all of UCSF's sites through 2035. The allocation of this growth at the Parnassus Heights campus site at LRDP horizon in 2035 is shown below in **Table 6.0-1**.

6.0.3 Average Daily Population

The total projected UCSF population across all campus sites (including population associated with the Phase 2 Medical Center at Mission Bay) would increase by approximately 17,000 at LRDP horizon. As shown in **Table 6.0-2**, below, the projected increase in average daily population at the Parnassus Heights campus site would be only 600 in 2035.

TABLE 6.0-1
PARNASSUS HEIGHTS EXISTING AND LRDP HORIZON GSF

Type of Space	Existing 2014 Total gsf	LRDP Horizon 2035 Total gsf
Instruction	318,600	280,100
Research	802,200	711,200
Clinical	950,500	1,051,300
Support		
Academic Support	217,500	215,000
Academic/Campus Admin	471,200	414,500
Campus Community	146,800	140,900
Logistics	144,700	138,800
Support Subtotal	980,200	909,200
Housing	242,000	510,900
Vacant/Alteration	8,000	6,000
Total	**3,301,500**	**3,468,700**

[1] Structured parking is not included.

TABLE 6.0-2
PARNASSUS HEIGHTS EXISTING AND PROJECTED AVERAGE DAILY POPULATION

	Existing (2013)	Projected Population at LRDP Horizon (2035)	Change
Students	3,503	4,133	630
Faculty and Staff	8,323	8,268	(55)
Patients	2,572	2,685	113
Visitors	3,549	3,462	(87)
Total	**17,947**	**18,547**	**600**

6.0.4 Parnassus Heights - 2014 LRDP Proposals

As described in Chapter 5, the 2014 LRDP proposals at the four campus sites consist of four general activities: 1) demolition, 2) renovation, 3) construction of new facilities, and 4) circulation, open space, and utilities/infrastructure proposals.

The 2014 LRDP proposals at the Parnassus Heights campus site are listed below:

Parnassus Heights - 2014 LRDP Demolition Proposals

- Surge
- Woods
- Medical Research 4
- Laboratory of Radiobiology
- Proctor
- Environmental Health and Safety

- Koret Vision Research
- Langley Porter Psychiatric Institute (and support structures)

Parnassus Heights - 2014 LRDP Renovation Proposals

- UC Hall
- Millberry Union towers
- Moffitt Hospital
- Faculty Alumni House seismic retrofit
- Fifth Avenue houses conversion to faculty housing

Parnassus Heights - 2014 LRDP Construction Proposals

- New Hospital Addition
- Faculty housing at Fifth and Parnassus avenues
- Faculty housing on Proctor site[1]

Parnassus Heights - 2014 LRDP Circulation, Open Space, and Utilities/Infrastructure Proposals

- Parnassus Avenue Streetscape Plan
- Saunders Court renovation
- Mount Sutro Open Space Reserve trails
- Medical gas storage tanks
- Diesel fuel storage tank replacement
- Retaining wall

Parnassus Heights - 2014 LRDP Proposal Construction Time Frames

Activities at the Parnassus Heights campus site to implement the 2014 LRDP proposals would occur between the year 2015 and the LRDP horizon in 2035. These are presented in **Table 6.0-3**, below. Construction is not now anticipated to occur at the Parnassus Heights campus site during the general 2020-2024 window.

1 The Proctor site may alternatively be restored to open space.

TABLE 6.0-3
PROPOSAL CONSTRUCTION TIME FRAMES AT PARNASSUS HEIGHTS

Proposal Category	Land Use	Gross Square Feet / Number of Residential Units
2015 - 2019		
Demolition	Medical Research 4	12,300 gsf
Demolition	Laboratory of Radiology	18,200 gsf
Demolition	Woods	3,900 gsf
Demolition	Surge	11,400 gsf
Renovation	UC Hall-Phase 1	74,700 gsf / 105 units
Renovation	Faculty Alumni House	7,400 gsf
Construction	Housing at Fifth and Parnassus Avenues	48,400 gsf / 45 units
Other	Parnassus Avenue Streetscape Plan-Phase 1 (PH)	--
Other	Mount Sutro Open Space Reserve trails (PH)	--
Other	Medical gas storage tanks (PH)	--
Other	Retaining wall (PH)	--
2020 -2024		
Other	Parnassus Avenue Streetscape Plan-Phase 2	--
Other	Saunders Court renovation	--
2025 -2030		
Demolition	Langley Porter Psychiatric Institute	111,100 gsf
Construction	New Hospital Addition	308,000 gsf
2031 -2035		
Demolition	Proctor	9,900 gsf
Demolition	Koret Vision Research	43,000 gsf
Demolition	Environmental Health and Safety	6,200 gsf
Renovation	UC Hall-Phase 2	68,300 gsf / 64 units
Renovation	Millberry Union towers	46,600 gsf / 83 units
Renovation	Moffitt Hospital	378,700 gsf
Construction	Proctor housing	30,400 gsf / 32 units

6.1 Aesthetics

This section considers the setting and aesthetic impacts at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential Aesthetics effects are contained in Section 4.1 of this EIR. The CEQA Significance Standards presented in Section 4.1.3 are used to evaluate the potential aesthetics impacts of all proposed 2014 LRDP activities.

6.1.1 Aesthetics Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Parnassus Heights campus site, the Initial Study concluded that:

- **Scenic vista.** The proposed New Hospital Addition would be the only activity to have a potential effect on a scenic vista. No additional analysis of this issue is required for other LRDP activities.

- **Scenic resources.** No activities would result in an adverse impact to scenic resources within a state scenic highway. Therefore, no additional analysis of this issue is required.

- **Effects on visual character or quality.** The proposed New Hospital Addition and the Parnassus Avenue Streetscape Plan would be the only activities to have potential effects on visual character or quality. No additional analysis of this issue is required for other LRDP activities.

- **Light and glare.** The proposed New Hospital Addition and the Parnassus Avenue Streetscape Plan would be the only activities to have potential effects on light and glare. Accordingly, no additional analysis of this issue is required for other LRDP activities.

- **Wind or shadow.** The proposed demolition of 8 existing buildings and construction of the New Hospital Addition would be the only activities to have potential effects regarding wind or shadow. Accordingly, no additional analysis of this issue is required for any other LRDP activity.

Finally, the Initial Study also concluded that the proposed renovations of Moffitt Hospital, UC Hall and the Millberry Union towers would result in no impact or less-than-significant impacts regarding any aesthetics issue. Therefore, no additional analysis is required for these building renovation activities.

6.1.2 Aesthetics – Parnassus Heights Setting

The Parnassus Heights campus site retains a distinct visual presence due to its design and natural character. The campus site occupies 107 acres on the northern slope of Mount Sutro, which descends over 800 feet from its summit to Parnassus Avenue and Irving and Carl Streets. Due to steep slopes, the developed portion of the campus site is mostly limited to the lower slope and shelf of Mount Sutro, with 61 acres within the Mount Sutro Open Space Reserve (Reserve). Other smaller-scale campus structures are located in the Reserve, hidden in heavily wooded areas on the slopes of Mount Sutro.

The lower campus shelf is a 33-acre area on the lower hillside of Mount Sutro along the north and south sides of Parnassus Avenue, with a visual character that is as urban and institutional. UCSF buildings extend to Irving and Carl Streets to the north. UCSF buildings are densely clustered and generally grouped by functional zone. The largest and most visually prominent buildings are on the south side of Parnassus Avenue and range in height from 7 to 16 stories. These buildings include the Medical Sciences building, the Clinical Sciences building, and Moffitt and Long Hospitals.

The slab-like facades of the Medical Sciences building and Moffitt Hospital are oriented parallel (east-west) along Parnassus Avenue and are interrupted by equally sized, adjacent wings of both buildings oriented perpendicular (north-south) to Parnassus Avenue. Projecting towers partially screen views of other large buildings behind them (e.g., Health Sciences East and West) and contrast with Mount Sutro's forested slopes to the south. At street level, small courts and open spaces at the bases of buildings, some with driveways, are visible, as are comparatively shorter buildings along Parnassus Avenue (e.g., Langley Porter Psychiatric Institute [LPPI], Clinical Sciences building and UC Hall). The presence of large buildings along the south side of Parnassus Avenue creates a solid street wall that screens views of other buildings located behind, such as the eight-story School of Nursing building located behind Clinical Sciences and UC Hall.

The Dental Clinics building is located on the western portion of the campus site, set back behind housing along Fifth Avenue. This building is a contemporary low-rise structure, with five levels stepping back from Fifth Avenue toward Koret Way to the southeast. A surface parking area is located adjacent to its south side along Kirkham Street. Immediately east of the Dental Clinics building is the Koret Vision Research building, which is a contemporary multistory building with setbacks above the second and fourth levels. To the south of these structures is the Medical Research 4 building, an oblong, two-story building oriented in the north-south direction.

The north side of Parnassus Avenue is less densely developed than the south side of the street. Building heights along the north side of Parnassus Avenue vary from nine stories (Ambulatory Care Center) to five stories (Kalmanovitz Library), gradually becoming lower (one to three stories) toward the western edge of the campus site. Parking structures are visible from Irving and Carl Streets and create a podium upon which both the Ambulatory Care Center and Millberry Union sit.

Buildings at the Parnassus Heights campus site are designed in a mix of architectural styles. However, despite variation in architectural style, the character of the buildings is visually consistent and interrelated throughout the campus site, due to the size and tight clustering of the structures.

In general, the campus site boundaries are clearly defined by the strong visual differences in building density, height and institutional character from the surrounding residential neighborhood, which generally consists of small-scale, two- to four-story, single- and multifamily homes, many exhibiting a Victorian or Edwardian architectural style. However, the UCSF campus includes some small-scale residences along Fifth Avenue and Third Avenue primarily for faculty housing. Small-scale commercial uses are intermixed throughout the neighborhood. About two blocks north of the campus site, the topography becomes more level, with a visual character dominated by trees, recreation fields and other facilities in Golden Gate Park.

6.1.3 Aesthetics – Parnassus Heights Impacts and Mitigation Measures

Impact AES-PH-1: The New Hospital Addition and faculty housing at the Proctor site and Fifth and Parnassus avenues at the Parnassus Heights campus site would not have a substantial adverse effect on a scenic vista. (Less than Significant)

The demolition of the existing LPPI building would alter the view of that area, but its loss would not adversely affect any scenic vistas of the Parnassus Heights campus site. The demolition of the LPPI building would be followed by the construction of the New Hospital Addition on that site. The New Hospital Addition would be adjacent to and visible from Parnassus Avenue, and due to the combination of the elevation of the hillside site and the height of the proposed hospital, would also be visible from a number of distant public view locations, including from Golden Gate Park to the north of the campus site. However, due to the topography of Mount Sutro and the proposed location of the new building at the LPPI site, the only scenic views that would be affected would be of the Reserve itself behind the proposed Hospital Addition. The existing LPPI building consists of the original "L"-shaped building ranging from two to six stories tall and a four-story wing addition constructed in 1959. The proposed Hospital Addition would be seven stories and about 110 feet tall. Although the hospital has not yet been designed, preliminary plans indicate that the height and bulk would be greater than the LPPI building, thus obscuring portions of some views of the Reserve on the hillside to the south as viewed from public streets and areas within Golden Gate Park. However, views of the Reserve behind LPPI from Golden Gate Park and other public areas are currently limited due to topography, existing vegetation and other buildings located in the vicinity of LPPI, including the Ambulatory Care Center and Medical Building 2. Therefore, the demolition of LPPI and construction of the New Hospital Addition at the LPPI site would not result in a substantial adverse effect on views of the Reserve and the impact would be less than significant. Besides the New Hospital Addition, other development proposed at the Parnassus Heights campus site include possible faculty housing at the Proctor site and at Fifth and Parnassus avenues. Both residential buildings would have heights anticipated not to substantially exceed heights of adjacent and nearby structures. Therefore, scenic views of the Mount Sutro Open Space Reserve (Reserve) would not be affected by these residential buildings.

Mitigation: None required.

Impact AES-PH-2: The New Hospital Addition, new faculty housing and the Parnassus Avenue Streetscape Plan at the Parnassus Heights campus site would not substantially degrade the existing visual character or quality of the site and its surroundings. (Less than Significant)

The proposed New Hospital Addition would be approximately seven stories or about 110 feet in height, excluding rooftop mechanical equipment that could add up to an additional 17 feet. The building has not yet been designed, but it is planned to be set back from Parnassus Avenue with a landscaped strip to provide a passenger drop-off/pickup, parking and loading loop that would exit directly across from Hillway Avenue. Additional loading space may be created at the back of the building. The upper portion of the building would step back from the lower portion to minimize

shading on Parnassus Avenue and to create an attractive appearance and pedestrian scale along this public street. As the eastern gateway to the Parnassus Heights campus site, the corner of the building would be designed to be architecturally prominent. The adjacent Long Hospital would be reconfigured to connect to the New Hospital Addition. A visual simulation showing basic height and bulk of the proposed building from Hill Point Avenue and Parnassus Avenue (viewpoint shown in **Figure 6.1-1**) is depicted in **Figure 6.1-2**.

As viewed in the simulation from this viewpoint, the proposed New Hospital Addition would present a larger building mass than the existing LPPI. It would be sited closer to Parnassus Avenue, generally in line with Moffitt Hospital and other buildings to the west. From this vantage point, Long Hospital would be obscured from views at the street level.

Although changes in appearance at the Parnassus Heights campus site would be noticeable, particularly along the south side of Parnassus Avenue, the New Hospital Addition would be built in accordance with UCSF's *Physical Design Framework* and *Facilities Design Guidelines* and would be consistent with the 2014 LRDP's Community Planning Principles regarding Building and Public Realm Design. The building would be sited appropriately in the campus site's Clinical functional zone. The design guidelines would ensure that the final design of the hospital responds to the form of adjacent buildings (e.g., in terms of massing and height) and the overall urban context of the Parnassus Heights campus site and surrounding neighborhood. Because the new building would be visually similar to existing uses (e.g., Moffitt and Long Hospitals) on and adjacent to the site, it would not substantially degrade the visual character of the site and its surroundings.

Further, the new building would occur in the context of the proposed Parnassus Avenue Streetscape Plan, which includes pedestrian improvements intended to make street crossings safer and more convenient, the creation of more usable outdoor space as well as visual design elements to strengthen the identity of UCSF at the Parnassus Heights campus site, and enhance the public realm. Improvements would include new paving, street furniture, lighting and street trees, sidewalk and crosswalk widening and more defined campus gateways at either end of the street as it passes through the campus site. It would also incorporate a new entrance way to align with the future New Hospital Addition. The improvements would occur in phases starting on the south side of Parnassus Avenue at the west end at Fifth Avenue, through the campus core and along the front of the New Hospital Addition to Medical Center Way.

While potential faculty housing buildings at the Proctor site and at Fifth and Parnassus avenues have not yet been designed, they would similarly be constructed in accordance with the *Physical Design Framework* and *Facilities Design Guidelines* and would be consistent with the 2014 LRDP's Community Planning Principles regarding Building and Public Realm Design.

Therefore, effects to visual quality and character with respect to the New Hospital Addition, new faculty housing and the Parnassus Avenue Streetscape Plan would be less than significant.

Mitigation: None required.

Figure 6.1-2

Visual Simulation-Parnassus Heights

Impact AES-PH-3: Construction of the New Hospital Addition and faculty housing buildings at the Parnassus Heights campus site could result in flood lighting on the sites during nighttime construction activities. (Potentially Significant)

Although construction operations are generally expected to take place during the day, some activities could be conducted at night to reduce noise, vibration or other effects on daytime office or research uses. To enable construction at night, flood lighting would be required. The use of night lighting would have the potential to disturb residents in neighborhoods near the hospital and faculty housing construction sites, and potentially also affect nighttime views. Night lighting of construction sites would be temporary and would cease upon completion of construction. **Mitigation Measure AES-LRDP-1** would be implemented to reduce the impact of nighttime work lighting to a less-than-significant level.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-1

Significance after Mitigation: Less than Significant

Impact AES-PH-4: The New Hospital Addition and new faculty housing at the Parnassus Heights campus site could create new sources of substantial light or glare that would adversely affect day or nighttime views in the area. (Potentially Significant)

Development of the New Hospital Addition and faculty housing could increase ambient light levels due to light dispersion from new buildings. Increases in night lighting could affect nighttime views on the campus site or in the surrounding neighborhood. New light sources could include street lights, illuminated signage, exterior safety lighting and light emitted from building windows. Glare could be generated from reflective building materials. Because specific architectural features and building materials have yet to be determined, the proposed improvements have the potential to include reflective surfaces, such as metal and glass. The resultant glare could affect nearby residents, pedestrians and passing motorists. **Mitigation Measure AES-LRDP-2** would be implemented to reduce the impact to a less than significant level. By employing appropriate design standards and minimizing the quantity of reflective material used in new construction, light and glare impacts and impacts to views related to lighting could be reduced to less-than-significant levels.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-2

Significance after Mitigation: Less than Significant

Impact AES-PH-5: The demolition of 8 existing buildings, including LPPI, and construction of the New Hospital Addition at the Parnassus Heights campus site would create street-level winds that could be hazardous to pedestrians in the area. (Potentially Significant)

Winds experienced at the Parnassus Heights campus site throughout the year originate from many directions, but for the purposes of determining comfort or safety issues that might arise, it is only necessary to consider the stronger winds that occur. Data from a nearly 9-year wind record from the Bay Area Air Quality Management District's Fort Funston meteorological station provide a good basis for understanding the winds that sweep in over the west side of San Francisco. These

data show that 33% of all winds at the Fort Funston station are SW, WSW or W winds with speeds of 7 mph or faster, while nearly 12% of all winds have speeds of 15 mph or faster and come from the following directions – S, SSW, SW, WSW, W, WNW, and NW – each with roughly equal frequencies of occurrence. Strong storm winds can come from any direction, but of the 52 recorded hourly winds greater than 30 mph, only one came from the northeast, while the other 51 were from the SSW through the NNW.

In leaving the coastline and approaching the Parnassus Heights campus site, winds encounter surface roughness, in the form of building and ground surfaces, and vegetation, so they lose speed and become more turbulent. Winds approaching the Parnassus Heights campus site, regardless of initial directions will be shaped by topography. Further, the winds that approach the Parnassus Heights campus site from the SW through the NW directions will tend to flow around the north flank of Mount Sutro and would be perceived by observers on the campus site as being generally winds from the west, but still retaining much of their speed.

Given the alignment of Parnassus Avenue and the wall of high-rise buildings along its south side, these winds over the campus site will follow Parnassus Avenue or a parallel street, as well as flow south of the high-rise central core of the campus site, between the buildings and the hillside. Those winds that flow between the high-rise central core and the hillside are the higher-speed winds with enough energy to possibly be adversely re-directed to ground level.

Winds mostly from the south have to cross the high-rise street wall to reach Parnassus Avenue and would be substantially slowed in the process; these winds likely would not have enough energy remaining to be adversely re-directed. As noted above, strong winds mostly from the northeast are relatively rare. Strong winds from the northwest may have some adverse effects, as discussed below.

However, demolition of the LPPI has the potential to affect the west winds that flow on the north and south sides of the high-rise central core, because it removes the east end of the street wall. Although the LPPI is not a tall building, it still acts as a low divider in the west–to-east flow of the stronger west winds. Removing the LPPI building would enable that divided wind flow to re-connect over the present LPPI site. Given that the wind would have a wider space within which to move, this should generally slow the wind speed there. The overall effect at pedestrian-level should not be adverse, and even may act to improve wind conditions at the demolition site under the stronger west winds. This would be a less-than-significant effect.

The other nine buildings to be demolished are much smaller buildings. Typically, a building that is 50 feet tall, or less, has very little to no effect on the wind, unless the building is very wide, or it is the only structure standing on an open site. Each of the smaller buildings has a typical height of less than 50 feet and either stands within a group of other buildings or is located in the stands of trees in the Reserve. These buildings would have little to no effect on winds in the vicinity unless removal of the building would open a path for west winds to reach into a wind-sensitive area of the campus site. Since the areas that adjoin these buildings are known not to be wind sensitive, the wind effects of demolishing any or all of these nine buildings would be less-than-significant.

Overall, the wind effects of the demolition of the 8 buildings, including the LPPI, would be less-than-significant. Although there could be an indefinite amount of time between the demolition of LPPI and the construction of the New Hospital Addition, or between the demolition of the other buildings and subsequent use of the sites, the wind effects would be a less-than-significant effect.

Regardless of the design, the New Hospital Addition would be an in-fill building – filling in a gap or adding to the street wall – a factor that, in itself, typically improves pedestrian wind conditions immediately around the building.

With respect to the construction of the New Hospital Addition, since a design is not available, this analysis must consider the bulk shape alone. If the proposed design differs in shape, the results may be different. However, the bulk shape now available would have good general characteristics to allow the west wind flow across the campus site, as is described above, for the present LPPI building to merge more smoothly, although in doing so, the wind speed may increase.

The primary difference between the LPPI and the bulk design is that the bulk design concept would fill the available ground space and be tapered at the east end, which would allow the smooth merging of the separated wind flows. The bulk design's setback from Parnassus Avenue and, to a limited extent, the lower-level podium/overhang would help to deflect and keep wind above the sidewalk at the corner of Parnassus Avenue and Medical Center Way. The long, 110-foot street wall could adversely affect winds on the sidewalk under strong NW winds, which would approach and strike the face of the building at a nearly 45° angle and could be redirected down onto the sidewalk along the Parnassus Avenue frontage of the building. However, the bulk design's setback from Parnassus Avenue and its lower-level podium/overhang would all tend to deflect those winds away from Parnassus Avenue sidewalks.

To summarize, because the bulk design considered for the New Hospital Addition would be an in-fill building, because it would generally fill the space between Long Hospital, Medical Center Way and Parnassus Street, and because it would setback from Parnassus Avenue and a lower-level podium/overhang well above the sidewalk, the bulk design of the New Hospital Addition would tend to reduce wind effects of the building on Parnassus Avenue sidewalks. The resulting wind effect should be less than the wind effects of the existing LPPI building under most wind conditions. The wind impact of the bulk design New Hospital Addition should be less than significant and no further mitigation would be required[2].

Should the design shape of the New Hospital Addition change, the new design will be evaluated with respect to wind hazard, and implementation of Mitigation Measure AES-LRDP-3 would ensure that any impacts would be less than significant.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-3

Significance after Mitigation: Less than Significant

[2] Regardless of whether changes in design occur, the New Hospital Addition would be subject to further review as necessary under CEQA

6.2 Air Quality

This section considers the setting and air quality impacts of implementing the 2014 LRDP at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Air Quality are contained in Section 4.2 of this EIR, while the plan-level Air Quality impacts of the 2014 LRDP are described in Section 5.1.2. The CEQA Significance Standards presented in Section 4.2.3 are used to evaluate the potential Air Quality impacts of all proposed 2014 LRDP activities.

6.2.1 Air Quality Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Parnassus Heights campus site, the Initial Study concluded that no activities would result in objectionable odors affecting a substantial number of people. Therefore, no additional analysis of this issue is required.

6.2.2 Air Quality – Parnassus Heights Setting

6.2.2.1 Sensitive Receptors

The closest sensitive receptors to the Parnassus Heights campus site are identified in **Figure 6.2-1.** On the campus site, existing sensitive receptors consist of the Fifth Avenue housing on the western edge of the campus site as well as child care centers at Third Avenue and Parnassus Avenue and at the end of Kirkham Street. There is additional campus housing on Third Avenue between Irving Street and Parnassus Avenue as well as the corner of Parnassus Avenue and Hillway Avenue. Moffitt/Long Hospital is also a sensitive receptor. Aldea Housing is located more than 1,500 feet south of the main campus footprint, towards the top of Mount Sutro and is therefore not considered a sensitive receptor. Off-campus receptors (residences) abut the western and northern campus site boundaries while residences to the east and south are buffered by varying depths of open space.

6.2.2.2 Existing Stationary Sources of Air Pollution

The Bay Area Air Quality Management District (BAAQMD) inventory of permitted stationary sources of emissions identifies one permitted operator of stationary emissions present within or near the 1,000-foot zone of influence of the site. This is the Parnassus Heights campus site itself, which operates 20 permitted air pollution sources on the campus site. These sources, listed in **Table 6.2-1**, are primarily stationary diesel engines for back-up power generators, combustion turbines, boilers and duct burners.

6.2.2.3 Non-permitted Stationary Sources of Air Emissions

The Parnassus Heights campus site also operates fume hoods which emit TACs. These fume hood emissions do not require a permit from BAAQMD based on the operating throughput and therefore have not been assigned an existing risk value in BAAQMD databases like permitted

sources. However, UCSF maintains an inventory of chemical throughput for each campus site and has prepared health risk assessments relative to fume hood emissions and other stationary source emissions on the Parnassus Heights campus site. A 1989 health risk assessment performed for the Parnassus Heights campus site identified health risks from research and teaching (hood vents), incinerators, and ethylene oxide sterilizers. Subsequent to this study, the incinerator and all ethylene oxide sterilizers have been decommissioned at the campus site and risks from these sources are no longer relevant to this analysis. Risks associated with fume hood emissions were estimated at 4.46 in one million at the maximally exposed individual (residence on Fourth Street) (Radian, 1989).

Since that time, UCSF has implemented a series of correctional measures to reduce exposure to fume hood emissions, which are expected to markedly reduce health risk from fume hood emissions reported in 1989. The first measure was to improve the mechanical ventilation of fume hoods both with respect to increased flow rate as well as to increasing exhaust stack height and consolidating the emission points. The second measure was to reduce the volume of chemical use within hoods which are now inventoried. At present there are approximately 208 active fume hoods in operation at the Parnassus Heights campus site.

6.2.2.4 Major Roadways Contributing to Air Pollution

In the City of San Francisco, Parnassus Avenue and Seventh Avenue are arterial streets in the existing local roadway system within the 1,000-foot zone of influence that have at least 10,000 vehicles in annual average daily traffic based on the City's SF CHAMP roadway model[3]. This traffic contributes to elevated concentrations of $PM_{2.5}$, DPM, and other contaminants emitted from motor vehicles near the street level. There are no freeways within 1,000 feet. A map of Air

[3] San Francisco County Transportation Authority, Chained Activity Modeling Process version 4.3.0, Average Daily Traffic Volumes, provided to ESA August 2, 2012.

Pollution Exposure Zones that includes both stationary and roadway sources compiled by the San Francisco Department of Public Health indicates that roadways around the campus site are not substantial contributors to localized cancer risks or $PM_{2.5}$ concentrations (SFDPH, 2013).

6.2.3 Air Quality – Parnassus Heights Impacts and Mitigation Measures

Impact AIR-PH-1: Implementation of the 2014 LRDP at the Parnassus Heights campus site would result in increased emissions of criteria air pollutants during demolition and construction activities. (Potentially Significant)

Construction activities would result in emissions of criteria pollutants from the use of heavy-duty construction equipment, haul truck trips, and vehicle trips generated from construction workers traveling to and from the site. In addition, fugitive dust or PM_{10} emissions would result from excavation, trenching, and other construction activities.

There are four types of proposals at the Parnassus Heights campus site under the LRDP:

- **Demolition:** Surge, Woods, Medical Research 4, Laboratory of Radiobiology, Proctor, Environmental Health and Safety, Koret Vision Research, and the Langley Porter Psychiatric Institute (and support structures)

- **Renovation:** UC Hall, Moffitt Hospital, Millberry Union towers, and Faculty Alumni House

- **Construction:** New Hospital Addition, Proctor housing, and housing at Fifth and Parnassus Avenues

- **Open Space and Utilities:** Parnassus Avenue Streetscape Plan, Saunders Court renovation, Mount Sutro Open Space Reserve trails, medical gas storage tanks, diesel fuel storage tank replacement, and retaining wall

Emissions from demolition and construction-related activities were calculated assuming four discrete construction windows in five- to six-year increments at the Parnassus Heights campus site, as presented in **Table 6.0-3**, Proposal Construction Time Frames at Parnassus Heights, located in Section 6.0.4 of this chapter. Implementation of the Parnassus Avenue Streetscape Plan, open space, and utility projects would require less intensive construction equipment and would not be expected to contribute substantially to the emissions estimated below for building demolitions and renovations.

Demolition and construction-related emissions from each of these 2014 LRDP proposals at the Parnassus Heights campus site were calculated using the California Emissions Estimator Model (CalEEMod), assuming completion by 2020, 2030 and 2035. Phasing lengths were based on CalEEMod default estimates which are based on square footage for medical office buildings and number of dwelling units for housing. It was assumed that there would be no off-road equipment involved in the renovation of UC Hall, Millberry Union towers, Moffitt Hospital, or the Faculty

TABLE 6.2-2
AVERAGE DAILY DEMOLITION AND CONSTRUCTION-RELATED POLLUTANT EMISSIONS WITHOUT MITIGATION - PARNASSUS HEIGHTS PROPOSALS

Years	Estimated Emissions (lbs/day)			
	ROG	NO_x	Exhaust PM_{10}	Exhaust $PM_{2.5}$
2015-2019	8.91	28.80	1.82	1.68
2025-2030	13.82	13.44	0.50	0.48
2031-2035	5.29	7.46	0.16	0.15
BAAQMD Considered Construction Threshold	54	54	82	54
Potential Significant Impact?	No	No	No	No

SOURCE: ESA (Appendix E)

Alumni House and that air emissions from the renovations would be generated solely by vendor trips bringing materials and construction worker trips. Construction start dates for these 2014 LRDP proposals were assumed to be year 2030 (except for UC Hall Phase 1). All model inputs and outputs are provided in Appendix E.

Table 6.2-2 presents the average annual daily construction emissions generated by the 2014 LRDP proposals at the Parnassus Heights campus site for each of the three development windows assumed. As can be seen in Table 6.2-2, estimated average daily construction-related exhaust emissions would not exceed the thresholds for NOx, ROG, or particulate matter. Because emissions would be less than the daily thresholds, the local effect would be less than significant.

The BAAQMD approach to analysis of construction-related particulate impacts (other than exhaust PM) emphasizes implementation of effective and comprehensive dust control measures rather than detailed quantification of emissions. As indicated under Impact AIR-LRDP-4 in Section 5.2 of this EIR, the BAAQMD considers construction-related fugitive dust impacts of projects to be less than significant if a suite of recommended dust-control measures are implemented. Therefore, BAAQMD-identified Best Management Practices for control of fugitive dust are adopted Campus-wide in Section 5.2 as **Mitigation Measure AIR-LRDP-1: Best Management Practices for Controlling Particulate Emissions.** With this measure in place the construction-related fugitive dust impacts would be less than significant.

Mitigation Measure: Implement Mitigation Measure AIR-LRDP-1

Although the criteria air pollutant emissions from demolition and construction proposals at the Parnassus Height campus site would be below BAAQMD significance thresholds, **Impact AIR-LRDP-4** in Section 5.2 identifies a significant and unavoidable LRDP construction-related air quality impact resulting from emissions of criteria air pollutants when the combined construction at all campus sites is considered. In response, **Mitigation Measure AIR-LRDP-2: Architectural Coatings** and **Mitigation Measure AIR-LRDP-3: Off-Road Equipment Control Measures** were adopted Campus-wide and therefore would also apply to construction projects at the Parnassus Heights campus site.

Mitigation Measures: Implement Mitigation Measure AIR-LRDP-2 and AIR-LRDP-3

Significance after Mitigation: Less than Significant

Impact AIR-PH-2: Demolition and construction activities at the Parnassus Heights campus site under the 2014 LRDP would increase emissions of toxic air contaminants (TACs) and increase health risks for nearby residents. (Less than Significant)

2014 LRDP construction activities would produce DPM and $PM_{2.5}$ emissions due to combustion equipment such as loaders, backhoes, and cranes, as well as haul truck trips. These emissions result in elevated concentrations of DPM and $PM_{2.5}$ at nearby receptors (both new and existing residences). These elevated concentrations could lead to an increase in the risk of cancer or other health impacts. Consequently, a health risk assessment was performed to determine the extent of increased cancer risks and hazard indices at the maximally exposed receptors. The health risk assessment was based on recommended methodology of the state Office of Environmental Health Hazard Assessment and adopted by BAAQMD. The cancer risk to residential receptors assumes exposure occurs 24-hours per day for 350 days per year. Cancer risk to residential receptors is based on the exposure for the duration of the construction period. These cancer risk estimates also incorporate age sensitivity factors (ASFs). This approach provides updated calculation procedures that factor in the increased susceptibility of infants and children to carcinogens as compared to adults. For estimating cancer risks for residential receptors over a 70 year lifetime, the incorporation of the ASFs results in a cancer risk adjustment factor of 1.7. For the Parnassus Heights campus site, the closest new residential uses would be located at Millberry Union towers and UC Hall, along Parnassus Avenue. Additional existing residences are located to the north, northeast, and northwest, and Aldea Housing is located on the southern portion of the campus site. Seven schools (such as Gratton Elementary School, Haight Ashbury Community Nursery School, and Marilyn Reed Lucia Child Care) were included in the analysis as well as approximately 725 recreational receptors within the Mount Sutro Open Space Reserve (Reserve). Nearly 1,680 receptors were included in the analysis, which used the annual mass construction emissions as predicted by CalEEMod and determined annual average concentrations of DPM and $PM_{2.5}$ that were then used to calculate risk values.

A summary of the health impacts related to demolition and construction of LRDP proposals at the Parnassus Heights campus site is presented in **Table 6.2-3**.

As shown in Table 6.2-3, the maximum cancer risk for the new residence-adult and residence-child associated with the project (located at Millberry Union towers and UC Hall) would be 0.05 and 0.6 per million, respectively. The maximum cancer risk for an existing residence-adult and residence-child (located to the north, northeast, and northwest, and Aldea Housing) would be 0.03 per million and 0.3 per million, respectively. The maximum cancer risk for a school-child receptor (such as Gratton Elementary School, Haight Ashbury Community Nursery School, and Marilyn Reed Lucia Child Care) would be less than 0.02 per million. Thus, the cancer risk due to construction activities alone is less than the BAAQMD threshold of 10 per million and would be less than significant.

TABLE 6.2-3
DEMOLITION AND CONSTRUCTION-RELATED HEALTH IMPACTS
PARNASSUS HEIGHTS PROPOSALS

Receptor Type	Cancer Risk (cancers per million)	Chronic Index	Acute Index	$PM_{2.5}$ Concentration ($\mu g/m^3$)
New Residence (adult / child)	0.05 / 0.59	<0.01	<0.01	<0.01
School Children	0.02	<0.01	<0.01	<0.01
Existing Residence (adult / child)	0.03 / 0.29	<0.01	<0.01	<0.01
BAAQMD Significance Criteria	10	1	1	0.3
Significant Impact?	No	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

The chronic HI would be less than 0.1 at all receptors. Because the chronic HI would be less than the BAAQMD threshold of 1.0, the impact of all proposals would be less than significant. The acute HI would be less than 0.01 at all receptors including recreational receptors at the Reserve. The acute HI would be below the BAAQMD threshold of 1 and the impact of the proposals would be less than significant.

The maximum annual $PM_{2.5}$ concentrations would be less than 0.1 $\mu g/m^3$ for the new residences associated with the proposals, a schoolchild, and the existing residences. The construction-related annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

Impact AIR-PH-3: Operations at the Parnassus Heights campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants. (Potentially Significant)

Operation of new Parnassus Heights development under the 2014 LRDP would result in an increase in criteria air pollutant and precursor emissions, including ROG, NOx, PM_{10} and $PM_{2.5}$ from a variety of emissions sources, including onsite area sources (e.g., natural gas combustion for space and water heating, landscape maintenance, use of consumer products such as hairsprays, deodorants, cleaning products, etc.) and mobile on-road sources. Operational emissions of criteria pollutants were estimated using the CalEEMod version 2013.2.2 emissions inventory model. All model inputs and outputs are provided in Appendix E.

One of the sources of operational emissions would be increased vehicle emissions from sources such as additional staff, patients, visitors and residents. Traffic volumes used to estimate vehicle-related emissions were derived from the Transportation Demand Analysis prepared for the LRDP (Adavant, 2014). In total, development at the Parnassus Heights campus site would generate an estimated 405 additional daily vehicle trips. In addition to exhaust emissions, vehicles would also generate PM_{10} and $PM_{2.5}$ from entrained road dust and tire and brake wear.

Emissions would also be generated by on-site natural gas combustion, operation of landscape maintenance equipment, and maintenance application of paint and other architectural coatings.

Table 6.2-4 presents estimated operational emissions from LRDP proposals at the Parnassus Heights campus site. Without mitigation, operational emissions of NOx and ROG, PM_{10} and $PM_{2.5}$ would be less than threshold levels. Emission reductions of ozone precursors (ROG and NOx) associated with demolitions and reuse of buildings would more than offset the increases from vehicle trips and would result in a net decrease of ozone precursors.

TABLE 6.2-4
UNMITIGATED OPERATIONAL CRITERIA POLLUTANT EMISSIONS - PARNASSUS HEIGHTS PROPOSALS

Air Pollutant	Estimated Emissions (lbs/day)			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
New Development				
Mobile Sources[a]	0.80	1.31	2.17	0.60
Area Sources[a]	15.61	0.31	0.16	0.16
Natural gas combustion	1.04	9.38	0.72	0.72
Demolition Losses				
Area Sources[a]	-5.24	<0.01	<0.01	<0.01
Natural gas combustion	-0.13	-1.18	-0.09	-0.09
Renovation Losses				
Area Sources[a]	-5.58	<0.01	<0.01	<0.01
Natural gas combustion	-0.16	-1.47	-0.11	-0.11
Total	**6.34**	**8.36**	**2.85**	**1.28**
Regional Significance Threshold	54	54	82	54
Significant Impact?	No	No	No	No

[a] Mobile sources are motor vehicles and trucks. Area sources include landscape maintenance (equipment used for these activities such as gasoline-powered lawnmowers and blowers), maintenance application of paints and other interior and exterior surface coatings, and increased use of consumer products that result in emissions of ROG. Natural gas combustion is for space and water heating.

SOURCE: ESA, 2014 (see Appendix E).

Although estimated emissions at the Parnassus Heights campus site would be less than the daily thresholds, **Impact AIR-LRDP-5** in Section 5.2 identifies a significant and unavoidable operational air quality impact resulting from emissions of criteria air pollutants when LRDP operations at all campus sites are considered. In response, **Mitigation Measure AIR-LRDP-4: BAAQMD-Suggested Operational Measures** was adopted Campus-wide and therefore would also apply to operation of projects at the Parnassus Heights campus site.

Mitigation Measure: Implement Mitigation Measure AIR-LRDP-4

Significance after Mitigation: Less than Significant

Impact AIR-PH-4: Operations at the Parnassus Heights campus site under the 2014 LRDP would expose persons (new receptors) to substantial levels of TACs, which may lead to adverse health effects. (Less than Significant)

As described in Section 5.1.2, the method for determining health risk requires the review of health risk from permitted sources and major roadways in the vicinity of a project (i.e., within a 1,000-foot radius of the source), then adding the project impacts to determine whether the health risk thresholds for new receptors are exceeded.

BAAQMD has developed a geo-referenced database of permitted emissions sources throughout the San Francisco Bay Area, and has developed the Stationary Source Risk & Hazard Analysis Tool (dated May 2011) for estimating cumulative health risks from permitted sources. Eight permitted sources are located within 1,000 feet of new residences associated with the 2014 LRDP and included in the cumulative analysis.

BAAQMD has also developed a geo-referenced database of major roadways throughout the San Francisco Bay Area and has developed the *Highway Screening Analysis Tool (*dated May 2011*)* for estimating cumulative health risks from roadways.

BAAQMD *CEQA Air Quality Guidelines* also require the inclusion of surface streets within 1,000 feet of the project with annual average daily traffic (AADT) of 10,000 or greater[4]. Upon review the health impacts from Parnassus Avenue with 11,700 AADT was included for the Parnassus Heights campus site.

Fume hood emissions also contribute to exposure of TACs. As discussed in the setting section, previous health risk assessments for fume hood emissions on the campus site estimated the increased cancer risk at the maximally exposed receptor to be 4.46 in one million (Radian, 1989). Because of the substantial subsequent reduction in chemical use due to microchemistry techniques implemented and improved ventilation systems, current risks are expected to be markedly lower than this 1989 estimate, which is overly conservative. Proposed new residential uses at Fifth and Parnassus Avenues and the Proctor site are located in the same general area as the hypothetical maximally exposed individual of the 1989 study.

A summary of the cumulative health impacts for the new residences proposed at the Parnassus Heights campus site is found in **Table 6.2-5**. Notably, for individual projects/new receptors, the threshold of significance is based on the source with the highest cancer risk, $PM_{2.5}$ concentration, or hazard in comparison to other sources within the 1,000-foot radius of the receptor.[5]

The health impacts from nearby sources in the area would affect new residents associated with the Parnassus Heights campus site. The highest cancer risk from any of the nearby sources would be 4.6 cancer cases per million. Thus, the cancer risk for new receptors is below the BAAQMD threshold of 10 cancer cases per million for a single source and would be less than significant.

TABLE 6.2-5
HEALTH IMPACTS FOR NEW RECEPTORS - PARNASSUS HEIGHTS PROPOSALS

Site #	Facility Type	Address/Source	Cancer Risk (cases per million persons)	Hazard Index	$PM_{2.5}$ Concentration ($\mu g/m^3$)
2479	UCSF / Parnassus[a]	3rd Avenue / Parnassus	4.59[a]	<0.01	0.01
		Roadway Risks - Parnassus Avenue	0.90	<0.01	0.09
		Fume hood emissions	4.46	0.12	<0.01
		Demolition and Construction (adult / child)	0.05 / 0.59	<0.01	<0.01
		Highest Single Source Impact	4.59	<0.01	0.09
		BAAQMD Significance Criteria (new receptor)	10	1	0.3
		Potentially Significant Impact?	No	No	No

[a] UCSF risks presented here were provided by BAAQMD in response to a stationary source inquiry form request and are refined values derived from a screening health risk assessment at an approximated 500 foot distance from the central utility plant area.

SOURCE: KB Environmental Sciences, Inc., 2014.

The highest hazard index from nearby sources would be less than 0.2, which is below the BAAQMD threshold of 1.0. The impact on the proposed residences at the Parnassus Heights campus site would therefore be less than significant. The highest annual $PM_{2.5}$ concentrations would be 0.09 $\mu g/m^3$ as a result of roadway traffic on Parnassus Avenue. This $PM_{2.5}$ concentration at new residences would be below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

Impact AIR-PH-5: Operations at the Parnassus Heights campus site under the 2014 LRDP would cumulatively expose persons (existing and new receptors) to substantial levels of TACs, which may lead to adverse health effects. (Less than Significant)

As described in Section 5.1.2, the method for determining health risk requires the review of health risk from permitted sources and major roadways in the vicinity of a project (i.e., within a 1,000-foot radius of the source), then adding the project risk to determine whether the cumulative health risk thresholds are exceeded. A summary of the cumulative health impacts for the existing residences for the Parnassus Heights campus site is found in **Table 6.2-6**.

The health impacts from construction and operations plus other sources (permitted sources and roadways) in the area would have a cumulative effect on nearby residence receptors. The maximum cumulative cancer risk for existing residence would be 9.98 per million and 13.36 per million for residence-adult and residence-child, respectively. Thus, the cumulative cancer risk is below the BAAQMD threshold of 100 per million and would be less than significant.

TABLE 6.2-6
CUMULATIVE HEALTH IMPACTS - PARNASSUS HEIGHTS

Site #	Facility Type	Address/Source	Cancer Risk (cancer cases per million persons)	Chronic Hazard Index	$PM_{2.5}$ Concentration ($\mu g/m^3$)
2479	UCSF / Parnassus[a]	3rd Avenue / Parnassus	4.59	<0.01	0.01
		Parnassus Avenue	0.90	<0.01	0.09
		Fume Hood Emissions	4.46	0.12	<0.01
		Proposed Project (adult / child)	0.03 / 0.29	<0.01	<0.01
		Demolition and Construction (adult / child)	0.05 / 0.59	<0.01	<0.01
		Grand Total (adult / child)	**10.03 / 13.95**	**0.15**	**0.11**
		BAAQMD Cumulative Significance Criteria	100	10	0.8
		Significant Cumulative Impact?	No	No	No

[a] UCSF risks presented here were provided by BAAQMD in response to a stationary source inquiry form request and are refined values derived from a screening health risk assessment at an approximated 500 foot distance from the central utility plant area.

SOURCE: KB Environmental Sciences, Inc., 2014.

The cumulative hazard index would be less than 1. This HI would be well below the BAAQMD threshold of 10 and the impact of the project would therefore be less than significant. The maximum cumulative annual $PM_{2.5}$ concentrations would be 0.1 $\mu g/m^3$, which is below the BAAQMD threshold of 0.8 $\mu g/m^3$, and hence would be considered less than significant.

Mitigation: None required.

6.3 Biological Resources

This section considers the setting and biological resources impacts of implementation of the 2014 LRDP at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Biological Resources are contained in Section 4.3 of this EIR. The CEQA Significance Standards presented in Section 4.3.3 are used to evaluate the potential impacts to biological resources of all proposed 2014 LRDP activities.

6.3.1 Biological Resources Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Parnassus Heights campus site, the Initial Study concluded that:

- **Special status species.** The proposed renovations of UC Hall, Moffitt Hospital and the Millberry Union towers would not result in any potential adverse effect, either directly or indirectly through habitat modifications, on special-status species. No additional analysis of this issue is required for these proposals.

- **Riparian habitat.** No 2014 LRDP proposals would result in an adverse impact to any riparian habitat. Therefore, no additional analysis of this issue is required.

- **Wetlands.** No 2014 LRDP proposals would result in an adverse impact to any federally protected wetlands. Therefore, no additional analysis of this issue is required.

- **Wildlife Movement.** The proposed renovations of UC Hall, Moffitt Hospital and the Millberry Union towers would not result in any impacts to established native resident or migratory wildlife corridors. No additional analysis of this issue is required for these proposals.

- **Policies.** No 2014 LRDP proposals would conflict with any applicable policies protecting biological resources. Therefore, no additional analysis of this issue is required.

- **Conservation plans.** No 2014 LRDP proposals would conflict with any applicable habitat conservation plan. Therefore, no additional analysis of this issue is required.

- **Tree protection.** No 2014 LRDP proposals would result in an adverse impact to heritage or landmark trees. Therefore, no additional analysis of this issue is required.

6.3.2 Biological Resources – Parnassus Heights Setting

Parnassus Heights is located on 107 acres of land near the geographical center of San Francisco. Parnassus Heights is bounded by Carl and Irving Streets to the north, Fifth Avenue to the west and Clarendon Avenue, Christopher Drive and Crestmont Drive to the south. The eastern boundary is bordered by the Cole Valley neighborhood and the City's Interior Greenbelt Natural Area. UCSF's facilities are concentrated at the north end of the campus site where Moffitt Long Hospital, the four schools, clinics, research, auxiliary services, housing, parking and other support uses are located.

The 61-acre Mount Sutro Open Space Reserve (Reserve) occupies the central and southern portion of the campus site and is designated by the Regents as permanent open space. Vegetation within the Reserve is dominated by non-native tree species including blue gum eucalyptus (*Eucalyptus globulus*), Monterey cypress (*Cupressus macrocarpa*), and Blackwood acacia (*Acacia melanoxylon*), with an understory of pittosporum (*Pittosporum* sp.), English ivy (*Hedra helix*), German ivy (*Delairea oderata*), garden nasturtium (*Tropaeolum majus*), Himalayan blackberry (*Rubus armeniacus*). Some native species that occur within the Reserve as a result of restoration efforts include California sagebrush (*Artemesia californica*), sticky monkey flower (*Mimulus aurantiavus*), mugwort (*Artemesia douglasii*), yellow bush lupine (*Lupinus arboreus*), and coyote brush (*Baccharis pilularis*). Other native species found in understory patches throughout the Reserve include California blackberry (*Rubus ursinus*), western sword fern (*Polystichum munitum*), and honeysuckle vine (*Lonicera hispidula*).

6.3.3 Biological Resources – Parnassus Heights Impacts and Mitigation Measures

Impact BIO-PH-1: Demolition and construction activities at the Parnassus Heights campus site could have a substantial adverse effect, either directly or through habitat modifications, on species identified as candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. (Potentially Significant)

The following 2014 LRDP proposals could have potentially significant adverse impacts on special-status wildlife and plant species that are known to occur or have a moderate or high potential to occur within or adjacent to the project sites. Suitable habitat that may support special-status plants, wintering aggregations of monarch butterflies, nesting and migratory birds, and special-status bats occurs within the Reserve, and within the vicinity of the proposal sites. Implementation of the mitigation measures described below would reduce potential impacts on special-status plant and wildlife species to a less-than-significant level by avoiding disturbance to special-status plants, wintering monarch butterflies, nesting birds, and roosting bats through seasonal work limits or restrictive buffers around plant populations, wintering sites, active nests, and roosts.

Demolish Existing Buildings

Under the 2014 LRDP, 8 buildings are proposed for demolition on the Parnassus Heights campus site: Surge, Woods, Medical Research 4, Laboratory of Radiobiology, Proctor, Environmental Health and Safety, Koret Vision Research, Langley Porter Psychiatric Institute (LPPI) and three small support buildings. These buildings are located on the northern portion of the Reserve and many of them abut suitable habitat for special-status wildlife inhabiting the Reserve. Following demolition of the Surge, Woods, and Environmental Health and Safety buildings these areas will be restored to open space and incorporated into the Reserve with the exception of existing parking areas. The process of demolishing buildings has the potential to adversely impact special-status wildlife species in surrounding habitat. Once the buildings are demolished and the construction debris is removed, that potential no longer exists.

Construct New Hospital Addition

Following demolition of the LPPI and three support buildings, an addition to the existing Long Hospital will be constructed in the footprints of the former LPPI and support buildings. Construction would take approximately four years. The New Hospital Addition would be located adjacent to the Reserve, which provides suitable habitat for special-status wildlife. The process of constructing the New Hospital Addition has the potential to adversely impact special-status wildlife species inhabiting the Reserve forest through increased noise and visual disturbance during building construction.

Open Space and Utilities

Mount Sutro Open Space Reserve Trails

The 2014 LRDP includes plans to construct three new trails within the Reserve, originally proposed as part of the Mount Sutro Management project, to enhance and improve access for visitors. The proposed trail alignments are approximate, but would generally follow: 1) a trail on the north side of the Reserve connecting the Historic Trail to the campus, allowing for ease of access to/from the campus (Sunset Trail). This trail would begin near the Koret Vision Research building and connect with Medical Center Way before continuing to the Historic Trail; 2) a trail connecting the South Ridge and Quarry Road Trails to Christopher Drive, allowing for easier public access from the south side of the Reserve (Christopher Trail); and 3) an extension of this trail to Clarendon Avenue, which also would provide access to trails in the Interior Greenbelt (on City-owned land) located southeast of the Reserve (Clarendon Trail). Vegetation removal, ground disturbance, and the use of heavy equipment during grading of the trails has the potential to adversely impact special-status plant and wildlife species within the immediate alignment of the new trails as well as within the surrounding habitat.

Medical Gas and Diesel Fuel Storage Tanks

Medical gas storage tanks, diesel fuel storage tanks, and the transmission lines connecting the tanks to Long Hospital are present beneath Medical Center Way. Under the 2014 LRDP the medical gas tanks will be relocated and expanded. The diesel tanks and transmission lines will also be replaced and brought up to code in their current location. Due to the location of Medical Center Way adjacent to the Reserve, special-status wildlife species could be adversely impacted by the increased noise and visual disturbance associated with these activities.

Retaining Wall

Landslides have occurred along the northern slope of the Reserve just south of the Dolby Regeneration Medicine Building. Construction of a retaining wall at this location would stabilize the hillside to prevent future landslides. Vegetation removal and ground disturbance, as well as required excavation and the use of heavy equipment during construction of the retaining wall has the potential to adversely impact special-status plant and wildlife species within the project footprint and in surrounding habitat.

Impacts to Monarch Butterflies

Demolition and building proposals described above could adversely impact overwintering aggregations of monarch butterflies, if present. Mature stands of eucalyptus within the Reserve

and in the vicinity of the retaining wall, new trails and buildings to be demolished provide suitable roosting conditions for wintering monarch butterflies. Disturbing active monarch roosts during the wintering season (October 1 – February 28) would be considered a significant impact. Implementing **Mitigation Measure BIO-PH-1a**, Preconstruction Surveys for Monarch Butterfly Winter Roosts and Avoidance, would reduce potential impacts on monarch butterflies to a less-than-significant level by requiring preconstruction surveys and implementing avoidance measures if active roosts are located.

Mitigation Measure BIO-PH-1a: Preconstruction Surveys for Monarch Butterfly Winter Roosts and Avoidance.

Prior to demolition activities, a qualified biologist familiar with monarch butterfly aggregating behavior and habitat shall conduct a preconstruction survey for the presence of overwintering monarch butterfly aggregations. The survey shall be conducted in December or January during the period when overwintering aggregations appear. Should an overwintering aggregation be identified in trees adjacent to individual proposal sites within the Reserve, a 200-foot buffer shall be established around the occupied trees until the aggregation has dispersed.

Significance after Mitigation: Less than Significant

Impacts to Special-Status and Migratory Birds

Demolition and building proposals described above, especially activities that involve heavy machinery, may adversely impact nesting bird species within 1/4-mile of project sites within and adjacent to the Reserve should they occur during the nesting season (February 15 – August 15). Migratory and native raptor and passerine bird species are known to stopover, forage, and/or nest in the mature non-native forest of the Reserve and on buildings to be demolished or renovated under the 2014 LRDP and within the Parnassus Heights campus site. Adverse effects associated with increased noise and visual disturbance during construction and demolition activities could affect nesting efforts at and around the project sites. The loss of an active nest would be considered a significant impact under CEQA. Moreover, disruption of nesting migratory or native birds is not permitted under the federal MBTA or the California Fish and Game Code, as it could constitute unauthorized take. Thus, the loss of any active nest by, for example, removing a tree or shrub or demolishing a structure containing an active nest, must be avoided under federal and California law. Implementing **Mitigation Measures BIO-PH-1b**, Preconstruction Breeding Bird Surveys and Nest Avoidance, would reduce potential impacts on migratory and special-status birds to a less-than-significant level by requiring preconstruction surveys and implementing avoidance measures if active nests are located.

Mitigation Measure BIO-PH-1b: Preconstruction Breeding Bird Surveys and Nest Avoidance.

Should construction activities associated with the new retaining wall, new trails, demolition of buildings, relocation, expansion, and replacement of the medical gas and diesel fuel tank storage, and construction of the new hospital addition within the Parnassus Heights campus site, commence during breeding bird season (February 15 – August 15) annually, UCSF shall retain a qualified biologist to conduct preconstruction nesting bird surveys in surrounding

habitat for nesting birds. UCSF shall implement specific measures to avoid and minimize impacts on nesting birds including, but not limited to, those described below.

- To avoid and minimize potential impacts on nesting raptors and other birds, preconstruction surveys shall be performed not more than two weeks prior to initiating vegetation removal and/or construction and demolition activities during the breeding season (i.e., February 15 through August 15).
- To avoid and minimize potential impacts on nesting raptors and other birds, a no-disturbance buffer zone shall be established around active nests during the breeding season until the young have fledged and are self-sufficient, when no further mitigation would be required. Typically, the size of individual buffers ranges from a minimum of 250 feet for raptors to a minimum of 50 feet for other birds but can be adjusted based on an evaluation of the site by a qualified biologist in cooperation with the USFWS and/or CDFW.
- Birds that establish nests after construction starts are assumed to be habituated to and tolerant of the indirect adverse impacts resulting from construction noise and human activity. However, direct take of nests, eggs, and nestlings is still prohibited and an appropriate buffer shall be established around the nest according to species and proximity to project activities in order to avoid nest abandonment or destruction, as determined by a qualified biologist.
- If construction or demolition activities ceases for a period of more than two weeks, or vegetation removal is required after a period of more than two weeks has elapsed from the preconstruction surveys, then new nesting bird surveys shall be conducted.

Significance after Mitigation: Less than Significant

Impacts to Special-Status Bats

Demolition and building proposals described above, especially activities that involve heavy machinery, could adversely impact special-status bats roosting within or adjacent to project sites within the Reserve forest. Bats hibernating or with an active maternity roost in trees on the perimeter of the Reserve forest adjacent to 2014 LRDP activities within the Parnassus Heights campus site could be disturbed by construction and demolition activities. Activities that could cause female bats to abandon pups could result in direct mortality of special-status bats at maternity roosts. This would be considered a significant impact. Potential impacts on special-status bats would be reduced to a less-than-significant level by **Mitigation Measure BIO-PH-1c**, Avoidance and Minimization Measures for Special-Status Bats, requiring preconstruction surveys and seasonal avoidance measures if active roosts are detected.

Mitigation Measure BIO-PH-1c: Avoidance and Minimization Measures for Special-Status Bats.

A qualified wildlife biologist shall conduct preconstruction special-status bat surveys of suitable roost sites in the vicinity of construction and demolition sites that abut the forest of Mount Sutro Open Space Reserve. If active day or night roosts are found, the wildlife biologist shall take actions to make such roosts unsuitable habitat before construction and demolition activities begin. A no-disturbance buffer of 100 feet shall be created around active bat roosts being used for maternity or hibernation purposes. Bat roosts that are

established during active construction or demolition are presumed to be unaffected by these activities, and no buffer would be necessary.

Significance after Mitigation: Less than Significant

Impacts to Special-Status Plants

Construction of new trails and the retaining wall within the Reserve could adversely impact special-status plants, if present, within the footprint of these project sites. Coastal triquetrella and San Francisco gumplant have the potential to occur in suitable habitat within the Reserve. Vegetation clearing and ground disturbance associated with construction of the retaining wall and new trails within the Reserve could result in direct loss of special-status plants or loss of the vegetation communities which support these species, which would be a significant impact. Implementing **Mitigation Measure BIO-PH-1d**, Preconstruction Surveys for Special-Status Plants and Plant Avoidance and **Mitigation Measure BIO-PH-1e**, Relocation of Special-Status Plants, would reduce the potential impacts on special-status plants to a less-than-significant level by requiring preconstruction surveys and requiring avoidance and relocation measures should special-status plants be found.

Mitigation Measure BIO-PH-1d: Preconstruction Surveys for Special-Status Plants and Plant Avoidance.

Prior to construction activities, a qualified botanist shall conduct preconstruction surveys for special-status plants, coastal triquetrella and San Francisco gumplant, within the footprints of and in suitable habitat adjacent to locations of the new retaining wall, new trail alignments, and any access routes and staging areas to be used in support of these projects. Surveys for coastal triquetrella can be conducted at any time of the year however surveys for San Francisco gumplant shall occur in the summer (June – September). Should special-status plant species be found during surveys, occurrences shall be marked in the field for avoidance during construction.

Mitigation Measure BIO-PH-1e: Relocation of Special-Status Plants.

If special-status plants are located within the retaining wall or new trails footprint and cannot be avoided, then a rare plant salvage and relocation plan shall be developed to relocate individuals to suitable habitat within the Reserve. A qualified botanist shall develop and implement the plan according to CDFW guidelines and in coordination with CDFW. At a minimum, the plan shall include collection of reproductive structures from affected plants, a full description of microhabitat conditions necessary for each affected species, seed germination requirements, restoration techniques for temporarily disturbed occurrences, assessments of potential transplant and enhancement sites, success and performance criteria, and monitoring programs, as well as measures to ensure long-term population viability. The mitigation methods shall include either salvage and transplantation or collection and propagation of seeds or other vegetative material. Any plant relocation shall be done under the supervision of a qualified restoration botanist.

Significance after Mitigation: Less than Significant

Impact BIO-PH-2: Demolition and construction activities at the Parnassus Heights campus site could interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. (Potentially Significant)

The City of San Francisco and the San Francisco Bay exist along the Pacific Flyway, a main north-south travel corridor for migrating birds extending from Alaska to Patagonia. The migratory flights of different types of birds occur at different altitudes. Soaring migrants, such as hawks, usually take advantage of thermal drafts and typically migrate at 3,000 feet or less. Most passerine species migrate at night and, over land, they typically fly 1,500 feet to 2,400 feet in altitude but can also fly much lower, depending on conditions. Weather conditions often affect the migratory altitude, since birds may fly higher or lower to avoid or take advantage of prevailing winds or to avoid a cloud deck (Cornell Lab of Ornithology, 2007).

The Reserve forest provides desirable habitat for both resident and migrating birds due to its expanse of mature trees and dense understory isolated within an urban setting. 2014 LRDP proposals located within the vicinity of suitable habitat for resident and migratory birds, such as the New Hospital Addition may result in an increase of bird collisions, resulting in a significant impact.

Implementation of **Mitigation Measure BIO-LRDP-1: Bird Safe Building Treatments** would reduce potential adverse effects on resident and migrating birds to a less than significant level by requiring design features that would make buildings more visible to birds.

Mitigation Measure: Implement Mitigation Measure BIO-LRDP-1

Significance after Mitigation: Less than Significant

Many collisions are induced by artificial night lighting, particularly from large buildings, which can be especially problematic for migrating songbirds since many are nocturnal migrants (Ogden, 1996). The tendency of birds to move towards lights at night when migrating, and their reluctance to leave the sphere of light influence for hours or days once encountered (Graber, 1968), has been well documented (Ogden, 1996). Birds can become “trapped” by a light source and, disoriented, continue to fly around the source until they become exhausted and drop to the ground, where they may be killed by predators (Ogden, 1996) or die from stress or exhaustion (Reed et al., 1985). Light attraction in birds is positively related to light intensity, and studies have shown that reduction in lighting intensity and changing fixed lighting to a flashing or intermittent light system can dramatically reduce avian mortality at lighted structures (Jones and Francis, 2003). It has been suggested that structures located at key points along migratory routes may present a greater hazard than those at other locations (Ogden, 2002). Other research suggests that fatal bird collisions increase as light emissions increase, that weather often plays an important part in increasing the risk of collisions (Verheijen, 1981), and that nights with heavy cloud cover and/or precipitation (e.g. San Francisco summer fog) present the conditions most likely to result in high numbers of collisions (Ogden, 2002).

Demolition and building proposals at the Parnassus Heights campus site described above could temporarily adversely impact resident and migrating birds and bats within or moving through project

sites and the surrounding Reserve due to an increase in night lighting during demolition and construction activities in support of the 2014 LRDP proposals. Implementation of **Mitigation Measure BIO-PH-2a**, Night Lighting Minimization during Construction and **Mitigation Measure BIO-PH-2b,** Operational Night Lighting Minimization, in combination with **Mitigation Measure BIO-PH-1b**, Preconstruction Breeding Bird Surveys and Nest Avoidance, and **Mitigation Measure BIO-PH-1c**, Avoidance and Minimization Measures for Special-Status Bats, would reduce potential adverse effects associated with 2014 LRDP activities on the Parnassus Heights campus site on resident and migratory birds and bats within the Reserve to less than significant levels.

Mitigation Measure BIO-PH-2a: Night Lighting Minimization during Construction.

Construction areas set up for nighttime activity and requiring lights shall implement the following measures as long as the safety of workers is not compromised:

- All construction related lighting shall be fully shielded and focused down to ensure no significant illumination passes beyond the immediate work area. Lighting shall be positioned around the perimeter of the work area positioned toward activity and not surrounding habitat of the Reserve.
- Yellow or orange light shall be used where possible.
- Construction personnel shall reduce the amount of lighting to the minimum necessary to safely accomplish the work.
- Night construction near suitable habitat for nesting and migratory birds and bats (i.e. the Reserve forest and understory vegetation) shall be avoided during nesting season (February 15 – August 15). If night construction near these areas cannot be avoided, light shall not be allowed to shine directly into suitable habitat.
- Construction areas set-up for night time activity are subject to all of the same preconstruction surveys for nesting birds and roosting bats listed in this section, above.

Mitigation Measure BIO-PH-2b: Operational Night Lighting Minimization.

In addition to minimizing night lighting during demolition and construction of the 2014 LRDP proposals, UCSF shall similarly ensure that the design and specifications for buildings implement design elements to reduce lighting usage, change light direction, and contain light. These include, but are not limited to, the following general considerations that shall be applied wherever feasible throughout 2014 LRDP proposals within the Parnassus Heights campus site to reduce night lighting impacts on avian and bat species:

- Avoid installation of lighting in areas where not required for public safety.
- Examine and adopt alternatives to bright, all-night, floor-wide lighting when interior lights would be visible from the exterior or when exterior lights must be left on at night, including:
    - Installing motion-sensitive lighting
    - Installing task lighting
    - Installing programmable timers
    - Installing fixtures that use lower-wattage, sodium, and yellow-red spectrum lighting (if compatible with personnel safety requirements).

- Install strobe or flashing lights in place of continuously burning lights for any obstruction lighting that may be required.
- Where exterior lights are to be left on at night, install fully shielded lights to contain and direct light away from the sky.

Significance after Mitigation: Less than Significant

No other established native resident or migratory wildlife corridors or native wildlife nursery sites exist within or in the vicinity of the Parnassus Heights campus site.

6.4 Cultural Resources

This section considers the cultural resources setting and impacts of implementation of the 2014 LRDP at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Cultural Resources are contained in Section 4.4 of this EIR. The CEQA Significance Standards presented in Section 4.4.3 are used to evaluate the potential impacts to cultural resources of all proposed 2014 LRDP activities.

6.4.1 Cultural Resources Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Parnassus Heights campus site, the Initial Study concluded that:

- **Historical resources.** The proposed New Hospital Addition would not result in an adverse effect on historical resources. Therefore, no additional analysis of this issue is required for this activity.
- **Archaeological resources.** The proposed demolition of 8 existing buildings and the renovations of Moffitt Hospital, UC Hall and the Millberry Union towers would not result in an adverse effect on archaeological resources. Therefore, no additional analysis of this issue is required for these activities.
- **Paleontological resources.** The proposed demolition of 8 existing buildings and the renovations of Moffitt Hospital, UC Hall and the Millberry Union towers would not result in an adverse effect on paleontological resources. Therefore, no additional analysis of this issue is required for these activities.
- **Human remains.** The proposed demolition of 8 existing buildings and the renovations of Moffitt Hospital, UC Hall and the Millberry Union towers would not result in an adverse effect on human remains. Therefore, no additional analysis of this issue is required for these activities.

6.4.2 Cultural Resources – Parnassus Heights Setting

UCSF is historically associated with the Toland Medical College, founded in downtown San Francisco in 1863. In 1873, the Toland Medical College was acquired by and became affiliated with the University of California. The UCSF campus was established through a combination of factors, including the appropriation of $250,000 by the state legislature in 1895 to construct three buildings to house the "Affiliated Colleges" of Dentistry, Medicine, and Pharmacy. Also, in 1895, Adolph Sutro, the former mayor of San Francisco, presented the University with a gift of its first 13 acres, known as Parnassus Heights. The cornerstone for the Affiliated Colleges at the Parnassus Heights site was laid on March 27, 1897, and the University opened in October 1898.

UC Hall, known as UC Hospital when it was completed in 1917, was the first hospital building constructed on the site. Construction of additional medical facilities, academic buildings, and other

support functions continued throughout the first half of the 20th century, occurring primarily along the south side of Parnassus Avenue and eventually stretching from 3rd Avenue to Hillway Avenue. Post-war growth continued to be concentrated in areas south of Parnassus Avenue, including Moffitt Hospital and the Medical Sciences Building (1955), as well as areas north of Parnassus Avenue to Irving Street.

In the period from the 1960s to 1980s, the University refurbished a number of the aging buildings such as UC Hall, originally completed in 1917, and the Clinical Sciences Building which was originally completed in 1933. Other buildings were demolished in this period, such as the old Medical School Building – completed in 1898 and located in what is now Saunders Court between the Medical Sciences Building and the School of Nursing.

New buildings during this period included University House which opened in 1965 to be used as the Chancellor's Residence, and two glass towers behind the Medical Science and Clinical Sciences buildings called Health Science East and West, which were completed in 1966. The School of Nursing building was competed in 1972 and the Ambulatory Care Center building on the opposite side of Parnassus Avenue was completed in 1973. In 1975, UCSF occupied over 3,000,000 square feet of clinical, research and office space. Numerous new buildings were also added in the 1980s, including the new School of Dentistry building (1980), the modernized Moffitt Hospital projects (1980), the new Long Hospital (1983), and the Koret Center (1986).

6.4.2.1 Mount Sutro Open Space Reserve

The potential historical significance of the Mount Sutro Open Space Reserve (Reserve) was evaluated as a cultural landscape as part of the UCSF *Mount Sutro Management Draft EIR* (UCSF, 2013). An analysis conducted for this EIR, completed by Bradley, et al (2013), found that the Reserve is a historical resource for the purposes of CEQA and is eligible for inclusion in the California Register of Historical Resources for its association with Adolph Sutro and his development of the Sutro Forest (the period of this significance extends from 1886 when Sutro first began to plant the Sutro Forest to his death in 1898), and for its association with the history of San Francisco and the informal development of this naturalistic landscape as a recreational area and green space for the City; the period of this significance extends from 1886 when Sutro first began to plant the forest to the present (UCSF, 2013).

The character-defining features that convey its historical significance include: (1) the presence of a forest that covers the overwhelming majority of the land area and whose dominant species is eucalyptus, (2) the presence of the Historic and Fairy Gates trails as part of a consciously laid out trail system and the presence of informal or social trails which have developed over time related to land use activities and to provide connections into Mount Sutro from the surrounding neighborhoods, and (3) the natural topographic characteristics of the site including the steep terrain, the rock outcrops, Stanyan Canyon and the summit (UCSF, 2013).

No archaeological resources have been recorded within the Reserve. However two sites within the Reserve are unofficially associated with Ishi, the name given to the lone survivor of the northern California tribe of Yahi Indians, who lived and worked at the Anthropology Museum on the UCSF

Parnassus Heights campus between 1911 and 1916. One site is the large rock outcropping which creates an overhang located southeast of the Chancellor's residence. The second is a deep cave with multiple chambers that is located northwest of the Chancellor's residence. In 1998, UCSF retained an archaeologist to perform archaeological testing and excavation in the area, but no artifacts that may have been attributable to Ishi were found (Holman, 1998).

6.4.3 Cultural Resources – Parnassus Heights Impacts and Mitigation Measures

Impact CUL-PH-1: Demolition of seven buildings at the Parnassus Heights campus site would not result in a substantial adverse change in the significance of historical resources. (No Impact)

The 2014 LRDP proposes to demolish eight buildings at the Parnassus Heights campus site: the Langley Porter Psychiatric Institute (LPPI), Environmental Health and Safety, Koret Vision Research, Surge, Woods, Medical Research 4, Laboratory of Radiobiology and Proctor. The effects of demolishing seven of these buildings are discussed below. Demolition of Surge is discussed under Impact PH-CUL-2.

To comply with the seismic requirements of Senate Bill 1953, inpatient uses at Moffitt Hospital would be decommissioned and a new addition to Long Hospital would be constructed on the present site of the Langley Porter Psychiatric Institute (LPPI). LPPI is a seven-story, 107,000 gsf building that houses psychiatric inpatient and outpatient uses, as well as instruction, research and administrative space. LPPI (including three small support structures that contain an additional 4,600 gsf) is planned to be demolished prior to 2025 to allow for construction of a new Hospital Addition. LPPI, constructed in 1941, and the three small support structures, constructed between 1964 and 1979, have been determined to be ineligible for inclusion in the California Register of Historical Resources (CRHR) and the National Register of Historic Places (NRHP) (Carey, 2011). The reconnaissance-level pedestrian survey of these buildings in 2014 by ESA found they are essentially unchanged since its original evaluations, although LPPI has received a newer paint scheme within the last 10 years. These buildings are not identified on any local registers or surveys and are not considered historic resources for CEQA purposes. As such, their proposed demolition under the 2014 LRDP would have no impact on historic resources. In addition, there are no historic resources in the immediate project vicinity that could be indirectly affected by the proposed new Hospital Addition.

The two-story, 6,200 gsf Environmental Health and Safety building is located south and uphill of the Dolby Regeneration Medicine Building across Medical Center Way on the northern edge of the Reserve. The occupants would be moved into other buildings on the campus site and the building demolished before the construction of the new hospital addition. The site would be restored as open space and added to the Reserve, though the existing parking area would remain as would the adjacent Annex building. The building was constructed in 1971. It was determined to be ineligible for inclusion in the CRHR or the NRHP and is not listed on a local register. It is not considered to be a historic resource. Because this building is not considered a historic resource for CEQA purposes, its demolition would have no significant impact to historic resources.

Located behind the Dental Clinics building and UC Hall on Koret Way, the four-story Koret Vision Research building contains approximately 40,000 gsf. The Koret Vision Research building would be demolished toward the end of the LRDP horizon, after the new Hospital Addition is built and the Moffitt building is renovated and can accommodate Koret Vision Research occupants and programs. The site may be developed with parking or open space. Constructed in 1986 and designed by the San Francisco-based architectural firm, The Design Partnership, the Koret Vision Research building was named for Joseph Koret, a local philanthropist who suffered from serious vision disability. As this building would not reach the standard 50-year age threshold by the 2035 horizon year, it would not meet the minimum age requirement for potential listing in the NRHP or CRHR. In addition, research did not reveal any significant historical or architectural associations that would indicate the building would qualify for the NRHP/CRHR once it does reach sufficient age. As such, this building would not be considered a historic resource for CEQA purposes, and its demolition would not result in a significant impact to historic resources.

The 2014 LRDP proposes to demolish four small buildings: Woods, Medical Research 4, Laboratory of Radiobiology and the Proctor building. Together, these four buildings contain about 44,300 gsf. The Medical Research 4 and the Laboratory of Radiobiology buildings would be demolished by 2016; the demolition of the Woods buildings would follow within the next several years. Because the Proctor building was constructed with funds donated by the Proctor family for use by the foundation for its clinical, research and teaching functions, UCSF is obligated to provide the Proctor Foundation with comparable replacement space or funds to construct equivalent new space. Such obligations must be met before the building is vacated and demolished; therefore, demolition of the Proctor building is likely to occur toward the end of the LRDP horizon.

None of these seven buildings is potentially eligible for the CRHR or the NRHP. The Woods building site would be restored to open space and incorporated into the Reserve, though its existing parking area would remain. The Laboratory of Radiobiology and Medical Research 4 sites would be developed to provide additional surface parking and possibly new loading dock space for delivery vehicles. The Medical Research 4 site may also be developed with expanded outdoor play yard space for the nearby Kirkham Child Care Center. The Proctor building site and 735 Parnassus Avenue site, where a small building was recently removed, may be developed with housing if they are not developed as open space.

A review of these buildings in 2014 by ESA found that all of them are essentially unchanged since they were originally evaluated, with the exception of Medical Research 4, which has been repainted. As such, their current historic status would remain unchanged. The demolition of Medical Research 4, the Laboratory of Radiobiology, Woods and Proctor buildings would have no impact on historic resources.

Mitigation: None required.

Impact CUL-PH-2: Demolition of the Surge building at the Parnassus Heights campus site would result in a substantial adverse change in the significance of an historical resource. (Potentially Significant)

The Surge building, which was constructed in 1966, would likely be eligible for the CRHR and NRHP when it reaches 50 years of age in 2016. The Surge building site would be restored to open space and incorporated into the Reserve, though its existing parking area would remain. According to the evaluation of this building,

> *When it becomes 50 years old [2016], it is likely that Surge will be eligible for listing in the NRHP/CRHR under Criterion C/3 as the "work of a master" (Claude Stoller), as a work that possesses "high artistic values," and as an excellent and well-preserved example of the Second Bay Region Tradition. As demonstrated, Stoller was an important figure in the architectural community of the Bay Region Tradition. Claude Stoller was best known as a practitioner of a regional variety of modernism called the Second Bay Region Tradition. Overall, the building retains integrity displaying the character defining features of the style and possesses the aspects of design, materials, and workmanship, location, setting, feeling and association.*

Given this evaluation, and the fact that the building appears unchanged since its original evaluation, the Surge building is presumed to be a historic resource for CEQA purposes when it reaches 50 years of age in 2016. As the building is proposed to be demolished sometime after 2016, demolition would be considered a significant impact to historical resources. UCSF shall implement **Mitigation Measure CUL-LRDP-2**, which requires documentation of this resource to National Park Service's Historic American Building Survey (HABS) standards. While avoidance of demolition would reduce the impact to a less-than-significant level, the implementation of HABS photo-documentation prior to demolition would not reduce the impact to a less-than-significant level. This impact is considered significant and unavoidable.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-2

Significance after Mitigation: Significant and Unavoidable

Impact CUL-PH-3: Renovation of Moffitt Hospital, UC Hall and Millberry Union towers at the Parnassus Heights campus site would not result in a substantial adverse change in the significance of historical resources. (Less than Significant)

UC Hall

Built in 1917, UC Hall is the oldest building on the Parnassus Heights campus site. It has been determined to be potentially eligible for the CRHR and the NRHP under criteria A/1 and C/3 (Carey & Co., 2003). A review of this building by ESA in 2014 found that it is unchanged since its original evaluation, and as such, its historic status would remain unchanged. This seven-story building is in the west end of the campus site on Parnassus Avenue. It contains approximately 147,000 gsf. UC Hall was slated for demolition in the 1996 LRDP. UCSF now proposes to retain, seismically retrofit, renovate and reuse UC Hall by 2019. The top three floors would be used as housing, with up to 134 beds in 105 units. Initially, the three full floors below the housing would be used as faculty offices; these floors would be converted to housing (up to 78 beds in 64 units)

after Moffitt Hospital is decommissioned and renovated and is available for other uses including the offices displaced from these three floors of UC Hall.

In the westernmost courtyard of UC Hall, is the single-story, semicircular Toland Hall auditorium structure. Within Toland Hall are series of Depression-era murals painted by Bernard Zakhiem, a student of Diego Rivera, in 1938. These murals depict the history of medicine in California. Original skylights also remain in the auditorium, and the two surviving original interior stairwells feature marble treads and steel balustrades topped by a clear varnished wood handrail. Although UC Hall's interior has been extensively modified, Toland Hall and its corresponding murals remain intact and are considered to be a significant resource (UCSF, 2005). As described in Mitigation Measure 3.3-3 in UCSF's LRDP #2 – Hospital Replacement EIR, UCSF would have been required to remove and conserve these murals at an appropriate facility prior to the demolition of UC Hall (UCSF, 2005). This measure would no longer apply, as the proposed project would retain UC Hall, including the Zakheim Murals in Toland Hall.

UCSF retained the firm of Page & Turnbull to make preliminary recommendations regarding alterations to the exterior of UC Hall that would be consistent with the Secretary of the Interior's Standards for Rehabilitation (Page & Turnbull, 2011). Recommendations were also made regarding the preservation of the Zakheim Murals within Toland Hall. As indicated in Chapter 3, *Project Description*, UCSF would follow those recommendations to ensure that, in carrying out the renovation project, the Secretary of the Interior's Standards for Rehabilitation are met. Generally, under CEQA, projects that comply with the Secretary of the Interior's Standards are considered to have a less-than-significant impact on the environment. As UCSF intends to follow the Standards for Rehabilitation when renovating UC Hall, no significant impacts to this historic resource would occur.

UCSF completed HABS photo-documentation of UC Hall in 2005 (Page & Turnbull, 2005). Although not required as part of mitigation for the renovation for this building, this effort provides a documentary record of the building in its existing condition, and documents the significant interior and exterior features of the building.

Millberry Union

The Millberry Union towers at 500 Parnassus Avenue are currently used as office space. UCSF would convert the upper levels to student housing (the original use of the towers). Preliminary studies indicate that up to 83 studio and one-bedroom units could be provided. This conversion would occur toward the end of the LRDP horizon after Moffitt Hospital is decommissioned and renovated, so that current occupants of the Millberry Union towers could be relocated into the vacated Moffitt building. The ground floor uses of Millberry Union and the levels below, which are mostly retail with a small amount of office and outpatient space, would not change.

Built in 1955, Millberry Union was determined individually eligible for inclusion in the NRHP and CRHR (Carey, 2011). This evaluation found that the building is historically significant under NRHP/CRHR Criterion A/1 (historic events), as the first and only location on campus where students and faculty could share in social, cultural, and recreational activities. A review of this

building by ESA in 2014 found that it is unchanged since its original evaluation, and as such, its historic status would remain unchanged. Millberry Union is considered a historic resource for CEQA purposes. Renovation activities to convert the upper levels from office space back to student housing (the original use of the towers), would primarily occur on the interior of the building and would not alter the building's exterior appearance. As the building has been identified as significant for its association with historic events, and not for its architecture, the proposed interior conversion project would not alter any of the features which convey its historic significance. The building would continue to serve both students and faculty after the conversion project. As such, no significant impacts to the Millberry Union as a historic resource would occur as a result of this project. No mitigation measures would be required.

Moffitt Hospital

The decommissioned Moffitt Hospital would be renovated and reused for outpatient, hospital support and office uses. The existing circular driveway along Parnassus Avenue, which would no longer be needed for patient drop-off and pick-up, would be reused for other purposes such as commercial loading, shuttle loading or open space. Constructed in 1955 and renovated and expanded numerous times since, Moffitt Hospital has been determined ineligible for inclusion in the CRHR and the NRHP. The reconnaissance-level pedestrian survey of this building in 2014 by ESA found they are essentially unchanged since its original evaluation. This building is not identified on any local registers or surveys and is not considered historic resources for CEQA purposes. Further renovation of Moffitt Hospital under the LRDP would have no impacts to historic resources.

Mitigation: None required.

Impact CUL-PH-4: Seismic rehabilitation of the historic Faculty Alumni House could result in a significant impact to this historic structure if not completed in accordance with the Secretary of the Interior's Standards. (Potentially Significant)

The Faculty Alumni House at 745 Parnassus Avenue was built in 1915, and was determined to be eligible for listing in the California Register by Carey & Co, in 2011. As such, the Faculty Alumni House is considered a historical resource for CEQA purposes. UCSF proposes to retrofit the Faculty Alumni House to meet seismic standards. However, the retrofit plans are conceptual at this point and no details are currently available. In the absence of detailed seismic retrofit plans, it is unknown whether the project would or would not adversely affect this historic building. If not completed in a manner that complies with the Secretary of the Interior's Standards for Rehabilitation, the seismic retrofit project could have a significant adverse impact on the integrity of this historic building, which would be considered a potentially significant impact to historic resources. There are measures available which could mitigate the potential impact to a less-than-significant level, described in Mitigation Measure CUL-PH-4.

> **Mitigation Measure CUL-PH-4:** UCSF shall ensure that the proposed seismic upgrades to the Faculty Alumni House at 745 Parnassus Avenue would comply with the Secretary of the Interior's Standards for Rehabilitation. UCSF shall hire a qualified professional architectural historian to review the proposed seismic upgrade plans for compliance with

the Standards, and prepare a technical memorandum which describes any changes to the seismic design (if any) that may be needed to meet the Standards. Generally, under CEQA, projects that comply with the Secretary of the Interior's Standards are considered to have a less-than-significant impact on the environment.

Significance after Mitigation: Less than Significant

Impact CUL-PH-5: Renovation of Saunders Court at the Parnassus Heights campus site could alter the features and spaces which convey its historic significance as a cultural landscape, which could result in a substantial adverse change in the significance of historical resources. (Potentially Significant)

With the completion of the Health Sciences Instruction & Research building in 1967, the old Medical School Building was demolished. In its place Saunders Court was constructed, which forms one of the few designed open spaces on campus. Designed by renowned landscape architect Robert Royston, Saunders Court features columns from the old Medical School Building as well as the cornerstone from one of the original Affiliated Colleges buildings from 1898. It is named after John B. De C. M. Saunders (1903-1991), UCSF's first Provost (1958-1964) and first Chancellor (1964-1966).

Asymmetrical concrete stairs descend from the south and southeast sides of Saunders Court onto a large patch of grass that occupies the center of this gently sloped, square-shaped landscape. Concrete pathways with alternating panels of exposed aggregate and bands of smooth concrete define the rest of the landscape's perimeter, while buildings surround the courtyard on all four sides. Pine trees and a variety of small green shrubs create a largely monochromatic palette of foliage. A low concrete bench runs the length of the southern perimeter, while a variety of temporary/removable benches are located within the landscape as well.

Saunders Court would undergo changes to improve its functionality for general use and special events. Improvements would include an expansion of the pavement, seating and tables at the north end to accommodate more people without compromising pedestrian movement between Medical Sciences and School of Nursing buildings, a new diagonal walkway with historic information about UCSF that would cut through the center of the courtyard, conversion of part of the lawn to a different surface material, new plants and features that mitigate windy conditions and provide access for the disabled and for fire trucks. The project would also improve connectivity between Parnassus Avenue and Saunders Court through Clinical Sciences.

At the time of the survey and evaluation by Carey & Co. in 2011, Saunders Court was 43 [now 46] years old, seven [now 4] years shy of the fifty-year threshold for resources typically listed on the NRHP/CRHR. It does not appear to meet a level of exceptional importance; however it is a significant cultural landscape on the UCSF campus and may become eligible for the NRHP/CRHR under Criteria A/1 and C/3 when it reaches fifty years of age. Saunders Court is the only space on campus that embodies both the original Affiliated Colleges campus and the postwar expansion of the university. Its footprint is that of the old Medical School Building, the last of the original Affiliated Colleges buildings to be demolished, and the courtyard exists because postwar expansion of the campus resulted in dramatic alterations to campus architecture. For these

reasons, the courtyard appears to be eligible for the NRHP/CRHR under Criterion A/1. Master landscape architect Robert Royston designed the courtyard. While more research would have to be completed to determine how significant this cultural landscape is within Royston's oeuvre, it may be eligible for the NRHP/CRHR under Criterion C/3 as the work of a master architect. The cultural landscape appears to retain excellent integrity in all seven categories, having undergone few alterations since its creation.

Given that Saunders Court may become eligible for the NRHP/CRHR under Criteria A/1 and C/3 when it reaches fifty years of age in 2017, well within the LRDP horizon, this landscape is presumed to be a historic resource for CEQA purposes. Proposed renovations would not alter its historic significance under NRHP/CRHR criterion A/1, as it would continue to represent postwar expansion of the campus, as well as the former location of the original Medical Center Building, even after proposed landscape improvements. The proposed renovations may alter its historic significance under NRHP/CRHR criterion C/3, including those features or spaces designed by master landscape architect Robert Royston, if the new courtyard design is completed in a manner that is incompatible with the original design intent. For example, the proposed new diagonal walkway through the center of the courtyard, conversion of part of the lawn to a different surface material, and new plantings, may not be compatible with Royston's original design intent for the courtyard. As such, renovation activities could have a significant impact on Saunders Court as a significant cultural landscape.

> **Mitigation Measure CUL-PH-5:** Prior to undertaking any further designs for the renovation of Saunders Court, UCSF shall: 1) complete additional research at the UCSF Archives and the Robert R. Royston Collection (1946-1972) at the Environmental Design Library at UC Berkeley to determine the relative significance of this cultural landscape within Royston's overall body of work, 2) identify the character-defining features of the landscape itself (i.e., those features which convey its historic significance), and 3), hire a professional landscape architect and/or landscape historian to design the renovation project in a manner that is respectful of, and compatible with, the character-defining features of the landscape and is consistent with the *Secretary of the Interior's Guidelines for Rehabilitating Cultural Landscapes*.
>
> **Significance after Mitigation:** Less than Significant

Impact CUL-PH-6: Construction of the New Hospital Addition at the Parnassus Heights campus site could cause substantial adverse changes to archaeological resources. (Potentially Significant)

To comply with the seismic requirements of Senate Bill 1953, a new addition to Long Hospital would be constructed on the Langley Porter Psychiatric Institute (LPPI) site. According to the project description in Chapter 3, construction would take about four years, ending by 2030. The addition would contain up to 140 beds in approximately 308,000 gsf. The New Hospital Addition would be seven stories or about 110 feet in height, excluding rooftop mechanical equipment which could add up to an additional 17 feet. The building has not yet been designed, but concept studies indicate it could be set back from Parnassus Avenue with a landscaped strip to provide a passenger drop-off/pick-up, parking and loading loop that would exit directly across from

Hillway Avenue. The upper portion of the building would step back from the lower portion to minimize shading on Parnassus Avenue and to create a more attractive appearance and better human scale when viewed from the public street. Additional loading space may be created at the back of the building. The corner of the building would be designed to be architecturally prominent as the eastern gateway to the campus site.

Previous studies and archival research conducted for the Parnassus Heights campus site have not identified archaeological resources at the site. Archaeological sites are generally located near watercourses or water bodies, and the Parnassus Heights campus site is not such a setting. Additionally, this campus site has been extensively modified over time, and the likelihood of discovering archaeological resources would thus be low.

In the unlikely event that archaeological artifacts are discovered during construction (including grading, excavation and other earthmoving activities), **Mitigation Measure CUL-LRDP-3** would be implemented to reduce the impact to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-3

Significance after Mitigation: Less than Significant

Impact CUL-PH-7: Construction of the New Hospital Addition at the Parnassus Heights campus site could cause substantial adverse changes to paleontological resources. (Potentially Significant)

Paleontology is a multidisciplinary science that combines elements of geology, biology, chemistry, and physics in an effort to understand the history of life on earth. Paleontological resources, or fossils, are the remains, imprints, or traces of once-living organisms preserved in rocks and sediments. The fossil yielding potential of a particular area is highly dependent on the geologic age and origin of the underlying rocks. In general, older sedimentary rocks (more than 10,000 years old) are considered most likely to yield vertebrate fossils of scientific interest. Review of geological maps and previous analysis suggests that there no unique paleontological resources or unique geologic features at the Parnassus Heights campus site, which is underlain by dune sands. In the event that paleontological resources are uncovered during the course of construction, implementation of **Mitigation Measure CUL-LRDP-3** would reduce impacts to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-3

Significance after Mitigation: Less than Significant

Impact CUL-PH-8: Construction of the New Hospital Addition at the Parnassus Heights campus site could cause substantial adverse changes to human remains. (Potentially Significant)

There are no known human remains, including those interred outside of formal cemeteries located at the Parnassus Heights campus site. In the event of an accidental discovery or recognition of

human remains during project excavation and construction, **Mitigation Measure CUL-LRDP-5** would be implemented to reduce the impact to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-5

Significance after Mitigation: Less than Significant

Impact CUL-PH-9: Infrastructure and utilities improvements proposed at the Parnassus Heights campus site, including the Parnassus Avenue Streetscape Plan, would not result in a substantial adverse change in the significance of historical resources. (Potentially Significant)

Parnassus Avenue Streetscape Plan

With the renovation of the Clinical Sciences and UC Hall buildings, and possibly new faculty housing near the Fifth and Parnassus Avenue intersection, there would be opportunities to begin implementing the proposed Parnassus Avenue Streetscape Plan. This plan calls for improvements that: make crossing the street safer and more convenient for pedestrians; reorganize and improve transit and UCSF shuttle operations; create more usable outdoor space; strengthen UCSF's identity; and enhance the public realm. Improvements would include new paving, street furniture, lighting and street trees, as well as sidewalk and crosswalk widening and more defined campus gateways at either end of the street as it passes through the campus site, incorporating the new entrance way to align with the future hospital addition. The improvements would occur in phases starting on the south side of Parnassus Avenue at the west end at Fifth Avenue, through the campus core and along the front of the Hospital Addition to Medical Center Way.

These improvements to Parnassus Avenue would have no direct or indirect impacts to historic resources facing this street, such as UC Hall and the Clinical Sciences Building, because as they would occur entirely within the existing right-of-way and would not otherwise affect these structures. The minor alteration to their setting resulting from wider crosswalks, lighting, and street trees, would not substantially alter their setting to such an extent that neither would remain eligible for listing in the NRHP or CRHR. As such, no significant impacts to historic resources would occur as a result of the Parnassus Avenue Streetscape Plan.

Utilities and Infrastructure Projects

The utilities and infrastructure projects include relocation and expansion of utility lines and replacement of medical gas and diesel fuel storage tanks in the vicinity of their current location near Medical Center Way, construction of a new retaining wall along Medical Center Way just south of the Dolby Regeneration Medicine Building, new and improved trails in the Reserve and renovation of Saunders Court.

The expansion of utility lines and replacement of medical gas and diesel fuel storage tanks at their current location near Medical Center Way would have no impact on historic architectural resources, as none are located at or near this area. Similarly, there are no historic architectural resources in or near the proposed location of the retaining wall across from the Regenerative Medicine Building. This area is currently a sloped, wooded, open space, and is part of the Reserve.

The potential impacts of adding three new trails and new switchbacks in the Reserve were reviewed as part of the Management Plan EIR for their potential to materially impair the character-defining features of Mount Sutro Cultural Landscape (UCSF, 2013). Based on this review, the trail system improvements would not demolish or materially alter in an adverse manner the physical characteristics of the Reserve that convey its historical significance and that justify its eligibility for the California Register of Historical Resources—the character-defining features consisting of a forest whose predominant species is eucalyptus, the trail system and the natural topographic characteristics. The evaluation and conclusion was made based on the following key components of the proposed Management Plan: (1) the trail system improvements would result in minimal vegetation removal; (2) the grading proposed would be limited to minor alterations in the topography in the vicinity of the trail improvements; (3) the existing trails and the three new proposed trails would remain unpaved and (4) the character-defining features, listed above, would all remain and would continue to convey the significance of the Reserve as part of the Mount Sutro Cultural Landscape. The proposed retaining wall behind the Dolby Regeneration Medicine building would similarly not result in adverse effects to the character-defining features of the Reserve. In summary, the proposed activities related to the trail system improvements and retaining wall would have a less-than-significant impact on the Reserve as a historical resource Landscape (UCSF, 2013).

The possibility for the inadvertent discovery of archaeological resources, paleontological resources or human remains, while low, cannot be discounted during construction of the proposed utilities, infrastructure and trail improvements. Implementation of **Mitigation Measures CUL-LRDP-3** through **CUL-LRDP-5** would reduce these potential impacts to a less than significant level.

Mitigation Measure: Implement Mitigation Measures CUL-LRDP-3 through CUL-LRDP-5

Significance after Mitigation: Less than Significant

6.5 Geology, Soils and Seismicity

This section considers the setting and geology, soils and seismicity impacts of implementation of the 2014 LRDP at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Geology, Soils and Seismicity are contained in Section 4.5 of this EIR. The CEQA Significance Standards presented in Section 4.5.3 are used to evaluate the potential Geology, Soils and Seismicity impacts of all proposed 2014 LRDP activities.

Those impacts that are specific to the implementation of the 2014 LRDP at the Parnassus Heights campus site are discussed below.

6.5.1 Geology, Soils and Seismicity Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Parnassus Heights campus site, the Initial Study concluded that:

- **Landslides or erosion.** The proposed renovations of Moffitt Hospital, UC Hall and the Millberry Union towers would not result in an adverse effect from landslides or substantial soil erosion. Therefore, no additional analysis of this issue is required for these activities.

- **Expansive soils.** No activities would be located on expansive soils. Therefore, no additional analysis of this issue is required.

- **Soils and wastewater disposal.** No activities would result in the installation of septic tanks or alternative wastewater disposal systems. Therefore, no additional analysis of this issue is required.

- **Structural hazards.** The proposed renovations of Moffitt Hospital, UC Hall and the Millberry Union towers would be the only activities to have potential effects regarding exposure to structural hazards in an existing building. Accordingly, no analysis of this issue is required for any other activity.

6.5.2 Geology, Soils and Seismicity – Parnassus Heights Setting

The Parnassus Heights campus site, located at elevations ranging from 375 to 425 feet above mean sea level (excluding the Mount Sutro Reserve area), slopes steeply down to the north at gradients ranging from 25 to 45 percent. Subsurface materials at the Parnassus Heights campus site consist of up to 40 feet of sandy materials and unconsolidated, compact marine sand, silt, and clay (ranging in thickness from less than 1 foot to more than 70 feet) overlying 25 to 35 feet of Franciscan chert, shale, sandstone, and greenstone.

The greenstone is generally fractured, weathered and altered to clay minerals, making it prone to landsliding. The site is within a CGS Seismic Hazard Zone for landslides (CGS, 2003) and the

City of San Francisco's Special Geologic Study Area (San Francisco Planning Department, 1997) for potential ground failure hazards caused by landsliding.

The Parnassus Heights campus site is not located within or immediately adjacent to an active fault trace and as a result is considered to have a very low potential for fault rupture. Therefore, no additional analysis related to fault rupture hazards is required.

6.5.3 Geology, Soils and Seismicity – Parnassus Heights Impacts and Mitigation Measures

There are four types of proposals at the Parnassus Heights campus site under the 2014 LRDP:

- **Demolition:** Surge, Woods, Medical Research 4, Laboratory of Radiobiology, Proctor, Environmental Health & Safety, Koret Vision Research and Langley Porter Psychiatric Institute and support structures
- **Renovation:** UC Hall, Moffitt Hospital and Millberry Union towers
- **Construction:** New Hospital Addition, Proctor housing and housing at Fifth and Parnassus Avenues
- **Open Space and Utilities:** Parnassus Avenue Streetscape Plan, Saunders Court renovation, Mount Sutro Open Space Reserve trails, medical gas storage tanks, diesel fuel storage tanks and retaining wall

As discussed in Section 5.5, the general Geology, Soils and Seismicity impacts that could occur as a result of implementing the 2014 LRDP, are:

> **Impact GEO-LRDP-1: Implementation of the 2014 LRDP could result in adverse effects to people and structures resulting from geologic hazards.**
>
> **Impact GEO-LRDP-2: Implementation of the 2014 LRDP could result in substantial soil erosion or loss of topsoil.**

Demolition activities could include disturbance to improvements that would expose underlying soils. If not managed appropriately, these soils could be subject to the effects of wind and water erosion. However, all construction activities including demolition activities would be required to adhere to best management practices that include erosion control measures.

The proposals to renovate Moffitt Hospital, UC Hall and Millberry Union Towers would be required to adhere to all applicable seismic requirements as contained in the most recent version of the California Building Code including any applicable local code requirements.

With implementation of these building code requirements, potential impacts to Geology, Soils and Seismicity that would be caused by proposed renovations of the existing UC Hall, Millberry Union Towers, and Moffitt Hospital would be less than significant.

The campus site is located in a seismically active region that could experience at least one major earthquake (Richter magnitude (M) 6.7 or higher) over the next 30 years. Strong ground shaking could occur during a moderate to severe earthquake occurring on one of the active Bay Area faults near to the campus site. Construction of the New Hospital Addition would require design, site preparation, and foundation construction in accordance with the most current version of the California Building Code or local code requirements if more stringent as well as the seismic standards of AB 1953 and the Office of Statewide Health Planning and Development (OSHPD) requirements for hospital facilities. Geotechnical review of the foundation design of the new facility would be required to adhere to the guidelines presented in *California Geological Survey – Note 48, Checklist for the Review of Engineering Geology and Seismology Reports for California Public Schools, Hospitals, and Essential Services Buildings.* Geotechnical review would also include evaluation of slope stability hazards as required by building code requirements. As a result, with implementation of these regulatory requirements any potential seismic impacts including liquefaction, landslides and other related

The proposed improvements to the streetscape of Parnassus Avenue would be relatively minor in terms of their seismic vulnerability, however they would nonetheless be subject to building code requirements, where applicable, as well as City of San Francisco Department of Public Works regulations that would ensure that proven geotechnical preparations and design would reduce potential seismic impacts to less than significant levels. In addition, implementation of required best management practices would reduce potential erosion impacts during construction.

Installation of the proposed changes to the utilities and infrastructure including the replacement of the underground storage tanks would include ground disturbing activities which could expose soils to the effects of wind and water erosion. However, all proposed construction activities would be required to adhere to best management practices that protect any exposed soils from erosion. Once construction is complete, all trenches and other areas of excavation would be covered by asphalt, concrete, or vegetated landscaping that would protect soils from the effects of erosion. In addition, utility connections to new and existing buildings are required to adhere to regulatory requirements that include measures such as flexible connections that minimize the potential for damage in the event of a substantial earthquake.

For these reasons, potential impacts to Geology, Soils and Seismicity that would be caused by the utilities and infrastructure proposals would be less than significant.

Mitigation: None required.

6.6 Greenhouse Gas Emissions

This section considers the setting and greenhouse gas emissions impacts of implementing the 2014 LRDP at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of greenhouse gas emissions are contained in Section 4.6 of this EIR. The CEQA Significance Standards presented in Section 4.6.3 are used to evaluate the potential greenhouse gas emissions impacts of all proposed 2014 LRDP activities.

6.6.1 Greenhouse Gas Emissions Issues Adequately Addressed in the Initial Study

The Initial Study concluded that proposed activities at the Parnassus Heights campus site and their potential effects on greenhouse gas emissions would be evaluated in the EIR.

6.6.2 Greenhouse Gas Emissions – Parnassus Heights Setting

Greenhouse gas (GHG) emissions are generated at the Parnassus Heights campus site from a variety of sources. These include motor vehicle trips generated by uses on site, electrical and natural gas usage including natural gas usage to power turbines at the Parnassus Central Utility Plant (PCUP), water and wastewater transport (the energy used to pump water and wastewater to and from the campus site), and solid waste generation.

6.6.3 Greenhouse Gas Emissions – Parnassus Heights Impacts and Mitigation Measures

Impact GHG-PH-1: Development at the Parnassus Heights campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions. (Potentially Significant)

Construction activities would result in emissions of criteria pollutants from the use of heavy-duty construction equipment, haul truck trips, and vehicle trips generated from construction workers traveling to and from the campus site.

Construction emissions were estimated using the CalEEMod emissions model assuming renovation of UC Hall and Millberry Union towers to residential uses, demolition of 8 existing buildings, construction of Proctor housing, construction of housing at Fifth and Parnassus avenues, construction of the New Hospital Addition and renovation of Moffitt Hospital.

Demolition and construction-related emissions from development at the Parnassus Heights campus site were calculated using the California Emissions Estimator Model (CalEEMod), assuming discrete construction windows in five to six year time frames. These windows are presented in **Table 6.0-3**, Proposal Construction Time Frames at Parnassus Heights, located in

Section 6.0.4 of this chapter. Implementation of the Parnassus Avenue Streetscape Plan and utility projects would require minimal construction equipment and would not be expected to contribute substantially to the emissions estimated below for building demolitions and renovations.

Construction-related emissions from development under the 2014 LRDP were calculated using CalEEMod, assuming completion by 2019, 2030 and 2035. Phasing lengths were based on CalEEMod default estimates which are based on square footage for medical office buildings and number of dwelling units for housing. It was assumed that there would be no off-road equipment involved in the renovations of UC Hall or Milberry Union towers and that air emissions from the renovation of these buildings would be generated solely by vendor trips bringing materials and construction worker trips. All model inputs and outputs are provided in Appendix E.

Table 6.6-1 presents the annual construction-related GHG emissions generated by development under the LRDP at the Parnassus Heights campus site for each of the development windows assumed. Estimated emissions are 191 metric tons of carbon dioxide equivalent greenhouse gases (CO_2e) in 2015-2019, 470 metric tons CO_2e in 2025-2030 and 202 metric tons CO_2e in 2031-3035[6]. As discussed earlier, BAAQMD has not established a quantitative threshold relative to construction-related emissions. In lieu of any proposed or adopted thresholds relative to construction-related emissions, these emissions are considered significant unless best management practices are implemented to reduce GHG emissions during construction, as feasible. Consequently, **Mitigation Measure GHG-LRDP-1** is identified to ensure implementation of best management practices during construction.

TABLE 6.6-1
ANNUAL CONSTRUCTION-RELATED GHG EMISSIONS
WITHOUT MITIGATION - PARNASSUS HEIGHTS CAMPUS SITE

Emission Source	Emissions (metric tons CO_2e / year)			
	CO_2	CH_4	N_2O	Total CO_2e
2015-2019	191	<1	<1	191
2025-2030	469	1	<1	470
2031-2035	202	<1	<1	202
Total	**–**	**–**	**–**	**863**

NOTE: Project CO_2 emissions estimates were made using CalEEMod v.2013.2.

Mitigation Measure: Implement Mitigation Measure GHG-LRDP-1

Significance after Mitigation: Less than Significant. Implementation of Mitigation Measure GHG-LRDP-1 would ensure that UCSF and its contractors employ feasible, effective measures to reduce GHG emissions during construction activities. This mitigation measure would reduce this potential impact to less than significant.

6 Emissions were calculated assuming construction was performed in the earliest part of the 5-yerar construction window to assume worst case emission factors for construction equipment and truck trips.

Impact GHG-PH-2: Development at the Parnassus Heights campus site under the 2014 LRDP would result in an increase in operational GHG emissions. (Less than Significant)

Area, Energy, and Indirect Sources

Operational GHG emissions associated with development under the 2014 LRDP would result from electrical and natural gas usage, water and wastewater transport (the energy used to pump water and wastewater to and from the campus site), and solid waste generation. GHG emissions from electrical usage are generated when energy consumed on the site is generated by the electrical supplier, PG&E. GHG emissions from natural gas are direct emissions resulting from on-site combustion for heating and other purposes. GHG emissions from water and wastewater transport are also indirect emissions resulting from the energy required to transport water from its source, and the energy required to treat wastewater and transport it to its treated discharge point. Solid waste-related emissions are generated when the increased waste generated by the increase- in development is disposed in a landfill where it decompose, producing methane gas.[7]

GHG emissions from electrical usage, natural gas combustion, mobile transportation, water and wastewater conveyance, and solid waste were estimated using the CalEEMod model, and are presented in **Table 6.6-2**. A default GHG emissions factor for PG&E was adjusted to reflect future reductions envisioned by PG&E (PG&E, 2013) as well as to account for the portion of electrical power supplied by the Parnassus Central Utility Plant (PCUP). Based on the estimated on-campus power derived from the PCUP a composite GH emission factor of 605.78 pounds per megawatt hour was assumed for new (converted) residential uses. Electrical and natural gas emissions also assume compliance with UCSF policy to achieve a 20 percent energy reduction beyond Title 24 requirements for new (converted) residential uses. Energy and indirect sources from previous converted uses are subtracted from the total as are the GHG emissions from energy and indirect sources from demolished uses.

Energy use (electrical and natural gas) represents approximately 62% of estimated operational GHG emissions and solid waste generation represents approximately 33%. The relatively high percentage of emissions from energy is the result of the electrical intensity factor assumed by CalEEMod for hospital land uses (6.78 kWh/sf/yr for Title 24 electricity and 5.52 kWh/sf/yr for non-Title 24 electricity).

Mobile Emission Sources

One of the sources of operational emissions would be increased vehicle emissions from additional staff, patients, visitors and residents at the Parnassus Heights campus site. Traffic volumes used to estimate vehicle-related emissions were derived from the Transportation Demand Analysis prepared for the LRDP (Adavant, 2014). Development under the 2014 LRDP at the campus site would generate an estimated 405 additional daily vehicle trips. GHG emissions from motor vehicle sources were calculated using the CalEEMod. Table 6.6-2 presents the incremental mobile source GHG emissions associated with development under the 2014 LRDP at the campus site, which represent approximately 6% of the net new operational GHG emissions.

[7] CH_4 from decomposition of municipal solid waste deposited in landfills is counted as an anthropogenic (human-produced) GHG. (USEPA, 2006).

TABLE 6.6-2
ANNUAL OPERATIONAL GHG EMISSIONS
WITHOUT MITIGATION - PARNASSUS HEIGHTS CAMPUS SITE

Emission Source	Emissions (metric tons/year)			
	CO_2	CH_4	N_2O	Total CO_2e
New Development				
Area Sources	3.99	<1	<1	3.99
Energy Sources	3,176	<1	<1	3,186
Net New Mobile Sources	307	<1	<1	307
Solid Waste	706	41.7	<1	1,582
Water and Wastewater	107	1.56	<1	151
Subtotal	**4,301**	**43.8**	<1	**5,230**
Demolition Losses				
Area Sources	<1	<1	<1	<1
Energy Sources	-1,106	<1	<1	-1,111
Solid Waste	-474	-28	<1	-1,061
Water and Wastewater	-48	-57	<1	-82
Subtotal	**-1,628**	**-85**	<1	**-2,254**
Renovation Losses				
Area Sources	<1	<1	<1	<1
Energy Sources	-1,093	<1	<1	-1,094
Solid Waste	-184	-10.9		-413
Water and Wastewater	-180	-2.7	<1	-256
Subtotal	**-1,457**	**-13.6**	<1	**-1,763**
Total				**1,213**

NOTE: Columns may not total precisely due to rounding. Rows may not total precisely due to differences in global warming potential.

As shown in Table 6.6-2, the sum of both direct and indirect GHG emissions resulting from operations under the LRDP at the Parnassus Heights campus site would result in a net increase of 1,213 metric tons per year of CO_2e.[8] Applying a service population of 575 persons associated with development at the Parnassus Heights campus site (630 students and -55 new faculty and staff) results in emissions of approximately 2.1 metric tons per year of CO_2e/SP. This is below the service population threshold of 4.6 metric tons per year of CO_2e/SP. Consequently, GHG emissions associated with development under the 2014 LRDP at the Parnassus Heights campus site would be less than significant.

Mitigation: None required.

8 CO_2e in all calculations of Project impact include CO_2, CH_4 and N_2O.

6.7 Hazards and Hazardous Materials

This section considers the setting and hazards and hazardous materials impacts of implementation of the 2014 LRDP at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Hazards and Hazardous Materials are contained in Section 4.7 of this EIR. The CEQA Significance Standards presented in Section 4.7.3 are used to evaluate the potential hazards and hazardous materials impacts of all proposed 2014 LRDP activities.

6.7.1 Hazards and Hazardous Materials Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Parnassus Heights campus site, the Initial Study concluded that:

- **Safety hazards from airport operations.** No activities would result in safety hazards resulting from proximity to public or private airports. Therefore, no additional analysis of this issue is required.
- **Wildland fires.** The proposed renovations of Moffitt Hospital, UC Hall and the Millberry Union towers would not result in exposure to wildland fires. Therefore, no additional analysis of this issue is required for these activities.

However, in light of some of the controversy surrounding the Mount Sutro Open Space Reserve and wildfire protection of this open space area, the potential impact from wildfires is discussed for the Parnassus Heights campus site below.

6.7.2 Hazards and Hazardous Materials – Parnassus Heights Setting

The Parnassus Heights campus site uses include, among others, the hospital, clinical offices, and medical research which all involve the transport, storage, handling, and disposal of hazardous materials. 2014 LRDP proposals include demolition of existing buildings which could contain hazardous building materials or hazardous material contamination, renovations to existing buildings which could also disturb hazardous building materials, constructing a replacement hospital, and changes to existing utilities and infrastructure for the purposes of expansion, updating, or code requirements.

6.7.3 Hazards and Hazardous Materials – Parnassus Heights Impacts and Mitigation Measures

Impact HAZ-PH-1: Implementation of the 2014 LRDP at the Parnassus Heights campus site could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions. (Potentially Significant)

As part of the proposed plans to update and improve utilities and infrastructure throughout UCSF, the medical gas storage tanks at the Parnassus Heights campus site would be relocated and expanded. In addition, existing underground diesel fuel storage tanks in Medical Center Way and associated underground connection lines to Long Hospital require replacement to meet State and local codes. Current plans anticipate replacement of these tanks underground in the same location, or nearby. The five 30,000 gallon underground storage tanks are used to store diesel fuel in case of a major emergency such as an earthquake. In addition, since San Francisco is among the identified counties where ultramafic bedrock materials are present and have the potential for naturally occurring asbestos fibers, there is a potential that excavation work as part of the improvements could potentially encounter naturally occurring asbestos, if it is present. If present, groundbreaking activities could disturb these fibers causing them to be airborne and potentially adversely affect workers and the public. However, according to statewide mapping, the Parnassus Heights campus site appears to be located east of any mapped ultramafic bedrock units for the City of San Francisco (CDMG, 2000) or where reported asbestos occurrences have been mapped (USGS, 2011). According to a geotechnical report for the upland slope stability, the bedrock of Mount Sutro consists of Franciscan Complex bedrock (chert, greenstone and meta-sandstone and shale) (Rutherford & Cheneke, 2006).[9] Naturally occurring asbestos fibers are more associated with the mineral chrysotile commonly found in serpentinite. Regardless, considering that bedrock is relatively shallow at this campus, the **Mitigation Measure HAZ-LRDP-1** would ensure that disturbance of underlying materials would not expose workers or the public to naturally occurring asbestos, if present, for any proposed earthwork activities during construction.

The decommissioned Moffitt Hospital would be renovated and reused for outpatient, hospital support, instruction and office uses. Originally constructed in 1955, renovation efforts will include disturbing existing building materials that could potentially contain hazardous materials such as lead-based paint, asbestos containing materials, polychlorinated biphenyls (PCBs), and mercury. If not addressed appropriately, construction workers and the public could be exposed to adverse effects as a result of exposure to these hazardous building materials, if present. As described in Section 5, existing regulations are sufficient to reduce potential exposure health risks to less than significant levels. Once renovations are complete, there would be a potential increase in the use, storage, and disposal of hazardous materials including biohazardous wastes.

An addition to Long Hospital would be constructed in order to comply with the requirements of Senate Bill 1953 which address seismic safety of hospitals. The seven story addition would replace services currently offered at Moffitt Hospital and likely reduce the use, storage, and disposal of associated hazardous materials and biohazardous wastes relevant to the existing hospital services. However, all use of hazardous materials would continue to require adherence to regulatory requirements that address the storage, use, and disposal of hazardous materials in a manner that limit health risks and upset and accident conditions, as required to operate the existing hospital.

[9] Greenstone refers to any compact dark-green altered or low-grade metamorphosed basic igneous rock that owes to its green color. It is distinct from Serpentinite which is also green and can contain naturally occurring asbestos fibers.

Once proposed improvements are constructed, the use, storage, and disposal of hazardous materials including biohazardous waste and low-level radioactive waste would continue as part of operations and may expand with proposed new construction and renovation. Any expansion of hazardous materials use, storage, and disposal would continue under similar regulatory requirements as existing UCSF policies and hazardous materials management practices as largely documented within the Chemical Hygiene Plan. The Chemical Hygiene Plan is reviewed and updated on an annual basis and includes safety procedures, training requirements, personal protective equipment requirements, signage protocols, emergency response details, and disposal guidelines that is in accordance with all federal, state, local regulatory requirements.

Mitigation Measure: Implement Mitigation Measure HAZ-LRDP-1

Significance after Mitigation: Less than Significant

Impact HAZ-PH-2: Implementation of the 2014 LRDP at the Parnassus Heights campus site could result in hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or waste within one-quarter mile of existing or proposed schools. (Less than Significant)

There are no schools located within a quarter mile of the Parnassus Heights campus site although Independence High School and Grattan Elementary are located approximately 0.3 and 0.4 miles, respectively, from the campus site. Regardless, the proposed plan would not include a substantive change in emissions or handling of hazardous materials and any expansion would occur under a continued practice of adherence to federal, state, local and UCSF policies and regulatory requirements.

Mitigation: None required.

Impact HAZ-PH-3: 2014 LRDP proposals at the Parnassus Heights campus sites that are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public. (Less than Significant)

Two listings for the Parnassus Heights campus site are found on the Geotracker database maintained by the State Water Resources Control Board for releases of diesel found in subsurface soil (SWRCB, 2014a and SWRCB, 2014b). A release was documented for 315 Parnassus Avenue, an adjacent property to the Parnassus Heights campus site, and the case was subsequently closed in 1999 indicating that no further action was required. The other release (diesel fuel), on the UCSF campus at 50 Medical Center Way, was also closed in 2001. As such, despite being included on a hazardous materials sites list pursuant to Government Code Section 65962.5, there is no indication that any known threat to human health or the environment remains and the impact is considered less than significant.

Mitigation: None required.

Impact HAZ-PH-4: Implementation of the 2014 LRDP at the Parnassus Heights campus would not expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands. (Less than Significant)

According to mapping for the City of San Francisco's Hazard Mitigation Plan, the Parnassus Heights campus site, which includes the Mount Sutro Open Space Reserve, is located in an area considered to be a high to very high potential for wildfire (URS, 2008). This determination is based on expected fire behavior for unique combinations of topography and vegetative fuels under a given severe weather condition and is initially based on an assigned fuel model combined with topography. In general, the susceptibility for high and very high wildfires dramatically increases in the late summer and early autumn as vegetation dries out, decreasing plant moisture content and increasing the ratio of dead fuel to living fuel (URS, 2008).

As discussed in the Project Description (Section 3.9.1.1), under a separate process that began prior to the 2014 LRDP, UCSF proposed management activities within the Reserve which were the subject of a Draft EIR published in January 2013. Subsequently, in light of the elevated fire danger resulting from California's current drought conditions, UCSF revised its proposal to focus on reducing the danger of wildfire. It retained a professional forester with a background in firefighting to identify fire hazard reduction measures for the Reserve area. Proposed hazard reduction measures, consistent with best management practices applied throughout California in forests located near urban areas were developed and are still in review at the time of preparation for this document although some urgent protection measures were completed in September 2013. However, the goal is to reduce the fire threat and thus the final result is likely to be a plan that includes hazard reduction from current conditions to ensure future protection from wildfire hazards. The final plan, at a minimum, will include fire hazard reduction measures as recommended by the forester. Recommendations include thinning of trees and understory in targeted areas near UCSF buildings, neighboring buildings, trails, and Medical Center Way. Any changes to the management activities analyzed in the January 2013 Draft EIR would be reviewed to determine what additional environmental analysis would be needed, if any, to comply with CEQA, separate from the 2014 LRDP and EIR.

2014 LRDP activities would not substantially increase the population at the Parnassus Heights campus site, and would not increase the number of structures within the Reserve. In addition, under a planning process separate from the 2014 LRDP, UCSF is seeking to minimize the wildfire danger within the Reserve and has already completed some of the work. Therefore, the potential impact from exposure of persons or structures to wildland fires attributable to the 2014 LRDP would be less than significant.

Mitigation: None required.

6.8 Hydrology and Water Quality

This section considers the setting and hydrology and water quality impacts of implementation of the 2014 LRDP at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential Hydrology and Water Quality effects are contained in Section 4.8 of this EIR. The CEQA Significance Standards presented in Section 4.8.3 are used to evaluate potential impacts to hydrology and water of all proposed 2014 LRDP activities.

Those impacts that are specific to the implementation of the 2014 LRDP at the Parnassus Heights campus site are discussed below.

6.8.1 Hydrology and Water Quality Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Parnassus Heights campus site, the Initial Study concluded that:

- **Groundwater supplies.** No activities would result in substantial depletion of groundwater supplies or interfere substantially with groundwater recharge. Therefore, no additional analysis of this issue is required.

- **Housing or other structures within flood hazard areas.** No activities would place housing or other structures within a flood hazard area. Therefore, no additional analysis of this issue is required.

- **Exposure to flooding.** No activities would result in exposure to flooding. Therefore, no additional analysis of this issue is required.

Finally, the Initial Study also concluded that the proposed renovations of Moffitt Hospital, UC Hall, and the Millberry Union towers would result in no impact or less-than-significant impacts regarding any hydrology or water quality issue. Therefore, no additional analysis is required for these building renovation activities.

6.8.2 Hydrology and Water Quality – Parnassus Heights Setting

The Parnassus Heights campus site is the oldest and largest of the UCSF campus sites, occupying about 107 acres of land at the base of Mount Sutro in the Inner Sunset mixed-use neighborhood. UCSF's facilities are concentrated at the north end of the campus site. The Mount Sutro Open Space Reserve (Reserve) occupies the central and southern portion of the campus site, up to 400 feet in elevation above Parnassus Avenue. The Reserve occupies 61 acres of ridgeline and hillslopes adjoining the drainage divide that forms the boundary between the San Francisco Bay and Pacific Ocean watersheds in the City of San Francisco. Accordingly, stormwater runoff from the campus site ultimately drains to storm drain inlets in the headwaters of either the Channel Basin or the Sunset Basin and is conveyed east or west, respectively, in the City's Combined

Sewer System (CSS) to either the Southeast or Oceanside water treatment plants, where it is treated prior to being discharged to Central San Francisco Bay or the Pacific Ocean. Though mean annual rainfall for north central San Francisco (Richmond District gage) is 20.0 inches (Western Regional Climate Center, www.wrcc.dri.edu), local orographic influences in the uplands of Mount Sutro elevate this total to 21-22 inches in the vicinity of the Parnassus Heights campus site (NOAA, 1971).

6.8.3 Hydrology and Water Quality – Parnassus Heights Impacts and Mitigation Measures

There are four types of proposals at the Parnassus Heights campus site under the 2014 LRDP:

- **Demolition:** Surge, Woods, Medical Research 4, Laboratory of Radiobiology, Proctor, Environmental Health & Safety, Koret Vision Research and Langley Porter Psychiatric Institute and support structures
- **Renovation:** UC Hall, Moffitt Hospital, and Millberry Union towers
- **Construction:** New Hospital Addition, Proctor housing and housing at Fifth and Parnassus avenues
- **Circulation, Open Space, and Utilities/Infrastructure:** Parnassus Avenue Streetscape Plan, Saunders Court renovation, Mount Sutro Open Space Reserve trails, medical gas storage tanks, diesel fuel storage tanks and retaining wall.

LRDP proposals at the Parnassus Heights campus site (including on-site staging) would include demolition, excavation, grading, and construction activities that would require temporary disturbance of surface soils and removal of existing pavement and sub-surface structures (if present). These activities would expose soil to water runoff as well as entrainment of sediment in the runoff. If dewatering would be necessary during construction, the water would likely contain suspended sediments and would require settling before being discharged to the CSS. Sediment in runoff and deposits of soil and related debris from haul truck tires on local streets could increase the amount of sediment entering the storm drains, which could potentially clog drain inlets and reduce the flow capacity of the storm drains. The accumulation of this material could potentially result in increased localized ponding or flooding, particularly after large storm events.

The use of construction equipment as well as the delivery, handling, and storage of construction materials and waste could contaminate stormwater that could negatively impact water quality. Potential contaminants include, but are not limited to (CSW/Stuber-Stroeh, 2011):

- Petroleum hydrocarbons and metals from stockpiled soils excavated from the site
- Fuel from storage drums
- Diesel from refueling trucks
- Oils and grease from miscellaneous heavy equipment

- Sewage from portable sanitary facilities
- Sediment from construction generated waste–piles of concrete, rock and debris
- Sediment from rock crushing activities
- Hazardous materials storage-hydraulic oil, motor oil, and lubricating fluid
- Spills and releases of hydrocarbons and related pollutants from routine light maintenance activities such as fluid topping off, and welding and repairing belts and gears of heavy equipment

Polluted stormwater runoff could violate water quality standards and/or waste discharge requirements established in the NPDES General Permit for Construction and the NPDES discharge permits for the Southeast and Oceanside Treatment Plants.

In accordance with the Construction General Stormwater Permit, UCSF would be required to prepare and implement a SWPPP for each LRDP construction project to minimize water quality impacts during construction activities on the campus site. The SWPPPs will be consistent with previous SWPPPs that have been developed for past development of the Parnassus Heights campus site (e.g. management of the Mount Sutro Open Space Reserve).

The SWPPPs will identify pollutant sources within the construction area and recommend site-specific BMPs regarding control of sediments in runoff and storage and use of hazardous materials to prevent discharge of pollutants into stormwater. Likely BMPs are listed in Section 5.1.8.

In addition, each 2014 LRDP construction project will need to obtain a water quality certification from the RWQCB for the construction activities, which would also require implementation of BMPs and specific measures for the protection of water quality during construction.

Proposed development and redevelopment at the Parnassus Heights campus site would not significantly change the volumes of site stormwater runoff, nor how this runoff is directed or routed through the campus site to the CSS. The proportion of impermeable surfaces at the campus site will not significantly change as a result of 2014 LRDP activities. Measures to prevent and minimize erosion and its potential effects on storm drain siltation and water quality would be included in the SWPPP.

Implementation of SWPPPs and associated BMPs would reduce erosion and water quality impacts during demolition and construction activities to less than significant.

The Parnassus Heights campus site is at an elevation of approximately +400 ft NAVD88[10], well above the zone of inundation by a 500-year seiche or tsunami (approximately +18.5 ft NAVD88, UCSF 2013), so there is no risk of flooding by seiche or tsunami.

[10] North American Vertical Datum of 1988

Much of Mount Sutro is located in a landslide hazard area that could result in mudflows. The landslide potential is addressed in Sections 5.5 and 6.5.

The regulatory requirements discussed in Sections 4.8 and 5.8 limit the potential adverse effects of these impacts to less than significant. For these reasons, potential impacts to Hydrology and Water Quality that would be caused by the 2014 LRDP proposals at the Parnassus Heights campus site would be less than significant.

Mitigation: None required.

6.9 Land Use and Planning

This section considers the setting and land use and planning impacts of implementation of the 2014 LRDP at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Land Use and Planning are contained in Section 4.9 of this EIR. The CEQA Significance Standards presented in Section 4.9.3 are used to evaluate the potential land use impacts of all proposed 2014 LRDP activities.

6.9.1 Land Use and Planning Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Parnassus Heights campus site, the Initial Study concluded that:

- **Physically divide an established community.** No activities would physically divide an established community. Therefore, no additional analysis of this issue is required.
- **Habitat conservation plan.** No activities would result in a conflict with any applicable habitat conservation plan. Therefore, no additional analysis of this issue is required.
- **Compatibility with local land uses or zoning.** The proposed demolition of 8 existing buildings and utilities/infrastructure projects would not conflict with local land uses or zoning. Therefore, no additional analysis of this issue is required.

6.9.2 Land Use and Planning – Parnassus Heights Setting

The Parnassus Heights campus site occupies about 107 acres of land at the base of Mount Sutro in the Inner Sunset mixed-use neighborhood. The campus site is bounded by Carl and Irving Streets to the north, Fifth Avenue to the west and Clarendon Avenue, Christopher Drive and Crestmont Drive to the south. UCSF's facilities are concentrated at the north end of the campus site where Moffitt and Long Hospitals, the four schools, clinics, research, auxiliary services, housing, parking and other support uses are located. The 61-acre Mount Sutro Open Space Reserve (Reserve) occupies the central and southern portion of the campus site, rising up to 400 feet in elevation above Parnassus Avenue.

Moderate- and medium-density residential areas, predominantly with two to three dwelling units per lot, are located immediately north and west of the campus site. A neighborhood commercial district is located to the west along Irving and Judah Streets and 9th Avenue. Golden Gate Park is approximately one-quarter mile to the north. Primarily single-family dwellings in the Cole Valley/Ashbury Heights neighborhoods are adjacent to the east, and neighborhood commercial uses are located at Cole and Carl Streets. There is also some moderate-high density residential to the southwest, on Fifth and Sixth Avenues.

6.9.2.1 UCSF Functional Zones

UCSF's existing functional zones at the Parnassus Heights campus site are depicted in Chapter 3, *Project Description*, Figure 3-7. The Instruction and Research, Clinical Care and Campus

Community zones are located at the core of the campus site along Parnassus Avenue. Housing is located along Third and Fifth Avenues, as well as in the Aldea student housing complex off Clarendon Avenue (surrounded by the Reserve).

6.9.2.2 City of San Francisco Zoning

The Parnassus Heights campus site is primarily located in the City's P (Public) Zoning District. P Districts refer to land owned by a governmental agency that is in public use, including open space. Housing located along Third and Fifth Avenues is designated as Residential House District, Two-Family (RH-2). Residential house districts are intended to recognize, protect, conserve and enhance residential areas characterized by limited scale in terms of building width and height. Structures in the RH-2 District usually do not exceed 25 feet in width or 40 feet in height.

The developed areas of the campus site are located within the following Height and Bulk Districts: 25-X, 40-X, 65-D, 80-D, 130-D, and 220-F. The locations with an "X" designation permit all floors of structures to cover the entire building footprint. The "D" designation limits floor plans above 40 feet to a maximum plan length of 110 feet and a maximum diagonal plan dimension of 140 feet. The "F" designation limits floor plans above 80 feet to a maximum plan length of 110 feet and a maximum diagonal plan dimension of 140 feet.

6.9.2.3 1976 Regents' Resolution

As discussed in Section 3.8.1.1, the 1976 Regents' Resolution adopted a limit on the amount of built space of 3.55 million gsf at the Parnassus Heights campus site (with some housing excluded), commonly referred to as the "space ceiling", within the newly designated campus site boundaries. Currently, Parnassus Heights contains approximately 3.85 million gsf of space, approximately 295,000 gsf or 8.3% above the space ceiling.

The 1976 Regents' Resolution also recognized the principle of limiting the average daily population at Parnassus Heights to be substantially in accordance with the level projected in the 1976 LRDP (13,400 persons). The 1996 LRDP established a new goal to limit the average daily population to 16,000 persons. Currently, the average daily population at Parnassus Heights is estimated at 17,950 persons.

6.9.3 Land Use and Planning – Parnassus Heights Impacts and Mitigation Measures

Impact LU-PH-1: Implementation of the 2014 LRDP at the Parnassus Heights campus site would be consistent with applicable land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental effect. (Less than Significant)

Upon adoption by the Regents, the proposed 2014 LRDP will replace the 1996 LRDP, as amended, and become the applicable campus land use plan for UCSF. Pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local

land use regulation. The University is the only agency with land use jurisdiction over programs and projects proposed at UCSF campus sites by the 2014 LRDP. Therefore, all proposed activities that would be in general conformity with the 2014 LRDP would have no significant land use impacts. However, UCSF considers the land use policies and zoning regulations of the City when analyzing potential land use impacts under CEQA. The 2014 LRDP is not expected to conflict with City plans and policies adopted for the purpose of avoiding or mitigating an environmental effect. Consistency with the City's height and bulk districts is discussed below under Impacts LU-PH-2 and LU-PH-3.

The 2014 LRDP proposed functional zones are generally consistent with the existing zones on the Parnassus Heights campus site. Under the 2014 LRDP, the Housing zone would be enlarged to capture UC Hall and the Proctor site, which are proposed for housing, from the Instruction and Research zone (which would be reclassified as Research). The Kirkham Child Development Center would be reclassified from Housing to Support. The Environmental Health and Safety Annex and the pump house would be newly classified as Support. The sites of the Environmental Health and Safety, Surge and Woods buildings proposed for demolition would be reclassified as Open Space and would become part of the Reserve, except for the areas containing existing parking. The former Campus Community and Logistical Support functional zones would be combined into a single Support zone, with a new, separate Parking zone for structured parking. The functional zone changes proposed by the 2014 LRDP do not present land use conflicts with adjacent existing land uses on the campus site. Compatibility between adjacent existing and proposed functional zones was taken into consideration in developing the proposed zones in the 2014 LRDP. Existing land use patterns reflect campus development guided by the planning principles embodied in the previous LRDPs. Therefore, implementation of the 2014 LRDP would have a less-than-significant impact regarding consistency with land use plans and policies adopted for the purpose of avoiding or mitigating an environmental effect.

Mitigation: None required.

Consistency with Regents' Resolution

The 2014 LRDP UCSF is proposing that the Regents update the 1976 Regents' Resolution by modifying the way space and population are monitored at the Parnassus Heights campus site. The proposed *Regent's Resolution Regarding the Parnassus Heights Campus Site* is included in Appendix C. The 2014 LRDP proposes to exclude all residential space from the space ceiling calculation, regardless of where it is located. Aldea Housing and University House would be removed from the space ceiling calculation under this proposal. All non-residential space would continue to be included in the space ceiling calculation. The exclusion of all residential space from the space ceiling calculation, plus all of the physical proposals for the Parnassus Heights campus site described in this EIR, would decrease the amount of space subject to the space ceiling to approximately 3.61 million gsf by 2035, or approximately 60,000 gsf (1.7%) above the 3.55 million gsf space ceiling limit. Although the space ceiling would still be exceeded in 2035, the existing overage of 8.3% would be substantially reduced under the proposed update to the 1976 Regents' Resolution. The proposed amendment to the Regents' Resolution also would tie average daily population projections for the Parnassus Heights campus site to the then-current LRDP EIR, as updated from time to time and approved by the Regents. The 2014 LRDP EIR projects an average daily population for the Parnassus Heights campus site of approximately 18,600 persons in 2035, an

increase of approximately 650 persons. The 2014 LRDP would be consistent with the space and population commitments for the Parnassus Heights campus site upon adoption by the Regents of the proposed update to the 1976 Regents' Resolution and the impact would be less than significant.

Mitigation: None required.

Impact LU-PH-2: The proposed New Hospital Addition at the Parnassus Heights campus site would be compatible with adjacent land uses. (Less than Significant)

The proposed New Hospital Addition would occupy the area currently occupied by the seven-story Langley Porter Psychiatric Institute building. This area is classified as Clinical Care under the existing functional zone and this use would remain unchanged with construction of the new hospital. The site for the New Hospital Addition is largely located within the City's 65-D Height and Bulk District. This district restricts building heights to 65 feet and limits floor plans above 40 feet to a maximum plan length of 110 feet and a maximum diagonal plan dimension of 140 feet. The proposed hospital addition would be seven stories or about 110 feet in height, excluding rooftop mechanical equipment which could add up to an additional 17 feet. The building is proposed to be set back from Parnassus Avenue with a landscaped strip. The upper portion of the building would also step back from the lower portion to minimize shading on Parnassus Avenue.

Although the building has not yet been designed, the proposed height would exceed the City's height limit for this site. As noted above, the University is exempt from local zoning. However, UCSF strives to adhere to City zoning codes to the extent practicable in accordance with 2014 LRDP Objective 1: Respond to the City and Community Context. The 2014 LRDP also includes an objective (Objective 3) to ensure that its facilities are seismically safe. In order to meet the SB 1953 mandate at Parnassus Heights, inpatient uses currently at Moffitt Hospital must be relocated prior to 2030, necessitating the construction of the New Hospital Addition. Therefore, to the extent feasible, UCSF would design the New Hospital Addition to avoid or minimize the effects of this conflict with the City's Planning Code, but it would not be possible to replace clinical uses currently in Moffitt Hospital with a new hospital that complies with the City's 65-D Height and Bulk District Regulations. In addition, the New Hospital Addition would replace an existing building on the Parnassus Heights campus site in an area already built out with other similar UCSF facilities, such as Moffitt Hospital and Long Hospital. The proposed building would be compatible with adjacent land uses and would not create a significant land use impact.

Mitigation: None required.

Impact LU-PH-3: The proposed renovations of Moffitt Hospital, UC Hall, Millberry Union towers, and the Faculty Alumni House at the Parnassus Heights campus site would be compatible with existing City regulations. (Less than Significant)

The decommissioned Moffitt Hospital would be renovated and reused for outpatient, hospital support and office uses. The use of the site for Clinical purposes would remain unchanged from its existing classification. The proposed retrofit of the Faculty Alumni House also would not result in changes in its existing classification as Housing. Proposed renovations would be limited to the interior and no conflicts would result with local zoning regulations. No impact would occur.

UCSF proposes to retain, seismically retrofit, renovate and reuse UC Hall by 2019. In Phase 1, the top three floors would be used as housing and the three full floors below the housing would be used as faculty offices. Retail, meeting, housing office and storage space are proposed on the ground floor, along with a loading dock at the west end of the building. In Phase 2, the three floors with faculty offices would be converted to housing after Moffitt Hospital is decommissioned and renovated and becomes available for other uses, including the offices displaced from these three floors of UC Hall. The Millberry Union towers are currently used as office space. UCSF would convert the upper levels to student housing under the 2014 LRDP. Both of these areas are currently zoned as Public by the City. The LRDP proposes to change the functional zone of UC Hall to Housing while Millberry Union would change from Campus Community to Support. Although these would be considered new uses, they would not be inconsistent with the Public zoning designation as UCSF would continue to own the facilities for public use and the impact would be less than significant.

Mitigation: None required.

6.10 Noise

This section considers the setting and noise impacts of implementation of the 2014 LRDP at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Noise are contained in Section 4.10 of this EIR. The CEQA Significance Standards presented in Section 4.10.3 are used to evaluate the potential noise impacts of all proposed 2014 LRDP activities.

6.10.1 Noise Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Parnassus Heights campus site, the Initial Study concluded that:

- **Permanent ambient noise.** The demolition of existing buildings would not result in a substantial permanent increase in ambient noise levels. Therefore, no additional analysis of this issue is required for these activities.

- **Airport noise.** No activities would be located within the vicinity of a public or private airport. Therefore, no additional analysis of this issue is required.

- **Average daily noise levels.** The demolition of existing buildings would not contribute to increases in average daily noise levels. Therefore, no additional analysis of this issue is required for these activities.

6.10.2 Noise – Parnassus Heights Setting

6.10.2.1 Existing Noise Environment

Long-term environmental noise in urbanized areas is primarily dependent on vehicle traffic volumes and the mix of vehicle types. The existing ambient noise environment within the Parnassus Heights campus site is dominated by vehicular traffic on Parnassus Avenue as well as stationary equipment noise on the eastern end of the campus site.

The San Francisco Department of Public Health (DPH) has mapped transportation noise throughout the City and County of San Francisco, based on modeled baseline traffic volumes derived from the San Francisco County Transportation Authority travel demand model.[11] DPH maps indicate the areas subject to noise levels over 60 dBA (L_{dn}) and the range of L_{dn} noise levels that occur on every street in San Francisco. The portions of these maps that cover the Parnassus Heights campus site indicate that areas along Parnassus Avenue are generally subject to noise levels between 65 and 60 dBA (L_{dn}).

[11] San Francisco Department of Public Health (DPH), San Francisco City-wide Noise Map, August 2006, Available online at http://www.sfdph.org/dph/files/EHSdocs/ehsPublsdocs/Noise/noisemap2.pdf Accessed April 30, 2013.

Ambient Noise Measurements

Ambient long-term (24-hour) and short-term (10-minute) noise measurement data were collected in January and March of 2014 to characterize noise conditions in the campus site area and its environs. Noise measurement locations are shown in **Figure 6.10-1**. To characterize ambient noise in the campus site area, short-term measurement data were compiled for three locations where residential land uses exist near primary LRDP activity sites, as shown in **Table 6.10-1**. Long-term noise data were collected adjacent to residential land uses on the southern campus boundary as well as outside UC Hall where converted residential land use is proposed; see **Table 6.10-2**.

TABLE 6.10-1
SHORT-TERM AMBIENT NOISE LEVEL DATA IN THE PARANSSUS HEIGHTS AREA

Measurement Location	Time	Noise Levels in dBA	
		Hourly L_{eq}	L_{max}
PS-ST1 Parnassus Avenue at 5th Avenue: Nearby residential receptor to UC Hall	5:08 pm	63.2	79.1
PS-ST2 Kirkham Street at 5th Avenue. Nearby residential receptor to truck route.	4:54 pm	59.1	72.5
PS-ST-3 Hillway Avenue at Parnassus Avenue. Nearby residential receptor to New Hospital Addition Site	5:25 pm	61.2	74.7

NOTE: See Figure 5.10-1 for noise measurement locations. L_{eq} represents the constant sound level; L_{max} is the maximum noise level.

SOURCE: Environmental Science Associates, 2014.

TABLE 6.10-2
LONG-TERM AMBIENT NOISE LEVEL DATA IN THE PARANSSUS HEIGHTS AREA

Measurement Location	Day-Night Noise level (DNL)	Noise Levels in dBA	
		Daytime hourly average, L_{eq}	Nighttime hourly average, L_{eq}
PS-LT1 UCSF Parnassus Property line at Edgewood Avenue residences	64	58	58
PS-LT-2 UC Hall Balcony. Proposed residential use location.	61	58	53

NOTE: See Figure 5.10-1 for noise measurement locations.

SOURCE: Environmental Science Associates, 2014.

Long-term monitoring location PS-LT1 is located at the top of the ridge at the eastern property line of the campus site. The noise environment at this location is dominated by mechanical equipment behind Moffitt Hospital. Noise data indicate that these sources are consistent throughout the daytime and nighttime hours. Long-term monitoring location PS-LT2 is located at UC Hall. The noise environment at this location is dominated by Parnassus Avenue vehicle traffic, which is relatively high during daytime hours but is much reduced after 10:00 p.m.

SOURCE: ESA

UCSF Long Range Development Plan Environmental Impact Report

Figure 6.10-1

Noise Measurements Locations – Parnassus Heights

Noise levels at both long term monitoring locations were marginally in excess of 60 DNL for proposed residential land uses with noise levels in excess of 60 DNL, the San Francisco General Plan suggests that new construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design.

6.10.2.2 Sensitive Receptors

Sensitive receptors for noise are generally considered to include nursing homes, senior citizen centers, schools, churches, libraries, and residences. Land uses in the campus site area are described in detail in Section 6.9, *Land Use*. The sensitive receptors nearest to the Parnassus Heights campus site are residential dwellings on Edgewood Avenue east of the campus, residential dwellings on Fifth Avenue and Kirkham Street west of the campus site and residential dwellings on Hillway Avenue and Irving Street north of the campus site.

6.10.3 Noise – Parnassus Heights Impacts and Mitigation Measures

Impact NOI-PH-1: Demolition activities proposed under the 2014 LRDP at the Parnassus Heights campus site would result in a temporary increase in ambient noise levels. (Potentially Significant)

As noted in the Regional Setting section, the hours that construction activity noise can occur is described in Section 2908 of the Police Code, known as the San Francisco Noise Ordinance. Although UCSF is not subject to the noise ordinance, it strives to be consistent with it to the extent feasible. Section 2908 prohibits any person, between the hours of 8:00 p.m. of any day and 7:00 a.m. of the following day, from erecting, constructing, demolishing, excavating for, altering, or repairing any building or structure if the noise level created is in excess of the ambient noise level by 5 dBA at the nearest property line.

Demolition of each of the eight buildings proposed under the LRDP would require the use of heavy duty off-road construction equipment as well as haul trucks to remove debris. Construction activity noise levels at and near each of these demolition sites would fluctuate depending on the particular type, number, and duration of uses of various pieces of construction equipment. **Table 6.10-3** shows typical noise levels produced by various types of construction equipment. Equipment typically involved with large-scale demolition would include excavators, dozers, loaders and trucks for off-hauling demolition debris. Additionally, a hoe-ram (a back-hoe fitted with a ramming bit) may be used to break up large concrete structures.

The demolition of the Proctor building would occur within 60 feet of an occupied residential building to the south while demolition of the Medical Research 4 (MR4) building would occur within 100 feet of another residential building of the same development. However these demolitions would occur in different years, with MR4 slated for demolition over approximately two months in 2015 and the Proctor building slated for demolition at the far end of the LRDP horizon (estimated at 2030).

TABLE 6.10-3
NOISE LEVELS FOR DEMOLITIONS AT THE PARNASSUS HEIGHTS CAMPUS SITE

Building	Estimated Demolition Schedule	Distance to Nearest Sensitive Receptor (feet)	Shielding Assumption	Estimated Noise Level at Receptor (dBA, Leq)	Noise Increase over Existing Daytime Conditions (dBA, Leq)
Laboratory of Radiobiology	July 2015 to February 2016	550 (5th Avenue residence)	Yes (-5 dBA)	55.6	-7.6
Medical Research 4	February 2015 to April 2015	100 (Kirkham Heights apartments)	None	75.4	**16.3**
Surge	May 2016 to June 2016	180 (Edgewood Avenue residences)	None	70.3	**12.3**
Woods	April 2017 to May 2017	200 (Edgewood Avenue residences)	None	69.4	**11.4**
Environmental Health and Safety	2030 -2031	550 (Kirkham Heights apartments)	None	60.6	1.5
LPPI	2030 -2031	250 (Edgewood Avenue residences)	None	71.5	**10.3**
Proctor	2030 -2031	60 (Kirkham Heights apartments)	None	79.8	**20.7**
Koret Vision Research	2033 -2034	280 (UCSF Child Care)	None	70.5	**11.4**

Table 6.10-3 presents a rough estimate of the sequence of proposed building demolitions and the proximity of sensitive receptor to each demolition site. As can be seen from the table, most demolition would occur sequentially with only demolition of Environmental Health and Safety and LPPI potentially occurring concurrently. Table 6.10-3 also presents an estimate of noise levels during demolition. These estimated noise levels assume simultaneous operation of an excavator, a loader and a bulldozer as calculated using the Roadway Construction Noise Model of the FHWA. Estimated noise levels for demolition of the more substantial structures of LPPI and Koret Vision Research also assume operation of a hoe-ram to break concrete.

Trucks off-hauling demolition debris would also generate noise. The number of daily truck trips would depend on the pace of demolition. The CalEEMod air quality model estimates that based on the square feet of demolition involved at LPPI and Proctor up to 38 daily truck trips could occur per day (19 truck loads per day). Different truck routes would be used for these two projects each of which would add about two additional truck trips per hour to local roadways. The Traffic Noise Prediction Model of the FHWA indicates that addition of two trucks per hour along Kirkham Avenue would increase the existing hourly noise level by 2.6 dBA, which would not be a significant contribution to existing roadside noise levels.

The data in Table 6.10-3 indicate that noise levels from proposed demolition would exceed 10 dBA over existing levels (a perceived doubling of loudness) during peak demolition activities at MR4, Surge, Woods, LPPI, and Proctor. Receptors near these buildings would also experience noise levels approaching or exceeding a speech-interference threshold of 70 dBA and result in a temporary but significant construction noise impact from demolition activities. Implementation of

Mitigation Measure NOI-LRDP-1 will reduce noise levels associated with demolition activities by 5 to 10 dBA. However it is likely that intermittent hoe-ram operations to break up concrete structures could result in noise levels at sensitive receptors in excess of 70 dBA during one to two weeks of the demolition of Proctor, even after mitigation. Consequently, this impact, although temporary, would be significant and unavoidable.

Mitigation Measure: Implement Mitigation Measure NOI-LRDP-1

Significance after Mitigation: Significant and Unavoidable

Impact NOI-PH-2: Construction activities proposed under the 2014 LRDP at the Parnassus Heights campus site would result in increases in ambient noise levels over the term of the exterior construction activities. (Potentially Significant)

The renovations of UC Hall, Millberry Union towers, and Moffitt Hospital are assumed to be predominantly interior renovations and would not involve operation of off-road construction equipment other than a small crane or man lift that would not be expected to substantially alter the existing noise environments. Since these renovation activities would be largely conducted within the existing buildings they would not result in significant construction noise impact outside of the buildings.

Implementation of the Parnassus Avenue Streetscape Plan, open space, and utility and proposals may also involve limited operations of some types of construction equipment, such as a backhoe. However the limited scope and duration of operation involved with these activities would not be expected to substantially alter the existing noise environments of Parnassus Avenue or Medical Center Way.

Construction of the New Hospital Addition would require the use of heavy-duty off-road construction equipment and is anticipated to occur between 2025 and 2030. Construction activity noise levels at and near the hospital site would fluctuate depending on the particular type, number, and duration of use of various pieces of construction equipment. Construction activities associated with the New Hospital Addition would involve excavation, grading, and earth movement and, potentially, pile driving. **Table 6.10-4** shows typical noise levels produced by various types of construction equipment typically involved with large-scale construction projects, would occur at a reference distance of 50 feet from the source and also as would occur at a distance of 200 feet, which is the approximate distance from the New Hospital Addition site to the nearest residences on Hillway Avenue and Edgewood Avenue.

The sensitive residential receptors nearest the New Hospital Addition site experience existing daytime noise levels of 58 dBA. Temporary noise from standard construction equipment could exceed these existing noise levels by as much as 19 dBA. If an impact pile driver were required, it could result in an increase of up to 31 dBA over existing noise levels, resulting in a temporary but significant noise increase over existing conditions over a period of pile installation. Consequently, mitigation measures to reduce construction noise are identified.

TABLE 6.10-4
TYPICAL NOISE LEVELS FROM CONSTRUCTION EQUIPMENT

Construction Equipment	Noise Level (dBA, Leq at 50 Feet)	Noise Level (dBA, Leq at 200 Feet)
Dump truck	76	64
Portable air compressor	78	66
Concrete mixer (truck)	79	67
Crane	81	69
Excavator	81	69
Dozer	82	70
Paver	77	65
Generator	81	69
Backhoe	78	66
Pile driver	101	89
Auger Drill Rig	84	72

SOURCE: FHWA, 2006.

Mitigation Measure: Implement Mitigation Measure NOI-LRDP-1 and NOI-LRDP-2.

Significance After Mitigation: Significant and Unavoidable. Mitigation Measures LRDP-NOI-1 and 2 would reduce the severity of noise generated by construction and pile-driving activities and reduce the potential annoyance to nearby residents and others who could be disturbed by pile-driving to the extent feasible. If piles can be installed though drilling and cast in place measures then these mitigation measures would result in a less than significant impact.

However, if geotechnical conditions exist such that impact or vibratory pile-driving is required, then construction noise would be significant. Although pile-driving noise would be intermittent and would occur over a short duration (up to about six weeks in total), even after mitigation the noise level would likely exceed ambient noise levels by 20 dBA during pile-driving activities, resulting in a significant and unavoidable impact.

Impact NOI-PH-3: Demolition and construction activities proposed under the 2014 LRDP at the Parnassus Heights campus site could generate ground-borne vibration. (Less than Significant)

The types of construction and demolition-related activities associated with propagation of ground-borne vibration include pile driving, use of hoe-rams for demolishing large concrete structures and foundations, and caisson drilling.

Demolitions

The only demolition activity associated with propagation of ground-borne vibration would be use of hoe-rams for demolishing large concrete structures or foundations. Operation of a hoe ram can result in peak particle velocities (PPV) of up to 0.089 inches per second (in/sec) at a distance of 25 feet (FTA, 2006). The Caltrans threshold of architectural damage for conventional sensitive

structures is 0.5 in/sec PPV for new residential structures and modern commercial buildings and 0.25 in/sec PPV for historic and older buildings.

The nearest existing off-campus structure is approximately 60 feet away from the site of the proposed demolition at LPPI. At this distance, vibration from hoe-ram operation would be expected to be reduced to 0.03 inches per second. Therefore, vibration from hoe-ram operation would not exceed the criterion published by Caltrans of 0.25 in/sec for the protection of fragile older buildings, or the 0.5 in/sec PPV criterion for newer buildings at any off campus receptors. Vibration levels from Hoe ram operations would be less than 0.04 inches per second at the nearest residential receptors and would be less than distinctly perceptible. Consequently, the LRDP demolitions would have a less-than-significant impact to ground-borne vibration.

Renovations

No renovation activity would propagate ground-borne vibration.

New Construction

Of the construction equipment likely to be used, pile driving has the potential to result in the highest levels of ground-borne vibration. Pile driving, if required, could take one or more months, and would occur during daytime hours, consistent with the City's Police Code.

Pile driving can result in peak particle velocities (PPV) of up to 1.5 inches per second (in/sec) at a distance of 25 feet (FTA, 2006), but typically results in an average of about 0.644 PPV at that distance. The Caltrans threshold of architectural damage for conventional sensitive structures is 0.5 in/sec PPV for new residential structures and modern commercial buildings and 0.25 in/sec PPV for historic and older buildings.

The nearest existing off-campus structure is approximately 200 feet away from the site of the proposed New Hospital Addition, where pile driving may occur. At this distance, vibration from pile driving would be expected to be reduced to 0.03 inches per second. Therefore, vibration from pile driving would not exceed the criterion published by Caltrans of 0.25 in/sec for the protection of fragile older buildings, or the 0.5 in/sec PPV criterion for newer buildings at any off campus receptors. Vibration levels would be substantially less (below 0.01 inches per second) at the nearest residential receptors, and would not generally be perceptible.

Consequently, the demolition or construction activities would have a less-than-significant impact with regard to ground-borne vibration.

Mitigation: None required.

Impact NOI-PH-4: Operational noise generated by development under the 2014 LRDP at the Parnassus Heights campus site could cause a long-term increase in ambient noise levels in the campus vicinity. (Less than Significant)

Demolitions

No long-term noise sources and no noise increases would be associated with the demolitions.

Renovations

Repurposing of UC Hall and Millberry Union towers may result in subtle increases in roadway traffic but even when the entirety of the LRDP is considered increased roadway noise is less than significant. No new mechanical or other stationary noise sources would be introduced by these renovations. Consequently, operational noise increases due to these LRDP renovations would be less than significant.

New Construction

Long-term noise sources associated with operation of the renovated UC Hall, Millberry Union towers, and Moffitt Hospital, and the New Hospital Addition would primarily consist of marginal increases in roadway traffic resulting from new and repurposed land use. There will likely be some new mechanical equipment (e.g. heating ventilation and air conditioning) associated with operation of the new hospital. The potential location of such equipment in not known given that there is, as yet, no design for the New Hospital Addition building but such equipment would be operated in such a manner as to conform to the extent feasible to the requirements of the City of San Francisco noise ordinance. Additionally new mechanical equipment would effectively replace older and potentially noisier HVAC equipment currently existing at LPPI that would be demolished as a project-level element hence resulting in potentially beneficial impacts.

UCSF has addressed stationary source noise from existing equipment at the Parnassus Heights campus site on an ongoing basis throughout the past 20 years. These efforts have included monitoring and mitigation identification for noise generated throughout the campus site (Smith, Fause McDonald, 1998); installing new, quieter equipment as older, noisier equipment is phased out; as well as follow-up noise monitoring conducted in 2010 demonstrating operational equipment noise consistent with the updated portion of the City's Noise Ordinance (Salter, 2010). UCSF continues its efforts to minimize equipment noise generated on campus. These efforts demonstrate that although UCSF is not subject to the City's noise ordinance, it strives to be consistent with it to the extent feasible. Consequently, new construction is anticipated to have a less than significant impact with respect to new stationary noise sources.

With respect to noise from increased roadway traffic, increased traffic would primarily be on the local roadway network surrounding the campus site, including Parnassus Avenue and Fifth Avenue based on turning movement volumes calculated for Section 6.14, *Transportation and Traffic*. A project would be considered to generate a significant impact if it resulted in a permanent increase in ambient noise levels greater than 3 dBA in the project vicinity above levels existing without the project for areas already impacted by noise.

Noise levels were determined for this analysis using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model and the turning movements in the traffic section for Existing (2014), Existing Plus LRDP, and Cumulative Plus LRDP conditions as determined in Section 6.14, *Transportation and Traffic*. Peak hour intersection turning data from the traffic study were analyzed to evaluate increases and resulting traffic-generated noise increases on roadway links most affected by LRDP -related traffic. The roadway segments analyzed and the results of the noise increases resulting from modeling are shown in **Table 6.10-5**, below.

TABLE 6.10-5
PEAK-HOUR TRAFFIC NOISE LEVELS IN THE VICINITY OF THE PARNASSUS HEIGHTS CAMPUS SITE

Roadway Segment[a,b]	(A) Existing	(B) Existing Plus Project	(B-A) Difference between Existing Plus Project and Existing[c]	(D) Cumulative Plus Project (2040)	(D-A) Difference between Cumulative Plus Project and Existing
Parnassus Avenue between Stanyan Street and Hillpoint Avenue	62.7	62.7	<0.1	63.2	0.5
Parnassus Avenue between 3rd Avenue and 5th Avenue	63.4	63.5	0.1	64.0	0.6
4th Avenue between Parnassus Avenue and Irving Street	56.1	56.2	0.1	57.2	1.1
5th Avenue between Parnassus Avenue and Irving Street	53.2	53.2	<0.1	53.4	0.2
5th Avenue between Parnassus Avenue and Kirkham Street	57.3	57.4	0.1	58.6	1.3
Kirkham Street between 5th Avenue and 6th Avenue	58.3	58.4	0.1	59.8	1.4

[a] Road center to receptor distance is 15 meters (approximately 50 feet) for all roadway segments. Noise levels were determined using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model.
[b] The analysis considered the vehicle mix based on – cars 95 percent, medium trucks four percent, and heavy trucks one percent on Parnassus Avenue based on observed city and para-transit bus activity. Traffic speeds for all vehicle classes were set at 25 mph for all vehicle classes.

SOURCE: ESA, 2014.

As shown in Table 6.10-5, the increase in traffic noise in the vicinity of the Parnassus Heights campus site from the Existing Plus LRDP traffic scenario compared to the Existing traffic scenario would increase peak hour noise levels by less than 3 dBA at all roadway segments. This is also true when the cumulative plus project condition is compared to existing conditions. Overall, traffic noise increases associated with the 2014 LRDP at all analyzed roadway segments in the vicinity of the Parnassus Heights campus site would be less than significant impacts.

Mitigation: None required.

Impact NOI-PH-5: Operations under the 2014 LRDP at the Parnassus Heights campus site would result in exposure of persons (new residents) to noise levels in excess of standards established in the general plan. (Less than Significant)

The LRDP would result in renovating and repurposing UC Hall and Millberry Union towers to residential uses. Long-term noise monitoring conducted at UC Hall indicates existing exterior noise level of 61 DNL. This noise level is within the "conditionally acceptable" noise exposure category as defined by the City of San Francisco General Plan Noise Element (greater than 60 DNL). New residences would also be constructed at Fifth and Parnassus Avenues and at the Proctor site. Noise levels at these locations are represented by the short-term measurements in Table 6.10-1 and range from 59 to 63 dBA which can reasonably be assumed to represent DNL levels in an environment where vehicle traffic is the predominant source.

A conditionally acceptable noise exposure is defined as one in which new construction or development should be undertaken only after a detailed analysis of noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice. Both UC Hall and Millberry Union towers have air-handling systems and windows are generally kept closed. Additionally, Section 1207 of the California Building Code (Title 24 of the California Code of Regulations) establishes material requirements in terms of sound transmission class (STC) [12] of 50 for all common interior walls and floor/ceiling assemblies between adjacent dwelling units or between dwelling units and adjacent public areas. This requirement would be sufficient to achieve the additional 1 dBA of sound reduction necessary to achieve the noise exposure goals of the San Francisco General Plan. Consequently, the 2014 LRDP would have a less than significant impact with regard to exposure of new residential receptors to noise levels in excess of acceptable noise exposure standards.

Mitigation: None required.

[12] The STC is used as a measure of a materials ability to reduce sound. The STC is equal to the number of decibels a sound is reduced as it passes through a material.

6.11 Population and Housing

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Population and Housing are contained in Section 4.11 of this EIR. The CEQA Significance Standards presented in Section 4.11.3 are used to evaluate the potential population and housing impacts of all proposed 2014 LRDP activities.

The 2014 LRDP would result in population growth in San Francisco or the wider Bay Area through increased employment and student enrollment. The 2014 LRDP would accommodate an increase in employment and students at all campus sites from the current approximately 30,840 to approximately 42,270 by 2035. This anticipated population increase could result in an increased demand for housing in the Bay Area. This overall increase and its potential effect on housing were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures.*

The 2014 LRDP development proposals would result in a small change in daily population at this campus site. The projected increase in population at the Parnassus Heights campus site would be approximately 600 people by 2035. Approximately 388 beds in 329 residential units are proposed under the 2014 LRDP for the campus site. Two-hundred fifty-two new units are proposed by converting existing building space (UC Hall and Millberry Union towers) and 77 new units are proposed for the Fifth and Parnassus avenues and Proctor sites. The direct and indirect physical environmental effects that result from these changes are fully considered in each of the appropriate topical sections of this Chapter.

6.12 Public Services

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Public Services are contained in Section 4.12 of this EIR. The CEQA Significance Standards presented in Section 4.12.3 are used to evaluate the potential public services impacts of all proposed 2014 LRDP activities.

In 2013, the estimated daily UCSF population across all sites, including patients and visitors, was approximately 39,420. At LRDP horizon in 2035, total population is projected to reach approximately 56,420, an increase of about 17,000, the majority of which would be associated with growth proposed by the 2014 LRDP. The projected increase in population at the Parnassus Heights campus site would be approximately 600 people by 2035.

This anticipated population increase could result in an increased demand for public services in San Francisco, including fire protection, law enforcement, and public education. This overall increase and its potential effect on public services were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures*. The anticipated small increase in population at this campus site under the LRDP would not cause substantial increased demand for public services specific to this campus site, and all impacts are found to be less than significant.

6.13 Recreation

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Recreation are contained in Section 4.13 of this EIR. The CEQA Significance Standards presented in Section 4.13.3 are used to evaluate the potential recreation impacts of all proposed 2014 LRDP activities.

In 2013, the estimated daily UCSF population across all sites, including patients and visitors, was approximately 39,420. At LRDP horizon in 2035, total population is projected to reach approximately 56,420, an increase of about 17,000, the majority of which would be associated with growth proposed by the 2014 LRDP. The projected increase in population at the Parnassus Heights campus site would be approximately 600 people by 2035.

This anticipated population increase could result in an increased use of recreational facilities on and near UCSF campus sites. This overall increase and its potential effect on recreational facilities, as well as effects resulting from 2014 LRDP proposals, were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures*. The anticipated small increase in population at this campus site under the LRDP would not cause substantial increased demand for recreation facilities specific to this campus site, and all impacts are found to be less than significant.

6.14 Transportation and Traffic

This section considers the transportation and traffic setting and impacts of implementation of the 2014 LRDP at the Parnassus Heights campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Transportation and Traffic are in Section 4.14 of this EIR. The CEQA Significance Standards presented in Section 4.14.3 are used to evaluate the potential transportation and traffic impacts of all proposed 2014 LRDP activities.

6.14.1 Transportation and Traffic Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Parnassus Heights campus site, the Initial Study concluded that:

- **Air traffic patterns.** No activities would result in a change in air traffic patterns. Therefore, no additional analysis of this issue is required.

6.14.2 Transportation and Traffic – Parnassus Heights Setting

A more-detailed description of current transportation and traffic characteristics in the Parnassus Heights campus site area is provided in Appendix G, the Transportation Impact Study (TIS) for the UCSF 2014 LRDP.

6.14.2.1 Roadway Facilities

The network of regional roadways that serve the Parnassus Heights campus site is described in Section 4.14.

With Golden Gate Park to the north and Mount Sutro to the south, the roadways used to access the Parnassus Heights campus site are primarily via east-west corridors – Parnassus Avenue-Judah Street, Irving Street-Carl Street, Lincoln Avenue, and Kirkham Street. Primary north-south routes to the Parnassus Heights campus site include Stanyan Street, Arguello Boulevard, Seventh Avenue, and Second Avenue through Fifth Avenue. The primary vehicular entrances to parking and loading areas for the campus site are located at the intersections of Second Avenue/Irving Street, Arguello Boulevard/Carl Street-Irving Street, along Parnassus Avenue, and at Fifth Avenue/Kirkham Street. Local access to the Parnassus Heights campus site is provided by an urban street grid network. Key local roadways through the campus site are discussed below.

The local road network serving the Parnassus Heights campus site consists primarily of two-lane roadways with on-street parking provided on both sides of the streets in most areas, as follows:

- **Kirkham Street** runs between the UCSF Parnassus Heights campus site to La Playa Street in the west. East of Fifth Avenue, Kirkham Street becomes Koret Way (a campus site street) and provides access to the School of Dentistry, Laboratory of Radiology, Medical Research 4, and School of Nursing buildings. West of Sixth Avenue, Kirkham Street has Class II bicycle lanes in both directions.

- **Carl Street/Irving Street** extends from Clayton Street to 48th Avenue. The City classifies this roadway as a Primary Transit Street (transit-oriented) east of Ninth Avenue. In the vicinity of the Parnassus Heights campus site, the N Judah light rail line operates along the roadway between Cole Street and Ninth Avenue. The street provides exclusive turn pockets for vehicles to enter the UCSF parking garage at the Second Avenue/Irving Street intersection.

- **Hugo Street** runs between Arguello Boulevard and Seventh Avenue. Between Seventh Avenue and Third Avenue, Hugo Street is designated as a Class III bicycle route.

- **Willard Street** runs from Fredrick Street to Woodland Avenue.

- **Medical Center Way**, a campus site street, runs from Parnassus Avenue to Johnstone Drive through the Mount Sutro Open Space Reserve.

- **Hillway Avenue** runs between Parnassus Avenue and Carl Street.

- **Arguello Boulevard** runs from Kezar Drive to Carl Street.

- **Second Avenue** runs from Lincoln Way to Irving Street, with the southern end of the street providing direct access to a large public parking deck on the Parnassus Heights campus site.

- **Third Avenue** runs between Lincoln Way and Parnassus Avenue. Between Hugo Street and Lincoln Way, Third Avenue is a designated Class III bicycle route. All northbound traffic on Third Avenue must turn right at Lincoln Way.

- **Fourth Avenue** runs between Lincoln Way and Parnassus Avenue. All northbound traffic on Fourth Avenue must turn right at Lincoln Way.

- **Fifth Avenue** runs between Lincoln Way and its terminus south of Kirkham Street. Fifth Avenue provides full access (i.e., northbound traffic can turn left and right) at Lincoln Way.

- **Sixth Avenue** runs between Lincoln Way and its terminus south of Kirkham Street. Sixth Avenue is designated as a bicycle route between Hugo Street and Kirkham Street and has a southbound Class II bicycle lane and a northbound Class III bicycle route (with shared-lane markings [“sharrows”]).

- **Eighth Avenue** runs between Lincoln Way and its southern terminus at Pacheco Street. The 66 Quintara bus line operates along Eighth Avenue between Parnassus Avenue and Lawton Street in the northbound direction only.

The roadway exceptions to the two-lane cross section are as follows:

- **Parnassus Avenue/Judah Street** is a two- to three-lane roadway that extends from Clayton Street to 48th Avenue. The City classifies this roadway as a Secondary Transit Street east of Ninth Avenue (in the vicinity of the Parnassus Heights campus site) and a Primary Transit Street (Transit-Oriented) west of Ninth Avenue. The 6 Parnassus and 43 Masonic bus lines operate on this street. A two-way left-turn lane extends from Stanyan Street to the Moffitt-Long Hospital. Access to the Millberry Union Garage is across from the Moffitt/Long Hospital Drop-off/Pick-up area; two signalized crosswalks facilitate heavy pedestrian volumes across the street in the same location. Parnassus Avenue/Judah Street is also designated as a Class III bicycle route east of Sixth Avenue. Class III bicycle routes employ “sharrows”.

- **Lincoln Way/Frederick Street** is a two- to four-lane Secondary Transit Street that forms the southern boundary of Golden Gate Park. At Third Avenue, Lincoln Way merges with Kezar Drive and is a main thoroughfare between the Sunset District and downtown. The 71/71L Haight-Noriega bus line uses the entirety of Lincoln Way and Frederick Street to travel to Stanyan Street, while the 16X Noriega Express and NX Express use Lincoln Way to merge onto Kezar Drive in order to get to the Fell-Oak streets one-way couplet.

- **Kezar Drive** is a two- to four-lane east-west Major Arterial Street north of Parnassus Avenue that provides the major connection from the Parnassus Heights campus site to the Fell-Oak Street one-way couplet. Kezar Drive has a Class I bicycle path facility. The 16X Noriega Express and NX Express bus lines use Kezar Drive to travel from Lincoln Way to Oak Street.

- **Stanyan Street** is a Secondary Transit Street from Geary Boulevard to Belgrave Avenue. It forms the eastern boundary of Golden Gate Park (excluding the Panhandle section of the park). In the vicinity of the Parnassus Heights campus site (north of Frederick Street), it is a four-lane roadway; south of Fredrick, it is a two-lane street. The 71/71L Haight-Noriega bus line operates along Stanyan Street north of Frederick Street.

- **Seventh Avenue** is a Secondary Transit Street, which provides access to Golden Gate Park and becomes Laguna Honda Boulevard to the south of the Parnassus Heights campus site. It has one northbound and two southbound lanes in the vicinity of the campus site. Seventh Avenue is designated as a Class III bicycle facility between Lincoln Way and Judah Street and as a Class II bicycle lane south of Judah Street. The 36 Teresita, 43 Masonic, and 44 O'Shaughnessy bus lines operate on Seventh Avenue south of Lawton Street.

- **Ninth Avenue** is a Secondary Transit Street, which provides access to Golden Gate Park and the Sunset District. It has one northbound and two southbound lanes in the vicinity of the Parnassus Heights campus site. The N Judah light rail line operates on Ninth Avenue between Irving and Judah streets. The 43 Masonic and 66 Quintara bus lines operate along Ninth Avenue between Judah Street and Lawton Street, while the 44 O'Shaughnessy line runs between Golden Gate Park and Lawton Street.

6.14.2.2 Parnassus Avenue Traffic Volumes

On the basis of traffic counts conducted on Parnassus Avenue between Fifth Avenue and Medical Center Way in 2007 and 2013, current traffic volumes on Parnassus Avenue are similar to those in 2007. The total daily traffic volume on Parnassus Avenue is relatively low by comparison to other two-lane streets in San Francisco. For example, Polk Street carries approximately 16,000 vehicles per day compared to approximately 10,000 vehicles per day on Parnassus Avenue. Although both Polk Street serves more commercial retail uses, compared to the more institutional and residential uses along Parnassus Avenue, this comparison shows that a two-lane street with frequent transit service is capable of serving much more traffic than currently exists on Parnassus Avenue, and that an oft-described "busy feel" on Parnassus is due more to other factors, such as double-parking and high pedestrian volumes, than to heavy traffic volumes.

6.14.2.3 Intersection Operating Conditions

Intersection operating conditions at 23 intersections were evaluated during the weekday peak hours of the AM (7:00 AM-9:00 AM) and PM (4:00 PM-6:00 PM) peak periods. Intersections

usually form the critical capacity constraints on roadways. Therefore, most transportation analyses examine intersection operations as a measure of overall roadway conditions.

The operating characteristics of intersections are evaluated using the concept of Level of Service ("LOS"). LOS is a qualitative description of driver comfort and convenience. Intersection levels of service range from LOS A, which indicates free flow or excellent vehicle flow conditions with short delays, to LOS F, which indicates congested or overloaded vehicle flow conditions with extremely long delays. In San Francisco, LOS A through D is considered acceptable, and LOS E and LOS F are considered unsatisfactory service levels. The intersections were evaluated using the 2000 Highway Capacity Manual (HCM) methodology. Tables summarizing the relationship between average delay per vehicle and LOS for signalized and unsignalized intersections according to the 2000 HCM method can be found in the appendices of the TIS for the 2014 LRDP (Appendix G).

For signalized intersections, this methodology determines the capacity for each lane group approaching the intersection. The LOS is based on average delay (in seconds per vehicle) for the various movements within the intersection. A combined weighted average delay and LOS is presented for the intersection. For unsignalized intersections, operations are defined by the average control delay per vehicle (in seconds per vehicle) for each stop-controlled movement or movement that must yield the right-of-way, and the LOS is determined by the worst (highest average delay) approach. Generally, the delay ranges for each LOS are lower than for signalized intersections because drivers expect less delay at unsignalized intersections.

As shown in **Table 6.14-1**, 21 of the 23 study intersections operate at an acceptable level of service, which is LOS D or better, during the AM peak hour and 20 study intersections operate at an acceptable LOS during the PM peak hour. The following intersections operate unacceptably during the AM or PM peak hours:

- Oak Street – Fell Street – Kezar Drive and Stanyan Street (Intersection #1) operates at LOS E during the PM peak hour due to the traffic volumes on northbound and southbound Stanyan Street.

- Lincoln Way and Ninth Avenue (Intersection #2) operates at LOS E during the PM peak hour due to the conflicting traffic volumes on westbound Lincoln Way and southbound Ninth Avenue.

- Lincoln Way and Fourth Avenue Intersection (#4) operates at LOS F during the AM peak hour due to high conflicting traffic volumes on eastbound Lincoln Way.

- Judah Street-Parnassus Avenue and Fifth Avenue (Intersection #15) operates at LOS E during the PM peak hour due to a combination of the traffic volumes on the stop-controlled approaches of Fifth Avenue and the relative lack of gaps in traffic on Judah Street-Parnassus Avenue.

- Kirkham Street and Seventh Avenue (Intersection #21) operates at LOS E during the AM peak hour due to the relatively high conflicting traffic volumes on northbound Seventh Avenue and eastbound Kirkham Street.

TABLE 6.14-1
EXISTING PEAK-HOUR INTERSECTION LEVEL OF SERVICE (LOS) – PARNASSUS HEIGHTS CAMPUS SITE

Intersection	Traffic Control[a]	Peak Hour	Delay (seconds)[b]	LOS[c]
1. Oak Street-Fell Street-Kezar Drive / Stanyan Street	Signal	AM PM	45 **58**	D **E**
2. Lincoln Way / Ninth Avenue	Signal	AM PM	39 **65**	D **E**
3. Lincoln Way / Seventh Avenue	Signal	AM PM	32 39	C D
4. Lincoln Way / Fourth Avenue	SSS	AM PM	**>50** 23	**F** C
5. Lincoln Way-Kezar Drive / Third Avenue	SSS	AM PM	24 29	C D
6. Fredrick Street / Stanyan Street	Signal	AM PM	26 24	C C
7. Irving Street / Ninth Avenue	Signal	AM PM	17 20	B B
8. Irving Street / Seventh Avenue	Signal	AM PM	24 25	C C
9. Irving Street / Fourth Avenue	AWS	AM PM	11 (12) 11 (12)	B (B) B (B)
10. Irving Street / Second Avenue	AWS	AM PM	10 (11) 11 (12)	B (B) B (B)
11. Irving Street / Arguello Boulevard	SSS	AM PM	15 27	B D
12. Judah Street / Ninth Avenue	Signal	AM PM	15 16	B B
13. Judah Street / Seventh Avenue	Signal	AM PM	32 25	C C
14. Judah Street / Sixth Avenue	AWS	AM PM	17 (18) 17 (22)	C (C) C (C)
15. Judah Street-Parnassus Avenue / Fifth Avenue	SSS	AM PM	22 **42**	C **E**
16. Parnassus Avenue / Fourth Avenue	AWS	AM PM	15 (18) 19 (23)	B (C) C (C)
17. Parnassus Avenue / Third Avenue	SSS	AM PM	17 20	C C
18. Parnassus Avenue / Hillway Avenue	SSS	AM PM	13 15	B C
19. Parnassus Avenue / Hill Point Avenue	SSS	AM PM	17 16	C C
20. Parnassus Avenue / Stanyan Street	Signal	AM PM	41 29	D C
21. Kirkham Street / Seventh Avenue	Signal	AM PM	**70** 30	**E** C
22. Kirkham Street / Sixth Avenue	AWS	AM PM	13 (16) 13 (14)	B (C) B (B)
23. Kirkham Street / Fifth Avenue	AWS	AM PM	<10 (<10) <10 (<10)	A (A) A (A)

[a] AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled

[b] Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersections, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach (indicated in parentheses).

[c] For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For unsignalized intersections, LOS is based on the worst approach, which for AWS is indicated in parentheses.

[d] **Bold** indicates unacceptable operations per UCSF LOS standards

SOURCE: Fehr & Peers, 2014.

6.14.2.4 Transit Network

The Parnassus Heights campus site is well-served by public transit, both local and regional. Regional service is described in Section 4.14. Local service is provided by the San Francisco Municipal Railway (Muni) bus and light rail lines, which provide transit service to the campus site and throughout San Francisco and can be used to access regional transit operators. Service to and from the East Bay is provided by Bay Area Rapid Transit (BART), Alameda-Contra Costa Transit (AC Transit) and ferries; service to and from the North Bay is provided by Golden Gate Transit buses and ferries; service to and from the Peninsula and South Bay is provided by SamTrans, BART, and Caltrain. As described in Section 4.14, UCSF supplements Muni transit service with its own shuttle system that provides direct connections to UCSF-operated or affiliated facilities throughout San Francisco. In many cases, these shuttles provide a direct transit alternative between two campus sites that would otherwise require a transfer between two or more Muni routes. Based on the 2013 UCSF Transportation Commute Survey, approximately 24% of those traveling to the Parnassus Heights campus site use public transit, while another 12% rely on UCSF shuttles to get to and from the campus site.

Local Transit

San Francisco Muni. San Francisco Municipal Railway (Muni) provides transit service within the City and County of San Francisco, including bus (both diesel and electric trolley), light rail (Muni Metro), cable car and electric streetcar lines. Muni operates nine bus and rail lines in the Parnassus Heights campus site area (see the TIS in Appendix G for details about these transit lines).The Transit Effectiveness Project (TEP) serves as both a thorough review of and repositioning of San Francisco's public transit system, initiated by SFMTA in collaboration with the City Controller's Office. The TEP is aimed at improving reliability, reducing travel times, providing more frequent service and updating Muni bus routes and rail lines to better match current travel patterns. TEP recommendations include new routes and route realignments, more service on busy routes, and elimination or consolidation of certain routes or route segments with low ridership. The TEP recommendations were unanimously endorsed by the SFMTA Board of Directors in October 2008, for environmental impact review. The initial TEP recommendations were revised based on public feedback on the draft TEP environmental impact report (TEP EIR). The TEP EIR was certified on March 27, 2014, and the SFMTA Board of Directors approved most of the Service Improvements and portions of the Transit Travel Time Reduction Proposals on March 28, 2014.[13] The TEP project will be implemented based on funding and resource availability. The TEP Implementation Strategy anticipates that many of the improvements will be implemented sometime between Fiscal Year 2014 and Fiscal Year 2019, subject to funding sources and resource availability.[14] The changes proposed by the TEP for routes near the Parnassus Heights campus site are described in the TIS (Appendix G).

---

UCSF Shuttle System

Shuttles to and from the Parnassus Heights campus site (Gold, Blue, Black, Tan, Purple, Grey, Lime, Pink, VA-Parnassus, and Bronze) stop at shuttle zones along the north side of Parnassus Avenue, between Third Avenue and the Library, and on the south side of Parnassus Avenue, just west of UC Hall, outside the Dental Clinic plaza at Fourth Avenue, and also east of Langley Porter Psychiatric Institute. These stops are designated by UCSF Transportation Services and reviewed/approved by SFMTA. A more-detailed description of the UCSF shuttle system serving the Parnassus Heights campus site area is provided in Appendix G (TIS for the 2014 LRDP).

6.14.2.5 Pedestrian Circulation

Walking to and from the Parnassus Heights campus site is a common travel mode option for many UCSF employees and students. Based on the 2013 UCSF Transportation Commute Survey, about 11% of those traveling there walk to and from the campus site.

Pedestrian facilities include sidewalks, crosswalks, curb ramps, and pedestrian signals. Within the campus site, sidewalks exist on both sides of the street in most locations, generally 12 feet to 15 feet wide. In some areas on the campus site, sidewalk widths exceed 20 feet. All study intersections provide painted crosswalks and directional curb ramps. High-visibility yellow continental stripe crosswalks exist on Judah Street at the intersections of Sixth and Seventh avenues. Two additional high-visibility continental stripe crosswalks exist on Parnassus Avenue adjacent to the Moffitt/Long Hospital Drop-off/Pick-up area, where there are two signalized pedestrian crosswalks with countdown timers. These signalized crossings accommodate the large number of pedestrians crossing from one side of Parnassus Avenue to the other. Most other crosswalks in the area are standard crosswalks; San Francisco typically only uses the standard crosswalk at signalized intersections, continental crosswalks at high-visibility locations (e.g., near schools), and ladder crosswalks.

Pedestrian counts were conducted at each crosswalk in the Parnassus Heights campus site between 7:00 AM and 7:00 PM in 2007 and 2013. A comparison of those counts showed that the 2013 pedestrian volumes are essentially unchanged from those in 2007. Some slight variations in crossing volumes at individual crosswalks was observed, and because there has not been any substantial development in the area since 2007, most changes in pedestrian activity likely would be related to typical seasonal or daily fluctuations or attributable to adjustments in the UCSF shuttle system routing. However, counts at the pedestrian crossing in front of the Medical Building 1 (ACC) at Irving Street increased 60% between 2007 and 2013. This may be an indication of increased light rail ridership.

During the same time period in which the two Parnassus Avenue signalized crosswalks accommodate approximately 18,500 crossings, the Parnassus Avenue roadway carries about 8,500 vehicles. Thus, on average, there are over two times more pedestrians crossing Parnassus Avenue than vehicles traveling along it. The pedestrian activity on Parnassus Avenue in the campus site area (Third Avenue to Hillway Avenue) is more than double the pedestrian activity occurring at Judah Street and Fifth Avenue to the west.

Field observations at the campus site indicate that the locations of the two signalized crosswalks across Parnassus Avenue in the campus site core area are not aligned with many pedestrians' desired travel paths. A number of pedestrians exiting the UCSF Medical Center walk around Moffitt Circle and walk directly across Parnassus Avenue into the entrance to the Millberry Union, rather than walk east or west to one of the two signalized crosswalks.

6.14.2.6 Bicycle Circulation

Despite the hilly topography at the Parnassus Heights campus site, bicycling is a viable and common travel mode. UCSF has identified bicycling as an effective tool in reducing congestion and pollution, promoting good health, and creating a livable environment. Based on the 2013 UCSF Transportation Commute Survey, approximately 5% of those traveling to and from the campus site do so by bike. In addition, approximately 3% of trips made by UCSF Parnassus employees and students to off campus, non-UCSF locations throughout the day are made by bike. This is consistent with the bicycling mode share throughout San Francisco.

Bicycle facilities in San Francisco consist of bicycle paths, separated bicycle lanes, bicycle lanes, and bicycle routes. Bicycle Paths (Class I) provide a completely separated right-of-way for the exclusive shared use of cyclists and pedestrians. These facilities are off-street and minimize cross-flow traffic, but they can be adjacent to an existing roadway. Separated Bicycle Lanes (Class II) provide a striped, marked and signed bicycle lane buffered from vehicle traffic. These facilities are located on roadways and require a minimum of four to five feet of space for exclusive bicycle traffic. Bicycle Lanes (Class II) provide a striped, marked and signed lane for bicycle travel. These one-way facilities are located on roadways and reserve a minimum of four to five feet of space for exclusive bicycle traffic. Bicycle Routes (Class III) provide a shared travel lane marked and signed for shared use with motor vehicle traffic. These facilities may or may not be marked with "sharrows" to emphasize that the roadway space is shared. Bicycle facilities located within or near the Parnassus Heights campus site are described above as part of the description of local roadways.

Bicycle counts were collected along Parnassus Avenue, near Moffitt Circle, and Irving Street, near Second Avenue between 7:00 AM and 7:00 PM on a typical weekday in 2007 and again on Parnassus Avenue in 2013 during the same time period. In 2007, Irving Street/Carl Street, despite the fact that it has no official bicycle route designation, carried approximately four times as many bicycles as Parnassus Avenue, which is a designated bicycle route. In 2007, higher volumes along Irving Street and Carl Street were likely the result of the street being relatively flat compared to Parnassus Avenue or the result of the UCSF bicycle cage being located on the ground level of the Millberry Union Garage, which has an entrance at Second Avenue/Irving Street. In 2013, bicycle counts along Parnassus Avenue had increase four-fold when compared to 2007, paralleling the uptick in bicycle use throughout the city that has been reported by the SFMTA and seen anecdotally on key corridors, such as Market Street.

UCSF provides free, secured bicycle parking inside a bicycle cage in the Millberry Union Garage. There are bike racks at five additional locations throughout the campus site: from east to west, they are at the Langley Porter Psychiatric Institute, Medical Building 1, the Kalmanovitz Library, the Clinical Science building and the Dental Clinics building. There are also on-street bicycle racks

located along Parnassus Avenue; however, most bicyclists are encouraged (by signs) to park in the designated bicycle parking areas in the campus site buildings. During site visits conducted in 2013, all of the designated bicycle parking areas were at near capacity, and numerous bikes were found to be parking on the street at parking meters and sign poles, indicating a high demand for bicycle parking facilities. Through the on-going monitoring of bicycle facilities, UCSF has since responded to user feedback about crowded bicycle parking facilities by doubling the capacity of the Millberry Union Garage bicycle cage and installing a new bike fix-it station.

6.14.2.7 Loading Conditions

The Parnassus Heights campus site has both service vehicle and passenger loading. There are 10 service vehicle loading facilities (with a total of 17 truck loading spaces) serving the existing uses on the campus site. This excludes the 30 on-street service vehicle spaces along Parnassus Avenue. Passenger loading takes place in the Moffitt Loop, located on Parnassus Avenue in front of Moffitt Hospital, or in passenger loading zones located along Parnassus Avenue.

The loading area located on Parnassus Avenue in front of the Medical Building 1 serves passenger vehicles, service vehicles, emergency vehicles, and is the drop-off location for valet service. This area in particular can become congested throughout the day, sometimes leading to vehicles blocking a lane of traffic as passenger and service loading occurs. Although all the loading areas are used regularly for building deliveries, the Central Receiving Area and Long Hospital are typically the busiest locations throughout the day.

6.14.2.8 Parking Conditions

On-Street Parking

Parking is available on most streets near the Parnassus Heights campus site, primarily with parallel parking on both sides of the street. However, due to the steep topography of the area, parking spaces perpendicular to the direction of travel are provided on some streets, on one side of the street only. A variety of parking regulations apply, with the majority of the spaces subject to Residential Parking Permit (Zone "J") restrictions (two-hour parking, except for residents, Mondays through Friday from 8:00 AM to 5:00 or 6:00 PM). Other parking spaces have meters and/or allow parking only during the non-peak commute periods.

Parking occupancies are about 85% on average over the course of the day. The parking demand in this area is primarily associated with the UCSF campus during the mid-morning (10:00 AM – 12 Noon) and midday (12 Noon – 2:00 PM) periods, and the residential and nearby neighborhood commercial uses during the evening period. These parking occupancies do not consider residents who park in their own driveways, which is typical in this area given the high parking demand.

Off-Street Parking

There are several UCSF-managed off-street parking facilities in the vicinity of the Parnassus Heights campus site that provide approximately 2,700 public and permit-only parking spaces. These include:

- Millberry Union / Kalmanovitz Library garage, located between Judah Street and Irving Street, with about a 1,075 vehicle capacity, of which approximately 1,000 spaces are available to the general public, and the rest are reserved to UCSF faculty and staff. In addition, staff, faculty, and students may purchase monthly "afternoon" parking permits to park in this garage on weekdays from 2:30 PM to 8:00 AM and anytime on the weekend.

- Medical Building 1 (Ambulatory Care Center) garage, located adjacent to the Millberry Union Garage, at the Irving Street / Arguello Boulevard intersection, with 1,007 marked parking spaces and the capacity to accommodate 330 additional vehicles with attendant parking. Permit parking is available for faculty, house staff, and senior management.

- Proctor surface lot is located south of Kirkham Street near the intersection of Fifth Avenue and provides 16 spaces available by permit.

- The Westside surface lot behind the Dental Clinics Building at Fourth Avenue and Kirkham Street, on the western edge of the campus site. There are 151 parking spaces; about 81 spaces are reserved for permit parking.

- Beckman surface lot is located on Koret Way across from the Beckman Vision Center, and provides 76 parking spaces, with 13 spaces available for public parking.

- The Environmental Health and Safety Building has a 9-space surface parking lot, off Medical Center Way, available by permit.

- The Surge and Woods lots form a 158-space surface parking lot located off Medical Center Way above the Parnassus Heights campus site. Parking permits for this location are issued for staff.

- The Langley Porter Psychiatric Institute has a 21-space surface parking lot, off Medical Center Way at the eastern edge of the campus site, available by permit.

- The Emergency Room parking area is accessed off Parnassus Avenue at the southeast end of the campus site and provides 23 parking spaces reserved for ambulances, emergency patients, and for designated radiation and chemotherapy patients.

- Aldea surface parking lots are located within the Aldea Housing Area in the southern portion of the campus site and contain 192 parking spaces reserved to UCSF residents.

In addition, the Kezar surface lot is a city-owned parking facility adjacent to Kezar Pavilion on Stanyan Street. UCSF has about 100 spaces reserved for staff and faculty use during the day. UCSF shuttle bus service is provided every 10 to 20 minutes on average between the lot and the campus from 5:30 AM to 9:00 PM.

The overall occupancy of the spaces in the above-described parking facilities is about 88% between 10:00 AM and 2:00 PM, and about 50% between 6:00 PM and 8:00 PM. An occupancy above 90% typically represents that the facility is at is effective capacity.

6.14.3 Transportation and Traffic – Parnassus Heights Campus Site Impacts and Mitigation Measures

6.14.3.1 Impact Methodology

Analysis Approach

The transportation analysis in this EIR considers operations-related issues related to vehicular traffic, transit facilities, pedestrians, bicyclists, and parking, as well as construction-related impacts, associated with implementation of the 2014 LRDP at the Parnassus Heights campus site. To determine potential impacts on the transportation system, it was first necessary to establish the background transportation conditions for the horizon years. Future year background conditions for the LRDP are based on the countywide travel demand model developed and maintained by the San Francisco County Transportation Authority (SFCTA).

Vehicle, pedestrian, bicycle, and transit travel demand associated with the 2014 LRDP was estimated based on factors developed from extensive surveys conducted at existing UCSF facilities over the past few years, and through the use of a four-step process: trip generation, mode split, trip distribution, and trip assignment. In the first step, the number of person trips generated by the 2014 LRDP was estimated on a daily, AM and PM peak hour basis. Next, the person trips were assigned to different modes of travel (automobile, transit, UCSF shuttle, bicycles, etc.). Then, the geographic distribution of the trip origins and destinations was predicted, and finally, project trips for each mode were assigned to specific streets, UCSF shuttle routes and transit lines along the transportation network.

Travel Demand Estimates

The 2014 LRDP proposes various levels of growth at each campus site through the plan horizon year of 2035. Some known projects, such as Phase 2 of the Medical Center in Mission Bay, are currently projected to occur between 2035 and 2040, after the 2014 LRDP horizon year, but have been incorporated into the travel demand estimates presented in this document, As such, the transportation analysis represents a conservative approach as it includes development five years past the 2015 LRDP horizon, to the year 2040. Each campus site is expected to increase in population through the 2014 LRDP horizon year of 2035, with the highest growth expected at the Mission Bay campus site.

The Parnassus Heights campus site is estimated to generate a total of approximately 3,055 new daily person trips by 2040. That number of trips reflects the total number of additional person trips that would be generated by the increased campus site population, but it does not reflect trips associated with the internal trips expected to occur within the campus site. An internal trip is a trip with its origin and destination within the same campus site (e.g., a researcher at the Parnassus Heights campus site traveling from her office to the Millberry Union to eat lunch and returning back to her office afterwards). Taking those internal trips into account, the Parnassus Heights campus site is estimated to generate approximately 1,928 new external daily person trips by 2040.

"Mode choice" is the designation of trips to the various means that people use to travel, such as automobile, transit, walking, bicycling, taxi, or other mode of transportation. The determination of the mode of transportation used in trips to and from the Parnassus Heights campus site would depend on many characteristics of the trip (e.g., the population group: that is, faculty, staff, vendor, patient, visitor), the type of trip (work, visit), and the specific site. Travel mode split and average vehicle occupancy assumptions were based on information collected by UCSF and its consultants, with the estimates of the future modal share based on the current modal splits for each campus site by population type, which take into account the transit accessibility, UCSF shuttle service, parking availability, and TDM measures being provided at each campus site; this approach is consistent with the travel demand methodologies established by the SF Planning Department. The majority of Parnassus Heights campus site trips arrive/depart the campus site by taking public transit or the UCSF shuttle service. The 1,928 external daily person trips generated by the Parnassus Heights campus site are expected to use the following travel modes:

274 Auto Drive Alone
107 Drop-Off/Taxi
48 Carpool/Vanpool
400 Public Transit
637 UCSF Shuttle
171 Bicycle/Motorcycle
291 Walk

The auto drive alone, drop-off/taxi, carpool/vanpool, and UCSF shuttle person trips would generate about 405 daily vehicle trips.[15]

Approximately 95 new vehicle trips would occur during both the AM and PM peak hour. There would be approximately 190 new transit riders in the AM peak hour and 170 new transit riders in the PM peak hour, with a majority of transit users using Muni and the UCSF shuttle bus service.

The new trips associated with the Parnassus Heights campus site were assigned to San Francisco and regional origins/destinations, including the four San Francisco Superdistricts (northeast, northwest, southeast, and southwest quadrants of the City), the East Bay, the North Bay, and the South Bay, as well as areas outside the Bay Area region. Information collected by UCSF as part of its yearly commute surveys of employees, patients, visitors and residents was used in this analysis.

6.14.3.2 Construction Period Impacts

Impact TRAF-PH-1: Implementation of the 2014 LRDP on the Parnassus Heights campus site could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during demolition and construction activities. (Potentially Significant)

Impacts associated with demolition and construction activities that would occur as the 2014 LRDP is implemented are addressed in Chapter 5 (**Impact TRAF-LRDP-1**). That 2014 LRDP

[15] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

Plan-Level analysis determined that although construction activities would be temporary, construction impacts would be considered potentially significant given the magnitude of 2014 LRDP development over the course of many years and need for on-going coordination and monitoring. The potentially significant determination would apply to the 2014 LRDP elements on the Parnassus Heights campus site. The implementation of LRDP **Mitigation Measure TRAF-LRDP-1: Construction Coordination and Monitoring Measures** would reduce construction-period impacts to less-than-significant levels.

Mitigation Measure: Implement **Mitigation Measure TRAF-LRDP-1**

Significance after Mitigation: Less than Significant

6.14.3.3 Operational Impacts

Impact TRAF-PH-2: Implementation of the 2014 LRDP on the Parnassus Heights campus site would increase traffic at intersections on the adjacent roadway network. (Less than Significant)

Table 6.14-2 presents a summary comparison of Existing and Existing plus 2014 LRDP intersection LOS for the weekday AM and PM peak hours. In general, the addition of 2014 LRDP-generated traffic would result in small changes in the average delay per vehicle at the study intersections, and all study intersections would continue to operate at the same service levels as under Existing conditions. While the great majority of the study intersections operate at acceptable levels of service (LOS D or better) under both AM and PM peak hour conditions under Existing conditions, and would continue to operate acceptably under Existing Plus 2014 LRDP conditions, the following five study intersections (listed by intersection number in Table 6.14-2) currently operate at unacceptable levels of service (LOS E or F), and would continue to operate at the same LOS under Existing Plus 2014 LRDP conditions:

1. Oak Street – Fell Street – Kezar Drive / Stanyan Street (PM peak hour)
2. Lincoln Way / Ninth Avenue (PM peak hour)
4. Lincoln Way / Fourth Avenue (AM peak hour)
15. Judah Street – Parnassus Avenue / Fifth Avenue (PM peak hour)
21. Kirkham Street / Seventh Avenue (AM peak hour)

For these five intersections, the 2014 LRDP's contribution to the intersection's critical movements was calculated to determine if the 2014 LRDP would have a significant impact, and in each case, the 2014 LRDP contribution would not be considered significant. Therefore, the 2014 LRDP's traffic impact at intersections on the adjacent roadway network would be considered less than significant.

Mitigation: None required.

[a] AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled

[b] Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersections, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach (indicated in parentheses).

[c] For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For unsignalized intersections, LOS is based on the worst approach, which for AWS is indicated in parentheses.

[d] **Bold** indicates unacceptable operations per UCSF LOS standards

SOURCE: Fehr & Peers, 2014.

Impact TRAF-PH-3: Implementation of the 2014 LRDP on the Parnassus Heights campus site would increase transit ridership demand. (Less than Significant)

As described in 6.14.3.1 above, approximately 190 and 170 new transit trips are expected during the AM and PM peak hour, respectively. About 50% of transit users will use a UCSF shuttle, and about 30% will use Muni, to commute to and from the campus site, with the remaining transit riders using BART, AC Transit, Caltrain, SamTrans or Golden Gate Transit.

San Francisco Muni. Existing Muni transit stops are located within a half-mile of the center of campus site, with multiple stops located through the campus site on Parnassus Avenue and adjacent to the campus site on Ninth Avenue, Irving Street and Lincoln Way. Major stop relocations adjacent to the campus site are not anticipated at this time. As part of the *Parnassus Avenue Streetscape Plan*, UCSF proposes that Muni consolidate the three transit stops on Parnassus Avenue into two transit stops in order to improve Muni's operating efficiency and provide more flexibility with respect to curb space allocation. The TEP proposes to reduce headways for the following routes: 43 Masonic, 44 O'Shaughnessy, and 71/71L Haight-Noriega.

The estimated number of 2014 LRDP-generated Muni trips is about a 2% increase in ridership traveling to and from the Parnassus Heights campus site, which would not require the expansion of transit service or facilities. Additionally, none of the specific proposals of the 2014 LRDP would reconfigure, or reduce access to, transit stops in a way that would degrade transit service to the campus site. Therefore, the 2014 LRDP's transit impact on Muni service would be considered less than significant.

Regional Transit. UCSF staff, patrons and students are anticipated to continue to use BART, AC Transit, Caltrain, SamTrans, and Golden Gate Transit for regional transit service through the 2014 LRDP horizon year. Regional service stations are likely to remain at existing locations, over a half-mile away, and can be accessed by other transit modes such as SF Muni and the UCSF shuttle. Fewer than 20 new regional transit trips are expected during each AM and PM peak hours, and that increase would not require the expansion of regional transit service or facilities. Therefore, the 2014 LRDP's transit impact on regional transit service would be considered less than significant.

UCSF Shuttle. As part of the Parnassus Avenue Streetscape Plan, UCSF will reorganize UCSF shuttle operations by centralizing pick-up and drop-off locations. Existing shuttle stations located at the campus site gateways will be relocated to the center of the campus site on Parnassus Avenue, fronting the campus library in the westbound direction and the Clinical Sciences building in the eastbound direction. The 2014 LRDP does not propose specific changes to shuttle service headways, although UCSF Transportation Services may change headways based on shifting shuttle demand as 2014 LRDP projects are constructed and occupied at each respective campus site.

An approximately 15% increase in UCSF Shuttle ridership during both peak hours is anticipated through the 2014 LRDP horizon year, and that increase would not require the expansion of UCSF shuttle service or facilities. Therefore, the 2014 LRDP's transit impact on UCSF Shuttle service would be considered less than significant.

Mitigation: None required.

Impact TRAF-PH-4: Implementation of the 2014 LRDP on the Parnassus Heights campus site would not cause a substantial conflict with pedestrian facilities, or otherwise decrease the performance or safety of such facilities. (Less than Significant)

UCSF proposes a variety of improvements to pedestrian and transit facilities at the campus site. The *Parnassus Avenue Streetscape Plan* proposes to make crossing Parnassus Avenue safer and more convenient for pedestrians, reorganize and improve transit and UCSF shuttle operations, create more usable outdoor space, and enhance the public realm. The *Parnassus Avenue Streetscape Plan* also proposes to modify the existing UCSF shuttle stops from the gateways of the campus site to a central location fronting the campus library in the westbound direction and the Clinical Sciences Building in the eastbound direction. In addition to the *Streetscape Plan*, the 2014 LRDP proposes to construct new trails in the Mount Sutro Open Space Reserve.

The 2014 LRDP would add approximately 210 pedestrian trips to the surrounding streets (mostly transit-access trips) during the AM peak hour, and about 190 pedestrian trips during the PM peak hour. Pedestrian trips would primarily use Parnassus Avenue and Carl-Irving Streets to travel to the surrounding residential neighborhoods or to the commercial areas in the Inner Sunset and Cole Valley.

Major stop relocations for Muni service adjacent to the campus site are not anticipated at this time. In addition to the above-cited proposed UCSF shuttle stop changes, proposed changes to buildings along Parnassus Avenue would likely shift some pedestrian traffic to the New Hospital Addition near Hillway Avenue and to the potential future housing at Parnassus and Fifth avenues.

Overall, the 2014 LRDP would improve pedestrian accessibility on the campus site frontage through the Parnassus Avenue Streetscape Plan and new trails in the Reserve. The immediate area surrounding the Parnassus Heights campus site includes robust pedestrian facilities that provide access to nearby neighborhoods, commercial uses, and transit stops, and that would accommodate the new pedestrian trips generated by the 2014 LRDP in addition to the shifts in pedestrian traffic that would occur in the future. The 2014 LRDP would not create substantial conflicts between pedestrians and autos, bicyclists, or transit vehicles. Therefore, the 2014 LRDP's impact to pedestrian circulation and facilities at the Parnassus Heights campus site would be less than significant.

Mitigation: None required.

Impact TRAF-PH-5: Implementation of the 2014 LRDP on the Parnassus Heights campus site would not would not cause a substantial conflict with bicycle facilities, or otherwise decrease the performance or safety of such facilities. (Less than Significant)

The area around the Parnassus Heights campus site has a number of streets with bicycle lanes, and streets designated as bicycle routes, including Parnassus Avenue, Kirkham Street, Sixth Avenue, and Seventh Avenue. In addition, there are several bicycle paths and bicycle routes in

nearby Golden Gate Park. The Parnassus Heights campus site is within convenient bicycling distance of residential and commercial areas in surrounding neighborhoods. Within the campus site, the *Parnassus Avenue Streetscape Plan* proposes to convert the current Class III bicycle route to a Class II bicycle lane on steep portion of Parnassus Avenue, from Fifth Avenue to Third Avenue. The SF Bike Plan does not include any short- or long-term improvements in the campus site area.

The 2014 LRDP is expected to increase bicycle demand in the area by approximately 20 new trips during both the AM and PM peak hours. These trips would primarily occur on designated bicycle facilities in addition to other popular routes such as Irving and Carl streets, which connect to surrounding neighborhoods through the San Francisco Bike Route network. The increased bicycle demand would be accommodated at the campus site through additional bicycle parking provided as a part of UCSF's TDM program. In the near-term, UCSF plans to add one new bicycle cage and 20 new bicycle racks at the Parnassus Heights Campus Site. This would increase bicycle parking capacity and generally improve bicycle conditions on the campus site.

The expected increase in bicycle traffic would not represent a level that would adversely affect bicycle facilities on the campus site, nor would the 2014 LRDP create substantial conflicts between bicyclists and pedestrians, autos, or transit vehicles. Therefore, the 2014 LRDP's impact to bicycle circulation and facilities at the Parnassus Heights campus site would be less than significant.

Mitigation: None required.

Impact TRAF-PH-6: Implementation of the 2014 LRDP on the Parnassus Heights campus site would increase loading demand. (Less than Significant)

The San Francisco Planning Code requires that land uses, such as medical offices and hospitals, provide off-street loading spaces according to a prescribed schedule. The required loading supply was estimated based on that Code requirement, and the existing and proposed loading supply exceeds the Code requirement at the Parnassus Heights campus site.

The demand for loading spaces through the 2014 LRDP horizon year was calculated based on surveys from the Parnassus Heights campus site and methods described in the City's *Transportation Impact Analysis Guidelines for Environmental Review*. The existing peak hourly demand is estimated to be about 52 spaces on the Parnassus Heights campus site, and the 2014 LRDP horizon year peak hourly demand is estimated to be about 55 spaces.

It is expected that the estimated 2014 LRDP loading supply should be adequate for the estimated demand, however, as mentioned above, the campus sites are unique and should be monitored over time. This is considered a less-than-significant impact if UCSF continues to monitor loading operations and provide appropriate supply with guidance from the SF Planning Code and existing operations.

In addition to freight loading, there is a demand for passenger loading spaces, and in order to estimate passenger loading demand, the drop-off/taxi service mode split and a portion of the carpool mode split percentages presented in the Travel Demand Estimates discussion (Section 6.14.3.1) above was applied to the peak AM and PM peak-hour person trips. The peak-hour passenger loading demand is estimated to increase by approximately 5% at the Parnassus Heights campus site.

As indicated by observations made of very active loading areas that on occasion generate queues of vehicles awaiting entry, there is an existing deficit of passenger loading supply to accommodate the existing peak hour demand at the Parnassus Heights campus site. It should be noted that this deficit appears to be exacerbated during peak times by some vehicles not adhering to all peak hour parking and loading regulations. As part of the 2014 LRDP, the *Parnassus Avenue Streetscape Plan*, which seeks to alleviate parking and loading congestion among other goals, will be implemented. In addition to the *Parnassus Avenue Streetscape Plan*, as part of the New Hospital Addition, a new passenger loading loop, larger than the current Moffitt Loop and sized to compensate for the existing deficit of passenger loading supply, will be provided off Parnassus Avenue.

The combination of the Parnassus Avenue Streetscape Plan and new passenger loading loop at the New Hospital Addition will be sufficient to accommodate the estimated 2014 LRDP demand; therefore, the 2014 LRDP's impact to passenger loading is considered less than significant.

Mitigation: None required.

Impact TRAF-PH-7: Implementation of the 2014 LRDP on the Parnassus Heights campus site would increase parking demand. (Less than Significant)

Under the 2014 LRDP, additional parking would be provided on the Parnassus Heights campus site, as warranted by the proposed development (i.e., the number of any new parking spaces would be determined as projects are proposed). It is estimated that the number of parking spaces owned by UCSF at the Parnassus Heights campus site would increase by approximately 90 spaces (about 3%) by year 2040. The following list describes the currently proposed changes in parking supply:

- Upon demolition of the Laboratory of Radiobiology building, the remaining surface pad may be improved, then used for approximately 30 contractor-only spaces sometime between 2014 and 2019.

- Upon demolition of the Medical Research 4 building, the remaining lot may be graded and improved and used for approximately 30 contractor-only spaces sometime between 2014 and 2019.

- About 20 parking spaces at the Surge surface lot would be converted from permit holder to contractor-only parking sometime between 2014 and 2019.

- Upon demolition of the Koret Vision building, the remaining surface pad may be improved, then used for approximately 30 contractor-only spaces sometime between 2031 and 2035.

As described previously, the available on-street parking is well-occupied at the Parnassus Heights campus site, and has therefore not been considered as a resource for the future parking utilization analysis, which has focused instead on the availability of off-street parking. Assessment of the growth of peak parking demand under the 2014 LRDP shows that the future parking utilization at the Parnassus Heights campus site would be at its effective capacity. Because there would not be a shortfall in parking supply, the 2014 LRDP's impact to parking demand is considered less than significant.

Mitigation: None required.

6.15 Utilities and Service Systems

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Utilities and Service Systems are contained in Section 4.15 of this EIR. The CEQA Significance Standards presented in Section 4.15.3 are used to evaluate the potential utilities and service systems impacts of all proposed 2014 LRDP activities.

The overall effects on water supply, wastewater treatment, storm drainage facilities, solid waste disposal and energy demand resulting from implementation of the 2014 LRDP were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures*. No expansion of water, wastewater or storm drainage facilities beyond the standard service connections of future buildings to the City's existing infrastructure is anticipated at the Parnassus Heights campus site.

CHAPTER 7
Mission Bay Campus Site – Setting, Impacts and Mitigation Measures

7.0 Introduction

This chapter considers the existing conditions and describes the potential impacts of 2014 LRDP activities proposed at the Mission Bay campus site. Functional zones, space program, population at LRDP horizon and proposed LRDP development activities that would occur at the Mission Bay campus site were described in detail in Section 3.8.2 of Chapter 3, *Project Description*, and are summarized briefly below. The remaining 15 major sections of this chapter present the site settings and impacts for each of the 15 environmental topics.

7.0.1 Functional Zones

The proposed functional zoning diagram for the Mission Bay campus site is shown in **Figure 3-11**, in Chapter 3, *Project Description*. Functional zones on the North Campus of the Mission Bay campus site reflect the organizational structure of the original *Mission Bay Master Plan and Design Guidelines*. A second Housing functional zone is proposed on the northern edge of the North Campus on Block 15, identified for future housing use because of its proximity to off-site residential development under construction north of the Mission Bay campus site, and proximity to on- and off-site open space and a potential public school site on Block 14.

The majority of clinical uses are expected to be located on the South Campus in the Clinical functional zone, in support of the UCSF Medical Center at Mission Bay. However, several clinics have been developed as a secondary use within the Research functional zone in cases where there is a close functional relationship between clinical and research programs, and this is likely to continue in the future.

Parking functional zones are located near the periphery of the campus site so as to minimize vehicular traffic within the campus site. The two parking zones on Owens Street provide for parking expansion when it is needed to support future program growth.

The East Campus (Blocks 33 and 34) is functionally zoned for research and parking use, shown as a striped pattern on Figure 3-11 because the exact footprints for those uses have not yet been determined. When the locations of specific uses on the parcel are identified, the functional zones for the East Campus will be updated accordingly.

7.0.2 Space Program

The LRDP proposes an additional 2.40 million gsf in owned and leased buildings across all of UCSF's sites through 2035. The allocation of this growth at the Mission Bay campus site at LRDP horizon in 2035 is shown in **Table 7.0-1**, below. As noted previously, for the purposes of the EIR analysis, growth at the Mission Bay campus site at the LRDP horizon includes the Phase 2 Medical Center at Mission Bay. The total space in 2035 also includes Mission Hall and the Phase 1 Medical Center, both of which are under construction and expected to open in late 2014 and 2015, respectively the cancer outpatient building and development of Blocks 33 and 34 (East Campus).

TABLE 7.0-1
MISSION BAY EXISTING AND LRDP HORIZON GSF

Type of Space	Existing 2013 Total gsf	LRDP Horizon 2035 Total gsf
Instruction	102,000	249,000
Research	891,600	1,908,800
Clinical	30,600	1,795,300
Support		
Academic Support	102,400	222,300
Academic/Campus Admin	174,000	478,100
Campus Community	187,300	266,500
Logistics	32,200	187,900
Support Subtotal	495,900	1,154,800
Housing	387,400	786,100
Vacant/Alteration	19,200	34,900
Total	**1,926,700**	**5,928,900**

7.0.3 Population

The total projected UCSF population across all campus sites (including population associated with the Phase 2 Medical Center at Mission Bay) would increase by approximately 17,000 at the LRDP horizon. As shown in **Table 7.0-2**, below, the projected increase in population at the Mission Bay campus site would be approximately 17,000 in 2035.

TABLE 7.0-2
MISSION BAY EXISTING AND PROJECTED POPULATION

	Existing (2013)	Projected Population at LRDP Horizon (2035)	Change
Students	489	586	97
Faculty and Staff	3,851	15,393	11,542
Patients	153	2,407	2,254
Visitors	324	3,462	3,138
Total	**4,817**	**21,848**	**17,031**

7.0.4 Mission Bay – 2014 LRDP Proposals

As described in Chapter 5, the 2014 LRDP proposals at the four campus sites consist of three general activities: 1) demolition, 2) renovation, 3) construction of new facilities, and 4) circulation, open space, and utilities/infrastructure proposals. The 2014 LRDP proposals at the Mission Bay campus site are listed below:

Construction Proposals

- New Housing on Block 15
- Develop Additional Research Capacity on Blocks 16, 18A, 23A, 25B, 33 and 34
- Phase 1 Medical Center – Cancer outpatient building
- Phase 2 Medical Center[1]
- New parking structures on Blocks 18, 33/34, and 38

Circulation, Open Space, and Utilities/Infrastructure Proposals

- Block 15 pump station upgrade

Mission Bay – 2014 LRDP Proposal Construction Time Frames

Activities at the Mission Bay campus site to implement the 2014 LRDP proposals would occur between the year 2015 and the LRDP horizon in 2035. These are presented in **Table 7.0-3**, below.

TABLE 7.0-3
PROPOSAL CONSTRUCTION TIME FRAMES AT MISSION BAY

Proposal Title	Land Use	Gross Square Feet / Number of Residential Units
2015-2019		
Block 15	Housing	418,200 gsf / 523 units
Block 33	Research Building	275,000 gsf
Block 33/34	Parking Garage	167,500 gsf
Cancer Outpatient	Medical Building	124,500 gsf
Block P15 pump station	--	--
2020-2025		
Block 23A	Research Building	232,200 gsf
Block 34	Research Building	225,000 gsf
Block 18	Parking Garage-Phase 1	271,000 gsf
2025-2030		
Block 25B	Research Building	323,000 gsf
Block 16	Research Building	377,400 gsf
2030-2035		
Block 18A	Research Building and Parking Garage	193,000 gsf
Phase 2 Medical Center	Hospital and Parking Garage	793,500 gsf

[1] The Phase 2 Medical Center at Mission Bay is anticipated to be constructed after the LRDP horizon year of 2035: however, the impacts associated with its construction and operation are evaluated in this EIR in order to provide a conservative analysis of future development of the entire Mission Bay campus site.

7.0.5 LRDP Variant

As discussed in Section 3.8.2.3 of Chapter 3, *Project Description,* the East Campus (Blocks 33 and 34) is proposed to be developed with up to 500,000 gsf and 500 parking spaces, and would be functionally zoned for research and parking use. UCSF is also considering a variant that would develop Blocks 33 and 34 with clinical uses for a portion of the proposed 500,000 gsf. Although the amount of clinical space that may be developed has not yet been determined, up to about 250,000 gsf could be developed, with the remainder 250,000 gsf as research/office use. Similar to the 2014 LRDP proposal for Blocks 33 and 34, no specific UCSF programs have been identified yet to relocate to the site, and no specific building design is proposed. Proposed development would follow the *Mission Bay South Redevelopment Area Plan "Design for Development"* regarding building height, bulk, setbacks, maximum tower floorplate and other design matters. As with the Blocks 33/34 proposal under the LRDP, up to 500 parking spaces would be developed under this variant.

The LRDP Variant would have the same or similar effects as the proposed 2014 LRDP development for most of the environmental topics analyzed in the EIR. Those topics that would have different effects are discussed in the following sections of this chapter: Section 7.2, *Air Quality*; Section 7.6, *Greenhouse Gas Emissions*; Section 7.9, *Land Use and Planning*; Section 7.10, *Noise*; and Section 7.15, *Transportation and Traffic*.

7.1 Aesthetics

This section considers the setting and aesthetics impacts at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential Aesthetics effects are contained in Section 4.1 of this EIR. The CEQA Significance Standards presented in Section 4.1.3 are used to evaluate the potential aesthetics impacts of all proposed 2014 LRDP activities.

7.1.1 Aesthetics Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Bay campus site, the Initial Study concluded that:

- **Scenic resources.** No activities would result in an adverse impact to scenic resources within a state scenic highway. Therefore, no additional analysis of this issue is required.

7.1.2 Aesthetics – Mission Bay Setting

The Mission Bay campus site is located within the 303-acre Mission Bay Redevelopment Area in the Mission Bay neighborhood, north of the Potrero Hill and Dogpatch neighborhoods. The campus site is generally bounded by Mission Bay Boulevard South to the north, Owens Street to the west, Mariposa Street to the south and Third Street to the east. It is a relatively flat area characterized primarily by man-made visual landmarks, including the elevated Interstate 280 highway to the west. The campus site includes 42.2 acres north of Sixteenth Street (North Campus) and 14.4 acres south of Sixteenth Street (South Campus). Sixteenth Street serves as the primary gateway from the west into the Mission Bay area. The North Campus is bifurcated by Fourth Street; through the South Campus, Fourth Street transitions into a large pedestrian plaza and bicycle route, which serve the Medical Center.

Natural features in the vicinity include Potrero Hill, located southwest and elevated above the campus site, and San Francisco Bay, which serves as the major visual boundary to the east. Development in the immediate vicinity of the campus site consists largely of new research and office buildings of similar size and character to UCSF, as well as multi-family residential buildings. Beyond Interstate 280, to the west and south of the campus site, are the Showplace Square, Dogpatch and Potrero Hill neighborhoods, which consist of residential areas, commercial buildings and some industrial uses. Non-residential buildings in these neighborhoods are generally bulky, two- to three story warehouse or former light industrial structures.

The visual environment on the campus site is dominated largely by campus buildings as well as Koret Quad. Genentech Hall, the adjoining Byers Hall, Sandler Neurosciences Center, Arthur and Toni Rembe Rock Hall and the Rutter Center all surround Koret Quad. The roughly three-acre quad is a grassy, landscaped open space immediately north of Genentech Hall that serves as a gathering place for the public as well as the campus community. A housing complex consisting of four separate buildings ranging from 7 to 15 stories with a total of 430 units is located northwest

of Koret Quad. The Smith Cardiovascular Research building and Diller Cancer Research building are located north of the housing complex. Campus buildings generally have large rectangular footprints, an 85-foot height to the cornice line, a light-colored material palette of two-toned travertine and concrete for the skin, light green tinted glazing, arcades at the ground level and sculptural treatment of the rooftop mechanical equipment and exhaust stacks. The Rutter Center serves as a contrast to other campus buildings with its reddish color and 144-foot tower. The campus site includes three parking structures: Third Street, Community Center Garage (adjoining the Rutter Center) and Owens Street (on south campus).

Mission Hall, a faculty office building, is currently under construction at the northeast corner of Fourth and 16th Streets. Phase 1 of the Medical Center at Mission Bay is currently under construction on the South Campus and will open in early 2015. Phase 1 includes three specialty hospitals, a medical outpatient building, an energy center, and structured and surface parking.

7.1.2.1 Mission Bay South Redevelopment Area Plan "Design for Development"

The San Francisco Office of Community Investment and Infrastructure's (OCII) *Mission Bay South Redevelopment Area Plan "Design for Development"* contains objectives and policies that serve as design guidelines for future development in the plan area surrounding the UCSF campus site at Mission Bay. These guidelines support the creation of a pattern of streets, parks and buildings that yields a high-density, urban streetscape while preserving and maximizing views to and from the area. The *Mission Bay South Plan* intends for new development to recognize the physical transition from the higher elevations of Potrero Hill to the lower elevations of the shoreline, thus allowing taller buildings closer to Potrero Hill and stepping down to lower building heights closer to the shoreline. The plan establishes major public open space corridors and uses, building height limits, view corridors and other design guidelines throughout the plan area to ensure access to sunlight, to reduce wind effects and to create a diverse and pleasant urban environment.

7.1.2.2 UCSF Mission Bay Design Guidelines

Design guidelines were developed by UCSF for the Mission Bay campus site that address such features as building mass, scale, height, floor size, proportion and setbacks. The *Mission Bay Campus Master Plan and Design Guidelines* (CMPDG) is an internal UCSF planning tool to provide an overall framework for the physical development of the Mission Bay campus site. It sets forth basic principles to guide the design of individual buildings and landscaping projects with the understanding that buildout of the campus site would include designs by many different architects over time. The CMPDG is intended to be compatible with the design standards and guidelines of the *Mission Bay South Redevelopment Area Plan* "*Design for Development*."

7.1.2.3 UCSF Physical Design Framework

As discussed in Section 4.1.2.2, development at UCSF is also guided by the *Physical Design Framework*, which sets forth a vision for the physical development of all UCSF campus sites. It

serves as the foundation for UCSF to plan and design future projects according to a clear and consistent set of planning and design principles, guidelines and strategies. The *Physical Design Framework* contains six planning principles that are universally applicable to UCSF campus sites. They express key thematic concepts of Context, Connectivity, Cohesiveness, Collegiality, Community and Conservation. The *Physical Design Framework* also includes six planning and design strategies for the Mission Bay campus site: 1) Strengthen UCSF's Identity and Wayfinding, 2) Enhance the Pedestrian Spine, 3) Complete the Open Space Network, 4) Enhance the Campus Core, 5) Develop Opportunity Areas, and 6) Develop Transportation Facilities.

7.1.3 Aesthetics – Mission Bay Impacts and Mitigation Measures

Impact AES-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site would not have a substantial adverse effect on a scenic vista. (Less than Significant)

The *Mission Bay South Redevelopment Area Plan "Design for Development"* guidelines designated view corridors along street alignments to preserve the orientation and visual linkages to the Bay and Mission Creek, to nearby hills, the Bay Bridge and the downtown skyline; and to preserve orientation and visual linkages that provide a sense of place within Mission Bay. Buildings proposed for the Mission Bay campus site under the 2014 LRDP on Blocks 15, 16, 18, 23, and 25; the cancer outpatient building; or the Phase 2 Medical Center would not intrude on views of the Bay, downtown or nearby hills as viewed from public streets or pedestrian corridors. Proposed development on Blocks 33 and 34 would similarly comply with the *Mission Bay South Redevelopment Area Plan "Design for Development"* guidelines regarding view corridors. Therefore, the impact would be less than significant.

Mitigation: None required.

Impact AES-MB-2: Implementation of the 2014 LRDP at the Mission Bay campus site would not substantially degrade the existing visual character or quality of the site and its surroundings. (Less than Significant)

The 2014 LRDP includes proposed development of remaining and increased entitlement on Blocks 16, 18, 23, and 25; a new housing complex on Block 15; the cancer outpatient building; and the Phase 2 Medical Center. Although these building have not yet been designed, preliminary designs provide basic parameters for development on each block. As summarized from Chapter 3, *Project Description*, Block 15 would include a housing complex comprised of four or fewer buildings with an internal courtyard. Building heights would range from 55 feet along Mission Bay Commons to 120 feet along Fifth Street. On Block 16, one research and/or office building and a central utility plant, or alternatively, two research buildings may be built. The height of the proposed buildings on Block 16 would be similar in height to other research buildings on the campus site (85 feet), but would have setbacks of 30 feet at the 55-foot height along Mission Bay Boulevard South in accordance with the CMPDG. Block 18 is proposed to include one office and/or research building up to 160 feet tall. A separate or attached parking garage up to 110 feet tall could be built east of the

proposed building on Block 18. A full-size, multi-purpose sports field would be developed on the eastern portion of the block. An 85-foot tall research building is proposed for the western side of Block 23. Block 25 is proposed to include a research/office building on the eastern side of the block with all or a portion of the building constructed up to 160 feet in height. The cancer outpatient building would be approximately 105 feet tall, with an additional 20 feet to the top of the mechanical screen. Phase 2 of the Medical Center would include multiple buildings that would be consistent with the design features of the Phase 1 Medical Center. Two enclosed pedestrian bridges are proposed at the third and fourth floors across Fourth Street that would connect Phase 1 on the east side of Fourth Street to Phase 2 on the west side of the street.

Three visual simulations showing basic height and bulk of the proposed buildings from viewpoints shown on **Figure 7.1-1** are provided below. **Figure 7.1-2** shows proposed development on Block 16 looking southwest along Fourth Street. The similarity in building height for proposed development on Block 16 with other existing buildings along Fourth Street is evident in this view.

Figure 7.1-3 shows the proposed residential complex on Block 15 as viewed from the planned Mission Bay Commons (not part of UCSF). Development on Block 16 is also visible in the background. The proposed office/research building on Block 25 is depicted in **Figure 7.1-4**. This view also includes a simulation of the cancer outpatient building, which is anticipated to be constructed prior to 2035 as part of the Phase 1 entitlement for the Medical Center at Mission Bay. Mission Hall, which is currently under construction on the western portion of Block 25 as shown in the existing view, would not be visible from this viewpoint upon completion of the LRDP-proposed building and the cancer outpatient building. Proposed development on Blocks 33 and 34 would follow the *Mission Bay South Redevelopment Area Plan "Design for Development"* guidelines regarding building height, bulk, setbacks, maximum tower floorplate and other design matters.

Although changes in appearance at the Mission Bay campus site would be noticeable, new buildings would be built in accordance with UCSF's CMPDG, *Physical Design Framework* and *Facilities Design Guidelines* and would be consistent with the 2014 LRDP's Community Planning Principles regarding Building and Public Realm Design. As buildings on the Mission Bay campus site are proposed during the LRDP horizon, consideration will be given to the development of open space, landscape improvements in the adjacent streets and pedestrian connections per the *Physical Design Framework.* Courtyards may be included as part of project design to provide additional open space. Proposed buildings would be sited appropriately in the Research, Housing, or Parking functional zone, as delineated by the 2014 LRDP. The design guidelines would ensure that final building designs respond to the form of adjacent buildings (e.g., in terms of massing and height) and the overall context of the Mission Bay campus site and vicinity. Because the proposed buildings would be visually similar to existing buildings on the campus site, they would not substantially degrade the visual character of the site and its surroundings. Therefore, effects to visual quality and character regarding implementation of the 2014 LRDP at the Mission Bay campus site are less than significant.

Mitigation: None required.

Figure 7.1-4

Visual Simulation-Mission Bay

Impact AES-MB-3: Implementation of the 2014 LRDP at the Mission Bay campus site could create new sources of substantial light or glare which would adversely affect day or nighttime views in the area. (Potentially Significant)

Development at the Mission Bay campus site could increase ambient light levels due to light dispersion from the new buildings. Increases in night lighting could affect nighttime views in this area of the campus site or in the surrounding neighborhood. New light sources could include street lights, illuminated signage, exterior safety lighting and light emitted from building windows. Glare could be generated from reflective building materials. Because specific architectural features and building materials of the new buildings have yet to be determined, the proposed improvements have the potential to include reflective surfaces, such as metal and glass. The resultant glare could affect nearby residents, pedestrians and passing motorists. **Mitigation Measure AES-LRDP-1** would be implemented to reduce the impact to a less than significant level. By employing appropriate design standards and minimizing the quantity of reflective material used in new construction, light and glare impacts and impacts to views related to lighting could be reduced to less-than-significant levels.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-1

Significance after Mitigation: Less than Significant

Impact AES-MB-4: Implementation of the 2014 LRDP at the Mission Bay campus site could result in flood lighting during nighttime construction activities. (Potentially Significant)

Although construction operations are generally expected to take place during the day, some activities could be conducted at night to reduce noise, vibration or other effects on daytime office or research uses. To enable construction at night, flood lighting would be required. The use of night lighting would have the potential to disturb residents in neighborhoods near the campus site, and potentially also affect nighttime views. Night lighting of construction sites would be temporary and would cease upon completion of construction. **Mitigation Measure AES-LRDP-2** would be implemented to reduce the impact of nighttime work lighting to a less than significant level.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-2

Significance after Mitigation: Less than Significant

Impact AES-MB-5: Implementation of the 2014 LRDP at the Mission Bay campus site could create street-level winds that could be hazardous to pedestrians in the area. (Potentially Significant)

Prior wind tunnel tests for proposed UCSF Mission Bay buildings have demonstrated that existing wind conditions within the Mission Bay campus site have improved over time as planned buildings have been constructed in accordance with the *Mission Bay South Redevelopment Area*

Plan "Design for Development." This general trend is expected to continue as more buildings are constructed in the Mission Bay Redevelopment Area and on the Mission Bay campus site.

The existing pedestrian wind conditions on the remaining large vacant parcels of land in the south Mission Bay Redevelopment Plan Area can be characterized as windy to very windy. Prior wind testing clearly demonstrates that "equivalent" wind speeds[2] in open areas within the south Mission Bay Redevelopment Area typically reach 16 to 22 mph. In large parcels without buildings to slow the wind, typically as many as half to three-quarters of the open area might experience wind speeds that exceed the wind hazard criterion of Section 148 of the Planning Code. The duration of each such wind hazard is typically less than 10 hours per year. However, in locations near to or in the wakes of buildings, it is possible that wind accelerations and turbulence created by buildings could result in wind hazards with longer durations.

However, as more buildings are built and fill in vacant sites in the south Mission Bay Redevelopment Plan Area and on the campus site, wind speeds in pedestrian areas near buildings will generally continue to decrease. Groups of buildings such as those at the UCSF campus site or similar structures built according to the "*Design for Development Guidelines"* substantially slow the winds. Winds in the downwind reach of such buildings, although much slowed, tend to be much more variable in speed. Typically, the range of wind speeds expected in locations on and around those sites would be 2 to 3 mph lower, namely in the range of 13 to 19 mph.

Exceptions occur along wide streets and on blocks fronting open spaces, such as the Commons, where the wind can regain speed before reaching a building – there, the higher speed wind striking a building can be deflected to cause adverse winds around the base of that building. Similarly, if a building or tower is much taller than nearby buildings, it can deflect winds to ground level to cause adverse winds there.

Prior wind testing conducted for the UCSF Mission Bay campus site included testing in 2001 for Block 20 Housing, the UCSF Medical Center at Mission Bay in 2008, and for Mission Hall, Building 25A, in 2012. These tests provide sufficient information to characterize wind conditions on the campus site. Because wind testing requires models, basic building masses and shapes such as described in the LRDP or in the *Mission Bay South Redevelopment Area Plan "Design for Development"* were used to model program buildings or upwind buildings in the Redevelopment Area whenever such buildings had not yet been designed. Using bulk shapes for such buildings yields the best possible approximation of the future wind conditions with the building design being wind tested. If that project design changes or if the other future building designs substantially differ from those bulk building shapes used, the wind test results may not correctly simulate the wind effects of those actual designs; further, major changes in the basic shape, dimensions, or the orientation of a building can substantially alter its wind effects and can compromise prior test results. On the other hand, experience indicates that simply articulating the basic building masses, as often done in the design process, will improve the performance of each building with respect to wind effects, making the results conservative.

[2] Throughout this discussion, "wind speed" refers to equivalent wind speed (a metric defined in the San Francisco Planning Code Section 148 protocol that includes the effects of turbulence) that is exceeded 10% of the time.

Wind testing in 2001 for UCSF Block 20 housing included the few existing buildings and the project as designed, while most of the surrounding planned campus site structures were represented as simple bulk shapes, because no designs existed.

Wind testing in 2008 for the UCSF Medical Center at Mission Bay included more actual existing buildings and fewer bulk shapes. This test found that both the "*LRDP Phase*" and the "*Future Phase*" of the Medical Center would substantially improve wind conditions in the vicinity by reducing the number and duration of previously occurring wind hazards. The Medical Center *Future Phase* scenario would still result in a single remaining wind hazard at one location at the corner of Mariposa and Third Streets. As a result, continued actions under UCSF Mitigation Measure 4.1-7 from the *UCSF Medical Center at Mission Bay EIR*[3] and its predecessor City Mitigation Measure D.7 from the *Mission Bay Subsequent EIR*[4], or under **Mitigation Measure AES-LRDP-3,** which is the functional equivalent of these two mitigation measures, would be required to eliminate this hazard during the on-going design process for the Medical Center *Future Phase*.

UCSF Mitigation Measure 4.1-7 was based on Mitigation Measure D.7 7, *which* derives from City *Planning Code* Section 148, and simply applies that hazardous wind criterion to proposed projects within the Mission Bay Redevelopment Area. However, under the 2014 LRDP, these two measures are superseded by the **Mitigation Measure AES-LRDP-3,** which is functionally equivalent to these two measures, and which will apply to new UCSF buildings over 100 feet in height. Therefore, compliance with **Mitigation Measure AES-LRDP-3** will also insure compliance with the hazardous wind criterion of City *Planning Code* Section 148.

Subsequent wind testing in 2012 for Mission Hall, Building 25A, found that the final design of Mission Hall would result in generally lower wind speeds on and around Block 25 than were measured in the 2008 wind tests. The major difference was that bulk models were used in the 2008 wind tests to represent nearby Buildings 25A and 25B, but these building shapes were substantially changed in developing the Mission Hall design that was wind tested in 2012. Overall, the results of the 2012 wind testing showed that wind conditions would be sufficiently improved to eliminate three nearby wind hazards found in the 2008 test; note that the wind hazard location at Mariposa and Third Streets was not tested in 2012 because Mission Hall could have no effect on winds at Mariposa and Third Streets.

Blocks 33 and 34 are vacant, and existing wind speeds on Blocks 33 and 34 should be substantially higher than occur on the Mission Bay campus site west of Third Street. However, development of these blocks in accordance with the "*Design for Development Guidelines"* should improve wind conditions in the same way as Mission Bay campus site development has improved wind conditions on the campus site to date.

3 UCSF Medical Center at Mission Bay Environmental Impact Report, Certified by The Regents of the University of California, September 17, 2008, State Clearinghouse No. 2008012075.

4 City and County of San Francisco, *Final Mission Bay Subsequent Environmental Impact Report*, September 17, 1998, certified October 14, 1998, Notice of Determination filed November 3, 1998 (State Clearinghouse Number 1997092068).

Increasing the Mission Bay campus site's development capacity north of Sixteenth Street will increase the density of UCSF development there. The increased density of buildings designed in accordance with the "*Design for Development Guidelines"* would be expected to further reduce general wind speeds downwind, in the same way as discussed above and as demonstrated by improved wind conditions on the UCSF Mission Bay campus site.

In addition to buildings, landscaping that includes street trees and street furniture is planned to accompany development of the Mission Bay campus site. It is well-known that the presence of large street trees, plantings, and street furniture would improve wind conditions on sidewalks on the campus site, and further reduce wind speeds measured in the wind tests by varying amounts, with reductions expected to be in the range of 1 mph to 3 mph.

With respect to the Wind Hazard Criterion, the 2014 LRDP proposals within the 85-foot height of the *Mission Bay South Redevelopment Area Plan "Design for Development"* should improve general wind conditions on the Mission Bay campus site from the current setting by reducing the overall number of wind hazards and the overall duration of exceedences.

Although most buildings would be 85 feet or less in height, the "*Design for Development"* also allows for buildings greater than 100 feet in height. Given the current understanding of wind conditions at the Mission Bay campus site due to actual development in accordance with the *"Design for Development,"* as discussed above, wind testing of every building or any portion greater than 100 feet in height is not necessary. However, with implementation of **Mitigation Measure AES-LRDP-3** the proposed design for a building over 100 feet shall be evaluated by an expert to determine the potential to cause a wind hazard, and if such a hazard cannot be judged unlikely, the design shall be wind tunnel tested.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-3

Significance after Mitigation: Less than Significant

Impact AES-MB-6: Implementation of the 2014 LRDP at the Mission Bay campus site could substantially reduce sunlight or significantly increase shadows in public open space areas or could shadow the potential school site on Block 14. (Less than Significant)

Development proposed under the 2014 LRDP could cast shadows on nearby public open spaces in Mission Bay, namely the Mission Bay Commons and Bayfront Park. These open spaces are not under the control of the San Francisco Recreation and Park Department and therefore are not subject to the provisions of *Planning Code* Section 295. However, development under the 2014 LRDP would be designed to comply with the *Mission Bay South Redevelopment Area Plan* "*Design for Development,"* which prescribes building height limits and other design guidelines that protect the parks from shadow. The *Design for Development* states that "Shadow studies have determined that development complying with the Design Standards will reasonably limit areas of shadow on public open spaces during the active months of the year and during the most actives times of the day." No further shadow analysis is required unless a variance is sought from the Design Standards such as height, bulk, setbacks, and streetwall heights. UCSF development

would be consistent with the *Design for Development* Design Standards, so impacts of shading on public open space areas would be less than significant.

UCSF does not intend to seek a variance from the Design Standards, but if a variance were sought, the following criteria are discussed in the *Design for Development*:

> "… To reasonably limit areas of open space in continuous shadow for extended periods of time, the area of public open space in continuous shadow for a period of one hour from March to September between 10 am and 4 pm should not exceed the following percentages:
>
> | | |
> |---|---|
> | Mission Creek Park | 13% |
> | Bayfront Park | 20% |
> | Triangle Square | 17% |
> | Mission Bay Commons | 11% |

The Mission Bay Commons is defined as that one-block portion of the commons east of Third Street; shadow from development under the 2014 LRDP would not reach that open space during the criteria times quoted above.

However, the proposed structures on Blocks 15 and 16 (and the existing buildings on Block 17) would cast some shadow on the other portions of the Commons that lie north of these sites and west of Third Street. The maximum area of shadow cast on those other portions of the Commons at any of these criteria times would be less than 9% of the open space area.

Development on the East Campus is close to, and could cast shadows on the southern-most portion of Bayfront Park. However, shadowing of that part of Bayfront Park would occur only in the latter half of the last hour of these criteria times, and the largest area of shadow at that time would be roughly a few percent of the total area of the park.

Therefore, project shadow would not reach the Mission Bay Commons (the protected one-block portion of the commons east of Third Street). Project shadowing on the other portions of the Commons open spaces would be less than the 11% criterion for the Commons. Project shadowing of Bayfront Park would occur in the last hour of the criteria times, and the largest area of shadow would be an order of magnitude less than the park's criterion of 20% shadow coverage. By conforming to these design standards, the development proposed under the 2014 LRDP would remain well within the shadowing criteria established by the "*Design for Development"* and therefore would have a less than significant impact on shadowing of public open space.

Development proposed under the 2014 LRDP also would cast shadows on the potential public school site on Block 14. The "*Design for Development"* provides no guidance as to the shadow protection for the school site, but shadow that would occur during the school day would be important to the school. Shadows from development proposed on Blocks 18 and 15 under the 2014 LRDP would reach onto Block 14. Because development on Block 18 would be south of Block 14, that shadow would reach the site generally from mid-morning to early afternoon; these are the times of day when the Block 18 shadow would be relatively short, and would cover only a portion of the school site. Development of housing on Block 15, to the east of Block 14, would

cast shadow on portions of the adjacent school site beginning in early morning throughout the year, with Block 15 shadow leaving Block 14 by 9:30 am in December, by 11:00 am in March, and by 10:30 am in June.

The potential use of the site as a school would require a school building and the building itself would occupy space and cast its own shadows on the site as well, in a configuration that is not now known. Determining the effect of shadow from future development under the 2014 LRDP on a potential school is speculative given that the school site configuration is unknown.

Mitigation: None required.

7.2 Air Quality

This section considers the setting and air quality impacts of implementing the 2014 LRDP at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Air Quality are contained in Section 4.2 of this EIR, while the plan-level Air Quality impacts of the 2014 LRDP are described in Section 5.2. The CEQA Significance Standards presented in Section 4.2.3 are used to evaluate the potential Air Quality impacts of all proposed 2014 LRDP activities.

7.2.1 Air Quality Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Bay campus site, the Initial Study concluded that:

- **Objectionable odors.** No activities would result in objectionable odors affecting a substantial number of people. Therefore, no additional analysis of this issue is required.

7.2.2 Air Quality – Mission Bay Setting

7.2.2.1 Sensitive Receptors

The sensitive receptors closest to the Mission Bay campus site are identified in **Figure 7.2-1**. On that campus site, existing sensitive receptors consist of the Mission Bay housing building on Block 20, a child care facility located on Block 18 and Koret Quad, which could be considered a recreational receptor. The hospital under construction will be a sensitive receptor when opened. Off-campus receptors consist of residential land uses approximately 300 feet northeast of the campus site, residential land uses approximately 650 feet northwest of the campus site (across Mission Creek) and residential land uses in Potrero Hill over 1,000 feet southwest of the campus site (on the west side of I-280 and south of Sixteenth Street). Additionally, there are recreational receptors (parks) located north west and northeast of the campus site.

7.2.2.2 Existing Stationary Sources of Air Pollution

The BAAQMD's inventory of permitted stationary sources of emissions identifies 18 permitted stationary emission sources present within or near the 1,000-foot zone of influence of the campus site. These permitted facilities are inventoried in **Table 7.2-1** and are primarily made up of stationary diesel engines for back-up power generators or fire water pump engines.

The Mission Bay campus site also operates fume hoods which emit TACs. These fume hood emissions do not require a permit from BAAQMD based on the operating throughput and therefore have not been assigned an existing risk value in BAAQMD databases like permitted sources. However, UCSF maintains an inventory of chemical throughput for each campus site and has prepared health risk assessments relative to fume hood emissions and other stationary source emissions on the Mission Bay campus site. A 2009 health risk assessment performed for

the Mission Bay campus site identified health risks from boilers, fume hoods, emergency generators, microturbines and a future cogeneration turbine proposed for the campus. Risks associated with all of these sources were estimated at 8 in one million at the maximally exposed off-site receptor and 2 in one million for the individual maximally exposed on-site receptor (ENVIRON, 2009). An assessment of existing fume hood emissions at Genentech Hall alone prepared in 2011 indicated an increased cancer risk from fume hoods to be 0.0217 in one million at the nearest off-site receptor (UCSF, 2011).

7.2.2.3 Major Roadways and Railways Contributing to Air Pollution

Third Street, Sixteenth Street and Mariposa Street are arterial streets in the existing local roadway system within the 1,000-foot zone of influence that have at least 10,000 vehicles in annual average daily traffic based on the City's SF CHAMP roadway model.[5] This traffic contributes to elevated concentrations of $PM_{2.5}$, DPM, and other contaminants emitted from motor vehicles near

[5] San Francisco Metropolitan Transportation Agency, Chained Activity Modeling Process version 4.3.0, Average Daily Traffic Volumes, provided to ESA August 2, 2012.

the street level. Interstate 280 Bridge extends in a northerly alignment in the vicinity of the Mission Bay campus site, and is approximately 400 horizontal feet west of the campus site, with the lanes at an elevation of approximately 20 feet above ground level. Aside from the surrounding major roadways, the only other areas of mobile-source activity or otherwise "non-permitted" sources (e.g., railyards, trucking distribution facilities, and high-volume fueling stations) located within 1,000 feet of the campus site would be Recology (formerly Golden Gate Disposal Company), which operates a storage yard for its collection trucks on Seventh Street approximately 900 feet west of the Mission Bay campus site. Additionally, Caltrain operates 96 daily diesel locomotive trips on its tracks approximately 400 feet west of the campus site, below I-280.

7.2.3 Air Quality – Mission Bay Impacts and Mitigation Measures

Impact AIR-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site would result in increased emissions of criteria air pollutants during construction activities. (Potentially Significant)

Construction activities under the 2014 LRDP at the campus site would result in emissions of criteria pollutants from the use of heavy-duty construction equipment, haul truck trips, and vehicle trips generated from construction workers traveling to and from the campus site. In addition, fugitive dust or PM_{10} emissions would result from excavation, trenching, and other construction activities.

Construction-related emissions from 2014 LRDP proposals were calculated using the California Emissions Estimator Model (CalEEMod), assuming four discrete construction windows in five year increments. These windows are presented in **Table 7.0-3**, Proposal Construction Time Frames at Mission Bay, located in Section 7.0.4 of this chapter.

Modeling assumed construction phasing lengths based on CalEEMod default estimates, which are based on square footage for hospitals and research/office uses. All model inputs and outputs are provided in Appendix E. Emissions for the 2015-2020 construction window included equipment operations and export of 9,000 cubic yards of soil for surcharging of building pads of Blocks 15 and 18.

Table 7.2-2 presents the average annual daily construction emissions generated by the development under the 2014 LRDP at the Mission Bay campus site. As can be seen in Table 7.2-2, estimated average daily construction-related exhaust emissions would not exceed the thresholds for ROG, NOx, or particulate matter.

The BAAQMD approach to analysis of construction-related particulate impacts (other than exhaust PM) emphasizes implementation of effective and comprehensive dust control measures rather than detailed quantification of emissions. As indicated under Impact AIR-LRDP-4 in Section 5.2 of this EIR, the BAAQMD considers construction-related fugitive dust impacts of projects to be less than significant if a suite of recommended dust-control measures are

TABLE 7.2-2
AVERAGE DAILY CONSTRUCTION-RELATED POLLUTANT EMISSIONS WITHOUT MITIGATION - MISSION BAY

Years	Estimated Emissions (lbs/day)			
	ROG	NO_x	Exhaust PM_{10}	Exhaust $PM_{2.5}$
2015-2019	16.42	38.92	1.86	1.74
2020-2024	8.65	19.70	0.86	0.81
2025-2030	7.75	14.67	0.55	0.51
2031-2035	15.72	15.76	0.36	0.35
BAAQMD Considered Construction Threshold	54	54	82	54
Potential Significant Impact?	No	No	No	No

implemented. Therefore, BAAQMD-identified Best Management Practices for control of fugitive dust are adopted Campus-wide in Section 5.2 as **Mitigation Measure AIR-LRDP-1: Best Management Practices for Controlling Particulate Emissions.** With this measure in place the construction-related fugitive dust impacts would be less than significant.

Mitigation Measure: Implement Mitigation Measure AIR-LRDP-1

Although the criteria air pollutant emissions from demolition and construction proposals at the Mission Bay campus site would be below BAAQMD significance thresholds, **Impact AIR-LRDP-4** in Section 5.2 identifies a significant and unavoidable LRDP construction-related air quality impact resulting from emissions of criteria air pollutants when the combined construction at all campus sites is considered. In response, **Mitigation Measure AIR-LRDP-2: Architectural Coatings** and **Mitigation Measure AIR-LRDP-3: Off-Road Equipment Control Measures** were adopted Campus-wide and therefore would also apply to construction projects at the Mission Bay campus site.

Mitigation Measures: Implement Mitigation Measure AIR-LRDP-2 and AIR-LRDP-3

Significance after Mitigation: Less than Significant

Impact AIR-MB-2: Construction activities at the Mission Bay campus site under the 2014 LRDP would increase emissions of toxic air contaminants (TACs) and increase health risks for nearby residents. (Potentially Significant)

Construction activities under the 2014 LRDP at the Mission Bay campus site would produce DPM and $PM_{2.5}$ emissions due to combustion equipment such as loaders, backhoes, and cranes, as well as haul truck trips. These emissions result in elevated concentrations of DPM and $PM_{2.5}$ at nearby receptors (both new and existing residences and schools) near the campus site. These elevated concentrations could lead to an increase in the risk of cancer or other health impacts.

Consequently, a health risk assessment was performed to determine the extent of increased cancer risks and hazard indices at the maximally exposed receptors. The health risk assessment was based on recommended methodology of the state Office of Environmental Health Hazard Assessment and adopted by BAAQMD. Detailed assumptions and methodology for the health risk assessment are included in Appendix E. For the Mission Bay campus site, the closest new residences (a total of approximately 330 receptors) would be located at Mission Bay housing within Block 15 along Mission Bay Boulevard North. Additional existing residences are located at Mission Bay housing within Block 20. One daycare is located in the immediate vicinity and approximately 200 recreational receptors (Campus Sport Field, Koret Quad, and Mission Creek Park) were included in the analysis. Nearly 840 receptors were included in the analysis, which used the annual mass construction emissions as predicted by CalEEMod and determined annual average concentrations of DPM and $PM_{2.5}$ which were then used to calculate risk values.

A summary of the health impacts related to construction under the 2014 LRDP at the Mission Bay campus site is presented in **Table 7.2-3**.

TABLE 7.2-3
CONSTRUCTION-RELATED HEALTH IMPACTS – MISSION BAY

Receptor Type	Cancer Risk (cases per million Persons)	Chronic Impact	Acute Impact	PM2.5 Concentration ($\mu g/m^3$)
New Residence (adult / child)	0.63 / 7.11	0.01	0.08	0.07
School Children	0.35	0.01	0.01	0.03
Existing Residence (adult / child)	0.73 / 8.21	0.01	0.17	0.05
BAAQMD Significance Criteria	10	1	1	0.3
Significant Impact?	No	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

Subsequent to the preparation of the health risk assessment, development of Blocks 33 and 34 were added to the long-term projects under the 2014 LRDP Project Description. Construction on these blocks would add incrementally to the risk values in Table 7.2-3. However, CEQA review for development of these blocks assuming a research and development land use was addressed in the *Mission Bay Subsequent EIR*. That document identified a significant impact with regard to operational TAC emissions and identified Mitigation Measure F.03 with regard to TAC emissions to reduce the impact to less than significant. Because the analysis of Blocks 33 and 34 has already undergone CEQA review, implementation of Mitigation Measure F.03 would be required of future development. This mitigation measure has been identified for development of Blocks 33 and 34 as **Mitigation Measure AIR-MB-1**.

As shown in Table 7.2-3, the maximum cancer risk for a new residence-adult and residence-child associated with the project (Mission Bay housing within Block 15) would be 0.6 and 7.1 cancer cases per million persons, respectively. The maximum cancer risk for an existing residence-adult

and residence-child (Mission Bay housing within Block 20) would be 0.7 and 8.2 cancer cases per million persons, respectively. Thus, the cancer risk due to construction activities alone is below the BAAQMD threshold of 10 cancer cases per million persons and would be less than significant. No school children receptors are located within the campus site, but a potential San Francisco Unified School District school site is located at Block 14, the northwestern most parcel of the campus site. Potential impacts to future school children receptors at this site are considered in Section 10.2, *Cumulative Impacts*.

The chronic HI would be less than 0.01 at all receptors. The chronic HI would be below the BAAQMD threshold of 1 and the impact of 2014 LRDP activities would be less than significant. The acute HI would be less than 0.2 at all receptors including recreational receptors within the Campus Sport Field, Koret Quad, and Mission Creek Park. The acute HI would be below the BAAQMD threshold of 1 and the impact of 2014 LRDP activities would be less than significant.

The maximum annual $PM_{2.5}$ concentrations would be less than 0.1 $\mu g/m^3$ for the new residences associated with the 2014 LRDP, any future school on Block 14, and the existing residences. The construction-related annual $PM_{2.5}$ concentration resulting from 2014 LRDP activities is below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

> **Mitigation Measure AIR-MB-1:** Obtain written verification from BAAQMD that the facility has been issued a permit from BAAQMD, if required by law, or that permit requirements do not apply to the facility. (Modified from *Mission Bay Subsequent EIR Mitigation Measure F.03*)
>
> **Significance after Mitigation:** Less than Significant

Impact AIR-MB-3: Operations at the Mission Bay campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants. (Potentially Significant)

Development under the 2014 LRDP would result in an increase in criteria air pollutant and precursor emissions, including ROG, NOx, PM_{10} and $PM_{2.5}$ from a variety of emissions sources, including onsite area sources (e.g., natural gas combustion for space and water heating, landscape maintenance, use of consumer products such as hairsprays, deodorants, cleaning products, etc.) and mobile on-road sources. Operational emissions of criteria pollutants were estimated using the CalEEMod version 2013.2.2 emissions inventory model. All model inputs and outputs are provided in Appendix E.

One of the sources of operational emissions at the campus site would be increased vehicle emissions from additional staff, patients, visitors and residents. Traffic volumes used to estimate vehicle-related emissions were derived from the Transportation Demand Analysis prepared for the LRDP (Adavant, 2014). 2014 LRDP activities at the campus site would generate an estimated 12,175 additional daily vehicle trips during the weekday. In addition to exhaust emissions, vehicles would also generate PM_{10} and $PM_{2.5}$ from entrained road dust and tire and brake wear.

Emissions would also be generated by on-site natural gas combustion, operation of landscape maintenance equipment, and maintenance application of paint and other architectural coatings.

Table 7.2-4 presents estimated operational emissions from development under the 2014 LRDP at the Mission Bay campus site in 2035. As shown in the table, without mitigation, operational emissions of NOx, ROG, and PM_{10} would exceed the threshold levels, resulting in a significant impact. The primary contributing sources to ROG emissions would be the use of consumer products associated with over 2 million square feet of development, while for NOx emissions, the primary sources are vehicle emissions and natural gas combustion. PM_{10} emissions are primarily associated with vehicle trips.

TABLE 7.2-4
UNMITIGATED OPERATIONAL CRITERIA POLLUTANT EMISSIONS - MISSION BAY

Air Pollutant	Estimated Emissions (lbs/day)			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Mobile Sources[a]	23.14	39.20	65.38	18.32
Area Sources[a]	103.4	0.50	0.24	0.24
Natural gas combustion	3.82	34.69	2.64	2.64
Total	**130.4**	**74.39**	**68.26**	**21.20**
Regional Significance Threshold	54	54	82	54
Significant Impact?	Yes	Yes	Yes	No

a Mobile sources are motor vehicles and trucks. Area sources include landscape maintenance (equipment used for these activities such as gasoline-powered lawnmowers and blowers), maintenance application of paints and other interior and exterior surface coatings, and increased use of consumer products that result in emissions of ROG. Natural gas combustion is for space and water heating.

SOURCE: ESA, 2014 (see Appendix E).

Impact AIR-LRDP-5 identifies a significant operational air quality impact resulting from emissions of criteria air pollutants when operation at all campus sites is considered. In response, **Mitigation Measure AIR-LRDP-4: BAAQMD-Suggested Operational Measures** was adopted Campus-wide and therefore would also apply to operation of projects at the Mission Bay campus site.

Mitigation Measure: Implement Mitigation Measure AIR-LRDP-4

Significance after Mitigation: Significant and Unavoidable. Mitigation Measure AIR-LRDP-4 would not result in the 59% reduction necessary (for ROG) or 27% (for NOx) to reduce the impact to a less-than-significant level. This amount of traffic reduction exceeds the best reduction estimates for TDM programs (BAAQMD, 2012b). Assuming a conservative 12% reduction in vehicle miles travelled associated with TDM measures (CAPCOA, 2010), operational emissions of ROG at the Mission Bay campus site would be reduced to 126.8 pounds per day and emissions of NOx would be reduced to 62.68 pounds per day. Consequently, 2014 LRDP development at the campus site with implementation of feasible mitigations would still result in significant environmental effects on air quality and contribute substantially to an existing air quality violation (ozone precursors and particulate matter). Therefore, even with implementation of Mitigation Measure AIR-MB-4, this impact would remain significant and unavoidable for emissions of ROG, NOx and PM_{10}.

NOx and ROG emissions are a concern as ozone precursors. The health implications of this significant impact would result from the potential to contribute to increased violations of the air quality standards for ozone. As indicated in Table 4.2-1, state and federal standards for ozone have not been exceeded in the past five years of monitoring in San Francisco, so the degree to which project would substantially contribute to a future violation of the ozone standard would be expected to be minimal. Further, the extent to which these significant ozone precursor emissions would result in adverse health effects is not readily quantifiable on a local scale because "by its very nature, air pollution is largely a cumulative impact. No single project is sufficient in size to, by itself, result in nonattainment of ambient air quality standards" (BAAQMD, 2011).

Impact AIR-MB-4: Operations at the Mission Bay campus site under the 2014 LRDP would expose persons (new receptors) to substantial levels of TACs, which may lead to adverse health effects. (Potentially Significant)

The BAAQMD's *CEQA Air Quality Guidelines* include standards and methods for determining the significance of health risk impacts for new receptors resulting from the 2014 LRDP. The method for determining health risk requires the review of health risk from permitted sources and major roadways in the vicinity of a project (i.e., within a 1,000-foot radius of the source), then adding the project impacts to determine whether the health risk thresholds for new receptors are exceeded.

BAAQMD has developed a geo-referenced database of permitted emissions sources throughout the San Francisco Bay Area, and has developed the Stationary Source Risk & Hazard Analysis Tool (dated May 2011) for estimating cumulative health risks from permitted sources. Eight permitted sources are located within 1,000 feet of new residences associated with the 2014 LRDP and included in the cumulative analysis.

BAAQMD has also developed a geo-referenced database of major roadways throughout the San Francisco Bay Area and has developed the *Highway Screening Analysis Tool* (dated May 2011) for estimating cumulative health risks from roadways.

Fume hood emissions also contribute to exposure to TACs. As discussed in the setting section, these fume hood emissions do not require a permit from BAAQMD based on the operating throughput and therefore have not been assigned an existing risk value in BAAQMD databases like permitted sources. An assessment of existing fume hood emissions at Genentech Hall prepared in 2011 indicated an increased cancer risk from fume hoods to be 0.0217 in one million at the nearest off-site receptor (UCSF, 2011).

A summary of the cumulative health impacts for the new residences under the 2014 LRDP Mission Bay campus site is found in **Table 7.2-5**.

The health impacts from nearby sources in the area would have an impact on new receptors associated with the 2014 LRDP at the Mission Bay campus site, including new housing on Block 15 and relocated child care facilities. The highest cancer risk from any of the nearby sources would

TABLE 7.2-5
HEALTH IMPACTS FOR MAXIMALLY EXPOSED NEW RECEPTORS - MISSION BAY

Site #	Facility Type	Address/Source	Cancer Risk (persons per million)	Hazard Index	PM2.5 Concentration ($\mu g/m^3$)
13160	UCSF/Mission Bay[a]	600 16th Street	2.89	<0.01	0.01
17357	Alexandrea Real Estate	1700 Owens Street	3.26	<0.01	<0.01
15874	David Gladstone	1650 Owens Street	0.54	<0.01	0.02
19073	Alexandrea Real Estate	1500 Owens Street	1.11	0.01	<0.01
		Fume Hood Emissions	0.02	<0.01	<0.01
		Caltrain	14.3	0.01	0.02
		I-280	5.32	0.01	0.05
		4th Street	0.34	<0.01	0.01
		7th Street	0.29	<0.01	0.01
		16th Street	0.39	<0.01	0.01
		Proposed LRDP construction and traffic (adult/child)	0.65/7.13	0.01	0.07
		Highest Single Source Impact	14.3	0.01	0.07
		BAAQMD Significance Criteria (new receptor)	10	1	0.3
		Potentially Significant Impact?	Yes	No	No

[a] UCSF risks presented here were calculated using data provided by BAAQMD in response to a stationary source inquiry form request and their risk and hazard emission screening calculator at an approximated 800 foot distance of Genentech Hall from Block 15.

SOURCE: KB Environmental Sciences, Inc., 2014; BAAQMD, 2014.

be 14.3 persons per million from operations of Caltrain. This cancer risk value declines negligibly with receptor height (14.0 in one million at 20 feet and 13.6 in one million at 30 feet). Thus, the cancer risk for new receptors exceed the BAAQMD threshold of 10 per million and would be significant. Diesel locomotives used by Caltrain are predicted to be transitioned to electric-powered locomotives by 2025, at which point the increased cancer risk values would drop to zero. Notwithstanding this predicted improvement, **Mitigation Measure AIR-MB-4** is identified to reduce DPM exposure at the proposed housing and child care at Block 15 to a less than significant level.

The highest hazard index from other nearby sources would be less than 0.1; well below the BAAQMD threshold of 1 and the impact of the proposed residences at the campus site would be less than significant. The highest annual $PM_{2.5}$ concentrations would be 0.1 $\mu g/m^3$. This $PM_{2.5}$ concentration at new residences would be below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

Mitigation Measure AIR-MB-4: Particulate Filtration Systems for Block 15 Housing and Child Care.

Air Filtration and Ventilation Requirements for Sensitive Land Uses. As part of the building design, UCSF shall include a ventilation plan for the proposed housing and day care building. The ventilation plan shall show that the building ventilation system removes at least 80% of the outdoor $PM_{2.5}$ concentrations from habitable areas and be designed by

an engineer certified by ASHRAE, who shall provide a written report documenting that the system meets the 80% performance standard and offers the best available technology to minimize outdoor to indoor transmission of $PM_{2.5}$.

Maintenance Plan. UCSF shall prepare a plan that ensures ongoing maintenance for the ventilation and filtration systems.

Significance after Mitigation: Less than Significant

Impact AIR-MB-5: Operations at the Mission Bay campus site under the 2014 LRDP would cumulatively expose persons (existing and new receptors) to substantial levels of TACs, which may lead to adverse health effects. (Less than Significant)

The BAAQMD's *CEQA Air Quality Guidelines* include standards and methods for determining the significance of cumulative health risk impacts for new projects. The method for determining health risk requires reviewing health risks from permitted sources and major roadways in the vicinity of a project (i.e., within a 1,000-foot radius of the source), then adding the project impacts to determine whether the cumulative health risk thresholds are exceeded.

Development under the 2014 LRDP would also result in an increase in TACs from boilers, fume hoods, emergency generators, microturbines and a future cogeneration turbine proposed for the campus. A health risk assessment performed for the Mission Bay campus site identified health risks associated with all of these sources which were estimated at 8 in one million at the maximally exposed off-site receptor and 2 in one million for the individual maximally exposed on-site receptor (ENVIRON, 2009).

A summary of the cumulative health impacts for the existing residences for the Mission Bay campus site are found in **Table 7.2-6**.

The health impacts from the 2014 LRDP construction and operations plus other sources (permitted sources and roadways) in the campus site would have a cumulative impact on nearby receptors. The maximum cumulative cancer risk for existing residence would be 14.9 and 22.4 persons per million for residence-adult and residence child, respectively. Non-residential receptors such as the recreational users of the proposed sports fields would have a lesser impact due to reduced exposure durations compared to residential receptors, which conservatively assume a 70 year exposure. Thus, the cumulative cancer risk is below the BAAQMD threshold of 100 per million and would be less than significant.

The cumulative HI would be less than 0.1. The HI would be well below the BAAQMD threshold of 10 and the impact of the 2014 LRDP would be less than significant. The maximum cumulative annual $PM_{2.5}$ concentrations would be 0.2 $\mu g/m^3$. The cumulative annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.8 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

TABLE 7.2-6
CUMULATIVE HEALTH IMPACTS - MISSION BAY

SOURCE: KB Environmental Sciences, Inc., 2014; ENVIRON 2009.
** These existing sources are included in the 2009 HRA values that analyzed all campus wide stationary source emissions under the 2008 LRDP Update.

LRDP Variant Conditions

Under the LRDP Variant, the Mission Bay campus site would generate slightly more vehicle trips than under the 2014 LRDP. Approximately 2,950 new vehicle trips would be generated during the AM peak hour and approximately 2,450 additional vehicles at the campus site during the PM peak hour. These represent increases of approximately 2% in the total number of vehicles compared to the 2014 LRDP during both the AM and PM peak hours.

With an overall 2% increase in daily trip generation, this Variant would increase operational mobile criteria air pollutant emissions by approximately 2% (0.4 pounds per day of ROG, 0.78 pounds per day of NOx, 1.31 pounds per day of PM_{10} and 0.37 pounds per day of $PM_{2.5}$). Daily emissions of ROG and NOx from operations at Mission Bay would still exceed significance thresholds and daily emissions of PM_{10} and $PM_{2.5}$ would remain below significance thresholds which would be the same impact conclusion as under the 2014 LRDP. Consequently, the LRDP Variant would have the similar operational air quality impacts as Mission Bay under the 2014 LRDP. Emissions from the LRDP Variant would also marginally increase cancer risk and hazard levels presented in Table 7.2-5 and 7.2-6. However, similar to criteria pollutant impacts, this variant would have the similar operational cancer risk and hazard impacts as Mission Bay under the 2014 LRDP.

Considering the additional contributions of the LRDP Variant in the context of the LRDP as a whole (Chapter 5), the additional emissions from the LRDP Variant would result in marginal increases of pollutants to those presented in Table 5-4. Daily emissions of ROG and NOx from operations at Mission Bay would still exceed significance thresholds and daily emissions of PM_{10} and $PM_{2.5}$ would remain below significance thresholds and would be the same impact as under the 2014 LRDP.

7.3 Biological Resources

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Biological Resources are contained in Section 4.3 of this EIR. The CEQA Significance Standards presented in Section 4.3.3 are used to evaluate the potential impacts to biological resources of all proposed 2014 LRDP activities.

After evaluation of the 2014 LRDP proposals at the Mission Bay campus site, the Initial Study concluded that all activities would result in no impact or less-than-significant impacts regarding biological resources issues. Therefore, no additional analysis is required.

7.4 Cultural Resources

This section considers the setting and cultural resources impacts of implementation of the 2014 LRDP at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Cultural Resources are contained in Section 4.4 of this EIR. The CEQA Significance Standards presented in Section 4.4.3 are used to evaluate the potential impacts to cultural resources of all proposed 2014 LRDP activities.

7.4.1 Cultural Resources Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Bay campus site, the Initial Study concluded that:

- **Historical resources.** No activities would result in an adverse effect on historical resources. Therefore, no additional analysis of this issue is required.

7.4.2 Cultural Resources – Mission Bay Setting

The Mission Bay area of San Francisco (approximately 300 acres on the east side of the City) once consisted of open bay and tidal marshes. Mission Bay was filled in the late 19th and early 20th centuries to provide additional land area to be used primarily for industrial expansion. Most of the area was owned by the Southern Pacific Railroad and is currently being redeveloped into a mixed-used community. The area once consisted of industrial and commercial buildings, warehouses, construction sites, and vacant parcels, but it is undergoing transition to a mixed-used community, which includes the UCSF Mission Bay campus site. A cultural resource evaluation prepared for the *Mission Bay Final EIR* (1990), the *Subsequent EIR* (1998), and the UCSF *LRDP Amendment #2* (2005) identifies three historic structures within Mission Bay: Fire Station 30, the Lefty O'Doul Bridge, and the Peter Maloney Bridge. None of these resources is within or near the campus site.

No recorded archaeological sites dating from the Prehistoric (2500 BC to AD 1500) or Protohistoric (1500s to 1700s) periods are located within the area potentially affected by construction proposed under the 2014 LRDP. The nearest recorded resources are about 1,500 feet away and have been identified as the southern tip of Steamboat Point, just south of Townsend and Third Streets, and the northern point of San Quentin, north of Mariposa Street, between Pennsylvania Avenue and Terry A. Francis Blvd. The Wing Lee Laundry Site, located on King Street between Third and Fourth Streets, is also about a half mile north of the Mission Bay campus site. There is no archival evidence that cultural resources are present at the Mission Bay campus site, and the potential for discovery is low.

7.4.3 Cultural Resources – Mission Bay Impacts and Mitigation Measures

Impact CUL-MB-1: Construction of 2014 LRDP proposals at the Mission Bay campus site could cause substantial adverse changes to archaeological resources. (Potentially Significant)

Development proposals under the 2014 LRDP would occur on Blocks 15, 16, 18, 23, 25, 33, 34 and on the site of the Medical Center at Mission Bay (cancer outpatient building and Phase 2). These blocks are either undeveloped or contain existing development completed within the last 10 years. Due to the relatively recent age of the buildings on the subject blocks and surrounding areas, no historic resources exist on these development sites or in the immediate vicinity.

Previous studies and archival research conducted for the Mission Bay campus site has not identified archaeological resources at the campus site (UCSF, 2005). Development to date on the UCSF Mission Bay North and South campuses has not resulted in the discovery of any significant archaeological resources. Archaeological sites are generally located near watercourses or water bodies. However, the Mission Bay area has been substantially altered over time, including the large amount of fill added along the shoreline; therefore, the likelihood of discovering archaeological resources is low.

In the unlikely event that archaeological artifacts are discovered during construction (including grading, excavation and other earthmoving activities), **Mitigation Measure CUL-LRDP-3** would be implemented to reduce the impact to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-3

Significance after Mitigation: Less than Significant

Impact CUL-MB-2: Construction of 2014 LRDP proposals at the Mission Bay campus site could cause substantial adverse changes to paleontological resources. (Potentially Significant)

Paleontology is a multidisciplinary science that combines elements of geology, biology, chemistry, and physics in an effort to understand the history of life on earth. Paleontological resources, or fossils, are the remains, imprints, or traces of once-living organisms preserved in rocks and sediments. The fossil yielding potential of a particular area is highly dependent on the geologic age and origin of the underlying rocks. In general, older sedimentary rocks (more than 10,000 years old) are considered most likely to yield vertebrate fossils of scientific interest. Review of geological maps and previous analysis suggests that there no unique paleontological resources or unique geologic features at the Mission Bay campus site, which is underlain by dune sands. In the event that paleontological resources are uncovered during the course of construction, implementation of **Mitigation Measure CUL-LRDP-4** would reduce impacts to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-4

Significance after Mitigation: Less than Significant

Impact CUL-MB-3: Construction of 2014 LRDP proposals at the Mission Bay campus site could cause substantial adverse changes to human remains. (Potentially Significant)

There are no known human remains, including those interred outside of formal cemeteries located at the Mission Bay campus site. In the event of an accidental discovery or recognition of human remains during project excavation and construction, **Mitigation Measure CUL-LRDP-5** would be implemented to reduce the impact to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-5

Significance after Mitigation: Less than Significant

7.5 Geology, Soils and Seismicity

This section considers the setting and geology, soils and seismicity impacts of implementation of the 2014 LRDP at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Geology, Soils and Seismicity are contained in Section 4.5 of this EIR. The CEQA Significance Standards presented in Section 4.5.3 are used to evaluate the potential Geology, Soils and Seismicity impacts of all proposed 2014 LRDP activities.

Those impacts that are specific to the implementation of the 2014 LRDP at the Mission Bay campus site are discussed below.

7.5.1 Geology, Soils and Seismicity Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Bay campus site, the Initial Study concluded that:

- **Landslides.** No activities would result in adverse effect from landslides. Therefore, no additional analysis of this issue is required.
- **Expansive soils.** No activities would be located on expansive soils. Therefore, no additional analysis of this issue is required.
- **Soils and wastewater disposal.** No activities would result in the installation of septic tanks or alternative wastewater disposal systems. Therefore, no additional analysis of this issue is required.
- **Structural hazards.** No activities would result in exposure to structural hazards in an existing building. Therefore, no additional analysis of this issue is required.

7.5.2 Geology, Soils and Seismicity – Mission Bay Setting

The Mission Bay campus site is relatively flat with a ground elevation of approximately 10 to 25 feet above mean sea level. The Mission Bay campus site is an artificially filled former tidal inlet containing varying thicknesses of non-engineered fill, Bay Mud, clay, and sand overlying sandstone bedrock. The fill is irregularly distributed across the campus site and is widely variable in its density, compaction, and corrosivity characteristics. Several feet of total and differential settlement have occurred in the 150 years since filling began. Depending on the season, groundwater is encountered at depths ranging from 5 to 9 feet below ground surface (Harding, 2001).

Numerous geotechnical investigations have been completed in the Mission Bay area, and have identified potential seismic hazards, including ground shaking, ground failure due to liquefaction, ground lurching or lateral spreading, and seismically induced settlement. The investigations found little settlement in Mission Bay immediately after the 1989 Loma Prieta earthquake. The

investigations concluded that these hazards would be reduced to "low" with the use of appropriate foundation and structural design elements (e.g., deep foundation systems such as pile supported foundations) in accordance with building code requirements (Harding, 2001).

A program to surcharge the land to compact the underlying fill was also recommended from earlier geotechnical investigations and has been underway for the past 10 years. The Mission Bay campus site is within a California Geologic Survey (CGS) Seismic Hazard Zone and the City of San Francisco's Special Geologic Study Area for potential ground failure hazards caused by liquefaction and would therefore be subject to Special Publication 117A (CGS, 2003). Special Publication 117A includes protocols for the identification of potentially liquefiable materials as well as appropriate requirements to minimize potential damage from liquefaction (e.g., use of edge containment structures, removal of liquefiable soils, dynamic consolidation, injection grouting, etc.).

7.5.3 Geology, Soils and Seismicity – Mission Bay Impacts and Mitigation Measures

2014 LRDP proposals at the Mission Bay campus consist of construction of new facilities, including housing on Block 15, research, office, and clinical uses on the remaining blocks.

As discussed in Section 5.5, the general Geology, Soils and Seismicity impacts that could occur as a result of implementing the 2014 LRDP, are:

> **Impact GEO-LRDP-1: Implementation of the 2014 LRDP could result in adverse effects to people and structures resulting from geologic hazards.**
>
> **Impact GEO-LRDP-2: Implementation of the 2014 LRDP could result in substantial soil erosion or loss of topsoil.**

The campus site is located in a seismically active region that could experience at least one major earthquake (Richter magnitude (M) 6.7 or higher) over the next 30 years. Strong ground shaking at the campus site could occur during a moderate to severe earthquake occurring on one of the active Bay Area faults near to the campus site. In general, the Mission Bay campus site contains conditions that present a number of potential geologic hazards including groundshaking, liquefaction, settlement, and differential settlement. If not addressed appropriately in site preparation and design, the presence of heterogeneous fill materials including building debris, soft compressible Bay Mud, and loose saturated soils would make new structures susceptible to damage from dynamic (earthquake) or static (slow compression of Bay Muds) forces. However, these hazards are commonplace in areas throughout the Bay margins and, as stated above, current code requirements and design practices such as the use of deep foundation systems are effective in reducing potential impacts. Therefore, with construction and design in accordance with the most recent version of the California Building Code, CGS Special Publication 117A, and the *UC Seismic Safety Policy* would reduce potential geotechnical hazards to less than significant levels.

Construction activities could also include disturbance to underlying soils. If not managed appropriately, these soils could be susceptible to the effects of wind and water erosion. However, all construction activities would be required to adhere to best management practices that include erosion control measures.

All new construction would be required to adhere to the most recent version of the California Building Code or local code if more stringent and CGS Special Publication 117A, which require structures to include measures to minimize potential damage from seismic hazards. During construction, implementation of best management practices would reduce potential for erosion.

Housing is also subject to building code requirements to address the potential geotechnical and seismic hazards that are present at the Mission Bay campus site. As noted above, the Mission Bay campus site includes underlying materials that present a number of geotechnical challenges which can be overcome through site preparation (e.g., replacement of unengineered fill with engineered fill, compaction of soft soils through surcharging, dynamic compaction etc.) and building foundation design (e.g., deep foundation systems) in accordance with the most stringent of current state or local building code requirements. During construction, implementation of best management practices would reduce potential for erosion.

Mitigation: None required.

7.6 Greenhouse Gas Emissions

This section considers the setting and greenhouse gas emissions impacts of implementing the 2014 LRDP at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of greenhouse gas emissions are contained in Section 4.6 of this EIR. The CEQA Significance Standards presented in Section 4.6.3 are used to evaluate the potential greenhouse gas emissions impacts of all proposed 2014 LRDP activities.

7.6.1 Greenhouse Gas Emissions Issues Adequately Addressed in the Initial Study

The Initial Study concluded that proposed 2014 LRDP activities at the Mission Bay campus site and their potential effects on greenhouse gas emissions would be evaluated in the EIR.

7.6.2 Greenhouse Gas Emissions – Mission Bay Setting

Greenhouse gas (GHG) emissions are generated at the Mission Bay campus site from a variety of sources. These include motor vehicle trips generated by uses on the campus site, electrical and natural gas usage including, water and wastewater transport (the energy used to pump water and wastewater to and from the campus site), and solid waste generation.

7.6.3 Greenhouse Gas Emissions – Mission Bay Impacts and Mitigation Measures

Impact GHG-MB-1: Development at the Mission Bay campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions. (Potentially Significant)

Construction-related GHG emissions from 2014 LRDP proposals at the Mission Bay campus site were calculated using the California Emissions Estimator Model (CalEEMod), assuming four discrete construction windows in five- to six-year increments. These windows are presented in **Table 7.0-3**, Proposal Construction Time Frames at Mission Bay, located in Section 7.0.4 of this chapter.

Modeling assumed construction phasing lengths based on CalEEMod default estimates which are based on square footage for hospitals and research/office uses. All model inputs and outputs are provided in Appendix E.

Construction-related GHG emissions for the peak year of each window of the anticipated construction period are presented in **Table 7.6-1**. Estimated peak emissions are 1,429 metric tons of carbon dioxide equivalent greenhouse gases[6] (CO_2e) in 2016, 862 metric tons CO_2e in 2021, 804 metric tons CO_2e in 2026 and 1,496 metric tons CO_2e in 2032. As discussed earlier, BAAQMD has

6 CO_2e in all calculations of project impact includes CO_2, CH_4 and N_2O.

TABLE 7.6-1
PEAK ANNUAL CONSTRUCTION-RELATED GHG EMISSIONS
WITHOUT MITIGATION - MISSION BAY

Construction Window	Emissions (metric tons/year)			
	CO_2	CH_4	N_2O	Total CO_2e
2015-2020	1,426	<1	<1	1,429
2020-2025	860	<1	<1	862
2025-2030	802	<1	<1	804
2030-2035	1,495	<1	<1	1,496

Project CO_2 emissions estimates were made using CalEEMod v.2013.2.

not established a quantitative threshold relative to construction-related emissions. In lieu of any proposed or adopted thresholds relative to construction-related emissions, these emissions are considered significant unless best management practices are implemented to reduce GHG emissions during construction, as feasible. Consequently, **Mitigation Measure GHG-LRDP-1** is identified to ensure implementation of best management practices during construction.

Mitigation Measure: Implement Mitigation Measure GHG-LRDP-1

Significance after Mitigation: Less than Significant. Implementation of Mitigation Measure GHG-LRDP-1 would ensure that UCSF and its contractors employ feasible, effective measures to reduce GHG emissions during construction activities. This mitigation measure would therefore reduce this potential impact to less than significant.

Impact GHG-MB-2: Development at the Mission Bay campus site under the 2014 LRDP would result in an increase in operational GHG emissions. (Less than Significant)

Area, Energy, and Indirect Sources

Operational GHG emissions associated with development at the Mission Bay campus site under the 2014 LRDP would result from electrical and natural gas usage, water and wastewater transport (the energy used to pump water and wastewater to and from the campus site), and solid waste generation. GHG emissions from electrical usage are generated when energy consumed on the campus site is generated by the electrical supplier, PG&E. GHG emissions from natural gas are direct emissions resulting from on-site combustion for heating and other purposes. GHG emissions from water and wastewater transport are indirect emissions resulting from the energy required to transport water from its source, and the energy required to treat wastewater and transport it to its treated discharge point. Solid waste-related emissions are generated when the increased waste generated by new development is disposed in a landfill where it decomposes, producing methane gas.[7]

[7] Methane (CH_4) from decomposition of municipal solid waste deposited in landfills is counted as an anthropogenic (human-produced) GHG. (USEPA, 2006).

GHG emissions from electrical usage, natural gas combustion, mobile transportation, water and wastewater conveyance, and solid waste were estimated using the CalEEMod model, and are presented in **Table 7.6-2**. A default GHG emissions factor for PG&E was adjusted to reflect future reductions envisioned by PG&E (PG&E, 2013) GHG emission factor of 290 pounds per megawatt hour was assumed. Electrical and natural gas emissions also assume compliance with UCSF policy to achieve a 20% energy reduction beyond Title 24 requirements for all new buildings. Energy use (electrical and natural gas) represents approximately 41% of estimated operational GHG emissions and solid waste generation represents approximately 19%. The relatively high percentage of emissions from energy is partially the result of the annual electrical energy use factor assumed by CalEEMod for hospital land uses (6.78 kWh/yr per square foot for Title 24 electricity and 5.52 kWh/yr per square foot for non-Title 24 electricity).

TABLE 7.6-2
ANNUAL OPERATIONAL GHG EMISSIONS
WITHOUT MITIGATION - MISSION BAY

Emission Source	Emissions (metric tons/year)			
	CO_2	CH_4	N_2O	Total CO_2e
Area Sources	6	<1	<1	7
Energy Sources	10,055	<1	<1	10,127
Mobile Sources	8,158	<1	<1	8,163
Solid Waste	2,091	124	<1	4,687
Water and Wastewater	999	31	<1	1,881
Total	**2,392**	**155**	**<1**	**24,865**

NOTE: Columns may not total precisely due to rounding. Rows may not total precisely due to differences in global warming potential.

Mobile Emission Sources

One of the sources of operational emissions would be increased vehicle emissions from travel by additional staff, patients, visitors and residents. Traffic volumes used to estimate vehicle-related emissions were derived from the Transportation Demand Analysis prepared for the LRDP (Adavant, 2014). Development under the 2014 LRDP at the campus site would generate an estimated 12,175 additional daily vehicle trips. GHG emissions from motor vehicle sources were calculated using the CalEEMod. Table 7.6-2 presents the incremental mobile source GHG emissions associated with the development under the 2014 LRDP at the Mission Bay campus site, which represents approximately 33% of the total operational GHG emissions.

As shown in Table 7.6-2, the sum of both direct and indirect GHG emissions resulting from operations under the 2014 LRDP would result in an estimated 24,865 metric tons per year of CO_2e. Applying a service population of 5,633 (new faculty and staff) results in emissions of approximately 4.4 metric tons per year of CO_2e/SP. This is below the service population threshold of 4.6 metric tons per year of CO_2e/SP and operational GHG emissions associated with development under the 2014 LRDP at the Mission Bay campus site would therefore be a less than significant impact.

Mitigation: None required.

LRDP Variant Conditions

Under the LRDP Variant, the Mission Bay campus site would generate slightly more vehicle trips than under the 2014 LRDP. Approximately 2,950 new vehicle trips would be generated during the AM peak hour and approximately 2,450 additional vehicles at the campus site during the PM peak hour. These represent increases of approximately 2% in the total number of vehicles compared to the 2014 LRDP during both the AM and PM peak hours.

With an overall 2% increase in daily trip generation, this Variant would increase operational mobile GHG emissions by approximately 2% (approximately 163 metric tons of CO_2e per year). Annual GHG emissions from operations at Mission Bay would still be 4.4 metric tons of CO_2e per service population as it would be under the 2014 LRDP and would be the same impact as under the 2014 LRDP. Consequently, the LRDP Variant would have similar operational GHG impacts at the Mission Bay campus site under the 2014 LRDP.

7.7 Hazards and Hazardous Materials

This section considers the setting and hazards and hazardous materials impacts at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Hazards and Hazardous Materials are contained in Section 4.7 of this EIR. The CEQA Significance Standards presented in Section 4.7.3 are used to evaluate the potential hazards and hazardous materials impacts of all proposed 2014 LRDP activities.

7.7.1 Hazards and Hazardous Materials Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Bay campus site, the Initial Study concluded that:

- **Safety hazards from airport operations.** No activities would result in safety hazards resulting from proximity to public airports. Therefore, no additional analysis of this issue is required.

- **Wildland fires.** No activities would result in exposure to wildland fires. Therefore, no additional analysis of this issue is required.

7.7.2 Hazards and Hazardous Materials – Mission Bay Setting

The Mission Bay campus site is located in a large parcel that has been subject to various periods of infill, debris disposal, and a long history of various industrial activities. The periphery of the parcel was filled by 1892 and the central region of the parcel, was filled between 1906 and 1913 which likely consisted of building rubble and debris from the 1906 San Francisco earthquake (Iris Environmental, 2009). Parts of the parcel to the west of Fifth Street were used as a former city dump between 1869 and 1895. Since 1916, land uses at Mission Bay have included a pipe yard, hay yard, garbage dock, several lumber yards, an icing platform, a City and County boiler house, a number of warehouses, a metal salvage company, and a variety of rail-related activities. There were also a variety of rail-related buildings including an incinerator, scales, material platform, carpenter shop, storehouse, blacksmith shop, electrical shop, and dryer shed.

According to a *Hazards Mitigation Program* (HMP) report that was prepared for earlier stages of development at Mission Bay, five underground storage tanks (USTs) were present at the site including one 10,000-gallon tank, one 8,000-gallon tank, two 1,000-gallon tanks, and one 550-gallon tank (Iris Environmental, 2009). The USTs were primarily used for the storage of gasoline or diesel. Another investigation report indicated that sixteen USTs were present and all were listed as "former" USTs (ENVIRON, 1998 as referenced in Iris Environmental, 2009).

According to a search of available databases from Department of Toxic Substances Control (DTSC) (Envirostor) and the State Water Resources Control Board (SWRCB) (Geotracker), there are a number of cases listed for the Mission Bay campus site and immediate surrounding area

(DTSC, 2014 and SWRCB, 2014). All of these cases located on the Mission Bay campus site have been closed indicating that no further risks to human health or the environment remain.

In 1999, as part of the preparation for the initial development of UCSF facilities at the Mission Bay campus site, an environmental Risk Management Plan (RMP) was developed under the direction of the Regional Water Quality Control Board to provide a decision framework and protocols for managing contaminants in the subsurface soil and groundwater in a manner that is protective of human health and the environment. The RMP was developed to be consistent with existing and planned future land uses including long-term phased development (Environ, 1999).

7.7.3 Hazards and Hazardous Materials – Mission Bay Impacts and Mitigation Measures

Impact HAZ-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions. (Potentially Significant)

Additional use of hazardous materials associated with implementation of the 2014 LRDP at the Mission Bay campus site would require adherence to regulatory requirements and existing UCSF policies that address the storage, use, and disposal of hazardous materials in a manner that limit health risks and upset and accident conditions. However, earthwork activities could also potentially encounter naturally occurring asbestos if not managed appropriately. With implementation of **Mitigation Measure HAZ-LRDP-1**, incorporation of best management practices, if warranted, would reduce potential impacts from exposure to naturally occurring asbestos to less than significant level.

Considering the past industrial uses of Mission Bay, it is also possible for volatile components of subsurface contaminants, if present, to migrate through building foundations exposing residents and visitors to potential soil vapor contamination. Previous studies have identified methane as an issue of concern at the Mission Bay campus site. Working with the RWQCB, BAAQMD, and the San Francisco Department of Public Health on a project by project basis, UCSF installs subsurface engineered control systems to address venting of volatile components of subsurface contaminants, protect public health, and ensure that maximum exposure levels for building occupants are not exceeded. Characterization and risk analysis of any subsurface contaminants would be addressed either through remediation prior to commencement of construction or through design elements such as vapor barriers that would protect future occupants from adverse health effects.

Mitigation Measure: Implement Mitigation Measures HAZ-LRDP-1

Significance after Mitigation: Less than Significant

Impact HAZ-MB-2: Implementation of the 2014 LRDP at the Mission Bay campus site could result in hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or waste within one-quarter mile of existing or proposed schools. (Less than Significant)

There are no schools located within a quarter mile of the Mission Bay campus site although Live Oak School is located approximately 0.4 miles from the campus site. In addition, Block 14 on the Mission Bay campus site is currently reserved for a school site by the San Francisco Unified School District. In general, existing hazardous materials use for administrative support services or even research laboratory purposes at UCSF does not involve large enough quantities of hazardous materials or result in emissions that would represent potential health hazards to schools near UCSF campus sites. Regardless, the proposed plan would not result in substantive emissions and all handling of hazardous materials would occur under a continued practice of adherence to federal, state, local and UCSF policies and regulatory requirements.

Mitigation: None required.

Impact HAZ-MB-3: 2014 LRDP proposals at the Mission Bay campus sites that are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 could create a significant hazard to the public. (Less than Significant)

As noted above, the entire Mission Bay campus site has a long history of industrial use and a number of environmental investigations, cleanup, and removal of USTs have occurred many of which are included in the Geotracker database. Although many of these cases have been closed indicating that no further action was required, there is still a potential to encounter previously unidentified contaminants. A Risk Management Plan (RMP) was developed for all of the *Mission Bay Redevelopment Plan* area for previous construction efforts and has been effective in reducing potential impacts as a result of past releases of hazardous materials. This document has been periodically amended by the RWQCB. As called for in the RMP, at the onset of each project, UCSF hires a qualified geotechnical/environmental consultant to do soil testing (including for sulfate and chloride content) and prepare a site-specific report identifying any necessary remediation The RMP provides construction protocols and notification procedures that would protect workers, the public, and the environment from any legacy contaminants that may be discovered during groundwater breaking activities.

Mitigation: None required.

Impact HAZ-MB-4: Implementation of the 2014 LRDP at the Mission Bay campus site would not result in a safety hazard for people residing or working in the vicinity of a private airstrip. (Less than Significant)

The existing facilities at the Mission Bay campus site will include a helicopter landing pad (helipad) which would be used for inter-facility transfers after Phase 1 of the Medical Center at Mission Bay opens in 2015. New facilities under the 2014 LRDP could potentially place new residents, visitors, or employees in proximity to safety hazards associated with this helipad.

The accident rate for medical helicopters averages approximately 1.8 fatal accidents per 100,000 flights. Using a 20 minute estimate for an average helicopter flight, this equals to approximately one fatal accident per 180,000 flights. This risk is increased where the landing site is unfamiliar to the pilot, which is more common during scene calls and would not be the case for the Mission Bay campus site. Of the 56 fatal accidents in US that involved medical helicopters (1991-2007), four occurred while landing or taking off from a hospital helipad. This rate equals approximately 1 in 2.5 million and is considered a measurable yet very small risk. None of the four fatal helicopter events caused any ground deaths to third parties, although in one accident, a hospital security guard who was helping service the helicopter was fatally injured. Moreover, based on the statistics associated with medical helicopter operations since 1991 in the United States, the observed risk to third parties has been negligible.

Statistics also reveal that helicopter accidents that cause serious injuries to third parties or substantial property damage are also extremely rare. Out of 132 incidents involving medical helicopters from 1991 to 2005,[8] none caused serious injury to a third party and one caused modest damage to a hospital building (Barnet, 2008).[9]

Based on information documenting national helicopter safety patterns provided above, it can be assumed that, while the risk of death or injury to third parties, and risk of property damage to structures near the project site is not zero, this risk is very small. The twelve million medical helicopter flights in the US since 1991 have caused no deaths to third parties in the vicinity of hospitals. Based on this and other statistics noted above, the likelihood of a third party death resulting from the operation of the proposed inter-facility transfer operation is also extremely small.

Mitigation: None required.

7.8 Hydrology and Water Quality

This section considers the setting and hydrology and water quality impacts of implementation of the 2014 LRDP at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Hydrology and Water Quality are contained in Section 4.8 of this EIR. The CEQA Significance Standards presented in Section 4.8.3 are used to evaluate the potential Hydrology and Water Quality impacts of all proposed 2014 LRDP activities.

Those impacts that are specific to implementation of the 2014 LRDP at the Mission Bay campus site are discussed below.

7.8.1 Hydrology and Water Quality Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Bay campus site, the Initial Study concluded that:

- **Groundwater supplies.** No activities would result in substantial depletion of groundwater supplies or interfere substantially with groundwater recharge. Therefore, no additional analysis of this issue is required.

7.8.2 Hydrology and Water Quality – Mission Bay Setting

7.8.2.1 Fluvial Hydrology and Stormwater Management

Historically, the Mission Bay area was part of San Francisco Bay, with the bay waters at ordinary high tide roughly being bounded by Townsend Street on the north, Eighth Street on the west, and Sixteenth Street on the south. Marshes, with intersecting sloughs, penetrated as far north as Mission Street between Seventh and Eighth streets, and Folsom Street between Fourth and Eighth streets (Sharpsteen, 1941). Mission Creek once was a navigable body of water that flowed from Mission Dolores to San Francisco Bay. In 1854 the California Legislature declared Mission Creek to be a navigable stream; although it has been filled in, it retains the designation today (Sharpsteen, 1941). The only remaining portion of Mission Creek above ground is the Mission Creek Channel that drains into China Basin.

The Mission Bay campus site does not drain to the City's combined sewer system (CSS); instead, the area has its own Small Municipal Separate Storm Sewer System (MS4). As discussed in Section 4.8, since this MS4 does not drain into one of the City's Water Treatment Plants, its Phase II NPDES General Permit requires development and adoption of a Storm Water Management Plan/Program (SWMP). When complete, the Mission Bay SWMP will minimize the discharge of pollutants into receiving waters, identify appropriate stormwater treatment practices with measurable performance criteria, and include six minimum measures to promote pollutant load reduction.

7.8.2.2 Flooding

The Federal Emergency Management Agency (FEMA) is preparing Flood Insurance Rate Maps (FIRMs) for the City and County of San Francisco (CCSF). FIRMs identify areas that are subject to inundation during a flood having a 1-percent chance of occurrence in a given year (also known as a "base flood," "100-year flood," or "1 percent annual chance flood"). FEMA refers to the floodplain as an area that is at risk from a flood of this magnitude as a Special Flood Hazard Area (SFHA). Communities use FIRMS to define planning and construction standards in flood-prone areas, and insurance companies use them to rate flood insurance policies. The Base Flood Elevations (BFEs) mapped on the FIRMs are based on the 100-year (1%) stillwater elevation (e.g. extreme high tide), as well as wave run-up processes due to locally-generated wind waves and longer-period swells from outside the Golden Gate. In the preliminary FIRM released in June 2013, portions of the Mission Bay campus site, including areas proposed for housing, are designated within the special flood hazard area (see **Figure 7.8-1**). However, this mapping does not consider UCSF's current activities that are raising ground elevations across the entire Mission Bay campus site[10] above the BFE (+10 ft NAVD88[11]) and anticipated future sea levels (see below). UCSF's ground surcharge and engineered fill placement programs at the Mission Bay campus site are raising ground elevations in areas proposed for entitlement/housing to a range of approximately +10.3 to +26.3 ft NAVD88 (Catellus, 1998). The final FIRM is scheduled to be released sometime in 2015 (FEMA, 2013B); by that time, UCSF expects that its work to raise elevations at the Mission Bay campus site will be complete, and that no areas of the campus site will be within a Special Flood Hazard Area.

7.8.2.3 Sea Level Rise

Increases in global air temperatures are causing the oceans to warm and expand and land ice to melt and run into the sea, resulting in sea level rise (SLR). The rate of SLR is projected to increase over the next hundred years, with acceleration in the rate expected to occur around mid-century. California Executive Order S-13-08, signed on November 14, 2008, specified that prior to the release of the then-in-progress Sea Level Rise Assessment Report from the National Academy of Sciences (NAS)/National Research Council (NRC), all state agencies planning construction projects in areas that are vulnerable to future sea level rise must consider a range of scenarios for 2050 and 2100 to assess project vulnerability, and, to the extent feasible, must reduce expected risks and increase resiliency with respect to sea level rise.

The NRC report, which was released in 2012, described a range of potential sea level rise values given various global CO_2 emission scenarios. The NRC report is consistent with assumptions used by the City[12]. For San Francisco Bay, the report describes an increase in the rate of sea level rise from around 0.7 mm/year measured at Alameda from 1939-2008 to an order of magnitude faster by 2100. Sea level rise rates at the Golden Gate ranged from 1.8 to 1.9 mm/year from

SOURCE: FEMA 2013

Figure 7.8-1

City of San Francisco Preliminary FIRM Mapping

June 2013

1930 to 1980. **Table 7.8-1** below presents a range of sea level rise projections[13] for the San Francisco region from the NRC report:

TABLE 7.8-1
REGIONAL SEA LEVEL RISE PROJECTIONS FOR SAN FRANCISCO FROM NRC (2012)

Year	Sea Level Rise Projection – Emissions Scenario A1B	Sea Level Rise – Range of Emissions Scenarios B1 and A1F1
2030	14.4 cm (5.7 in)	4.3 - 29.7 cm (1.7 - 11.7 in)
2050	28 cm (11.0 in)	12.3 - 60.8 cm (4.8 - 23.9 in)
2100	91.9 cm (36.2 in)	42.4 - 166.4 cm (16.7 - 65.5 in)

UCSF is utilizing surcharging and engineered fill to raise ground elevations at the Mission Bay campus site such that they will be higher than the projected mid-range and high-range (A1B) 2050 sea levels (existing sea levels + 11.0 and 23.9 inches sea level rise, respectively). The final ground elevations[14] on the Mission Bay campus site will range from approximately +10.3 to +26.3 ft NAVD88 (Catellus, 1998). The existing Mean Higher High Water (MHHW) at the campus site is approximately +5.9 ft NAVD88; 23.9 inches of sea level rise by 2100 would raise the MHHW to approximately +7.9 ft NAVD88.

7.8.2.4 Seiches and Tsunamis

Tsunamis (seismic sea waves) are long period waves that are typically caused by underwater seismic disturbances, volcanic eruptions, or submerged landslides. Tsunamis, which travel at speeds up to 700 miles per hour, are typically only 1 to 3 feet high in open ocean water but may increase in height to up to 90 feet as they reach coastal areas, so can cause potentially large amounts of damage when they reach land (URS, 2008). Low-lying coastal areas such as tidal flats, marshlands, and former Bay margins that have been artificially filled but are still at or near sea level are generally the most susceptible to tsunami inundation.

A seiche is caused by oscillation of the surface of an enclosed body of water such as the San Francisco Bay due to an earthquake or large wind event. Seiches can result in long-period waves that cause run-up or overtopping of adjacent lands, similar to tsunami run-up.

Since 1850, more than 50 tsunamis have been recorded or observed in San Francisco Bay. Nine of these tsunamis originated in Alaska and were caused by an earthquake, earthquake and landslide, or volcano and earthquake. Only one tsunami has been recorded as originating along

[13] Emissions scenario A1B assumes high economic growth, low population growth that peaks mid-century, the rapid introduction of more efficient technologies, and a balance between fossil and alternative fuels. A1F1 has the same assumptions as A1B except it is more fossil fuel-intensive. Scenario B1 assumes the same low population growth as the A1 scenarios, but a shift toward a lower-emission service and information economy and cleaner technologies. The A1FI scenario yields the highest carbon dioxide (CO_2) emissions by 2100, and the B1 scenario yields the lowest CO_2 emissions.

[14] NAVD88 is a reference datum for ground elevations. For readers more familiar with San Francisco Datum, the elevation reference often used within San Francisco, 0.0 ft NAVD88 is -11.322 ft SF Datum. Therefore a ground elevation of +10.3 ft NAVD88 would be -1.022 ft SF Datum.

the Central California coast: a 4-inch run-up that was recorded at the Presidio gauge station shortly after the 1906 earthquake. In March 2011, a tsunami originating in Japan caused a swell of approximately two feet in San Francisco Bay (TWC, 2011).

In 2009, the California Geological Survey, California Emergency Management Agency, and the Tsunami Research Center at the University of California completed the State's official tsunami inundation maps. Based on this mapping, portions of the Mission Bay campus site are located in an area identified for potential inundation in the event of a tsunami or seiche (see **Figure 7.8-2**) of up to approximately 6 feet (CCSF, 2011). The earthquake that hit Japan in March 2011 initiated a tsunami that traveled for 10 hours before reaching the California coast (TWC, 2011). When the tsunami warning was issued, coastal county offices of emergency services were able to use the state's official tsunami inundation maps to focus their response.

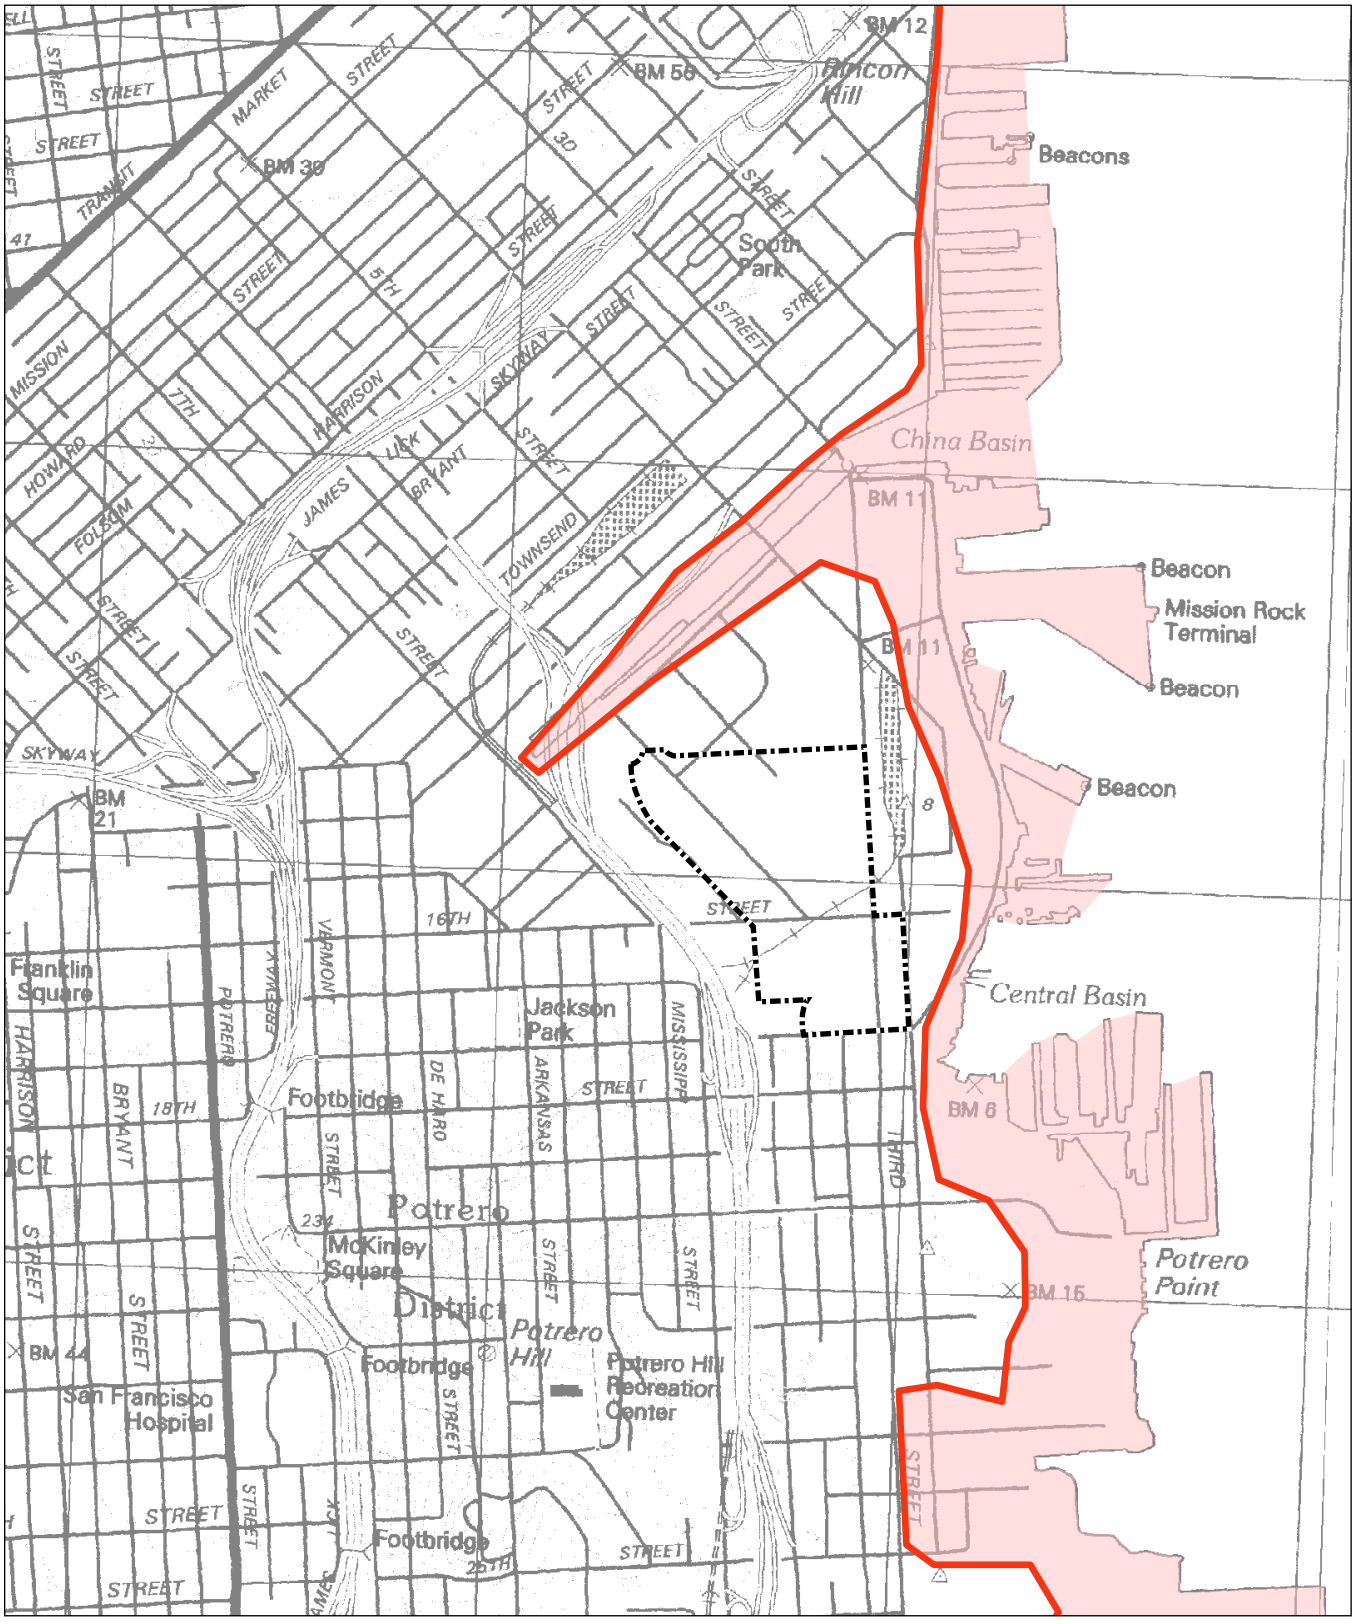
The National Oceanic and Atmospheric Administration operates the Tsunami Warning System with centers located in Hawaii and Alaska. The state National Warning System provides warnings to the West Coast (including California) and Alaska. Based on the level of threat, a Tsunami Advisory, Watch, or Warning would be issued. In San Francisco, occupants would be notified via the Outdoor Public Warning System, notification of the local media, public address systems, and the Alert San Francisco public notification system.

7.8.3 Hydrology and Water Quality – Mission Bay Impacts and Mitigation Measures

Impact HYD-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site could violate water quality standards or waste discharge requirements or otherwise substantially degrade water quality. (Potentially Significant)

The 2014 LRDP proposals at the Mission Bay campus site consist of construction of new facilities, including housing on Block 15, research, office, and clinical uses buildings on the remaining blocks.

Proposed LRDP development at the Mission Bay campus site (including on-site staging) would include demolition, excavation, grading, and construction activities that would require temporary disturbance of surface soils and removal of existing pavement and sub-surface structures (if present). These activities would expose soil to water runoff as well as entrainment of sediment in the runoff. If dewatering would be necessary during construction, the water would likely contain suspended sediments and would require settling before being discharged to the local MS4. Sediment in runoff and deposits of soil and related debris from haul truck tires on local streets could increase the amount of sediment entering the storm drains, which could potentially clog drain inlets and reduce the flow capacity of the storm drains. The accumulation of this material could potentially result in increased localized ponding or flooding, particularly after large storms.



SOURCE: City and County of San Francisco

UCSF Long Range Development Plan Environmental Impact Report

Figure 7.8-2
Tsunami Inundation Map
For Emergency Planning

The use of construction equipment as well as the delivery, handling, and storage of construction materials and waste could contaminate stormwater that could adversely affect water quality. Potential contaminants include, but are not limited to (CSW/Stuber-Stroeh, 2011):

- Petroleum hydrocarbons and metals from stockpiled soils excavated from the site
- Fuel from storage drums
- Diesel from refueling trucks
- Oils and grease from miscellaneous heavy equipment
- Sewage from portable sanitary facilities
- Sediment from construction generated waste–piles of concrete, rock and debris
- Sediment from rock crushing activities
- Hazardous materials storage-hydraulic oil, motor oil, and lubricating fluid
- Spills and releases of hydrocarbons and related pollutants from routine light maintenance activities such as fluid topping off, and welding and repairing belts and gears of heavy equipment

Polluted stormwater runoff could violate water quality standards and/or waste discharge requirements established in the MS4 Permit as well as the NPDES General Permit for Construction.

In accordance with the Construction General Stormwater Permit, UCSF would be required to prepare and implement a SWPPP for each LRDP construction project to minimize water quality impacts during construction activities on the campus site. The SWPPPs will be consistent with previous SWPPPs that have been developed for past development of the Mission Bay campus site (e.g. UCSF Medical Center at Mission Bay, CSW/Stuber-Stroeh, 2011) as well as similar water quality protection measures in the campus site's Risk Management Plan (ENVIRON, 1999).

The SWPPPs will identify pollutant sources within the construction area and recommend site-specific BMPs regarding control of sediments in runoff and storage and use of hazardous materials to prevent discharge of pollutants into stormwater. Likely BMPs are listed in Section 5.8.

In addition, each 2014 LRDP construction project will need to obtain a water quality certification from the RWQCB for the construction activities, which would also require implementation of BMPs and specific measures for the protection of water quality during construction.

Proposed 2014 LRDP development at the Mission Bay campus site will not increase the proportion of the site that is covered in impermeable surfaces (Mission Bay Campus Master Plan, UCSF 1999). Under the MS4 Phase II General Permit (above), projects that build or replace a minimum of 2,500 square feet must drain no more water off the site after construction than before construction. According to an analysis by Freyer & Laureta (2013), the existing storm drain system at the Mission Bay campus site is adequately sized to collect and transmit runoff from a planned 5-year storm, and that the proposed increases in entitlement/housing square footage will

not increase anticipated drainage volumes from developed areas. The analysis found that the existing storm water infrastructure at the campus site was adequate and that there is no need to replace or increase the existing conveyance piping system. Therefore, the proposed LRDP actions at the Mission Bay campus site will comply with the MS4 regulations, and the resulting impacts to on-site and off-site erosion, siltation, and flooding would be less than significant.

As discussed above, new LRDP development must drain no more water off the campus site after construction than before. The Freyer & Laureta (2013) analysis found that the existing storm drain system is adequately sized to collect and transmit runoff from a 5-year storm, the proposed developments will not increase anticipated drainage volumes from developed areas, and there is no need to replace or increase the existing conveyance piping system.

Implementation of SWPPPs and associated BMPs, part of the regulatory requirements discussed in Sections 4.8 and 5.8, as well as implementation of mitigation measures previously identified in the *Mission Bay Subsequent EIR*, would reduce erosion and water quality impacts during demolition and construction activities under the 2014 LRDP at the Mission Bay campus site to less than significant.

Mitigation Measure HYD-MB-1a: Participate in the City's existing Water Pollution Prevention Program. UCSF shall facilitate implementation of the City's Water Pollution Prevention Program by providing and installing wastewater sampling ports in any building anticipated to have a potentially significant discharge of pollutants to the sanitary sewer, as determined by the Water Pollution Prevention Program of the San Francisco Public Utilities Commission's Bureau of Environmental Regulation and Management, and in locations as determined by the Water Pollution Prevention Program. (*Mission Bay Subsequent EIR Mitigation Measure K.02*).

Mitigation Measure HYD-MB-1b: UCSF shall design and construct sewer improvements such that potential flows to the City's combined sewer system from the project do not contribute to an increase in the annual overflow volume as projected by the Bayside Planning Model by providing increased storage in oversized pipes, centralized storage facilities, smaller dispersed storage facilities, or detention basins, or through other means to reduce or delay stormwater discharges to the City system. (*Mission Bay Subsequent EIR Mitigation Measure K.03*).

Mitigation Measure HYD-MB-1c: Implement alternative technologies or use other means to reduce settleable solids and floatable materials in stormwater discharges to China Basin Channel to levels equivalent to, or better than, City-treated combined sewer overflows. Such alternatives technologies could include one or more of the following: biofilter system, vortex sediment system, catch basin filters, and/or additional source control measures to remove particulates from streets and parking lots. (Modified from *Mission Bay Subsequent EIR Mitigation Measure K.04*).

Significance after Mitigation: Less than Significant

Impact HYD-MB-1: Development of proposed housing on Block 15 at the Mission Bay campus site would place housing within a 100-year flood hazard area as mapped on the preliminary (2013) FIRM map for San Francisco, potentially impede flood flows, and potentially expose people to a significant risk of loss, injury, or death associated with flooding. (Less than Significant)

As previously discussed, portions of the Mission Bay campus site that are currently proposed for housing and other types of development are designated within the preliminary 100-year Special Flood Hazard Zone and 500-year floodplain due to their low-lying elevations and proximity to a tidal flood source in Mission Creek. Ground elevations in these areas are currently being raised above Base Flood Elevation of +10 ft NAVD via surcharging and engineered fill placement. The San Francisco FIRM is in the process of being refined and updated, and UCSF expects that the final FIRM will reflect these efforts and not map any portions of the campus site within an Special Flood Hazard Area. Therefore, this impact would be less than significant.

Mitigation: None required.

Impact HYD-MB-2: Development of 2014 LRDP proposals on the Mission Bay campus site would expose people or structures to a significant risk of loss, injury or death due to inundation by seiches or tsunamis. (Less than Significant)

As previously discussed, portions of the Mission Bay campus site are within an area that could potentially be inundated by a tsunami or seiche in a "worst case [tsunami] scenario."[15] Impacts to structures would be less than significant with incorporation of specific design features such as seismic structural elements that would increase the resilience of structures to tsunamis or seiches. Impacts to people would be less than significant with implementation of the San Francisco outdoor warning system, which would notify people of an impending tsunami or seiche. In the event that an earthquake occurred that would be capable of producing a tsunami that could affect San Francisco, the National Warning System would provide warning to the City. The San Francisco Outdoor Public Warning System facility (sirens and loudspeakers, tested each Tuesday at 12:00 noon) at UCSF in Mission Bay, would be initiated that would sound an alarm alerting the public to tune into local TV, cable TV, or radio stations, which would carry instructions for appropriate actions to be taken as part of the Emergency Alert System. Police would also canvas the neighborhoods sounding sirens and bullhorns, as well as knocking on doors as needed, to provide emergency instructions. Evacuation centers would be set up if required. The advance warning system would allow for evacuation of people prior to a tsunami or seiche and would provide a high level of protection to public safety.

Mitigation: None required

[15] As defined by the San Francisco Modeling of Tsunami Effects at Marine Oil Terminals (SF MOT) study developed by Borrero et al. in 2006.

Impact HYD-MB-3: Development of 2014 LRDP proposals on the Mission Bay campus site would expose people or structures to an increased risk of loss, injury or death due to flooding from sea level rise. (Less than Significant)

As previously discussed, portions of the Mission Bay area are potentially vulnerable to inundation from sea level rise, even if higher estimates of sea level rise (e.g. the higher range 2050 estimates by the NRC) are validated over time.

While various state and local guidelines exist for planning for and anticipating sea level rise, there are currently no legally enforceable engineering or design standards that can be applied to proposed development in vulnerable areas aside from those that are based on existing (i.e., without sea level rise) conditions (e.g. the City's Floodplain Management Ordinance). In addition, there exists considerable uncertainty among planners and engineers about how to reconcile uncertainty in anticipated rates of sea level rise with the typical horizons for capital improvement projects and long-range development plans such as the 2014 LRDP.

The University uses science to guide decisions, and accordingly, it has decided to address this uncertainty by raising ground elevations in undeveloped/under construction portions of the campus site such that post-grading elevations across the campus site will range from approximately +10.3 to +26.3 ft NAVD88. This will raise ground elevations at the campus site above the projected MHHW in 2050, assuming that future sea levels are consistent with the mid-range projections described in the 2012 NRC report (and established as the most recent sea level rise guidance by the state).

Low-lying areas of the campus site, or areas adjacent to the campus site, could still be vulnerable to flooding due to storm surge, king tides, and other forcing factors that could raise water levels well above MHHW. In addition, higher than expected sea level rise could drive increases in local groundwater elevations, which could affect the performance of flood-management infrastructure such as storm drains.

UCSF will continue to monitor the situation, and if future sea levels are higher than expected such that the Mission Bay campus site is vulnerable to sea level rise-induced flooding, it will propose projects to protect people or structures from sea level rise at the Mission Bay campus site.

7.9 Land Use and Planning

This section considers the setting and land use and planning impacts of implementation of the 2014 LRDP at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Land Use are contained in Section 4.9 of this EIR. The CEQA Significance Standards presented in Section 4.9.3 are used to evaluate the potential land use impacts of all proposed 2014 LRDP activities.

7.9.1 Land Use and Planning Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Bay campus site, the Initial Study concluded that:

- **Physically divide an established community.** No activities would physically divide an established community. Therefore, no additional analysis of this issue is required.

- **Habitat conservation plan.** No activities would result in a conflict with any applicable habitat conservation plan. Therefore, no additional analysis of this issue is required.

7.9.2 Land Use and Planning – Mission Bay Setting

The Mission Bay campus site is generally bounded by Mission Bay Boulevard South to the north, Owens Street to the west, Mariposa Street to the south and Third Street to the east. The campus site is within the 303-acre Mission Bay Redevelopment Area in the Mission Bay neighborhood north of the Potrero Hill and Dogpatch neighborhoods. The campus site includes the original 42 acres north of Sixteenth Street (North Campus) and 14.4 acres south of Sixteenth Street (South Campus) subsequently acquired for the Medical Center at Mission Bay. The North Campus includes six research buildings, a campus community center and 430 units of housing in four separate buildings. Mission Hall, a faculty office building, is currently under construction at the northeast corner of Fourth and Sixteenth Streets. Phase 1 of the Medical Center at Mission Bay is currently under construction on the South Campus and will open in 2015. Phase 1 includes 289-bed hospital, medical building and energy center. Over 1,000 parking spaces will be provided in a surface lot and existing garage. UCSF is in advanced discussions to acquire Mission Bay Blocks 33 and 34, a 3.83-acre parcel directly across Third Street from the South Campus. UCSF hopes to complete the acquisition in the summer of 2014. Under the 2014 LRDP, the Mission Bay campus site boundaries would be expanded to include Blocks 33 and 34, which would be known as the East Campus.

7.9.2.1 UCSF Functional Zones

Most of the North Campus is located with the Instruction and Research functional zone, with other large areas classified as Housing, Open Space and Campus Community. The South Campus is classified entirely as Clinical (see Figure 3-10 in Chapter 3, *Project Description*).

7.9.2.2 City of San Francisco Zoning

The entire campus site is zoned as Mission Bay Redevelopment Area (MB-RA), and the Height and Bulk District is also MB-RA. Buildings on the Mission Bay campus site are limited to heights ranging from 85 to 160 feet (exclusive of rooftop mechanical equipment) by the *Mission Bay South Redevelopment Plan* (see discussion below under *Existing Planning Agreements*).

7.9.2.3 UCSF Mission Bay Design Guidelines

Design guidelines were developed by UCSF for the Mission Bay campus site that address such features as building mass, scale, height, floor size, proportion and setbacks. The *Mission Bay Campus Master Plan and Design Guidelines* (CMPDG) is an internal UCSF planning tool to provide an overall framework for the physical development of the Mission Bay campus site. It sets forth basic principles to guide the design of individual buildings and landscaping projects with the understanding that buildout of the campus site would include designs by many different architects over time. The CMPDG is intended to be compatible with the design standards and guidelines for the Mission Bay Redevelopment Area adopted by the City and the former San Francisco Redevelopment Agency (now known as the Office of Community Investment and Infrastructure [OCII]).

As indicated in UCSF's *Mission Bay Phase Two Study*, overall base building heights on the North Campus are set by the CMPDG at 85 feet, exclusive of rooftop mechanical equipment. Buildings occupying up to twenty percent (20% or 5.2 acres) of developable area on the North Campus may be built to a height of 110 feet. Buildings occupying up to ten percent (10% or 2.6 acres) of developable area on the North Campus may be built to a height of 160 feet. Currently, only 1.1% and 0.6% (0.3 and 0.16 acres), respectively, of the North Campus have been built within the 110 foot and 160 foot height categories. This occurs in the housing complex on Block 20, where buildings reach heights of 85 to 155 feet, and with the tower of Rutter Center on Block 21B, which is 144 feet high. The CMPDG also includes building height parameters for certain areas of the campus site. In order to ensure that the Mission Bay Commons has good exposure to sunlight, buildings exceeding 55 feet along the Commons (adjacent to UCSF Blocks 14 through 17) must step back their facades 30 feet from the building edge above 55 feet. On other sites, building heights should be designed to avoid shading existing and planned open spaces and outdoor recreation areas to the extent possible. Further, the tallest buildings should be located on sites adjoining major urban corridors such as Third, Owens or Sixteenth Streets where they can act as landmarks.

7.9.2.4 Existing Planning Agreements

At Mission Bay, UCSF development is subject to agreements that were negotiated by UCSF with the City and the developer of Mission Bay in connection with the Mission Bay Redevelopment Plan Area.

Mission Bay Redevelopment Plan Area

The *Mission Bay Redevelopment Area North and South Plans* was prepared by the City and County of San Francisco and approved by the San Francisco Board of Supervisors in November 1998. The plans call for over 6,000 residential units (including affordable housing), commercial, retail, and entertainment uses, a large hotel, and over 40 acres of publicly accessible open space in the 303-acre area consisting of Mission Bay Area North and Mission Bay Area South on either side of the China Basin Channel. The overall objective of the plan is to remove industrial blight and stimulate development, employment, and economic growth. A key objective is to retain and promote UCSF academic and research activities within the City by providing a major new campus site large enough to accommodate a critical mass of scientific programs into the initial decades of the 21st century. A site within the Mission Bay Area South was identified in the plan that now consists of the Mission Bay campus site.

Agreements Related to the North Campus

With the transfer of 30 acres from Catellus to UCSF for the North Campus, a Contribution Agreement was prepared outlining the conditions associated with this transfer of property. The Contribution Agreement describes UCSF's financial obligations including contributions towards the construction of public infrastructure (streets and utilities), maintenance of the open space system throughout the Mission Bay Redevelopment Plan area and the development of a public fire station (currently under construction). Also included are UCSF's obligations to provide a minimum of eight acres of publicly accessible open space on the North Campus (which UCSF has already completed), and to donate Block 14 to the San Francisco Unified School District should the district request the property for a public school by 2027. A Donation Agreement was also prepared between UCSF and San Francisco for the City's donation of 13 additional acres for the North Campus, consisting of rights-of-way of previously planned public streets that had not been developed.

Agreements Related to the South Campus

As part of the acquisition of property for the South Campus, UCSF entered into a ground lease for Blocks 36-39 with Catellus and a Memorandum of Understanding (MOU) with OCII to establish UCSF's obligations including contributions towards the construction of public infrastructure, affordable housing, maintenance of the open space system throughout the Mission Bay Redevelopment Plan area, and limitations on building heights, massing and signage for development of the South Campus. UCSF subsequently acquired Block X3 to complete assembly of the South Campus, and the MOU with the City was then amended to cover that property as well.

Agreements Related to the East Campus

In connection with the pending acquisition of Blocks 33 and 34 (which will be referred to as the East Campus), UCSF anticipates entering into a MOU with OCII regarding UCSF's financial obligations, including contributions towards the construction of public infrastructure; affordable housing; maintenance of the open space system throughout Mission Bay; and agreement to follow the *Mission Bay South Redevelopment Area Plan "Design for Development"* regarding building

height, bulk, setbacks, maximum tower floorplate areas, and other design matters for buildings on the East Campus. UCSF also anticipates entering into an Agreement with the infrastructure developer for Mission Bay (FOCIL-MB, LLC) regarding UCSF's contribution towards public infrastructure.

Mission Bay Planning Principles

In response to community concern regarding UCSF's acquisition of land for the Medical Center at Mission Bay and 654 Minnesota Street, UCSF partnered with its Community Advisory Group (CAG) to convene the UCSF Mission Bay Community Task Force (Task Force). The purpose of the Task Force was to identify community issues related to UCSF's development in the Mission Bay Redevelopment Plan area and to produce planning principles to address these issues. These Planning Principles, which were incorporated into the *LRDP Amendment #3*, have since been expanded to address community concerns across all UCSF sites.

7.9.3 Land Use and Planning – Mission Bay Impacts and Mitigation Measures

Impact LU-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site would be consistent with applicable land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental effect. (Less than Significant)

Upon adoption by the Regents, the proposed 2014 LRDP will replace the 1996 LRDP, as amended, and become the applicable campus land use plan for UCSF. Pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation. The University is the only agency with land use jurisdiction over programs and projects proposed at UCSF campus sites by the 2014 LRDP. Therefore, all proposed activities that would be in general conformity with the 2014 LRDP would have no significant land use impacts. However, UCSF considers the land use policies and zoning regulations of the City when analyzing potential land use impacts under CEQA. The 2014 LRDP is not expected to conflict with City plans and policies adopted for the purpose of avoiding or mitigating an environmental effect.

The 2014 LRDP proposed functional zones are generally consistent with the existing zones on the Mission Bay campus site. Functional zone changes are proposed for Blocks 15 and 18. Block 15 is currently classified as Instruction and Research and would be reclassified as Housing under the 2014 LRDP. The western, triangular portion of Block 18 would be reclassified from Support and Parking to Research as its shape is not conducive to an efficient parking garage layout. Only minor classification label changes are proposed elsewhere on the Mission Bay campus site. Blocks 33 and 34, proposed as the new East Campus at the Mission Bay campus site, have not been designated with functional zones by UCSF. As part of the approval of the 2014 LRDP, the Regents also would designate these blocks for Research and Parking. UCSF is also considering a variant for Blocks 33 and 34 that would designate a portion of these blocks for Clinical use, with

the remainder as Research and Parking. Clinical uses are considered a "secondary use" under the *Mission Bay South Redevelopment Plan* and would require a finding of consistency with the plan by OCII.

The functional zone changes proposed by the 2014 LRDP do not present land use conflicts with adjacent existing land uses on the campus site. Compatibility between adjacent existing and proposed functional zones was taken into consideration in developing the proposed zones in the 2014 LRDP. Existing land use patterns reflect campus site development guided by the planning principles embodied in the previous LRDPs. Therefore, implementation of the 2014 LRDP would have a less-than-significant impact regarding consistency with land use plans and policies adopted for the purpose of avoiding or mitigating an environmental effect.

Mitigation: None required.

Impact LU-MB-2: Implementation of the 2014 LRDP at the Mission Bay campus site would be compatible with adjacent land uses. (Less than Significant)

The 2014 LRDP includes proposed development on Blocks 15, 16, 18, 23, and 25, and acquisition and development of Blocks 33 and 34. In addition, it is assumed that the last building of Phase 1 of the Medical Center at Mission Bay (cancer outpatient building) as well as Phase 2 of the Medical Center would be constructed by 2035. On Block 16, one research and/or office building and a central utility plant totaling approximately 289,000 gsf, or alternatively two research buildings totaling up to 377,400 gsf may be built. The height of the proposed buildings on Block 16 would be similar in height to other research buildings on the campus site, but would have setbacks of 30 feet at the 55-foot height along Mission Bay Boulevard South in accordance with the CMPDG. Block 18 is proposed to include one office and/or research building with up to 193,000 gsf and up to 160 feet tall. A separate or attached parking garage up to 110 feet tall could be built east of the proposed building on Block 18. A full-size, multi-purpose sports field would be developed on the eastern portion of the block. An 85-foot tall, 232,200 gsf research building is proposed for the western side of Block 23. Block 25 is proposed to include a 323,300 gsf research/office building on the eastern side of the block with all or a portion of the building constructed up to 160 feet in height.

A new housing complex consisting of 523 units and totaling 398,700 is proposed for Block 15. The complex would be comprised of four or fewer buildings with an internal courtyard. The buildings would range from 55 feet in height along Mission Bay Boulevard South, 85 feet along Sixth Street and Nelson Rising Lane and up to 120 feet along Fifth Street. The complex could include a 20,000 gsf child care center. If the child care center is developed on this block, approximately 15,000 square feet of the courtyard would be dedicated as an outdoor play yard. If child care is located elsewhere, approximately 12 additional units could be added to the housing program on Block 15. In addition, approximately 1,500 assignable square feet could be considered on this block (or Block 23) for UCSF police.

As described in the Setting in Section 7.9.2.3, above, buildings occupying up to twenty percent (20% or 5.2 acres) of developable campus site area may be built to a height of 110 feet. Buildings

occupying up to ten percent (10% or 2.6 acres) of developable campus site area may be built to a height of 160 feet. Currently, 1.1% and 0.6%, respectively, of the campus site have been built within the 110 foot and 160 foot height categories. Under the 2014 LRDP, the area on the campus site occupied by buildings up to 110 feet in height would increase to 5% (1.4 acres) of developable campus site area. The area occupied by buildings up to 160 feet in height would increase to 6% (1.7 acres) of developable campus site area. Proposed buildings under the 2014 LRDP would therefore be consistent with the height restrictions for the campus site as determined in the CMPDG. New buildings proposed for Blocks 15, 16, 18, 23, and 25 would be designed to be consistent with other parameters of the CMPDG, including such items as mass, floor size, proportion and setbacks.

Blocks 33 and 34 (to be known as the East Campus) would be developed with up to 500,000 gsf and 500 parking spaces. No specific UCSF programs have been identified yet to relocate to the site, and no specific building design is proposed. Proposed development on the East Campus would follow the *Mission Bay South Redevelopment Area Plan "Design for Development"* regarding building height, bulk, setbacks, maximum tower floorplate and other design matters.

The cancer outpatient building and the Phase 2 Medical Center would be consistent with the MOU with OCII regarding height, bulk and setback requirements as determined in the *UCSF Medical Center at Mission Bay EIR* (UCSF, 2008).

As discussed above, proposed development on the Mission Bay campus site would be consistent with the CMPDG, the *Mission Bay South Redevelopment Area Plan "Design for Development,"* and other agreements with the City and OCII. New buildings would be constructed in an area containing existing UCSF facilities and near other similar development projects adjacent to the campus site. Proposed UCSF development on the northern portion of the campus site would be separated from residential areas to the north by the Mission Bay Commons. Development proposed for the Mission Bay campus site under the 2014 LRDP would be compatible with adjacent land uses and the impact would be less than significant.

Mitigation: None required.

7.10 Noise

This section considers the setting and noise impacts of implementation of the 2014 LRDP at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Noise are contained in Section 4.10 of this EIR. The CEQA Significance Standards presented in Section 4.10.3 are used to evaluate the potential noise impacts of all proposed 2014 LRDP activities.

7.10.1 Noise Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Bay campus site, the Initial Study concluded that:

- **Airport noise.** No activities would be located within the vicinity of a public airport. Therefore, no additional analysis of this issue is required.

7.10.2 Noise – Mission Bay Setting

7.10.2.1 Existing Noise Environment

Long-term environmental noise in urbanized areas is primarily dependent on vehicle traffic volumes and the mix of vehicle types. The existing ambient noise environment within the Mission Bay campus site area is dominated by vehicular traffic on Third Street, Sixteenth Street and Mariposa Street as well as from the elevated section of Interstate 280 (I-280) to the west of the campus site.

The San Francisco Department of Public Health (DPH) has mapped transportation noise throughout the City and County of San Francisco, based on modeled baseline traffic volumes derived from the San Francisco County Transportation Authority travel demand model[16]. DPH maps indicate the areas subject to noise levels over 60 dBA (L_{dn}) and the range of L_{dn} noise levels that occur on every street in San Francisco. The portions of these maps that cover the campus site area indicate that areas along Third Street are generally between 65 and 70 dBA (L_{dn}) south of Sixteenth Street but exceed 70 dBA north of Sixteenth Street.

Ambient Noise Measurements

Ambient long-term (24-hour) and short-term (10-minute) noise measurement data were collected in January and March of 2014 to characterize noise conditions in the campus site area and its environs. Noise measurement locations are shown in **Figure 7.10-1**. To characterize ambient noise in the campus site area, short-term measurement data were compiled for two locations where residential land uses exist near primary 2014 LRDP development proposals, as shown in **Table 7.10-1**. Long-term noise data was collected adjacent to proposed residential land uses on the campus site. These data are presented in **Table 7.10-2**.

16 San Francisco Department of Public Health (DPH), San Francisco City-wide Noise Map, August 2006, Available online at http://www.sfdph.org/dph/files/EHSdocs/ehsPublsdocs/Noise/noisemap2.pdf Accessed April 30, 2013.

UCSF Long Range Development Plan Environmental Impact Report

Figure 7.10-1

Noise Measurements Locations – Mission Bay

TABLE 7.10-1
SHORT- TERM AMBIENT NOISE LEVEL DATA IN THE MISSION BAY CAMPUS SITE AREA

Measurement Location	Time	Noise Levels in dBA	
		Hourly L_{eq}	L_{max}
MB-ST1: UCSF Mission Bay Block 18 Existing Child Care Facility	4:15	67.8	83.6
MB-ST2: UCSF Mission Bay Block 20 Existing Residential Uses	4:30	68.0	76.8
MB-ST-3: UCSF Future Mariposa City Park	4:56	70.9	79.4

NOTE: See Figure 7.10-1 for noise measurement locations. L_{eq} represents the constant sound level; L_{max} is the maximum noise level.

SOURCE*:* Environmental Science Associates, 2014.

TABLE 7.10-2
LONG- TERM AMBIENT NOISE LEVEL DATA IN THE MISSION BAY CAMPUS SITE AREA

Measurement Location	Day-Night Noise level (DNL)	Noise Levels in dBA	
		Daytime hourly average Leq	Nighttime hourly average Leq
MB-LT1. UCSF Mission Bay Block 15	64	60	57

NOTE: See Figure 7.10-1 for noise measurement locations.

SOURCE*:* Environmental Science Associates, 2014.

Long-term monitoring location MB-LT1 is located north of the existing terminus of Nelson Rising Lane at the southeast corner of Block 15. The noise environment at this location is dominated by distant vehicle traffic on Third Street and I-280. This location experiences noise levels of 64 DNL, which, for residential land uses, the General Plan suggests that new construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design.

7.10.2.2 Sensitive Receptors

Sensitive receptors for noise are generally considered to include nursing homes, senior citizen centers, schools, churches, libraries, residences, and hospitals. Land uses in the campus site area are described in detail in Section 7.9, *Land Use*. On the Mission Bay campus site, existing sensitive receptors consist of the Mission Bay housing building on Block 20, and a child care facility located on Block 18. Off-campus receptors consist of residential land uses approximately 300 feet northeast of the campus site, residential land uses approximately 650 feet northwest of the campus site (across Mission Creek) and residential land uses in Potrero Hill over 1,000 feet southwest of the campus site.

7.10.3 Noise – Mission Bay Impacts and Mitigation Measures

Impact NOI-MB-1: Construction activities proposed under the 2014 LRDP at the Mission Bay campus site would result in increases in ambient noise levels over the term of the exterior construction activities. (Potentially Significant)

As noted in the Regional Setting section, the hours that construction activity noise can occur is restricted by Section 2908 of the Police Code. Although UCSF is not subject to the noise ordinance, it strives to be consistent with it. Section 2908 prohibits any person, between the hours of 8:00 p.m. of any day and 7:00 a.m. of the following day, from erecting, constructing, demolishing, excavating for, altering, or repairing any building or structure if the noise level created is in excess of the ambient noise level by 5 dBA at the nearest property line.

Table 7.10-3 presents an estimate of the sequence of proposed building construction and the proximity of sensitive receptor to each construction site. As can be seen from the table, most construction would occur sequentially with only construction of the Block 23 research building, the cancer outpatient building and the Block 18 sports field potentially occurring concurrently. Table 7.10-3 also presents an estimate of noise levels during construction. These estimated noise levels assume simultaneous operation of an excavator, a loader and a bulldozer common to grading work for foundations as calculated using the Roadway Construction Noise Model of the FHWA.

TABLE 7.10-3
NOISE LEVELS FOR CONSTRUCTION AT THE MISSION BAY CAMPUS SITE

Building	Estimated Construction Schedule	Distance to Nearest Sensitive Receptor (feet)	Shielding Assumption	Estimated Noise Level at Receptor (dBA, Leq)	Noise Increase over Existing Daytime Conditions (dBA, Leq)
Block 15 Housing	2015 to 2016	250 (Block 18 Child Care)	None	67.4	7.4
Block 23 Research Building	January 2018 to January 2020	175 (Block 20 Housing)	None	70.5	2.5
Cancer Outpatient Building	January 2018 to January 2020	800 (Block 20 Housing)	None	57.6	-10.4
Block 18 Sports Field	July 2018 to July 2019	100 (Block 15 Housing)		75.4	**15.4**
Block 25 Research Building	January 2023 to January 2025	450 (Block 20 Housing)	None	62.3	-5.3
Block 16 Research Building & CUP	January 2028 to January 2030	100 (Block 15 Housing)	None	75.4	**15.4**
Block 18 Parking Phase I	July 2021 to July 2022	100 (Block 15 Housing)	None	75.4	**15.4**
Block 18 Research Building	January 2033 to January 2034	200 (Block 15 Housing)		69.4	9.4
Block 18 Parking Phase II	July 2034 to July 2035	200 (Block 15 Housing)	None	69.4	9.4
Phase 2 Medical Center	2035	840 (Pennsylvania Avenue residences)	None	56.9	-14.1

TABLE 7.10-4
TYPICAL NOISE LEVELS FROM CONSTRUCTION EQUIPMENT

Construction Equipment	Noise Level (dBA, Leq at 50 Feet)	Noise Level (dBA, Leq at 100 Feet)
Dump truck	76	70
Portable air compressor	78	72
Concrete mixer (truck)	79	73
Crane	81	75
Excavator	81	75
Dozer	82	76
Paver	77	71
Generator	81	75
Backhoe	78	72
Pile driver	101	95
Auger Drill Rig	84	78

SOURCE: FHWA, 2006.

The nearest sensitive residential receptors on the Mission Bay campus site currently experience existing daytime noise levels of 60 dBA (Future Block 15) and 69 dBA (Existing Block 20 housing and day care center on Block 18). Noise from standard construction equipment could exceed these existing noise levels by as much as 15 dBA. Implementation of **Mitigation Measure NOI-LRDP-1** will reduce the impacts from standard construction equipment by as much as 5 to 10 dBA, which would be less than significant for most locations, depending on the existing ambient noise level.

Mitigation Measure: Implement Mitigation Measure NOI-LRDP-1

Significance after Mitigation: Less than Significant

Impact NOI-MB-2: Construction activities proposed under the 2014 LRDP at the Mission Bay campus site would result in increases in ambient noise levels during pile-driving activities. (Potentially Significant)

It is likely that most of the buildings developed at the Mission Bay campus site would require pile-driving, given the soil conditions in the area and the development history of the Mission Bay campus site and surrounding area. An impact pile driver, if required, could result in an increase of up to 35 dBA over existing noise levels at the nearest receptor, 100 feet away in many cases, resulting in a significant noise increase over existing conditions. Consequently, mitigation measures to reduce pile-driving noise are identified in **Mitigation Measure NOI-LRDP-2**.

Mitigation Measure: Implement **Mitigation Measure NOI-LRDP-2**

Significance After Mitigation: Significant and Unavoidable. Mitigation Measure NOI-LRDP-2 would reduce the severity of noise generated by pile-driving activities and reduce the potential annoyance to nearby residents and others who could be disturbed by pile-

driving to the extent feasible. If piles can be installed though drilling and cast in place measures then this mitigation measure would result in a less than significant impact.

However, if geotechnical conditions exist such that impact or vibratory pile-driving is required, then construction noise would be significant. Although pile-driving noise would be intermittent and would occur over a short duration, even after mitigation the noise level would likely exceed 20 dBA during pile-driving activities, resulting in a significant and unavoidable impact.

Impact NOI-MB-3: Construction activities proposed under the 2014 LRDP at the Mission Bay campus site could generate ground-borne vibration. (Less than Significant)

The types of construction activities associated with propagation of ground-borne vibration include pile driving, use of hoe-rams for demolishing large concrete structures and caisson drilling. It is possible that pile driving and drilling could occur during hospital construction. Pile driving, if required could take one or more months, and would occur during daytime hours, consistent with the City's Police Code.

Of the construction equipment likely to be used for construction, pile driving has the potential to result in the highest levels of groundborne vibration. Pile driving can result in peak particle velocities (PPV) of up to 1.5 inches per second (in/sec) at a distance of 25 feet (FTA, 2006), but typically results in an average of about 0.644 PPV at that distance. The Caltrans measure of the threshold of architectural damage for conventional sensitive structures is 0.5 in/sec PPV for new residential structures and modern commercial buildings and 0.25 in/sec PPV for historic and older buildings.

The nearest existing structure is approximately 50 feet away from the site of the proposed buildings, where pile driving may occur and 100 feet away from the nearest residential building. At the 50-foot distance, vibration from pile driving would be expected to be reduced to 0.23 inches per second. Therefore, vibration from pile driving would not exceed the criterion published by Caltrans of 0.5 in/sec PPV for new residential structures and modern commercial buildings. At the 100-foot distance, vibration from pile driving would be expected to be reduced to 0.08 inches per second where vibration levels could be perceptible at the nearest residential receptors but would be below the thresholds considered strongly perceptible or severe, 0.1 in/sec PPV and 0.4 in/sec PPV, respectively.

Consequently, the development at Mission Bay under the 2014 LRDP would have a less-than-significant impact with regard to groundborne vibration.

Mitigation: None required.

Impact NOI-MB-4: Operational noise generated by development under the 2014 LRDP at the Mission Bay campus site could cause a long-term increase in ambient noise levels in the campus vicinity. (Less than Significant)

Long-term noise sources associated with operation of the new buildings and hospital would primarily consist of marginal increases in roadway traffic resulting from new and repurposed land uses. There will likely be some new mechanical equipment (e.g. heating ventilation and air conditioning, back up generator testing) associated with operation of these new buildings. The potential location of such equipment in not known but such equipment would be operated is such a manner as to conform to the requirements of the City of San Francisco Noise Ordinance. Noise from maintenance testing of backup generators would occur briefly once a week during daytime hours and would be roughly equivalent to that generated by a single truck engine, which would not be expected to represent a substantial increase in noise levels in an urban environment.

A project would be considered to generate a significant impact if it resulted in a permanent increase in ambient noise levels greater than 3 dBA in the project vicinity above levels existing without the project for areas already impacted by noise.

Increased traffic would primarily be on the local roadway network, including Third Street and Mission Bay Boulevard South. Noise levels were determined for this analysis using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model and the turning movements in the traffic section for Existing (2014), Existing Plus LRDP, and Cumulative Plus LRDP conditions. Peak hour intersection turning data from the traffic study were analyzed to evaluate increases and resulting traffic-generated noise increases on roadway links most affected by 2014 LRDP-related traffic. The roadway segments analyzed and the results of the noise increases resulting from modeling are shown in **Table 7.10-5**, below.

TABLE 7.10-5
PEAK-HOUR TRAFFIC NOISE LEVELS IN THE VICINITY OF THE MISSION BAY CAMPUS SITE

Roadway Segment[a,b]	(A) Existing	(B) Existing Plus LRDP	(B-A) Difference between Existing Plus LRDP and Existing[c]	(D) Cumulative Plus LRDP (2040)	(D-A) Difference between Cumulative Plus LRDP and Existing
3rd Street between Mission Bay Boulevard and 16th Street	68.9	69.3	0.4	71.3	2.4
3rd Street between Mariposa Street and 20th Street	68.4	68.9	0.5	70.8	2.4
3rd Street between Channel Street and Mission Bay Boulevard	69.2	69.6	0.4	71.1	1.9
Mission Bay Boulevard South between 3rd Street and 6th Street	50.3	51.1	0.8	55.5	5.2

[a] Road center to receptor distance is 15 meters (approximately 50 feet) for all roadway segments. Noise levels were determined using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model.

[b] The analysis considered the vehicle mix based on – cars 95%, medium trucks 3%, and heavy trucks 2% on 3rd Street. Traffic speeds for all vehicle classes were set at 35 mph for 3rd Street. Mission Bay Boulevard had a more standard non-arterial assumption of 97% cars, 2% medium trucks, and 1% heavy trucks on 3rd Street and a traffic speeds for all vehicle classes of 25 mph

SOURCE: ESA, 2014.

As shown in Table 7.10-5, the increase in traffic noise from the Existing Plus LRDP scenario compared to the Existing scenario would increase peak hour noise levels by less than 3 dBA at all roadway segments. Overall, operational and traffic noise impacts associated with development under the 2014 LRDP at all analyzed roadway segments in the vicinity of the Mission Bay campus site would be less than significant.

Mitigation: None required.

Impact NOI-MB-5: Operations under the 2014 LRDP at the Mission Bay campus site would result in exposure of persons (new residents) to noise levels in excess of standards established in the general plan. (Less than Significant)

The proposed Block 15 housing project would result in a new residential use and child care facility that would be considered a sensitive receptor. Long-term noise monitoring conducted at Block 15 indicates an existing exterior noise level of 64 DNL. As shown in Table 7.10-5, future roadway traffic on South Mission Bay Boulevard on the northern boundary of Block 15 would contribute 55 dBA to this existing measures value, resulting in a future (2040) condition of 64.5 dBA. This noise level is within the "conditionally acceptable" noise exposure category as defined by the City of San Francisco General Plan Noise Element (greater than 60 DNL).

The Phase 1 Medical Center will operate a helipad that will have occasional helicopter operations. Noise modeling for helicopter operations at the UCSF Medical Center at Mission Bay was conducted as part of the *Final SEIR, UCSF Medical Center at Mission Bay—Residential Sound Reduction Program for Helicopter Operations*. This modeling indicates that "busy day" helicopter operations at the hospital would contribute a CNEL of 54 dBA at Block 20. Block 15 is further away from the helipad and would be expected to experience a lesser noise contribution. Adding this contribution to the existing ambient noise levels at Block 15 as well as future traffic noise contributions results in a cumulative future noise level of 64.9 dBA[17].

A conditionally acceptable noise exposure is defined as one in which new construction or development should be undertaken only after a detailed analysis of noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction combined with closed windows and fresh air supply systems or air conditioning will normally suffice. The proposed housing units on Block 15 would have air handling systems. Additionally, Section 1207 of the California Building Code (Title 24 of the California Code of Regulations) establishes material requirements in terms of sound transmission class (STC) [18] of 50 for all common interior walls and floor/ceiling assemblies between adjacent dwelling units or between dwelling units and adjacent public area. This requirement would be sufficient to achieve the additional 4.9 dBA of sound reduction necessary to achieve the noise exposure goals of the San Francisco General Plan.

[17] CNEL is roughly equivalent to DNL, usually within 1 dBA

[18] The STC is used as a measure of a materials ability to reduce sound. The STC is equal to the number of decibels a sound is reduced as it passes through a material.

Mitigation: None required.

LRDP Variant Conditions

Under the LRDP Variant, the Mission Bay campus site would generate slightly more vehicle trips than under the 2014 LRDP. Approximately 2,950 new vehicle trips would be generated during the AM peak hour and approximately 2,450 additional vehicles at the campus site during the PM peak hour. These represent increases of approximately 2% in the total number of vehicles compared to the 2014 LRDP during both the AM and PM peak hours. This additional traffic would increase roadway noise by less than 0.1 dBA for all roadways analyzed in Table 7.10-5 and would have the same less than significant impact as identified for the 2014 LRDP.

7.11 Population and Housing

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Population and Housing are contained in Section 4.11 of this EIR. The CEQA Significance Standards presented in Section 4.11.3 are used to evaluate the potential population and housing impacts of all proposed 2014 LRDP activities.

The 2014 LRDP would result in population growth in San Francisco or the wider Bay Area through increased employment and student enrollment. The 2014 LRDP would accommodate an increase in employment and students at all campus sites from the current approximately 30,840 to approximately 42,270 by 2035. This anticipated population increase could result in an increased demand for housing in the Bay Area. This overall increase and its potential effect on housing were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures.*

The 2014 LRDP development proposals would result in changes in daily population at this campus site. The projected increase in population at the Mission Bay campus site would be approximately 17,000 people by 2035 with implementation of the 2014 LRDP (including the Phase 2 Medical Center at Mission Bay). A new housing complex with approximately 774 beds in 523 units is proposed on Block 15 by the 2014 LRDP. The direct and indirect physical environmental effects that result from these changes are fully considered in each of the appropriate topical sections of this Chapter.

7.12 Public Services

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Public Services are contained in Section 4.12 of this EIR. The CEQA Significance Standards presented in Section 4.12.3 are used to evaluate the potential public services impacts of all proposed 2014 LRDP activities.

In 2013, the estimated daily UCSF population across all campus sites, including patients and visitors, was approximately 39,420. At LRDP horizon in 2035, total population is projected to reach approximately 56,420, an increase of about 17,000, the majority of which would be associated with growth proposed by the 2014 LRDP. The projected increase in population at the Mission Bay campus site would be approximately 17,000 people by 2035.

This anticipated population increase could result in an increased demand for public services in San Francisco, including fire protection, law enforcement, and public education. This overall increase and its potential effect on public services were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures*. The anticipated increase in population at this campus site under the LRDP would not cause substantial increased demand for public services specific to this campus site, and all impacts are found to be less than significant.

7.13 Recreation

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Recreation are contained in Section 4.13 of this EIR. The CEQA Significance Standards presented in Section 4.13.3 are used to evaluate the potential recreation impacts of all proposed 2014 LRDP activities.

In 2013, the estimated daily UCSF population across all campus sites, including patients and visitors, was approximately 39,420. At LRDP horizon in 2035, total population is projected to reach approximately 56,420, an increase of about 17,000, the majority of which would be associated with growth proposed by the 2014 LRDP. The projected increase in population at the Mission Bay campus site would be approximately 17,000 people by 2035.

This anticipated population increase could result in an increased use of recreational facilities on and near UCSF campus sites. This overall increase and its potential effect on recreational facilities, as well as effects resulting from 2014 LRDP proposals, were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures*. The anticipated increase in population at this campus site under the LRDP would not cause substantial increased demand for recreation facilities specific to this campus site, and all impacts are found to be less than significant.

7.14 Transportation and Traffic

This section considers the setting and the potential transportation and traffic impacts of implementation of the 2014 LRDP at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Transportation and Traffic are contained in Section 4.14 of this EIR. The CEQA Significance Standards presented in Section 4.14.3 are used to evaluate the potential transportation and traffic impacts of all proposed 2014 LRDP activities.

7.14.1 Transportation and Traffic Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Bay campus site, the Initial Study concluded that:

- **Air traffic patterns.** No activities would result in a change in air traffic patterns. Therefore, no additional analysis of this issue is required.

7.14.2 Transportation and Traffic – Mission Bay Setting

A more-detailed description of current transportation and traffic characteristics in the Mission Bay campus site area is provided in Appendix G, the Transportation Impact Study (TIS) for the UCSF LRDP.

7.14.2.1 Roadway Facilities

The network of regional roadways that serve the Mission Bay campus site is described in Section 4.18.

The campus site sits within the Mission Bay Redevelopment Area and is bordered by the South of Market (SoMa) neighborhood to the north, Potrero Hill to the south and west, and Dogpatch to the south. The primary north-south corridors are Third Street, Fourth Street, and Seventh Street and the primary east-west corridors are Sixteenth Street and Mariposa Street. Local access to the Mission Bay campus site is provided by an urban street grid network. Key local roadways through the campus site are discussed below.

The local road network serving the Mission Bay campus site includes several two-lane roadways with on-street parking provided on both sides of the streets in most areas, as follows:

- **Berry Street** runs from Third Street to Owens Street, operating as an eastbound one-way street between Third and Fourth streets.

- **Mission Rock Street** runs from Terry A. François Boulevard to Fourth Street.

- **Fourth Street** is a Primary Transit Important roadway that runs from Market Street to Sixteenth Street. It is designated as a Class III bicycle route as it crosses Mission Creek,

after which it transitions into Class II bicycle lanes between Channel Street and Sixteenth Street. The T Third Street light rail line operates on Fourth Street between King Street and Channel Street.

- **Owens Street** runs from Sixteenth Street to the Mission Bay Circle. On-street parking is prohibited on both sides of the street.

- **Seventh Street** is a Secondary Arterial roadway that runs from Market Street to Sixteenth Street. Seventh Street has Class II bicycle lanes between Brannan and Sixteenth streets.

Other roadways providing access to the Mission Bay campus site are as follows:

- **Mission Bay Boulevard North** is a one to two-lane Local Street that extends from Terry A. François Boulevard to Fourth Street. Mission Bay Boulevard North is the westbound component of the Mission Bay Boulevard one-way couplet.

- **Mission Bay Boulevard South** is a one to two-lane Local Street that extends from Fourth Street to Terry A. François Boulevard. Mission Bay Boulevard South is the eastbound component of the Mission Bay Boulevard one-way couplet.

- **Channel Street** is a four-lane east-west Local Street that extends from west of Fourth Street to Third Street. The T Third Street rail line operates on Channel Street between Third and Fourth streets within a physically separated median in the roadway.

- **Sixteenth Street** is a four-lane east-west Secondary Arterial roadway with left-turn pockets that extends from Third Street to Castro Street. Sixteenth Street has Class II bicycle lanes in both directions between Third Street and Kansas Street.

- **Mariposa Street** is a four-lane east-west Local Street that extends from Illinois Street to Harrison Street that is located at the southern edge of the UCSF campus site. The I-280 on- and off-ramps (southbound and northbound, respectively) are located immediately east of the intersection of Pennsylvania and Mariposa streets. Mariposa Street is a designated Class III bicycle route with shared-lane markings (“sharrows”) between Illinois Street and Mississippi Street.

- **Third Street** is a four-lane north-south Primary Transit Important roadway that extends from Market Street to Bayshore Boulevard. Third Street is designated as a Class III bicycle route with “sharrows” between King Street and Terry A. François Boulevard in the northbound direction only. The T Third Street light rail line operates along Third Street between Channel Street and Bayshore Boulevard along a physically separated median in the roadway.

- **King Street** is a five to six-lane east-west Primary Transit Important roadway that extends from Second Street to Fifth Street and the I-280 freeway. The N Judah and T Third Street light rail lines operate along the entirety of King Street within a physically separated median in the roadway.

- **Mission Bay Drive** is a four-lane Local Street that extends from the Mission Bay Circle to Seventh Street under the I-280 freeway and across the Caltrain railroad tracks; the eastbound and westbound travel lanes are separated by a landscaped median, and Class II bicycle lanes are provided on both sides of the street.

- **Mississippi Street** is a north-south roadway that runs discontinuously between Sixteenth/ Seventh and César Chávez streets. In the vicinity of the Mission Bay campus site, Mississippi Street has one traffic lane each way, and Class II bicycle lanes are provided on both sides of the street between Sixteenth and Mariposa streets.

Proposed Local Roadway Changes

The 1998 *Mission Bay South Area Plan* proposed substantial changes to the roadway infrastructure in the vicinity of the Mission Bay campus site that are to be constructed as the area develops. Of all of these, the following infrastructure improvements are to be implemented as part of the opening of Phase 1 of the Medical Center at Mission Bay in February 2015:

- Owens Street will be extended from Sixteenth Street to Mariposa Street, to connect with the I-280 on- and off-ramps and to create a new intersection at Mariposa Street. The existing signal at the intersection of Mariposa Street and the I-280 northbound off-ramp will be upgraded to accommodate the new Owens Street approach.

- Mariposa Street will be widened on the north side from Owens Street to Illinois Street by approximately 15 feet, and left turn lanes will be provided at major intersections. The Mariposa Street Bridge over the Caltrain tracks will be restriped to provide two exclusive left turn lanes in the westbound direction for a total of three lanes, and create a new signalized intersection with Owens Street.

- The northbound I-280 off-ramp will be widened to the east to provide an additional lane and better align with Owens Street. Mariposa Street between the I-280 southbound on-ramp and Pennsylvania Avenue will be re-striped to accommodate the lane configurations described above.

- The existing STOP-sign controlled intersection of Mariposa Street and the I-280 southbound on-ramp will be signalized; the new signal will be interconnected with the existing signal at the off-ramp.

7.14.2.2 Intersection Operating Conditions

Intersection operating conditions at 21 intersections were evaluated during the weekday peak hours of the AM (7:00-9:00AM) and PM (4:00-6:00PM) peak periods. Intersections usually form the critical capacity constraints on roadways. Therefore, most transportation analyses examine intersection operations as a measure of overall roadway conditions.

The operating characteristics of intersections are evaluated using the concept of Level of Service ("LOS"). LOS is a qualitative description of driver comfort and convenience. Intersection levels of service range from LOS A, which indicates free flow or excellent vehicle flow conditions with short delays, to LOS F, which indicates congested or overloaded vehicle flow conditions with extremely long delays. In San Francisco, LOS A through D is considered acceptable, and LOS E and LOS F are considered unsatisfactory service levels. The intersections were evaluated using the 2000 Highway Capacity Manual (HCM) methodology. Tables summarizing the relationship between average delay per vehicle and LOS for signalized and unsignalized intersections according to the 2000 HCM method can be found in the appendices of the Transportation Impact Study (TIS) for the UCSF Long Range Development Plan (Appendix G).

For signalized intersections, this methodology determines the capacity for each lane group approaching the intersection. The LOS is based on average delay (in seconds per vehicle) for the various movements within the intersection. A combined weighted average delay and LOS is presented for the intersection. For unsignalized intersections, operations are defined by the average control delay per vehicle (in seconds per vehicle) for each stop-controlled movement or movement that must yield the right-of-way, and the LOS is determined by the worst (highest average delay) approach. Generally, the delay ranges for each LOS are lower than for signalized intersections because drivers expect less delay at unsignalized intersections.

As shown in **Table 7.14-1**, 19 of the 21 study intersections operate at an acceptable level of service, which is LOS D or better, during the AM peak hour, and 19 study intersections operate at an acceptable LOS during the PM peak hour. The following intersections operate unacceptably during the AM or PM peak hours:

- King Street and Third Street (Intersection #24) operates at LOS E during the PM peak hour due to the high conflicting traffic volumes on the westbound through and eastbound left turning movements on King Street.
- Mariposa Street and the I-280 Northbound Off-ramp (Intersection #43) operates at LOS F during the AM peak hour due to the volume of traffic exiting I-280 via the off-ramp.
- Mariposa Street and the I-280 Southbound On-ramp (Intersection #44) operates at LOS E and LOS F during the AM and PM peak hours, respectively, due to the high conflicting volumes on east- and westbound Mariposa Street attempting to access I-280 via the Southbound On-ramp.

7.14.2.3 Transit Network

The Mission Bay campus site is well-served by public transit, both local and regional. Local service is provided by the Muni bus and light rail lines. Regional service is provided by BART, AC Transit, Golden Gate Transit, SamTrans, and Caltrain. In addition, there are two shuttle systems that provide service to the Mission Bay campus site: the UCSF shuttle system, and two shuttle lines operated by the Mission Bay Transportation Management Association (MBTMA). These shuttles supplement Muni transit service and provide direct connections to UCSF-operated facilities throughout San Francisco and the Powell Street BART station. According to the most recent transportation commute survey, approximately 20% of those traveling to and from the campus site use public transit, while another approximately 30% rely on UCSF shuttles to get to and from the campus site.

Local Transit

San Francisco Muni. San Francisco Municipal Railway (Muni) provides transit service within the City and County of San Francisco, including bus (both diesel and electric trolley), light rail (Muni Metro), cable car and electric streetcar lines. Muni operates three bus and rail lines in the Mission Bay campus site (see the Transportation Impact Study (TIS) in Appendix G for details about these transit lines).

TABLE 7.14-1
EXISTING PEAK-HOUR INTERSECTION LEVEL OF SERVICE (LOS) – MISSION BAY

Intersection	Traffic Control[a]	Peak Hour	Delay (seconds)[b]	LOS[c]
24. King Street / Third Street	Signal	AM PM	46 **70**	D **E**
25. King Street / Fourth Street	Signal	AM PM	43 53	D D
26. Brannan Street / Seventh Street	Signal	AM PM	14 25	B C
27. Channel Street / Third Street	Signal	AM PM	40 30	D C
28. Channel Street / Fourth Street	Signal	AM PM	15 16	B B
29. Mission Rock Street / Third Street	Signal	AM PM	37 29	D C
30. Mission Bay Boulevard North / Third Street	Signal	AM PM	17 16	B B
31. Mission Bay Boulevard South / Third Street	Signal	AM PM	23 20	C B
32. Mission Bay Drive / Owens Street	Roundabout	AM PM	<10 <10	A A
33. Mission Bay Drive / Seventh Street	Signal	AM PM	20 22	C B
34. 16th Street / Third Street	Signal	AM PM	36 31	D C
35. 16th Street / Fourth Street	Signal	AM PM	26 27	C C
36. 16th Street / Owens Street	Signal	AM PM	32 30	C C
37. 16th Street / Seventh Street	Signal	AM PM	43 44	D D
38. 16th Street / Rhode Island Street	Signal	AM PM	15 13	B B
39. 16th Street / Vermont Street	Signal	AM PM	19 15	B B
40. 16th Street / Potrero Avenue	Signal	AM PM	27 35	C C
41. Mariposa Street / Third Street	Signal	AM PM	**52** 28	**D** C
42. Mariposa Street / Fourth Street	Signal	AM PM	<10 11	A B
43. Mariposa Street / I-280 Northbound Ramps	Signal	AM PM	**73** 31	**E** C
44. Mariposa Street / I-280 Southbound Ramps	SSS	AM PM	**>50** **>50**	**F** **F**

[a] AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
[b] Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersections, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach (indicated in parentheses).
[c] For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For unsignalized intersections, LOS is based on the worst approach, which for AWS is indicated in parentheses.
[d] **Bold** indicates unacceptable operations per UCSF LOS standards

SOURCE: Fehr & Peers, 2014.

The Transit Effectiveness Project (TEP) serves as both a thorough review of and repositioning of San Francisco's public transit system, initiated by SFMTA in collaboration with the City Controller's Office. The TEP is aimed at improving reliability, reducing travel times, providing more frequent service and updating Muni bus routes and rail lines to better match current travel patterns. TEP recommendations include new routes and route realignments, more service on busy routes, and elimination or consolidation of certain routes or route segments with low ridership. The TEP recommendations were unanimously endorsed by the SFMTA Board of Directors in October 2008, for environmental impact review. The initial TEP recommendations were revised based on public feedback on the draft TEP environmental impact report (TEP EIR). The TEP EIR was certified on March 27, 2014, and the SFMTA Board of Directors approved most of the Service Improvements and portions of the Transit Travel Time Reduction Proposals on March 28, 2014.[19] The TEP project will be implemented based on funding and resource availability. The TEP Implementation Strategy anticipates that many of the improvements will be implemented sometime between Fiscal Year 2014 and Fiscal Year 2019, subject to funding sources and resource availability. [20] The changes proposed by the TEP for routes near the Mission Bay campus site are described in the TIS (Appendix G).

The Central Subway Project is the second phase of the Third Street light rail line (i.e., T Third), which opened in 2007. Construction of the underground segment from Bryant to Clay Street is currently underway, and the Central Subway will extend the T Third line northward from its current terminus at Fourth and King streets to a surface station south of Bryant Street and go underground at a portal under I-80. From there it will continue north to stations at Moscone Center, Union Square where it will provide passenger connections to the Powell Street Station and BART—and in Chinatown, where the line will terminate at Stockton and Clay streets. Construction of the Central Subway is scheduled to be completed in 2017, and revenue service is scheduled for 2019. This project would improve transit service between the Mission Bay campus site and Downtown.

UCSF Shuttle System

Shuttles to and from the Mission Bay campus site (Gold, Blue, Grey, Red, and Green) stop at loading zones along Fourth Street in front of the Koret Quad and in front of the parking lot located near Campus Way. These stops are designated by UCSF Transportation Services and reviewed/approved by SFMTA. A more-detailed description of the UCSF shuttle system serving the Mission Bay campus site area is provided in the TIS (Appendix G).

The document and supporting information may also be viewed at the Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA in case file 2011.0558E.

20 San Francisco Municipal Transportation Agency. 2014. TEP Implementation Workbook, March 5, 2014, Available online at: http://www.sfmta.com/sites/default/files/projects/TEP%20Implementation%20Plan%20-%20Section%201%20%282%29_1.pdf. Accessed June 27, 2014.

Mission Bay Shuttle System

The Mission Bay Transportation Management Association (MBTMA), formed several years ago in conformance with mitigation measures identified in the *Mission Bay Subsequent EIR*, provides two shuttle bus route services (east and west) between Mission Bay and the Powell BART Station and the Fourth/King Caltrain Station; they are free of charge and open to all employees, residents, and visitors to the Mission Bay Redevelopment Area and the China Basin building (at 185 Berry Street). The west route serves Seventh and Owens streets, while the east route serves Third Street and Mission Bay Boulevard North and South; both operate at 15-minute intervals from 7:00 to 10:00 am and 3:45 to 8:15 pm.

7.14.2.4 Pedestrian Circulation

Based on the 2013 UCSF Transportation Commute Survey, approximately 6% of those traveling to and from the campus site walk and about 37% of all trips made by UCSF Mission Bay campus site employees and students to off-campus locations throughout the day are made by foot. Due to the developing nature of the Mission Bay neighborhood, pedestrian volumes are currently relatively low surrounding the campus site. Pedestrian activity is generally higher towards the center of the campus site along Fourth Street and the many pedestrian alleyways and plazas such as Gene Friend Way and Campus Way. Pedestrian activity is also higher around transit hubs such as the UCSF shuttle stop on Fourth Street south of Gene Friend Way and the T Third light rail stops on Third Street at Gene Friend Way.

Pedestrian facilities include sidewalks, crosswalks, curb ramps, and pedestrian signals. Within the campus site area, sidewalks generally exist on both sides of the street in most locations, and are generally 12 to 15 feet wide. There are sidewalks gaps along roadway frontages of the campus site that are currently under construction including the south side of Sixteenth Street between Seventh and Third Streets and the west side of Third Street between Sixteenth and Mariposa Streets. These sidewalk gaps will be closed upon completion of construction of the adjacent buildings. All intersections surrounding the campus site include standard painted crosswalks and directional curb ramps. Pedestrian median refuges are provided along Fourth Street to slow traffic and reduce the pedestrian exposure time while crossing the street. Pedestrian signals with count down timers are provided at all signalized intersections. In addition to the on-street pedestrian facilities, there are numerous public pedestrian alleyways and plazas that reduce the size of the city blocks for pedestrians. This provides a fine-grained pedestrian oriented network and reduces pedestrian walking distances throughout the campus site.

Field observations at the campus site indicate that pedestrians cross where Campus Way meets Owens Street into the Gladstone Institute building. This crossing is currently unmarked but is a popular route as this is the most direct path for pedestrians between the center of the campus site to the Starbucks adjacent to the Gladstone Institute building and destinations to the west along Sixteenth Street.

7.14.2.5 Bicycle Circulation

The topography within and around the Mission Bay campus site is flat, which facilitates easy bicycle travel. Based on the 2013 UCSF Transportation Commute Survey, approximately 7% of those traveling to and from the campus site bike. In addition, approximately 9% of trips made by UCSF Mission Bay employees and students to off-campus, non-UCSF locations throughout the day are made by bike. This is approximately three times greater than the bicycling mode share throughout San Francisco.

The following bicycle facilities are located within or near the Mission Bay campus site:

- **King Street** is part of San Francisco Bike Route 5 and is a short east-west bike route that travels in front of AT&T Park between Second and Third streets with Class II bicycle lanes. The bicycle lane ends mid-way between Second and Third streets, and turns into a Class III facility with shared-lane ("sharrow") markings. The route ends at Third Street.

- **Sixteenth Street** is part of San Francisco Bike Route 40 and is an east-west bike route that extends from Terry A. François Boulevard to Kansas Street. Between Third Street and Kansas Street, 16th Street has Class II bicycle lanes in both directions. Between Terry A. Francois Boulevard and Third Street, Sixteenth Street is currently designated as a Class III bicycle facility, and will be upgraded to a Class II facility as a part of the Mission Bay South Infrastructure Plan.

- **Mariposa Street** is part of San Francisco Bike Routes 7 and 23 and is an east-west bike route that extends from Illinois Street to Mississippi Street as a Class III bicycle facility with "sharrow" markings. At its eastern terminus, Mariposa Street connects to the Class II bicycle lanes on Terry A. François Boulevard, while on its western terminus it connects to the Class II bicycle lanes that continue north on Mississippi Street.

- **Third Street** is San Francisco Bike Route 5 and is a short north-south bike route that extends from King Street to Terry A. François Boulevard and is designated as a Class III bicycle facility with "sharrows". At its southern terminus, Third Street connects to the Class II bicycle lanes on Terry A. François Boulevard.

- **Fourth Street** is a north-south bike route that extends from Berry Street to Sixteenth Street. Fourth Street is designated as a Class III bicycle facility as it crosses Mission Creek until Channel Street, south of which it has Class II bicycle lanes. The Fourth Street bicycle lanes provide the primary bicycle access through the Mission Bay campus site.

- **Seventh Street** is part of San Francisco Bike Route 23 and is a north-south bicycle route that extends from Brannan Street to Sixteenth Street with Class II bicycle lanes.

- **Mississippi Street** is part of San Francisco Bike Route 23 and is a north-south bike route that extends from Sixteenth Street to Mariposa Street with Class II bicycle lanes.

- **Mission Bay Drive** is an east-west bike route that extends from the Mission Bay Circle to Seventh Street. It is designated as a Class II bicycle facility that provides bicycle access across the Caltrain tracks into the Mission Bay campus site.

The San Francisco Bike Plan (June 2009) ("Bike Plan") includes a planned bikeway near/along Mission Creek between Fourth Street and Harrison Street, which is listed as a long-term project in the Bike Plan.

Bicycle counts indicate the most popular bicycling route through the campus site is Fourth Street, where between 40 and 50 bicyclists were observed during the AM and PM peak hours. Campus Way is also a popular connection into the campus site from Sixteenth Street, with 10-20 bicyclists observed crossing Owens Street at Campus Way during the AM and PM peak hours.

Bicycle racks are provided throughout the Mission Bay campus site in front of campus buildings, on-street, and within the Owens Street garage. Popular bicycle parking locations, such as the gym, were observed to be nearly fully occupied during a site visit in February 2014. In an effort to increase bike parking here at the Mission Bay campus site to meet the growing demand, while also taking into account the feedback received from bicyclists, UCSF has since redesigned and expanded the bike parking throughout the campus site. This included new racks that double the amount of bike parking available in each area of installation, while providing equal access to all bicycle frame shapes and sizes.

7.14.2.6 Loading Conditions

The Mission Bay campus site has both service vehicle and passenger loading. There are eight off-street service vehicle loading facilities serving the existing uses on the campus site. Passenger and service vehicles may also load on-street at marked zones on Fourth Street and Nelson Rising Lane.

Based on 2010 monthly data, the Helen Diller Cancer Research building receives approximately 100 deliveries each month, resulting in approximately three to four deliveries per day. The four loading spaces are sufficient for existing operations. The Rutter Center rarely expects deliveries for special events. On occasion, an event may require delivery of conference materials. Daily deliveries are typical for the Café and laundry services, resulting in a minimum of three deliveries per day. The two loading spaces are sufficient for existing operations.

The loading area at Genentech Hall, monitored by security guards, receives approximately 20 deliveries each day for Genentech Hall and the adjacent Byers Hall. The six loading spaces are comprised of four dock spaces and two small delivery van spaces. Based on the existing delivery operations, the six spaces are sufficient for current operations.

In general, existing loading areas provide a sufficient amount of space for passenger and vehicle loading based on feedback from UCSF Facilities Services. No delivery vehicles were observed double parking or using other facilities. Some passenger loading vehicles used empty metered parking spots for pick-up and/or drop-off because of their proximity.

Future loading areas may be provided at the Research CUP/EH&S Building. The Third Street Garage may include some loading spaces that are currently used for permit parking and UCPD emergency supplies. Mission Hall is not anticipated to include an off-street loading area. UCSF

Facility Services assume Campus Way, an adjacent private street, would be marked with loading areas similar to the on-street loading zones on Nelson Rising Lane.

7.14.2.7 Parking Conditions

On-Street Parking

Most on-street parking provided in the vicinity of the Mission Bay campus site is regulated with a combination of two-hour, four-hour and unlimited time meters; exceptions include portions of Terry François Boulevard, Mission Bay Boulevard North and South, Sixteenth Street, and Mariposa Street. Parking limits are generally in effect between 9:00 AM and 6:00 PM, with longer hours (until 10:00 PM). Parking is prohibited on Sixteenth Street, west of Third Street; in addition, portions of Mariposa and Illinois streets have baseball game-day-only tow-away parking prohibitions.

Mission Bay experiences a high parking utilization on most streets, including those with lower time limits. The streets that are surrounded by finished construction and occupied buildings have low parking availability, especially on weekday days. On other streets where parking demand is managed by two-hour time limits, very few of the parking spaces are used, which is an inefficient use of the existing parking supply. SFMTA, through its SFPark program, is implementing changes to the parking rates and time limits in the Mission Bay and Dogpatch neighborhoods to better manage and operate the existing on-street parking supply.

Overall on-street parking occupancy is 48% during the mid-morning period (10:00 AM – 12 Noon) and 89% during the midday period (12 Noon – 2:00 PM), while the late evening period (6:00 PM – 8:00 PM) occupancy is 61% during a baseball game, and 24% on a no-event day. Although, as expected, the street parking occupancy in the late evening is higher when a game takes place at AT&T Park, it is not as high as during the midday, which represents the peak parking demand period.

Off-Street Parking

The Mission Bay campus site currently has almost 1,600 parking spaces located in the 1630 Third Street Garage, 1675 Owens Street Community Center Garage, and in three surface parking lots. They all offer a combination of public, patient and UCSF-only permitted parking spaces. Non-UCSF-owned off-street public parking also is available at the 1670 Owens Street Garage (approximately 800 spaces) and at the 450 South Street Garage (about 1,400 spaces).

Overall off-street parking occupancy is 19% during the morning period and 69% during the midday period, while the overall occupancy in the evening is 41%. The overall parking occupancy at the UCSF parking facilities is substantially higher than at the other garages, reaching 85% at midday, the peak parking demand period. An occupancy above 90 percent, such as at the Third Street garage, typically represents that the facility has reached its effective capacity. Similar to the on-street parking occupancy conditions described above, the off-street parking occupancy in the late evening when a game takes place at AT&T Park is not as high as during the midday period.

7.14.3 Transportation and Traffic – Mission Bay Campus Site Impacts and Mitigation Measures

7.14.3.1 Impact Methodology

Analysis Approach

The transportation analysis in this EIR considers operations-related issues related to vehicular traffic, transit facilities, pedestrians, bicyclists, and parking, as well as construction-related impacts, associated with the 2014 LRDP at the Mission Bay campus site. To determine potential impacts on the transportation system, it was first necessary to establish the background transportation conditions for the horizon years. Future year background conditions for this project are based on the countywide travel demand model developed and maintained by the San Francisco County Transportation Authority (SFCTA).

Vehicle, pedestrian, bicycle, and transit travel demand associated with the 2014 LRDP was estimated based on factors developed from extensive surveys conducted at existing UCSF facilities over the past few years, and through the use of a four-step process: trip generation, mode split, trip distribution, and trip assignment. In the first step, the number of person trips generated by the 2014 LRDP was estimated on a daily, AM and PM peak hour basis. Next, the person trips were assigned to different modes of travel (automobile, transit, UCSF shuttle, bicycles, etc.). Then, the geographic distribution of the trip origins and destinations was predicted, and finally, project trips for each mode were assigned to specific streets, UCSF shuttle routes and transit lines along the transportation network.

Travel Demand Estimates

The 2014 LRDP proposes various levels of growth at each campus site through the plan horizon year of 2035. Some known projects, such as Phase 2 of the Medical Center in Mission Bay, are currently projected to occur between 2035 and 2040, after the 2014 LRDP horizon year, but have been incorporated into the travel demand estimates presented in this document, As such, the transportation analysis represents a conservative approach as it includes development five years past the 2015 LRDP horizon, to the year 2040. Each campus site is expected to increase in population through the 2014 LRDP horizon year, with the highest growth expected at the Mission Bay site.

The Mission Bay campus site is estimated to generate a total of approximately 38,688 new daily person trips by 2040. That number of trips reflects the total number of additional person trips that would be generated by the increased campus site population, but it does not reflect trips associated with the internal trips expected to occur within the campus site. An internal trip is a trip with its origin and destination within the same campus site (e.g., a researcher at the Parnassus Heights campus site traveling from her office to the Millberry Union to eat lunch and returning back to her office afterwards). Taking those internal trips into account, the Mission Bay campus site is estimated to generate approximately 33,749 new external daily person trips by 2040. An interim trip generation assessment was also conducted at the Mission Bay campus site only for

the year 2015, when Phase 1 of the Medical Center project is expected to open. With the opening of Phase 1 of the Medical Center, there would be an increase of about 9,420 external daily person trips.

"Mode choice" is the designation of trips to the various means that people use to travel, such as automobile, transit, walking, bicycling, taxi, or other mode of transportation. The determination of the mode of transportation used in trips to and from the Mission Bay campus site would depend on many characteristics of the trip (e.g., the population group that is, faculty, staff, vendor, patient, visitor), the type of trip (work, visit), and the specific site. Travel mode split and average vehicle occupancy assumptions were based on information collected by UCSF and its consultants, with the estimates of the future modal share based on the current modal splits for each campus site by population type, which take into account the transit accessibility, UCSF shuttle service, parking availability, and TDM measures being provided at each campus site; this approach is consistent with the travel demand methodologies established by the SF Planning Department. The majority of Mission Bay campus site trips arrive/depart the campus site by driving and public transit. The above-cited external daily person trips generated by the Mission Bay campus site (by 2015 and 2040) are expected to use the following travel modes:

	2015	2040
Auto Drive Alone	3,757	12,872
Drop-Off/Taxi	282	988
Carpool/Vanpool	819	2,649
Public Transit	2,097	7,472
UCSF Shuttle	934	5,256
Bicycle/Motorcycle	557	1,856
Walk	974	2,656

The auto drive alone, drop-off/taxi, carpool/vanpool, and UCSF shuttle person trips would generate about 4,051 and 14,974 daily vehicle trips in 2015 and 2040, respectively.[21]

By 2015, approximately 680 new vehicle trips would occur during the AM peak hour, and about 490 new vehicle trips would occur during the PM peak hour. By 2040, approximately 2,880 new vehicle trips would occur during the AM peak hour, and about 2,410 new vehicle trips would occur during the PM peak hour.

Regarding increased transit ridership, with a majority of transit users using Muni, BART and the UCSF shuttle bus service, by 2015, there would be approximately 690 new transit riders in the AM peak hour and 560 new transit riders in the PM peak hour. By 2040, there would be approximately 3,180 new transit riders in the AM peak hour and 2,920 new transit riders in the PM peak hour.

The new trips associated with the Mission Bay campus site were assigned to San Francisco and regional origins/destinations, including the four San Francisco Superdistricts (northeast,

[21] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

northwest, southeast, and southwest quadrants of the City), the East Bay, the North Bay, and the South Bay, as well as areas outside the Bay Area region. Information collected by UCSF as part of its yearly commute surveys of employees, patients, visitors and residents was used in this analysis.

7.14.3.2 Construction Period Impacts

Impact TRAF-MB-1: Implementation of the 2014 LRDP on the Mission Bay campus site could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during construction activities. (Potentially Significant)

Impacts associated with demolition and construction activities that would occur as the 2014 LRDP is implemented are addressed in Chapter 5 (Impact TRAF-LRDP-1). That 2014 LRDP Plan-Level analysis determined that although construction activities would be temporary, construction impacts would be considered potentially significant given the magnitude of LRDP development over the course of many years and need for on-going coordination and monitoring. The potentially significant determination would apply to the LRDP elements of the Mission Bay campus site. The implementation of LRDP **Mitigation Measure TRAF-LRDP-1: Construction Coordination and Monitoring Measures** would reduce construction-period impacts to less-than-significant levels.

Mitigation Measure: Implement **Mitigation Measure TRAF-LRDP-1**

Significance after Mitigation: Less than Significant

7.14.3.3 Operational Impacts

Impact TRAF-MB-2: Implementation of the 2014 LRDP on the Mission Bay campus site would increase traffic at intersections on the adjacent roadway network. (Less than Significant)

Table 7.14-2 presents a summary comparison of Existing and Existing plus Plan intersection LOS for the weekday AM and PM peak hours. The Existing Plus LRDP conditions reflects modifications to the lane geometries and signal timing plans proposed by both the LRDP and foreseeable (funded) infrastructure improvements for several study intersections surrounding and within the Mission Bay Campus Site. In general, the addition of 2014 LRDP-generated traffic would result in small changes in the average delay per vehicle at most study intersections, with the exception of those that serve as major access points on Sixteenth Street. Most study intersections would continue to operate at the same service levels as under Existing conditions. The great majority of the study intersections operate at acceptable levels of service (LOS D or better) under both AM and PM peak hour conditions under Existing conditions, and would continue to operate acceptably under Existing Plus 2014 LRDP conditions.

TABLE 7.14-2
EXISTING AND EXISTING PLUS 2014 LRDP
PEAK-HOUR INTERSECTION LEVEL OF SERVICE (LOS) – MISSION BAY

43. Mariposa Street / I-280 Northbound Ramps	Signal	AM	**73**	**E**	34	C
		PM	31	C	33	C
44. Mariposa Street / I-280 Southbound Ramps	SSS	AM	**>50**	**F**	<10	A
		PM	**>50**	**F**	14	B

[a] AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
[b] Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersections, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach (indicated in parentheses).
[c] For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For unsignalized intersections, LOS is based on the worst approach, which for AWS is indicated in parentheses.
[d] **Bold** indicates unacceptable operations per UCSF LOS standards

SOURCE: Fehr & Peers, 2014.

The following study intersections (listed by intersection number in Table 7.14-2) currently operate at unacceptable levels of service (LOS E or F):

24. King Street / Third Street (PM peak hour)
43. Mariposa Street / I-280 Northbound Ramp (AM peak hour)
44. Mariposa Street / I-280 Southbound Ramp (AM and PM peak hours)

The 2014 LRDP would add 36 vehicle trips to the critical eastbound left turn movement (LOS F) during the PM peak hour at the King Street/Third Street (Intersection #24) signalized intersection, which represents a four percent increase from Existing conditions. The 2014 LRDP would add two vehicle trips to the westbound through movement (LOS E), which is an increase of less than one percent. Those percent increases would be less than the threshold of significance, and the 2014 LRDP's contribution (and impact) would be considered less-than-significant.

The reconfiguration of Mariposa Street/I-280 Northbound Ramp (Intersection #43), and signalization and reconfiguration of Mariposa Street/I-280 Southbound Ramp (Intersection #44) would result in improved service levels at these intersections from unacceptable existing levels of service (LOS E or F) to acceptable levels of service (LOS D or better) under Existing Plus LRDP conditions. Therefore, the LRDP would have a less-than-significant impact at these three intersections.

Mitigation: None required.

Impact TRAF-MB-3: Implementation of the 2014 LRDP on the Mission Bay campus site would increase transit ridership demand. (Less than Significant)

As described in 7.14.3.1 above, by 2015,about 690 and 560 new transit trips are expected during the AM and PM peak hour, respectively, with a majority of transit users using Muni, BART and the UCSF shuttle bus service. By 2040, there would be approximately 3,180 new transit riders in the AM peak hour and 2,920 new transit riders in the PM peak hour.

San Francisco Muni

Existing Muni transit stops are located within a half-mile to the campus site and are accessible by walking. Major stop relocations adjacent to the campus site are not anticipated at this time. The TEP proposes to reduce headways for the T Third, and 10 Townsend (the latter to be renamed 10 Sansome). In addition, the TEP proposes to re-route the 22 Fillmore by continuing its route on Sixteenth Street between Kansas and Rhode Island streets to the Mission Bay campus site and reduce headways. Prior to this extension of the 22 Fillmore, the SFMTA proposes to implement a temporary motor coach service (preliminarily named the "55") between the campus site and the Sixteenth Street BART Station to coincide with the opening of Phase 1 of the Medical Center at Mission Bay. The route would follow Sixteenth Street between Mission Street to Third Street, and Third Street from Sixteenth Street to Mission Bay Boulevard North.

Once the estimated number of 2014 LRDP-generated Muni trips are added to the T Third and 10 Townsend, those Muni routes would continue to operate satisfactorily according to Muni

crowding standards.[22] The 22 Fillmore would operate at greater than 85% capacity utilization with the addition of 2014 LRDP-generated trips, but with the addition of the interim 55 Route, the combination of the 22 Fillmore and the 55 Route would operate at less than 85% capacity utilization during both the AM and PM peak hours.

The estimated number of 2014 LRDP-generated Muni trips traveling to and from the Mission Bay campus site would not require the expansion of transit service or facilities. Long-term funding for the 55 Route is uncertain, but if Muni were to discontinue the service, UCSF would replace the transit capacity with shuttle service adequate to fill the gap in transit service. Thus, this analysis includes the 55 Route as a de facto permanent service. Additionally, none of the specific proposals of the 2014 LRDP would reconfigure, or reduce access to, transit stops in a way that would degrade transit service to the campus site. Therefore, the 2014 LRDP's transit impact on Muni service would be considered less than significant.

Regional Transit

In addition to Muni operations for travel within San Francisco, regional transit services such as BART, AC Transit, Caltrain, SamTrans, and Golden Gate Transit were considered for the analysis. Existing stations are located over a mile away and can access the Mission Bay campus site by Muni or UCSF and MBTMA shuttles. Major service changes are not anticipated in the near term.

The number of new 2014 LRDP-generated regional transit trips would not require the expansion of regional transit service or facilities. Therefore, the 2014 LRDP's transit impact on regional transit service would be considered less than significant.

UCSF and Mission Bay Transportation Management Association Shuttle

The 2014 LRDP does not propose specific changes to shuttle service headways, although UCSF Transportation Services may change headways based on shifting shuttle demand as 2014 LRDP projects are constructed and occupied. With the opening of the Phase 1 of the Medical Center at Mission Bay, additional shuttle stops will be provided fronting the new hospital, but headways and service route changes are not anticipated at this time.

An additional estimated 540 AM peak-hour shuttle person trips and 520 PM peak-hour shuttle person trips, an approximately 90% and 185% increase in shuttle person trips during the AM and PM peak hours, respectively, are anticipated through the 2014 LRDP horizon year, and that increase would be accommodated by periodically expanded UCSF shuttle service as implemented by UCSF Transportation Services as part of the 2014 LRDP. Therefore, the 2014 LRDP's transit impact on UCSF Shuttle service would be considered less than significant.

Mitigation: None required.

[22] Note that the 10 Inbound Townsend during the PM peak hour would operate at greater than 85% capacity utilization, both with and without the 2014 LRDP-generated trips, but the 2014 LRDP would not contribute to crowding on the line in a significant way.

Impact TRAF-MB-4: Implementation of the 2014 LRDP on the Mission Bay campus site would not cause a substantial conflict with pedestrian facilities, or otherwise decrease the performance or safety of such facilities. (Less than Significant)

The 2014 LRDP proposes the extension of several streets through the campus site including Nelson Rising Lane east of Fourth, Fifth, and Sixth streets south of Mission Bay Boulevard South, and Owens Street south of Sixteenth Street. These streets would be designed with sidewalks, curb cuts, and crosswalks that minimize conflicts between vehicles and pedestrians and meet San Francisco's *Better Streets Plan* standards. In addition to these street extensions, UCSF is upgrading existing sidewalks along Sixteenth Street and constructing a new public pedestrian plaza on Fourth Street between Sixteenth and Mariposa streets in coordination with on-going construction. Beyond the campus site, no improvements to the pedestrian facilities in the area are proposed.

The 2014 LRDP would add approximately 2,840 and 2,440 pedestrian trips (mostly transit-access trips) to the surrounding streets during the AM and PM peak hours, respectively. The new pedestrian trips would be distributed along the many roadways and pedestrian alleyways crossing through the campus site. Pedestrian trips leaving the campus site to residential and commercial destinations would primarily occur along Sixteenth and Mariposa streets to the west, along Third and Minnesota streets to the south, and along Third, Fourth, and Seventh streets to the north. Muni transit riders would walk along Third Street to the T Third light rail line stops on Third Street and Gene Friend Way or Mariposa Street, and along Sixteenth and Connecticut streets to the 22 Fillmore stop at Eighteenth and Connecticut streets. Caltrain riders would walk north along Fourth Street to the station at Fourth and King streets. UCSF and Mission Bay TMA shuttle riders would stay within the campus site and use shuttle stops located on Fourth or Owens streets.

The above-described TEP improvements would, among other things, shorten the walking distance for transit riders and reduce travel time to the transit stops for each of these routes. Although pedestrian volumes are currently relatively low due to the developing nature of the Mission Bay neighborhood, existing pedestrian facilities are designed to accommodate higher pedestrian volumes than the 2014 LRDP would generate in the future, including the 12- to 15-foot-wide sidewalks and crosswalks.

The immediate area surrounding the Mission Bay campus site includes existing or proposed pedestrian facilities that provide access to nearby neighborhoods, commercial uses, and transit stops. The 2014 LRDP would not create substantial conflicts between pedestrians and autos, bicyclists, or transit vehicles. Therefore, the 2014 LRDP's impact to pedestrian circulation and facilities at the Mission Bay campus site would be less than significant.

Mitigation: None required.

Impact TRAF-MB-5: Implementation of the 2014 LRDP on the Mission Bay campus site would not would not cause a substantial conflict with bicycle facilities, or otherwise decrease the performance or safety of such facilities. (Less than Significant)

The area around the Mission Bay campus site has a number of streets with bicycle lanes, and streets designated as bicycle routes, including King Street, Sixteenth Street, Mariposa Street,

Fourth Street, and Seventh Street. The Mission Bay campus site is within convenient bicycling distance of residential and commercial areas in surrounding neighborhoods. The 2014 LRDP does not propose changes to the bicycle circulation network surrounding the Mission Bay campus site. The San Francisco Bike Plan includes (as a long-term project) a planned bikeway near/along Mission Creek between Fourth and Harrison streets. In addition, an expansion of the Bay Area Bike Share program currently is being evaluated and could include a new station at Fourth Street near Rock Hall on the Mission Bay campus site. The proposed implementation of this expansion is the fall of 2014.

The 2014 LRDP is expected to increase bicycle demand in the area by approximately 276 and 214 new trips during both the AM and PM peak hours, respectively. These trips would primarily occur on designated bicycle facilities, which connect to surrounding neighborhoods through the San Francisco Bike Route network. The increased bicycle demand would be accommodated through the existing on-campus site parking supply in additional to new bicycle parking locations in future buildings and the potential Bay Area Bike Share station. In the near-term, UCSF plans to add one additional bicycle cage and 10 bicycle racks at the Mission Bay campus site, which would increase bicycle parking capacity and generally improve bicycle conditions on the campus site.

The expected increase in bicycle traffic would not represent a level that would adversely affect bicycle facilities on the campus site, nor would the 2014 LRDP create substantial conflicts between bicyclists and pedestrians, autos, or transit vehicles. Therefore, the 2014 LRDP's impact to bicycle circulation and facilities at the Mission Bay campus site would be less than significant.

Mitigation: None required.

Impact TRAF-MB-6: Implementation of the 2014 LRDP on the Mission Bay campus site would increase loading demand. (Less than Significant)

The San Francisco Planning Code requires that land uses, such as medical offices and hospitals, provide off-street loading spaces according to a prescribed schedule. The required loading supply was estimated based on that Code schedule, and the existing and proposed loading supply exceeds the Code requirement at the Mission Bay campus site.

The demand for loading spaces through the 2014 LRDP horizon year was calculated based on surveys from the Parnassus Heights campus site and methods described in the City's *Transportation Impact Analysis Guidelines for Environmental Review*. The existing peak hourly demand is estimated to be about 34 spaces on the Mission Bay campus site, and the 2014 LRDP horizon year peak hourly demand is estimated to be about 77 spaces.

It is expected that the estimated 2014 LRDP loading supply should be adequate for the estimated demand, but as mentioned above, the campus sites are unique and should be monitored over time. This is considered a less-than-significant impact if UCSF continues to monitor loading operations and provide appropriate supply with guidance from the San Francisco Planning Code and existing operations.

In addition to freight loading, there is a demand for passenger loading spaces, and in order to estimate passenger loading demand, the drop-off/taxi service mode split and a portion of the carpool mode split percentages presented in 7.14.3.1 above was applied to the peak AM and PM peak-hour person trips. The peak-hour passenger loading demand is estimated to increase by approximately 270% at the Mission Bay campus site. The major contributor of the increase in anticipated passenger loading demand is the opening of Phase 1 and 2 of the UCSF Medical Center at Mission Bay.

The existing passenger loading supply is sufficient for the estimated 2014 LRDP loading needs during the PM peak hour and in need of an additional five feet to be sufficient for the AM peak hour. As part of the LRDP, additional passenger loading supply will be implemented in the form of driveway loops in front of the Women's, Cancer, and Children's Hospital on the south side of campus. Visitors and patrons would access the new northern passenger loading loop from Sixteenth Street, and the new southern passenger loading loop from Mariposa Street.

The combination of the new passenger loading loops at the Women's, Cancer, and Children's Hospital and adequate existing supply will be sufficient to accommodate the estimated 2014 LRDP demand; therefore, the 2014 LRDP's impact to passenger loading is considered less than significant.

Mitigation: None required.

Impact TRAF-MB-7: Implementation of the 2014 LRDP on the Mission Bay campus site would increase parking demand. (Less than Significant)

Under the 2014 LRDP, additional parking would be provided on the Mission Bay campus site, as warranted by the proposed development (i.e., the number of any new parking spaces would be determined as projects are proposed). It is estimated that the number of parking spaces owned by UCSF at the Mission Bay campus site would increase by approximately 1,050 spaces by 2015, and by an additional 2,750 spaces (total of 3,800 spaces) by 2040. The following list describes the currently proposed changes in parking supply:

- The 621-space garage structure at Owens Street, south of Sixteenth Street, would open for service to the public in February 2015, as the Phase 1 Medical Center becomes operational.
- A new 429-space surface parking lot adjacent to the above-cited new Owens Street garage would be built, which also would open in conjunction with the Phase 1 Medical Center Project.
- Approximately 160 existing surface parking spaces, located in the North Campus, would be eliminated as the existing parking lots are replaced by new buildings.
- A new parking garage would be built on Block 18B in the North Campus containing approximately 1,540 parking spaces. The ground floor of the garage would be sized to accommodate about 60 UCSF shuttle buses.
- About 500 new spaces would be provided within Blocks 33 and 34, east of Third Street.

- An expansion of the Owens Street garage would be constructed as part of the second phase of the Medical Center, sometime after 2035, to replace the 429-space Phase 1 surface lot that would be replaced by new hospital buildings, and to accommodate the additional expected demand. The new structure would be built to the south of the Phase 1 garage and could have a capacity of up to 1,300 spaces.

As described previously, the available on-street parking is well-occupied at the Mission Bay campus site, and has therefore not been considered as a resource for the future parking utilization analysis, which has focused instead on the availability of off-street parking.

By 2015, with the opening of the Phase 1 Medical Center and the completion of the Mission Hall Building, parking utilization at the UCSF parking facilities would be below, but close to, its maximum capacity, with a potential campus site surplus of about 230 spaces.

Assessment of the growth of peak parking demand under the 2014 LRDP shows that by 2040 the future parking utilization at the Mission Bay campus site would be approximately 430 spaces above the future planned supply. However, as part of the implementation of the 2014 LRDP, UCSF would monitor parking demand at each phase of development and adjust parking supply as demand warrants. Should the demand for parking exceed on-site supply, priority for on-site parking would be given to patients and visitors, and if necessary, UCSF would look to secure off-site parking to satisfy staff demand. That additional parking supply could be on the site, if available, or elsewhere in the vicinity. As the sites develop, UCSF (through its Campus Transportation Services Offices) will make efforts to educate faculty, staff and students about transit options in order to reduce auto usage and parking demand. Thus, the parking impacts under the 2014 LRDP would be less than significant.

Mitigation: None required.

LRDP Variant Conditions

As described in Section 3.8.2.3 of Chapter 3, *Project Description*, UCSF is considering the development of clinical uses for a portion of the Blocks 33 and 34 site. The amount of clinical space that may be developed has not yet been determined, but up to half of the site (about 250,000 gsf of clinical space) could be developed, with the remainder as research/office use.

Travel Demand. Under the LRDP Variant, the Mission Bay campus site would generate approximately 2% more vehicle trips during both the AM and PM peak hours when compared to the 2014 LRDP. The travel demand for other travel modes (walking, bicycling, and transit) for the Mission Bay campus site also would be about 2% higher compared to the 2014 LRDP. The estimated increase in loading demand (service and passenger) and parking demand at the Mission Bay campus site under the LRDP Variant would be similar, if not slightly more due to the introduction of clinical space, to that generated by the 2014 LRDP.

Existing Plus LRDP Variant Impacts. All the study intersections for the Mission Bay campus site would continue to operate at the same levels of service as under Existing Plus 2014 LRDP

conditions, and like for the 2014 LRDP, the LRDP Variant would have a less-than-significant traffic impact.

Transit service conditions (for Muni, regional transit, and UCSF and MBTMA shuttle buses) associated with the LRDP Variant would be similar to those for the 2014 LRDP, albeit with slightly (about 2%) higher ridership levels than under the 2014 LRDP. Like for the 2014 LRDP, the LRDP Variant would have a less-than-significant transit impact. The T Third would operate at greater than 85% capacity utilization with the addition of LRDP Variant-generated trips under the AM peak hour in the outbound direction (towards UCSF). While this is not considered a significant impact per UCSF transit standards, this would exceed Muni's crowding standards. Therefore, the following Improvement Measure has been identified:

> Development of clinical uses on Blocks 33/34 is considered a "secondary use" under the *Mission Bay South Redevelopment Plan*, which requires findings by the Office of Community Investment and Infrastructure that the use is consistent with the *Mission Bay South Redevelopment Plan*. UCSF would continue to study the amount of clinical space proposed under the LRDP Variant, and would refine the proposal before bringing it forth to the City for approval. In refining the LRDP Variant, UCSF would consider reducing the size of the clinical facilities at Blocks 33/34 to a level that will reduce the transit ridership on the T Third to less than the Muni's capacity utilization of 85 percent.

Likewise, pedestrian, bicycle, loading (commercial and passenger), and parking impacts associated with the LRDP Variant, as for the 2014 LRDP, would be less than significant. Finally, similar to the 2014 LRDP, impacts associated with demolition and construction activities that would occur as the LRPD Variant is implemented at the Mission Bay campus site would be considered potentially significant. The implementation of LRDP **Mitigation Measure TRAF-LRDP-1: Construction Coordination and Monitoring Measures** would reduce construction-period impacts to less-than-significant levels.

7.15 Utilities and Service Systems

This section considers the setting and utilities and service system impacts of implementation of the 2014 LRDP at the Mission Bay campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Utilities and Service Systems are contained in Section 4.15 of this EIR. The CEQA Significance Standards presented in Section 4.15.3 are used to evaluate the potential utilities and service systems impacts of all proposed 2014 LRDP activities.

The overall effects on water supply, wastewater treatment, storm drainage facilities, solid waste disposal and energy demand resulting from implementation of the 2014 LRDP were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures*. As discussed in Chapter 5, these overall effects would be less than significant. Impacts that are specific to the Mission Bay campus site are discussed below.

7.15.1 Utilities and Service Systems – Mission Bay Impacts and Mitigation Measures

Impact UTIL-MB-1: There would be sufficient water supply infrastructure to serve 2014 LRDP development at the Mission Bay campus site. (Less than Significant)

Engineering studies have determined that it is not necessary to replace and/or upsize City low pressure piping already constructed, as there is sufficient capacity in the pipe system to supply increased water demand in order to serve the proposed 2014 LRDP development at the Mission Bay campus site, including development on Blocks 33 and 34. However, in order to obtain required pressures within proposed buildings, water pumps may need to be installed. This would be determined at the time buildings are designed (Freyer & Laureta, Inc, 2013 and 2014). The impact would be less than significant.

There also is sufficient capacity in the Fire Protection Water Supply System to meet fire flow requirements for each proposed building, including development on Blocks 33 and 34 (Freyer & Laureta, 2013 and 2014). Additional campus fire protection water supply piping would need to be installed by UCSF per Exhibit 4, Low Pressure Water Exhibit, as described in the *UCSF Mission Bay Civil Master Plan*, adjacent to development blocks to serve future buildings (Freyer & Laureta, Inc, 2013). The impact would be less than significant.

Mitigation: None required.

Impact UTIL-MB-2: There may be impacts related to wastewater infrastructure as a result of 2014 LRDP development at the Mission Bay campus site. (Potentially Significant)

UCSF independent engineering studies based on pre-hospital sanitary sewer flows (original projects) have determined that it is not necessary to replace and/or upsize City and University sanitary sewer conveyance piping already constructed in order to serve the proposed growth at the

Mission Bay campus site, including development on Blocks 33 and 34. The City has not validated these studies and will still need to evaluate collection system capacities to ensure adequate capacity remains during detailed project design phase(s). However, sanitary sewer piping would need to be constructed to serve future development parcels. This does not deviate from the *UCSF Mission Bay Civil Master Plan* (Freyer & Laureta, Inc, 2013 and 2014).

The estimated peak flow increase to the pump station on Mission Bay Redevelopment Area Block P15 due to the University's proposed growth is 159 gallons per minute (0.23 million gallons per day), resulting in the need for pump station capacity of 6.63 million gallons per day. This is below the pumping capacity of the pump station. Based on engineering studies and original projections of demand at the UCSF campus to provide extra capacity for UCSF LRDP, the pump station can be modified without structural or piping modifications by replacing existing 25 horsepower (hp) pumps with 30 hp pumps. These more powerful pumps are physically the same size as the existing pumps and can be connected to the existing discharge piping. Replacement of existing pumps with 30 hp pumps would increase the pump station capacity to 5,100 gpm (7.34 million gallons per day) (Freyer & Laureta, Inc, 2013). However, these engineering studies' assumptions will need to be confirmed with the San Francisco Public Utilities Commission (SFPUC). The SFPUC has recently indicated that additional upgrades and modifications to the P15 pump station may include (1) replacement of existing pumps with larger pumps than those assumed above; (2) additional pumps and enlargement of the pump station wet well with associated controls; (3) modification of the force main; (4) odor control; (5) other modifications may be necessary for proper operations. (Michael Tran, SFPUC, August 7, 2014). However the University will only address pump capacity and not any pre-existing pump station deficiencies observed by the SFPUC.

The replacement of the P15 pumps proposed by UCSF would be subject to review and approval by the SFPUC. Because it is unknown at this time whether the SFPUC would approve this upgrade or require additional modifications to the P15 pump station, UCSF has conservatively concluded that potential improvements to the P15 pump station may be required that may also result in physical environmental effects.

The planned storm drain pump station on Block P23 (to be installed by FOCIL-MB, LLC/Mission Bay Development Group) would remove stormwater that is currently directed to the Mariposa Pump Station. Mariposa Pump Station is a combined sewer pump station, but it will be used to convey sanitary flows for the areas within Mission Bay, including the Phase 1 Medical Center at Mission Bay, when the storm drain pump station on Block P23 is complete. The new storm drain pump station on Block P23 would drastically reduce the volume of Mission Bay wet weather flow from entering the Mariposa Pump Station. Although Mission Bay wet weather flow would not be directed to the Mariposa Pump Station in the future (when the storm drain pump station on Block P23 is complete), the station must be operated with a clear distinction between wet and dry weather under strict State and Federal regulations, and thus not increase the actual dry weather capacity of the pump station.

However, the SFPUC has recently indicated to UCSF that average dry weather flows to the Mariposa Pump Station are exceeding previous projections and existing capacity for dry weather

flows, which in turn requires occasional use of the wet weather pumps to handle the increased dry weather flows. This flow increase is not a result of UCSF Mission Bay development since developed blocks in Mission Bay do not yet discharge the projected flow rate from blocks tributary to the Mariposa Pump Station, as defined in the *Mission Bay Sanitary Sewer Master Plan.* The SFPUC has further indicated to UCSF that the dry weather pump station may need to be upsized to handle increased demand in dry weather flows to the Mariposa Pump Station. The SFPUC is currently evaluating the adequacy of temporary measures such as pipe reconfiguration to handle existing and planned flows during the interim period between the opening of the Phase 1 Medical Center on February 1, 2015 and a permanent long term solution for Mariposa Pump Station and the associated growth in the pump station service area. (Michael Tran, SFPUC, August 1, 2014). It is not known at this time whether any pipe improvements downstream of the pump station has affected pump performance at this time.

Because it is unknown at this time whether the capacity of the Mariposa Pump Station and associated sanitary collection system are adequate to handle flows resulting from 2014 LRDP development at the Mission Bay campus site, UCSF has conservatively concluded that potential improvements to the pump station may be required that may also result in physical environmental effects.

> **Mitigation Measure UTIL-MB-1:** UCSF will monitor sanitary sewer flows to the P15 pump station in congruence with on-going monitoring conducted by the SFPUC. If the SFPUC determines that improvements are required to increase the capacity of the P15 pump station as a result of development within the pump station basin, including 2014 UCSF LRDP development at the Mission Bay campus site, UCSF will contribute its fair share to SFPUC for the potential required pump capacity improvements.
>
> UCSF will monitor sanitary sewer flows to the Mariposa Pump Station in congruence with on-going monitoring conducted by the SFPUC. If the SFPUC determines that improvements are required to increase the capacity of the Mariposa Pump Station as a result of development within the pump station basin, including 2014 UCSF LRDP development at the Mission Bay campus site, UCSF will contribute its fair share to SFPUC for the potential required improvements.
>
> **Significance after Mitigation: Significant and Unavoidable**. Because potential improvements are outside UCSF jurisdiction to implement, the impact is considered significant and unavoidable even with the incorporation of the above-noted mitigation measures.

Impact UTIL-MB-3: There would be sufficient storm drainage infrastructure to serve 2014 LRDP development at the Mission Bay campus site. (Less than Significant)

The storm drain piping in the public streets surrounding and traversing the Mission Bay campus site is of sufficient size to collect planned 5-year storm runoff from the campus site. The increase in growth proposed by the 2014 LRDP does not increase planned drainage volumes from development blocks. Based upon understanding of the *Mission Bay Storm Drainage Master Plan* and Campus Storm Drain Piping, engineering studies have determined there is no need to replace and/or upsize City and University storm drainage conveyance piping already constructed

(Freyer & Laureta, Inc, 2013). The planned storm drain pump on Block P23 should be constructed in order to serve development of Blocks 33 and 34 (Freyer & Laureta, 2014). The impact would be less than significant.

Mitigation: None required.

CHAPTER 8
Mount Zion Campus Site – Setting, Impacts and Mitigation Measures

8.0 Introduction

This chapter considers the existing conditions and describes the potential impacts of 2014 LRDP activities proposed at the Mount Zion campus site. Functional zones, space program, population at LRDP horizon and proposed LRDP development activities that would occur at the Mount Zion campus site were described in detail in Section 3.8.3 of Chapter 3, *Project Description*, and are summarized briefly below. The remaining 15 major sections of this chapter present the site settings and impacts for each of the 15 environmental topics.

8.0.1 Functional Zones

Currently, there is no functional zone diagram for the Mount Zion campus site. **Figure 3-13**, in Chapter 3, *Project Description*, illustrates the proposed campus boundary and functional zones. The proposed boundary encompasses only those buildings owned by UCSF. A majority of the site is proposed as Clinical, consistent with the predominance of inpatient and outpatient uses. The cancer research building is designated as Research. Support areas include structured parking controlled by UCSF.

8.0.2 Space Program

The LRDP proposes an additional 2.39 million gsf in owned and leased buildings across all of UCSF's campus sites through 2035. The 172,600 gsf allocation of this growth at the Mount Zion campus site at LRDP horizon in 2035 is shown in **Table 8.0-1**, below.

8.0.3 Population

The total projected UCSF population across all campus sites (including population associated with the Phase 2 Medical Center at Mission Bay) would increase by approximately 17,000 at LRDP horizon. As shown in **Table 8.0-2**, below, the projected increase in population at the Mount Zion campus site would be approximately 1,600 in 2035.

TABLE 8.0-1
MOUNT ZION EXISTING AND LRDP HORIZON GSF

Type of Space	Existing 2013 Total gsf	LRDP Horizon 2035 Total gsf
Instruction	63,300	63,300
Research	97,400	139,300
Clinical	450,100	518,200
Support

Patients	1,406	1,962	556
Visitors	1,199	1,547	348
Total	**4,655**	**6,270**	**1,615**

8.0.4 Mount Zion – 2014 LRDP Proposals

As described in Chapter 5, the 2014 LRDP proposals at the four campus sites consist of four general activities: 1) demolition, 2) renovation, 3) construction of new facilities, and 4) circulation, open space, and utilities/infrastructure proposals. The 2014 LRDP proposals at the Mount Zion campus site are listed below:

Demolition Proposals

- Hellman
- Harold Brunn Institute
- Dialysis Center
- 2255 Post[1]

Renovation Proposals

- Main Hospital

[1] This building may alternatively be seismically retrofitted.

Construction Proposals[2]

- Office/Research building

Mount Zion – 2014 LRDP Proposal Construction Time Frames

Activities at the Mount Zion campus site to implement the 2014 LRDP proposals would occur between the year 2015 and 2025. These are presented in **Table 8.0-3**, below.

TABLE 8.0-3
PROPOSAL CONSTRUCTION TIME FRAMES AT MOUNT ZION

Proposal Category	Proposal Title	Square Feet / Number of Dwelling Residential Units
2015 - 2019		
Demolition	Hellman, Brunn, and Dialysis Center	85,000 gsf
Renovation	Main Hospital	--
Construction	Office/Research building	257,300 gsf
2020 -2024		
Demolition (or Renovation)	2255 Post Street	7,450 gsf
2025-2030		
None Proposed		
2031 -2035		
None Proposed		

[2] An additional 78,000 gsf of parking may be developed either underground or off-site.

8.1 Aesthetics

This section considers the setting and aesthetics impacts at the Mount Zion campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential Aesthetics effects are contained in Section 4.1 of this EIR. The CEQA Significance Standards presented in Section 4.1.3 are used to evaluate the potential aesthetics impacts of all proposed 2014 LRDP activities.

8.1.1 Aesthetics Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mount Zion campus site, the Initial Study concluded that:

- **Scenic vista.** No activities would result in an adverse impact to scenic vistas. Therefore, no additional analysis of this issue is required.

- **Scenic resources.** No activities would result in an adverse impact to scenic resources within a state scenic highway. Therefore, no additional analysis of this issue is required.

- **Effects on visual character or quality.** The proposed construction of the Office/Research Building would be the only activity to have potential effects on visual character or quality. No analysis of this issue is required for the other activities.

- **Wind or shadow.** The proposed construction of the Office/Research Building would be the only activity to have potential effects regarding wind or shadow. Accordingly, no analysis of this issue is required for any other activity.

Finally, the Initial Study also concluded that the proposed renovation of the Main Hospital would result in no impact or less-than-significant impacts on aesthetics. Therefore, no additional analysis is required for this renovation activity.

8.1.2 Aesthetics – Mount Zion Setting

The Mount Zion campus site occupies approximately 7.6 acres on six contiguous blocks in San Francisco's Western Addition, an urban neighborhood that consists of commercial, medical, residential and neighborhood commercial uses. The campus site is generally bounded by Bush Street to the north, Scott Street to the east, Post Street to the south and Broderick Street to the west. Unlike the Parnassus Heights campus site, the Mount Zion campus site is visually intertwined with adjacent, non-University uses and the campus buildings are not perceived as a single visual entity.

The Medical Center at Mount Zion is located on the central, or main block, and consists of an eight-story medical center housed in two buildings (Buildings A and B). Building A is on the north side of Post Street, with a 275-foot frontage that creates an unbroken visual plane for about three-quarters of the block. The hospital's long, horizontal bands of inset windows lend to its

visual prominence on the block. Building B is perpendicular to Building A and has a narrow frontage located mid-block on Sutter Street, adjacent to the hospital's loading area.

Other medically-related uses line the perimeter of the main block in dense buildings up to five stories tall. These include the five-story Hellman building on the southeast corner of Post and Scott Streets; the four-story Harold Brunn Institute located mid-block on Scott Street; the single-story Dialysis Center on the corner of Sutter and Scott Streets; and the five-story outpatient Helen Diller Comprehensive Cancer Center on the corner of Divisadero and Sutter Streets. The Cancer Research building and Women's Health Center are located in an eight-story contemporary building across Sutter Street from Building B. To the northeast and southwest of the main block are two UCSF outpatient medical office buildings of four stories each, completed in 1997. UCSF also owns and operates three parking garages and one surface parking lot at the Mount Zion campus site.

Most buildings along Divisadero Street consist of residential and office uses above ground floor retail. Kaiser Medical Center is located on Geary Boulevard, one block to the southwest. Residential uses are widespread north and west and directly across Scott Street to the east of the main block. The area along Post Street south of the main block is predominantly low-rise medical offices, portions of which are leased by UCSF, and surface parking lots. The Hamilton Recreation Center is located southeast of the Hellman building, at the intersection of Post and Scott Streets.

8.1.3 Aesthetics – Mount Zion Impacts and Mitigation Measures

Impact AES-MZ-1: The proposed office/research building at the Mount Zion campus site would not substantially degrade the existing visual character or quality of the campus site and its surroundings. (Less than Significant)

The proposed office/research building would be would be built on the east side of the main block where the Hellman, Harold Brunn Institute and Dialysis Center buildings are currently located. The proposed building could potentially be one or more buildings, or a phased building. The total program target for the building(s) would be approximately 257,300 gsf. Although this building has not yet been designed, a capacity analysis conducted by UCSF indicated that a building along Scott Street could be built up to 65 feet tall with a 20-foot step back at the 40-foot height level to lower the building scale at the street level. It could be set back from Post Street to align with the existing hospital building. Building space on Sutter Street could be up to 105 feet in height with a 20-foot setback along Sutter and Scott Streets. The proposed building would comply with the City's height limit, but not the bulk limit. Up to 185 parking spaces could be constructed in two levels underground, if not developed off-site. Streetscape improvements would be made along the affected street frontages. Visual simulations showing basic height and bulk of the proposed building from the intersection of Scott Street and Post Street and from the intersection of Scott Street and Sutter Street (viewpoints shown in **Figure 8.1-1**) are depicted in **Figures 8.1-2** and **8.1-3**, respectively.

Visual Simulation of Proposed Project

Note: Visual simulation depicts potential building envelope, not proposed design.

SOURCE: Environmental Vision

Figure 8.1-3

Visual Simulation-Mount Zion

As shown in Figure 8.1-2, this portion of the proposed building would be shorter than the existing Hellman building. The building would extend north down Scott Street at this same height in areas currently occupied by the shorter Harold Brunn Institute and Dialysis Center buildings. The 105-foot-tall portion of the proposed building along Sutter Street is visible in the background and also can be seen in Figure 8.1-3.

The new building would be built in accordance with UCSF's *Physical Design Framework* and *Facilities Design* Guidelines and would be consistent with the 2014 LRDP's Community Planning Principles regarding Building and Public Realm Design. It would be sited appropriately in the campus site's Clinical functional zone (newly designated by the 2014 LRDP). The design guidelines would ensure that the final design of the building responds to the form of adjacent buildings (e.g., in terms of massing and height) and the overall urban context of the Mount Zion campus site and surrounding neighborhood. Because the new building would be visually similar to existing uses on and adjacent to the site, the proposed building would not substantially degrade the visual character of the site and its surroundings. Therefore, effects to visual quality and character are less than significant.

Mitigation: None required.

Impact AES-MZ-2: The proposed office/research building at the Mount Zion campus site could create new sources of substantial light or glare which would adversely affect day or nighttime views in the area. (Potentially Significant)

The proposed building could increase ambient light levels due to light dispersion resulting from a larger building at this location. Increases in night lighting could affect nighttime views in this area from the surrounding neighborhood. New light sources could include street lights, illuminated signage, exterior safety lighting and light emitted from building windows. Glare could be generated from reflective building materials. Because specific architectural features and building materials of the new building have yet to be determined, the proposed improvements have the potential to include reflective surfaces, such as metal and glass. The resultant glare could affect nearby residents, pedestrians and passing motorists. **Mitigation Measure AES-LRDP-1** would be implemented to reduce the impact to a less than significant level. By employing appropriate design standards and minimizing the quantity of reflective material used in new construction, light and glare impacts and impacts to views related to lighting would be reduced to less-than-significant levels.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-1

Significance after Mitigation: Less than Significant

Impact AES-MZ-3: Construction of the proposed office/research building at the Mount Zion campus site could result in flood lighting sites during nighttime construction activities. (Potentially Significant)

Although construction operations are generally expected to take place during the day, some activities could be conducted at night to reduce noise, vibration or other effects on daytime office or research uses. To enable construction at night, flood lighting would be required. The use of

night lighting would have the potential to disturb residents in neighborhoods near the construction site, and potentially also affect nighttime views. Night lighting of the construction site would be temporary and would cease upon completion of construction. **Mitigation Measure AES-LRDP-2** would be implemented to reduce the impact of nighttime work lighting to a less than significant level.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-2

Significance after Mitigation: Less than Significant

Impact AES-MZ-4: The proposed office/research building at the Mount Zion campus site would cast shadow on the Hamilton Recreation Center. (Potentially Significant)

Development of an office/research building on the main block at the Mount Zion campus site could cast shadows on City property that is under the control of the Recreation and Park Department. That 3.97-acre property,[3] the site of the Hamilton Recreation Center, occupies the block bounded by Post Street, Steiner Street, Geary Boulevard and Scott Street.

Because the Hamilton Recreation Center property is protected by the City of San Francisco's Sunlight Ordinance, the proposed office/research building potentially could conflict with this established standard of significance for the City of San Francisco.

Shadow from the proposed building could reach into the western portion of the Hamilton Recreation Center property for up to approximately 30 minutes before the last hour before sunset on the summer solstice, when afternoon shadow from the building would reach farthest south and east during the entire year. Shadow from the building would reach the property in the afternoon two months before the solstice, would increase to a maximum on the solstice, and then decrease and disappear two months after the solstice.

Hamilton Recreation Center

The Hamilton Recreation Center includes a recently rebuilt Recreation Center building that contains an auditorium, gym, kitchen and a heated swimming pool with two indoor water slides. The Recreation Center also has a children's playground, two tennis courts, outdoor basketball court and green field space. The Recreation Center buildings are on the east end of the block, fronting Steiner Street, while the Western Addition Branch Library occupies the west end of the block. The library building, which fronts on Scott Street, is at the corner of Geary Boulevard and Scott Street, while the library's parking is to the north, at the corner of Scott and Post Streets.

San Francisco Planning Code Section 295

Section 295 of the Planning Code, the Sunlight Ordinance, was adopted through voter approval of Proposition K in 1984 to protect certain public open spaces from shadowing by new structures. Section 295 prohibits the issuance of building permits for structures or additions to structures greater than 40 feet in height that would shade property under the jurisdiction of or designated to be acquired by the Recreation and Park Commission, during the period from one hour after

[3] Designated as Lot 2 of Assessor's Block 0703.

sunrise to one hour before sunset, unless the Planning Commission, following review and comment by the general manager of the Recreation and Park Department in consultation with the Recreation and Park Commission, determines that such shade would have an insignificant impact on the use of such property.

In 1989, the two Commissions adopted shadow criteria for 14 downtown parks, including an Absolute Cumulative Limit[4] for new shadow for each open space and set forth qualitative criteria for assessing new shadow. For projects that would affect parks for which a quantitative limit was established, shadow impacts have typically been judged less than significant if the project would not exceed the Absolute Cumulative Limit.

In establishing the Absolute Cumulative Limits for the downtown parks, the Commissions generally relied upon the following guidelines: for smaller parks (of less than two acres) on which more than 20% of the potential "Proposition K" sunlight was in shadow under then-existing conditions, no additional shadow was to be permitted. (This standard was applied to nine downtown parks.) For larger parks (of two acres or more) with between 20% and 40% existing shadow, the Absolute Cumulative Limit was to be set at 0.1%; that is, an additional 0.1% more shadow square foot-hours would be permitted beyond existing conditions. For larger parks shadowed less than 20% of the time, an additional 1.0% new shadow was to be permitted. No guideline was provided for parks of less than two acres that have less than 20% existing shadow. These downtown parks guidelines also may be applied to other parks.

Applying these guidelines to Hamilton Recreation Center, as a "larger park" of more than two acres in size, the park would have an Absolute Cumulative Limit of either 0.1% or 1.0%, depending upon the amount of shadow that now falls on the park throughout the year. Either way, the new shadow from any new building could not exceed 1.0% of the theoretical available sunlight hours.

Because the potential shadow of the new building would be slightly less than the existing shadow cast by the Hellman building, the net effect on shadow would be to slightly reduce the shadow that falls on Hamilton Recreation Center property in late afternoons in the two months before and two months after the summer solstice. As a consequence, and with implementation of **Mitigation Measure AES-LRDP-4**, this impact would be considered less than significant.

Demolition of any or all of the Hellman, Brunn, or Dialysis Center buildings could increase sunlight on Hamilton Recreation Center property in late afternoons close to the summer solstice. This would occur until the office/research building is built.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-4

Significance after Mitigation: Less than Significant

[4] The Absolute Cumulative Limit is a quantitative measure of how much new shadow may be added to a park. The limit can be stated either as a shadow coverage quantity (in square foot-hours or as a percentage of the theoretical available sunlight hours on a park). Although it can be calculated knowing only the area of the park, establishing an appropriate criterion value of the Absolute Cumulative Limit for any park has been based on knowing the park's existing shadow coverage.

Impact AES-MZ-5: The demolition of the three existing buildings and construction of the office/research building at the Mount Zion campus site would create street-level winds that could be hazardous to pedestrians in the area. (Potentially Significant)

Winds experienced at the Mount Zion campus site have the same directional origins as winds at the Parnassus Heights campus site (see the detailed discussion in Section 5.1, *Aesthetics*). For the purposes of determining comfort or safety issues that might arise, it is only necessary to consider the stronger winds that occur. Based on data from the Bay Area Air Quality Management District's Fort Funston meteorological station, 33% of all winds measured there are SW, WSW or W winds with speeds of 7 mph or faster, while nearly 9% of all winds with speeds of 15 mph or faster come from the following directions – S, SSW, SW, WSW, W, WNW, and NW – each with roughly equal frequencies of occurrence. Strong storm winds can come from any direction, but of the 52 recorded hourly winds greater than 30 mph, only one came from the northeast, while the other 51 were from the SSW through the NNW.

In leaving the coastline and approaching Mount Zion, winds lose speed and become more turbulent. Pedestrian-level winds at Mount Zion, regardless of initial directions, will be shaped by the topography and the buildings that line the street grid. The stronger winds that approach Mount Zion from the SW through the NW directions would be perceived by observers at Mount Zion as being generally winds from the west.

Given the building configurations and street alignment at Mount Zion, these generally westerly winds encounter the existing hospital building first, strike the Divisadero Street façade nearly head-on and then flow around the building and along Sutter and Post Streets. The existing buildings along Sutter and Post Streets channel these flows, but do not strongly interact with them to affect wind conditions at street level. The present gap in the street wall mid-block on Sutter Street likely introduces turbulence into the pedestrian-level winds there.

The proposed office/research building would be up to 105 feet in height on Sutter Street with a 20-foot setback along Sutter and Scott Streets. The Scott Street frontage would be up to 65 feet tall with a 20-foot step back at the 40-foot height level. The building façade would set back from Post Street to align with the existing hospital building. As a result, the building would replace the building mass removed when the three existing buildings are demolished. The proposed office/research building would add new building mass and height mid-block along Sutter Street. Because the proposed office/research building design incorporates set-backs, any adverse wind effects at pedestrian level due to the added height of the new building would be relatively minor, compared to existing wind conditions.

Regardless of the design, the office/research building would be an in-fill building – replacing the Hellman, Harold Brunn Institute, and Dialysis Center buildings, and also filling in an existing gap in the street wall along Sutter Street – a factor that, it itself, typically improves pedestrian wind conditions immediately around the building.

The changes in wind conditions due to demolition of the Hellman, Harold Brunn Institute, and Dialysis Center buildings and the subsequent construction of the proposed office/research building would not result in a new Pedestrian-level wind hazard or increase an existing wind

hazard on adjacent sidewalks. The wind impact would be less than significant and no further mitigation would be required. Although there could be an indefinite amount of time between the demolition of one or more of these buildings and the construction of the office/research building, the wind effects would be a less-than-significant impact.

Should the design shape of the office/research building change, the new design should be evaluated with respect to wind hazard.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-3

Significance after Mitigation: Less than Significant

8.2 Air Quality

This section considers the setting and air quality impacts of implementation of the 2014 LRDP at the Mount Zion campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Air Quality are contained in Section 4.2 of this EIR, while the plan-level Air Quality impacts of the 2014 LRDP are described in Section 5.1.2. The CEQA Significance Standards presented in Section 4.2.3 are used to evaluate the potential Air Quality impacts of all proposed 2014 LRDP activities.

8.2.1 Air Quality Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mount Zion campus site, the Initial Study concluded that:

- **Objectionable odors.** No activities would result in objectionable odors affecting a substantial number of people. Therefore, no additional analysis of this issue is required.

8.2.2 Air Quality – Mount Zion Setting

8.2.2.1 Sensitive Receptors

The closest sensitive receptors to the Mount Zion campus site consist of residential land uses approximately 100 feet east of the campus site on Scott Street, residential land uses approximately 100 feet north of the campus site on Bush Street and residential land uses south of Geary Boulevard about 400 feet south of the campus site. Additionally, there are recreational receptors (parks) located north west and northeast of the campus site.

8.2.2.2 Existing Stationary Sources of Air Pollution

The BAAQMD's inventory of permitted stationary sources of emissions identifies seven permitted stationary emission sources present within or near the 1,000-foot zone of influence of the campus site. These permitted facilities are inventoried in **Table 8.2-1** and are primarily made up of stationary diesel engines for back-up power generators and dry cleaners.

The Mount Zion campus site also operates fume hoods which emit TACs. These fume hood emissions do not require a permit from BAAQMD based on the operating throughput and therefore have not been assigned an existing risk value in BAAQMD databases like permitted sources. UCSF maintains an inventory of chemical throughput for each campus site and has implemented a series of correctional measures to reduce exposure to fume hood emissions which are expected to minimize health risks from fume hood emissions. The primary measure was to reduce the volume of chemical use within hoods which are now inventoried. At present there are approximately 48 active fume hoods in operation at the Mount Zion campus site.

TABLE 8.2-1
STATIONARY SOURCES WITHIN THE MOUNT ZION CAMPUS SITE AREA

Source #	Facility Type	Address

13887	Kaiser Permanente MOB	2238 Geary Boulevard
13888	Kaiser Permanente Garage	2130 O'Farrell Street
13889	Kaiser Permanente Garage	2190 O'Farrell Street

SOURCE: BAAQMD, 2012c and ESA.

8.2.2.3 Major Roadways Contributing to Air Pollution

Geary Boulevard and Divisadero Street are arterial streets in the existing local roadway system within the 1,000-foot zone of influence that have at least 10,000 vehicles in annual average daily traffic based on the City's SF CHAMP roadway model[5]. This traffic contributes to elevated concentrations of $PM_{2.5}$, DPM, and other contaminants emitted from motor vehicles near street level.

8.2.3 Air Quality – Mount Zion Impacts and Mitigation Measures

8.2.3.1 Construct Office/Research Building

Impact AIR-MZ-1: Implementation of the 2014 LRDP at the Mount Zion campus site would result in increased emissions of criteria air pollutants during demolition and construction activities. (Potentially Significant)

Construction activities would result in emissions of criteria pollutants from the use of heavy-duty construction equipment, haul truck trips, and vehicle trips generated from construction workers traveling to and from the campus site. In addition, fugitive dust or PM_{10} emissions would result from excavation, trenching, and other construction activities.

2014 LRDP proposals for the Mount Zion campus site include: demolish the Hellman, Harold Brunn Institute (Brunn), and Dialysis buildings, construct an office/research building; and, renovate the Main Hospital. Construction-related emissions from these proposals were calculated using the California Emissions Estimator Model (CalEEMod), assuming completion by 2020 and

5 San Francisco Metropolitan Transportation Agency, Chained Activity Modeling Process version 4.3.0, Average Daily Traffic Volumes, provided to ESA August 2, 2012.

phasing lengths based on CalEEMod default estimates which are based on square footage for office and research buildings. All model inputs and outputs are provided in Appendix E.

Table 8.2-2 presents the average annual daily construction emissions generated by 2014 LRDP proposals at the Mount Zion campus site. As can be seen in Table 8.2-2, estimated average daily construction-related exhaust emissions would not exceed the thresholds for NOx, or particulate matter, but would marginally exceed the ROG threshold.

TABLE 8.2-2
AVERAGE DAILY CONSTRUCTION-RELATED POLLUTANT EMISSIONS WITHOUT MITIGATION - MOUNT ZION

	Estimated Emissions (lbs/day)			
Years	**ROG**	**NO_x**	**Exhaust PM_{10}[a]**	**Exhaust $PM_{2.5}$[a]**
2015	**55.53**	21.80	1.14	1.05
BAAQMD Considered Construction Threshold	54	54	82	54
Potential Significant Impact?	Yes	No	No	No

SOURCE: ESA (Appendix E)

The BAAQMD approach to analysis of construction-related particulate impacts (other than exhaust PM) emphasizes implementation of effective and comprehensive dust control measures rather than detailed quantification of emissions. As indicated under Impact AIR-LRDP-4 in Section 5.2 of this EIR, the BAAQMD considers construction-related fugitive dust impacts of projects to be less than significant if a suite of recommended dust-control measures are implemented. Therefore, BAAQMD-identified Best Management Practices for control of fugitive dust are adopted Campus-wide in Section 5.2 as **Mitigation Measure AIR-LRDP-1: Best Management Practices for Controlling Particulate Emissions**. With this measure in place the construction-related fugitive dust impacts would be less than significant.

Mitigation Measure: Implement Mitigation Measures AIR-LRDP-1

Impact AIR-LRDP-4 identifies a significant and unavoidable LRDP construction-related air quality impact resulting from emissions of criteria air pollutants when the combined construction at all campus sites is considered. In response, **Mitigation Measure AIR-LRDP-2: Architectural Coatings** and **Mitigation Measure AIR-LRDP-3: Off-Road Equipment Control Measures** were adopted Campus-wide and therefore would also apply to construction projects at the Mount Zion campus site.

Mitigation Measures: Implement Mitigation Measure AIR-LRDP-2 and AIR-LRDP-3

Significance after Mitigation: Less than Significant

Impact AIR-MZ-2: Demolition and construction activities at the Mount Zion campus site under the 2014 LRDP would increase emissions of toxic air contaminants (TACs) and increase health risks for nearby residents. (Less than Significant)

2014 LRDP construction activities would produce DPM and $PM_{2.5}$ emissions due to combustion equipment such as loaders, backhoes, and cranes, as well as haul truck trips. These emissions result in elevated concentrations of DPM and $PM_{2.5}$ at nearby receptors. These elevated concentrations could lead to an increase in the risk of cancer or other health impacts. Consequently, a health risk assessment was performed to determine the extent of increased cancer risks and hazard indices at the maximally exposed receptors. The health risk assessment was based on recommended methodology of the state Office of Environmental Health Hazard Assessment and adopted by BAAQMD. The cancer risk to residential receptors assumes exposure occurs 24-hours per day for 350 days per year. Cancer risk to residential receptors is based on the exposure duration of the construction period.

Additionally, cancer risk estimates also incorporate age sensitivity factors (ASFs). This approach provides updated calculation procedures that factor in the increased susceptibility of infants and children to carcinogens as compared to adults. For estimating cancer risks for residential receptors over a 70 year lifetime, the incorporation of the ASFs results in a cancer risk adjustment factor of 1.7.

A summary of the health impacts related to 2014 LRDP construction activities at the Mount Zion campus site is presented in **Table 8.2-3**.

TABLE 8.2-3
CONSTRUCTION-RELATED HEALTH IMPACTS - MOUNT ZION

Receptor Type	Cancer Risk (per million) persons	Chronic Index	Acute Index	PM2.5 Concentration ($\mu g/m^3$)
School Children	0.01	0.01	0.01	0.01
Existing Residence (adult / child)	0.05 / 0.54	0.01	0.01	0.01
BAAQMD Significance Criteria	10	1	1	0.3
Significant Impact?	No	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

As shown in Table 8.2-3, the maximum cancer risk for an existing residence-adult and residence-child (located to the south of Sutter Street and west of Divisadero Street) would be 0.05 per million and 0.5 per million, respectively. The maximum cancer risk for a school-child receptor (Ben Franklin Middle School and Gateway High School) would be 0.01 per million persons. Thus, the cancer risk due to construction activities alone is below the BAAQMD threshold of 10 per million and would be less than significant.

The chronic HI would be 0.01 at all receptors. The chronic HI would be below the BAAQMD threshold of 1 and the impact of the 2014 LRDP construction activities at the Mount Zion campus site would be less than significant. The acute HI would be 0.01 at all receptors including Hamilton

Recreational Center. The acute HI would be below the BAAQMD threshold of 1 and the impact of the 2014 LRDP construction activities at the Mount Zion campus site would be less than significant.

The maximum annual $PM_{2.5}$ concentrations would be less than 0.01 $\mu g/m^3$ for the schoolchild and the existing residences. The construction-related annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

Impact AIR-MZ-3: Operations at the Mount Zion campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants. (Potentially Significant)

Development under the 2014 LRDP at the Mount Zion campus site would result in an increase in criteria air pollutant and precursor emissions, including ROG, NO_X, PM_{10} and $PM_{2.5}$ from a variety of emissions sources, including onsite area sources (e.g., natural gas combustion for space and water heating, landscape maintenance, use of consumer products such as hairsprays, deodorants, cleaning products, etc.) and mobile on-road sources. Operational emissions of criteria pollutants were estimated using the CalEEMod version 2013.2.2 emissions inventory model. All model inputs and outputs are provided in Appendix E.

One of the sources of operational emissions would be increased vehicle emissions from additional staff, patients, and visitors. Traffic volumes used to estimate vehicle-related emissions were derived from the Transportation Demand Analysis prepared for the 2014 LRDP (Adavant, 2014). Development at the campus site would generate an estimated 1,292 additional daily vehicle trips. In addition to exhaust emissions, vehicles would also generate PM_{10} and $PM_{2.5}$ from entrained road dust and tire and brake wear.

Emissions would also be generated by on-site natural gas combustion, operation of landscape maintenance equipment, and maintenance application of paint and other architectural coatings.

Demolition of the Hellman, Brunn and Dialysis buildings would not result in operational emissions, but instead could potentially reduce emissions from natural gas demand. It is assumed that program space and clinics now in the three buildings proposed for demolition would be accommodated by the renovated hospital and that current vehicle trips generated by uses to be demolished would remain. Renovation and decommissioning of the hospital would also likely result in a reduction in operational emissions from natural gas demand for which hospital land uses have a much higher demand than the proposed out-patient medical office uses. Consequently, there would be no increase in operational emissions from demolition proposals at the Mount Zion campus site.

Table 8.2-4 presents estimated operational emissions from development under the 2014 LRDP at the Mount Zion campus site. As shown in the table, without mitigation, operational emissions of NO_X and ROG, PM_{10} and $PM_{2.5}$ would be below threshold levels.

TABLE 8.2-4
UNMITIGATED OPERATIONAL CRITERIA POLLUTANT EMISSIONS- MOUNT ZION

Air Pollutant	Estimated Emissions (lbs/day)			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Mobile Sources[a]	3.42	6.23	5.55	1.56
Area Sources[a]	6.24	<0.001	<0.001	<0.001
Natural gas combustion	0.15	1.40	0.11	0.11
Total	**9.82**	**7.64**	**5.66**	**1.67**
Regional Significance Threshold	54	54	82	54
Significant Impact?	No	No	No	No

[a] Mobile sources are motor vehicles and trucks. Area sources include landscape maintenance (equipment used for these activities such as gasoline-powered lawnmowers and blowers), maintenance application of paints and other interior and exterior surface coatings, and increased use of consumer products that result in emissions of ROG. Natural gas combustion is for space and water heating.

SOURCE: ESA, 2014 (see Appendix E).

Although estimated emissions at the Mount Zion campus site would be less than the daily thresholds, **Impact AIR-LRDP-5** in Section 5.2 identifies a significant and unavoidable operational air quality impact resulting from emissions of criteria air pollutants when LRDP operations at all campus sites are considered. In response, **Mitigation Measure AIR-LRDP-4: BAAQMD-Suggested Operational Measures** was adopted Campus-wide and therefore would also apply to operation of projects at the Mount Zion campus site.

Mitigation Measure: Implement Mitigation Measure AIR-LRDP-4

Significance after Mitigation: Less than Significant

Impact AIR-MZ-4: Operations at the Mount Zion campus site under the 2014 LRDP would increase emissions of TACs and increase health risks for nearby residents. (Less than Significant)

Operations under the 2014 LRDP would not generate substantial DPM emissions. Development at the campus site would generate an estimated 1,292 additional daily vehicle trips from staff, students and visitors that would be almost entirely gasoline powered. The new office/research building proposed for the Mount Zion campus site under the 2014 LRDP could include new fume hoods for research or clinical purposes. However, these emissions would be partially offset by the demolition of the Brunn building, which currently has operational fume hoods. The increase in fume hood emissions from the new building would be expected to be less than that currently occurring at Genentech Hall on the Mission Bay campus site, which operates approximately 160 fume hoods. A recent health risk estimate of Genentech Hall identified the cancer risk from fume hoods to be 0.0217 in one million at the nearest off-site receptor to the northwest (UCSF, 2011). The health risk contribution from fume hoods in the new office/research building proposed for the Mount Zion campus site is expected to be less than this nominal contribution from Genentech Hall. No other new operational sources of TACs are proposed.

The proposed office research building could be as high as 105 feet. Buildings greater than 70 feet in height are required by building code to have a back-up emergency generator. Depending on the fuel source this generator may be a source of DPM. Per its Policy and Procedure Manual, the BAAQMD requires implementation of Best Available Control Technology for Toxics and would deny an *Authority to Construct* or a *Permit to Operate* for any new or modified source of TACs that exceeds a cancer risk of 10 in one million or a chronic or acute hazard index of 1.0. The permitting process under BAAQMD Regulation 2 Rule 5 requires a Health Risk Screening Analysis, the results of which are posted on the District's website. These permitting requirements would ensure that the health risks of any required generator would be less than significant.

Operations would have a less-than-significant impact with regard to health risks.

Mitigation: None required.

8.3 Biological Resources

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Biological Resources are contained in Section 4.3 of this EIR. The CEQA Significance Standards presented in Section 4.3.3 are used to evaluate the potential impacts to biological resources of all proposed 2014 LRDP activities.

After evaluation of the 2014 LRDP proposals at the Mount Zion campus site, the Initial Study concluded that all activities would result in no impact or less-than-significant impacts regarding biological resources issues. Therefore, no additional analysis is required.

8.4 Cultural Resources

This section considers the setting and cultural resources impacts of implementation of the 2014 LRDP at the Mount Zion campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Cultural Resources are contained in Section 4.4 of this EIR. The CEQA Significance Standards presented in Section 4.4.3 are used to evaluate the potential impacts to cultural resources of all proposed 2014 LRDP activities.

8.4.1 Cultural Resources Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mount Zion campus site, the Initial Study concluded that:

- **Historical resources.** The proposed renovation of the Main Hospital and the construction of the office/research building would not result in an adverse effect on historical resources. Therefore, no additional analysis of this issue is required for these activities.

- **Archaeological resources.** The proposed demolition of the Hellman, Brunn and Dialysis buildings and renovation of the Main Hospital would not result in an adverse effect on archaeological resources. Therefore, no additional analysis of this issue is required for these activities.

- **Paleontological resources.** The proposed demolition of the Hellman, Brunn and Dialysis buildings and renovation of the Main Hospital would not result in an adverse effect on paleontological resources. Therefore, no additional analysis of this issue is required for these activities.

- **Human remains.** The proposed demolition of the Hellman, Brunn and Dialysis buildings and renovation of the Main Hospital would not result in an adverse effect on human remains. Therefore, no additional analysis of this issue is required for these activities.

8.4.2 Cultural Resources – Mount Zion Setting

The Mount Zion campus site is in a dense urban neighborhood of San Francisco, distributed across six adjoining blocks, within the area bounded by Broderick Street to the west, Scott Street to the east, Bush Street to the north, and Geary Boulevard to the south. Mount Zion Hospital was founded in 1887 by the Mount Zion Association, comprised primarily of members of San Francisco's Jewish community. The first hospital began operation in January 1897 on Sutter Street in downtown San Francisco, and moved to its current location in the Western Addition neighborhood in 1912. The Hellman Building, a T-Shaped neoclassical-style building at the northwest corner of Post and Scott Streets, was built by Isaiah W. Hellman and designed by J.E. Kraftt & Sons Architects. The building was constructed as a hospital and opened in February 1914. It has undergone several alterations, and by 1941, the building was no longer used for patient care but for administrative and office facilities. The building was reinforced with steel straps in 1995.

Hospital expansion occurred regularly throughout the 20th century. Community-based fundraising campaigns enabled the hospital to modernize and expand in the post-war era and again in the 1960s. In 1990, Mount Zion and UCSF entered into an Integration Agreement creating a joint venture in the areas of patient care, education, and research.

8.4.3 Cultural Resources – Mount Zion Impacts and Mitigation Measures

Impact CUL-MZ-1: Demolition of the Hellman building at the Mount Zion campus site would result in a substantial adverse change in the significance of an historical resource. (Potentially Significant)

The 2014 LRDP proposes to demolish the Hellman, Harold Brunn Institute and Dialysis Center buildings. These three buildings are located on the east side of the main block along Scott Street between Sutter and Post Streets. The Hellman building is seismically compromised. UCSF would demolish all three buildings, but not necessarily at the same time, and the occupants and programs would be relocated into the repurposed hospital buildings or located elsewhere. Demolition of the Hellman building would likely occur in 2016-2017. In addition, the seismically-compromised building at 2255 Post Street would be retrofitted or demolished. See also Figure 3-14 in Chapter 3 of this EIR.

Of the four buildings proposed for demolition, only the Hellman building is a historic resource for CEQA purposes (ARG, 2003). The Brunn and Dialysis buildings were determined ineligible for listing in the CRHR and NRHP, and are not considered historic resources (ARG, 2003). The building at 2255 Post Street is not individually significant at the local, state or national level under any of the four California Register criteria of evaluation. A review of these buildings by ESA in 2014 found no changes to these buildings since their original evaluation. As such, their current status would remain.

The Hellman building is eligible for listing in the NRHP/CRHR under criterion A/1 because it is associated with the development of a well-known San Francisco institution founded with a mission to subsidize care for the poor of a specific ethnic and religious group (similar to other 19th century hospitals in San Francisco, such as the French Hospital, German Hospital, and St. Mary's Hospital). The Hellman building is also eligible for listing in the NRHP/CRHR under criterion C/3 because the building is typical of an early 20th century hospital building in San Francisco. Its design was influenced by Mount Sinai Hospital in New York, a contemporary medical facility considered a model of hospital design (ARG, 2003).

As the Brunn, Dialysis and 2255 Post Street buildings are not historic resources, their demolition would not result in a significant impact to historic resources. Proposed demolition of the Hellman building would have a significant impact on historic resources because it would materially affect in an adverse manner the qualities and characteristics which convey its historic significance. Certain mitigation measures such as HABS photography has already been completed for the Hellman building. Additional measures are available to reduce the impact of demolition, as described in **Mitigation Measure CUL-MZ-1**, below. However, both the previously

implemented and future measures would not reduce the impact of demolition to a less-than-significant level. As such, the removal of the Hellman building would remain a significant and unavoidable impact.

> **Mitigation Measure CUL-MZ-1:** Typical mitigation for the demolition of a historic resource includes HABS-level photodocumention, as well as public interpretation. HABS-level photodocumentation was already completed in 2006.[6] UCSF shall furnish copies of the report to local depositories of historical information to enhance public understanding and increase the availability of these materials for future research. Such depositories shall include the History Room of the San Francisco Public Library (Main Branch), San Francisco Heritage, and the Northwest Information Center at Sonoma State University.
>
> As part of the design for the proposed new office/research building to be constructed in this location, UCSF shall install interpretive materials at or near the site to enhance public awareness in the form of a historical marker, kiosk, or other display which contains historical photos and text about the Hellman building's historical significance. The contents of the display can be obtained from the HABS documentation effort. Even after implementation of these measures, the impact of the loss of the Hellman building would remain significant and unavoidable.
>
> **Significance after Mitigation:** Significant and Unavoidable

Impact CUL-MZ-2: Renovation of the Main Hospital at the Mount Zion campus site would not result in a substantial adverse change in the significance of historical resources. (Less than Significant)

The inpatient facilities at the Mount Zion campus site are provided in two interconnected buildings. Neither building will meet SB 1953 seismic requirements through 2030, so both will require decommissioning as inpatient facilities by this date. With the opening of the Medical Center at Mission Bay in 2015, the inpatient uses at the Mount Zion campus site will be relocated to the Mission Bay campus site and the inpatient buildings will subsequently be repurposed for outpatient use.

The Main Hospital at Mount Zion was completed in 1950 and designed by architect Milton Pfleuger, but it has expanded numerous times since, both upward and outward, to accommodate the growth in patient care requirements. As such, the building retains none of its original design, and was determined ineligible for listing in the NRHP/CRHR in 2003, and is not considered a historic resource for CEQA purposes (ARG, 2003). A review of this building by ESA in 2014 found no changes to this building since its original evaluation, and as such, its status would remain unchanged. As the Main Hospital at Mount Zion is not considered a historic resource for CEQA purposes, the proposed renovation project would have no impacts on historic resources.

Mitigation: None required.

6 Page & Turnbull, *Historic American Building Survey Documentation, Hellman Building*, October, 2006.

Impact CUL-MZ-3: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to historical resources. (Less than Significant)

As described in Chapter 3, *Project Description*, one or more buildings (or a phased building) would be built on the east side of the main block where the Hellman, Harold Brunn Institute and Dialysis Center buildings are currently located. (See also Figures 3-14 and 3-15). A new building along Scott Street could be built up to 65 feet with a 20-foot step back at 40 feet in height to lower the building scale at the street level. It could be set back from Post Street to align with the existing hospital building for a grander landscaped entrance. Building space on Sutter Street could be up to 105 feet in height with a 20-foot setback along Sutter and Scott Streets. Up to 185 parking spaces could be constructed in two levels underground, if not developed off-site. Streetscape improvements would be made along the affected street frontages.

This proposed new building would necessitate the demolition of the historic Hellman building, and the impacts of this effort are discussed above under Impact CUL-MZ-1. Other than demolition of the Hellman building, construction of a new building in this location would have no direct or indirect impacts to historic resources, as none is located (or will be located) at or near this area of the block once the Hellman building has been removed. There are no other historic resources identified on the subject block or immediate vicinity with the exception of the Jewish Family and Children's Services Center at 1615 Scott Street, directly across Scott Street from the Hellman building. This Renaissance Revival-style brick building, constructed in 1930, may be eligible for listing in the NRHP/CRHR upon further review. Even if determined to be a historic resource at a later date, the proposed new office/research building to be constructed across the street would be separated from this potentially historic building by the 60-foot width of Scott Street, as well as the proposed 20-foot setback along Scott Street, for a total of an 80-foot separation. This separation would be sufficient to allow the Jewish Family and Children's Services Center to retain its integrity of setting, and the building would not be indirectly affected by the proposed project. As such, the construction of a new office/research building would have no impact on historic resources.

Mitigation: None required.

Impact CUL-MZ-4: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to archaeological resources. (Potentially Significant)

Previous studies and archival research conducted for the Mount Zion campus site have not identified archaeological resources at the campus site (UCSF, 2005). Archaeological sites are generally located near watercourses or water bodies. Additionally, this campus site has been extensively modified over time, and the likelihood of discovering archaeological resources would be low. In the unlikely event that archaeological artifacts are discovered during construction (including grading, excavation and other earthmoving activities), **Mitigation Measure CUL-LRDP-3** would be implemented to reduce the impact to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-3

Significance after Mitigation: Less than Significant

Impact CUL-MZ-5: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to paleontological resources. (Potentially Significant)

Paleontology is a multidisciplinary science that combines elements of geology, biology, chemistry, and physics in an effort to understand the history of life on earth. Paleontological resources, or fossils, are the remains, imprints, or traces of once-living organisms preserved in rocks and sediments. The fossil yielding potential of a particular area is highly dependent on the geologic age and origin of the underlying rocks. In general, older sedimentary rocks (more than 10,000 years old) are considered most likely to yield vertebrate fossils of scientific interest. Review of geological maps and previous analysis suggests that there are no unique paleontological resources or unique geologic features at the Mount Zion campus site, which is underlain by dune sands. In the event that paleontological resources are uncovered during the course of construction, implementation of **Mitigation Measure CUL-LRDP-4** would reduce impacts to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-4

Significance after Mitigation: Less than Significant

Impact CUL-MZ-6: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to human remains. (Potentially Significant)

There are no known human remains, including those interred outside of formal cemeteries located at the Mount Zion campus site. However, in the event of an accidental discovery or recognition of human remains during project excavation and construction, **Mitigation Measure CUL-LRDP-5** would be implemented to reduce the impact to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-5

Significance after Mitigation: Less than Significant

8.5 Geology, Soils and Seismicity

This section considers the setting and geology, soils and seismicity impacts of implementation of the 2014 LRDP at the Mount Zion campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Geology, Soils and Seismicity are contained in Section 4.5 of this EIR. The CEQA Significance Standards presented in Section 4.5.3 are used to evaluate the potential Geology, Soils and Seismicity impacts of all proposed 2014 LRDP activities.

Those impacts that are specific to the implementation of the 2014 LRDP at the Mount Zion campus site are discussed below.

8.5.1 Geology, Soils and Seismicity Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mount Zion campus site, the Initial Study concluded that:

- **Landslides.** No activities would result in an adverse effect from landslides. Therefore, no additional analysis of this issue is required.
- **Erosion.** The proposed renovation of the Main Hospital would not result in substantial soil erosion. Therefore, no additional analysis of this issue is required for this activity.
- **Expansive soils.** No activities would be located on expansive soils. Therefore, no additional analysis of this issue is required.
- **Soils and wastewater disposal.** No activities would result in the installation of septic tanks or alternative wastewater disposal systems. Therefore, no additional analysis of this issue is required.
- **Structural hazards.** The proposed renovation of the Main Hospital would be the only activity to have potential effects regarding exposure to structural hazards in an existing building. Accordingly, no analysis of this issue is required for any other activity.

8.5.2 Geology, Soils and Seismicity – Mount Zion Setting

The Mount Zion campus site is located at an elevation of approximately 120 feet above mean sea level and slopes gently to the southeast. Subsurface materials at the Mount Zion campus site generally consist of recent unconsolidated sand and alluvium. The campus site is not within the City of San Francisco's Special Geologic Study Area for potential ground failure hazards caused by landsliding or liquefaction.

8.5.3 Geology, Soils and Seismicity – Mount Zion Impacts and Mitigation Measures

There are three types of proposals at the Mount Zion campus site under the 2014 LRDP:

- **Demolition:** Hellman, Brunn and Dialysis Buildings (and possibly 2255 Post Street)
- **Renovation:** Main Hospital (and possibly 2255 Post Street)
- **Construction:** Construct Office/Research Building

As discussed in Section 5.5, the general Geology, Soils and Seismicity impacts that could occur as a result of implementing the 2014 LRDP, are:

> **Impact GEO-LRDP-1: Implementation of the 2014 LRDP could result in adverse effects to people and structures resulting from geologic hazards.**
>
> **Impact GEO-LRDP-2: Implementation of the 2014 LRDP could result in substantial soil erosion or loss of topsoil.**

Demolition activities could include disturbance to improvements that would expose underlying soils. If not managed appropriately, these soils could be subject to the effects of wind and water erosion. However, all construction activities including demolition activities would be required to adhere to best management practices that include erosion control measures. As a result, the potential impacts related to erosion would be reduced to less than significant.

The proposed renovations at the hospital are in response to the facility's inability to meet SB 1953 seismic code requirements for inpatient hospital care facilities. As a result, renovations are proposed to repurpose the facility for outpatient services. Any renovations involving structural changes to the building could require seismic upgrades, if applicable, however in general, renovations would likely be more cosmetic and subject to the same potential geologic and seismic hazards as presently exist.

The campus site is located in a seismically active region that could experience at least one major earthquake (Richter magnitude (M) 6.7 or higher) over the next 30 years. Strong ground shaking at the campus site could occur during a moderate to severe earthquake occurring on one of the active Bay Area faults near to the campus site. New construction of the office/research building would be required to include site preparation and design in accordance with the UC *Seismic Safety Policy* and current and most stringent of either the California Building Code or local building code requirements that would minimize the potential for geologic and seismic hazards to adversely affect the proposed structure and future occupants. Adherence to these regulatory requirements would ensure that seismic hazards are reduced to less than significant levels.

Mitigation: None required.

8.6 Greenhouse Gas Emissions

This section considers the setting and greenhouse gas emissions impacts of implementing the 2014 LRDP at the Mount Zion campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of greenhouse gas emissions are contained in Section 4.6 of this EIR. The CEQA Significance Standards presented in Section 4.6.3 are used to evaluate the potential greenhouse gas emissions impacts of all proposed 2014 LRDP activities.

8.6.1 Greenhouse Gas Emissions Issues Adequately Addressed in the Initial Study

The Initial Study concluded that proposed 2014 LRDP activities at the Mount Zion campus site and their potential effects on greenhouse gas emissions would be evaluated in the EIR.

8.6.2 Greenhouse Gas Emissions – Mount Zion Setting

Greenhouse gas (GHG) emissions are generated at the Mount Zion campus site from a variety of sources. These include motor vehicle trips generated by uses on site, electrical and natural gas usage including, water and wastewater transport (the energy used to pump water and wastewater to and from the campus site), and solid waste generation.

8.6.3 Greenhouse Gas Emissions – Mount Zion Impacts and Mitigation Measures

Impact GHG-MZ-1: Development at the Mount Zion campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions. (Potentially Significant)

Construction emissions from development under the 2014 LRDP at the Mount Zion campus site were estimated using the CalEEMod emissions model assuming demolition of 85,000 square feet of existing buildings and the construction of a 257,300 square foot office/research building. Construction-related emissions were calculated assuming completion by 2020 and phasing lengths based on CalEEMod default estimates which are based on square footage. All model inputs and outputs are provided in Appendix E. Construction-related GHG emissions for each year of the anticipated construction period are presented in **Table 8.6-1**. Estimated emissions are 183 metric tons of carbon dioxide equivalents[7] (CO_2e). As discussed earlier, BAAQMD has not established a quantitative threshold relative to construction-related emissions.

In lieu of any proposed or adopted thresholds relative to construction-related emissions, these emissions are considered significant unless best management practices are implemented to reduce GHG emissions during construction, as feasible. Consequently, **Mitigation Measure GHG-LRDP-1** is identified to ensure implementation of best management practices during construction.

[7] CO_2e in all calculations of project impact include CO_2, CH_4 and N_2O.

TABLE 8.6-1
ANNUAL CONSTRUCTION-RELATED GHG EMISSIONS
WITHOUT MITIGATION - MOUNT ZION

Construction Window Source	Emissions (metric tons CO_2e / year)			
	CO_2	CH_4	N_2O	Total CO_2e
2015-2020	182	<1	<1	183

NOTE: Project CO_2 emissions estimates were made using CalEEMod v.2013.2.

Mitigation Measure: Implement Mitigation Measure GHG-LRDP-1

Significance after Mitigation: Less than Significant. Implementation of Mitigation Measure GHG-LRDP-1 would ensure that UCSF and its contractors employ feasible, effective measures to reduce GHG emissions during construction activities. This mitigation measure would therefore reduce this potential impact to less than significant.

Impact GHG-MZ-2: Development at the Mount Zion campus site under the 2014 LRDP would result in an increase in operational GHG emissions. (Less than Significant)

Area, Energy, and Indirect Sources

Operational GHG emissions associated with development under the 2014 LRDP at the Mount Zion campus site would result from electrical and natural gas usage, water and wastewater transport (the energy used to pump water and wastewater to and from the campus site), and solid waste generation. GHG emissions from electrical usage are generated when energy consumed on the campus site is generated by the electrical supplier, PG&E. GHG emissions from natural gas are direct emissions resulting from on-site combustion for heating and other purposes. GHG emissions from water and wastewater transport are also indirect emissions resulting from the energy required to transport water from its source, and the energy required to treat wastewater and transport it to its treated discharge point. Solid waste-related emissions are generated when the increased waste generated by new development is disposed in a landfill where it decomposes, producing methane gas.[8]

GHG emissions from electrical usage, natural gas combustion, mobile transportation, water and wastewater conveyance, and solid waste were estimated using the CalEEMod model, and are presented in **Table 8.6-2**. Default GHG emissions factor for PG&E was adjusted to reflect future reductions envisioned by PG&E (PG&E, 2013). Electrical and natural gas emissions also assume compliance with UCSF policy to achieve an energy use 20% lower than Title 24 requirements.

[8] CH_4 from decomposition of municipal solid waste deposited in landfills is counted as an anthropogenic (human-produced) GHG. (USEPA, 2006).

TABLE 8.6-2
ANNUAL OPERATIONAL GHG EMISSIONS
WITHOUT MITIGATION - MOUNT ZION CAMPUS

Emission Source	Emissions (metric tons/year)			
	CO_2	CH_4	N_2O	Total CO_2e
Area Sources	<1	<1	<1	<1
Energy Sources	1,190	<1	<1	1,195
Mobile Sources	719	<1	<1	720
Solid Waste	564	33.3	<1	1,264
Water and Wastewater	67.3	1.0	<1	97
Demolition Losses				
Area Sources	<1	<1	<1	<1
Energy Sources	-435	<1	<1	-437
Solid Waste	-186	-11	<1	-418
Water and Wastewater	-22	<1	<1	-32
Net Total	**1,897**	**23**	**<1**	**2,389**

NOTE: Columns may not total precisely due to rounding. Rows may not total precisely due to differences in global warming potential.

Demolition projects would result in reductions in electrical and natural gas usage, water and wastewater transport (the energy used to pump water and wastewater to and from the campus site), and solid waste generation from the buildings being demolished. While there could be a reduction in energy demand resulting from reuse of the Main Hospital from in-patient to out-patient use, it was conservatively assumed that this reduction would be negligible. GHG emission reductions would be realized from reduction in electrical demand, natural gas use, water and wastewater transport and solid waste generation.

Mobile Emission Sources

One of the sources of operational emissions would be increased vehicle emissions from traffic for additional staff, patients, visitors and residents. Traffic volumes used to estimate vehicle-related emissions were derived from the Transportation Demand Analysis prepared for the 2014 LRDP (Adavant, 2014). New development under the 2014 LRDP at the Mount Zion campus site would generate an estimated 179 additional daily vehicle trips. GHG emissions from motor vehicle sources were calculated using the CalEEMod. Table 8.6-2 presents the incremental mobile source GHG emissions associated with 2014 LRDP development, which represent approximately 22% of the total operational GHG emissions from new development.

As shown in Table 8.6-2, the sum of both direct and indirect GHG emissions resulting from operations under the 2014 LRDP, including operational losses from demolition of older less-efficient buildings would result in an estimated 2,389 metric tons per year of CO_2e. Applying a service population of 711 persons associated with development at the Mount Zion campus site (649 new faculty, staff and 62 students) results in emissions of approximately 3.4 metric tons CO_2e/SP/yr. This is below the service population threshold of 4.6 metric tons per year of CO_2e/SP

and operational GHG emissions associated with development under the 2014 LRDP would therefore be a less-than-significant impact.

Mitigation: None required.

8.7 Hazards and Hazardous Materials

This section considers the setting and hazards and hazardous materials impacts of implementation of the 2014 LRDP at the Mount Zion campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Hazards and Hazardous Materials are contained in Section 4.7 of this EIR. The CEQA Significance Standards presented in Section 4.7.3 are used to evaluate the potential hazards and hazardous materials impacts of all proposed 2014 LRDP activities.

8.7.1 Hazards and Hazardous Materials Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mount Zion campus site, the Initial Study concluded that:

- **Safety hazards from airport operations.** No activities would result in safety hazards resulting from proximity to public or private airports. Therefore, no additional analysis of this issue is required.

- **Wildland fires.** No activities would result in exposure to wildland fires. Therefore, no additional analysis of this issue is required.

8.7.2 Hazards and Hazardous Materials – Mount Zion Setting

The Mount Zion campus site uses include the hospital, clinical offices, outpatient programs, and parking lots all located within a mixed-use neighborhood commercial district, which all involve the transport, storage, handling, and disposal of hazardous materials. Proposed 2014 LRDP activities include demolition of existing buildings which could contain hazardous building materials, renovations to existing buildings which could also disturb hazardous building materials, and constructing an office/research building

8.7.3 Hazards and Hazardous Materials – Mount Zion Impacts and Mitigation Measures

Impact HAZ-MZ-1: Implementation of the 2014 LRDP could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions. (Potentially Significant)

The current inpatient facilities at the Mount Zion campus site cannot meet newer seismic code requirements through 2030, so both will require decommissioning as inpatient facilities. Inpatient uses at the Mount Zion campus site will be relocated to the Mission Bay campus site and the inpatient buildings will subsequently be repurposed for outpatient use. The renovation efforts to repurpose these facilities could include disturbing existing building materials which could potentially contain hazardous building materials such as lead-based paint, asbestos containing materials, polychlorinated biphenyls (PCBs), and mercury. If not addressed appropriately,

construction workers and the public could be exposed to adverse effects as a result of exposure to these hazardous building materials, if present. As described in Chapter_5, existing regulations are sufficient to reduce potential exposure health risks to less than significant levels. Once renovations are complete, there could be a potential net increase in the use, storage, and disposal of hazardous materials including biohazardous wastes, however any additional hazardous materials handling activity would be subject to federal, state, local, and existing UCSF policies and plans.

One or more buildings (or a phased building) would be built in place of the Hellman, Harold Brunn Institute and Dialysis Center buildings. Development could also include two levels of underground parking. The level of hazardous materials use, storage and disposal would likely depend on whether the building(s) end up being used as offices or for research purposes. Either way, any expanded or additional use of hazardous materials would require adherence to regulatory requirements that address the storage, use, and disposal of hazardous materials in a manner that limit health risks and upset and accident conditions. Hazardous materials use, storage and disposal also would be offset with the hazardous materials practices that existed with the operations of the Hellman, Brunn and Dialysis Buildings which are proposed for demolition.

San Francisco is among the identified counties where ultramafic bedrock materials are present and have the potential for naturally occurring asbestos fibers. Ground disturbing activities such as excavation for construction of foundations or the underground parking have the potential to encounter bedrock containing naturally occurring asbestos fibers. If not addressed appropriately, disturbance of these fibers could expose workers and the public to adverse health effects. With implementation of **Mitigation Measure HAZ-LRDP-1**, the potential impact would be reduced to less than significant levels.

Mitigation Measure: Implement Mitigation Measure HAZ-LRDP-1

Significance after Mitigation: Less than Significant

Impact HAZ-MZ-2: Implementation of the 2014 LRDP at the Mount Zion campus site could result in hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or waste within one-quarter mile of existing or proposed schools. (Less than Significant)

There are several schools located within a quarter mile of the Mount Zion campus site including Gateway High School and Drew School which are located approximately 0.2 miles from the campus site. While there may be net changes in the amount and type of hazardous materials handled, stored, and disposed of, the 2014 LRDP proposals would overall not represent a substantive change in emissions or handling of hazardous materials and all activities would continue adherence to federal, state, local and UCSF policies and regulatory requirements.

Mitigation: None required.

8.8 Hydrology and Water Quality

This section considers the setting and hydrology and water quality impacts of implementation of the 2014 LRDP at the Mount Zion campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential Hydrology and Water Quality effects are contained in Section 4.8 of this EIR. The CEQA Significance Standards presented in Section 4.8.3 are used to evaluate the potential impacts to hydrology and water quality of all proposed 2014 LRDP activities.

Those impacts that are specific to the implementation of the 2014 LRDP at the Mount Zion campus site are discussed below.

8.8.1 Hydrology and Water Quality Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mount Zion campus site, the Initial Study concluded that:

- **Groundwater supplies.** No activities would result in substantial depletion of groundwater supplies or interfere substantially with groundwater recharge. Therefore, no additional analysis of this issue is required.

- **Housing or other structures within flood hazard areas.** No activities would place housing or other structures within a flood hazard area. Therefore, no additional analysis of this issue is required.

- **Exposure to flooding.** No activities would result in exposure to flooding. Therefore, no additional analysis of this issue is required.

- **Inundation by seiche, tsunami or mudflow.** No activities would result in inundation by seiche, tsunami or mudflow. Therefore, no additional analysis of this issue is required.

Finally, the Initial Study also concluded that the proposed renovation of the Main Hospital would result in no impact or less-than-significant impacts regarding any hydrology or water quality issue. Therefore, no additional analysis is required for this building renovation activity.

8.8.2 Hydrology and Water Quality – Mount Zion Setting

The Mount Zion campus site occupies various portions of a six-block stretch of San Francisco bounded by Bush, Geary, Broderick, and Scott streets. The main campus block is the hospital located on Post and Sutter streets. The area is almost completely covered in impervious surfaces and drains to the Southeast Treatment Plant.

8.8.3 Hydrology and Water Quality – Mount Zion Impacts and Mitigation Measures

There are three types of proposals at the Mount Zion campus site under the 2014 LRDP:

- **Demolition:** Hellman, Brunn and Dialysis Buildings (and possibly 2255 Post Street)
- **Renovation:** Main Hospital (and possibly 2255 Post Street)
- **Construction:** Construct Office/Research Building

Proposed LRDP development at the Mount Zion campus site (including on-site staging) would include demolition, excavation, grading, and construction activities that would require temporary disturbance of surface soils and removal of existing pavement and sub-surface structures (if present). These activities would expose soil to water runoff as well as entrainment of sediment in the runoff. If dewatering would be necessary during construction, the water would likely contain suspended sediments and would require settling before being discharged to the CSS. Sediment in runoff and deposits of soil and related debris from haul truck tires on local streets could increase the amount of sediment entering the storm drains, which could potentially clog drain inlets and reduce the flow capacity of the storm drains. The accumulation of this material could potentially result in increased localized ponding or flooding, particularly after large storm events.

The use of construction equipment as well as the delivery, handling, and storage of construction materials and waste could contaminate stormwater that could negatively impact water quality. Potential contaminants include, but are not limited to (CSW/Stuber-Stroeh, 2011):

- Petroleum hydrocarbons and metals from stockpiled soils excavated from the site
- Fuel from storage drums
- Diesel from refueling trucks
- Oils and grease from miscellaneous heavy equipment
- Sewage from portable sanitary facilities
- Sediment from construction generated waste–piles of concrete, rock and debris
- Sediment from rock crushing activities
- Hazardous materials storage-hydraulic oil, motor oil, and lubricating fluid
- Spills and releases of hydrocarbons and related pollutants from routine light maintenance activities such as fluid topping off, and welding and repairing belts and gears of heavy equipment

Polluted stormwater runoff could violate water quality standards and/or waste discharge requirements established in the NPDES General Permit for Construction and the NPDES discharge permits for the Southeast Treatment Plant.

In accordance with the Construction General Stormwater Permit, UCSF would be required to prepare and implement a SWPPP for each LRDP construction project to minimize water quality impacts during construction activities on the campus site. The SWPPPs will be consistent with previous SWPPPs that have been developed for past development of the Mount Zion campus site (e.g. construction of the Mount Zion Parking Garage).

The SWPPPs will identify pollutant sources within the construction area and recommend site-specific BMPs regarding control of sediments in runoff and storage and use of hazardous materials to prevent discharge of pollutants into stormwater. Likely BMPs are listed in Section 5.1.8.

In addition, each 2014 LRDP construction project will need to obtain a water quality certification from the RWQCB for the construction activities, which would also require implementation of BMPs and specific measures for the protection of water quality during construction.

Proposed development and redevelopment at the Mount Zion campus site would not significantly change the volumes of site stormwater runoff, nor how this runoff is directed or routed through the campus site to the CSS. The proportion of impermeable surfaces at the campus site will not significantly change as a result of 2014 LRDP activities. Measures to prevent and minimize erosion and its potential effects on storm drain siltation and water quality would be included in the SWPPP.

Implementation of SWPPPs and associated BMPs would reduce erosion and water quality impacts during demolition and construction activities to less than significant. These regulatory requirements, discussed in Sections 4.8 and 5.8, limit the potential adverse effects of these impacts to less than significant.

Mitigation: None required.

8.8.4 References

CSW/Stuber-Stroeh Engineering Group, Inc., *Storm Water Pollution Prevention Plan*, UCSF Medical Center at Mission Bay, San Francisco, California, August, 2011.

8.9 Land Use and Planning

This section considers the setting and land use and planning impacts of implementation of the 2014 LRDP at the Mount Zion campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Land Use are contained in Section 4.9 of this EIR. The CEQA Significance Standards presented in Section 4.9.3 are used to evaluate the potential land use impacts of all proposed 2014 LRDP activities.

8.9.1 Land Use and Planning Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mount Zion campus site, the Initial Study concluded that:

- **Physically divide an established community.** No activities would physically divide an established community. Therefore, no additional analysis of this issue is required.
- **Habitat conservation plan.** No activities would result in a conflict with any applicable habitat conservation plan. Therefore, no additional analysis of this issue is required.
- **Compatibility with local land uses or zoning.** The proposed demolition of Hellman, Brunn and Dialysis buildings would not conflict with local land uses or zoning. Therefore, no additional analysis of this issue is required for these activities.

8.9.2 Land Use and Planning – Mount Zion Setting

The Mount Zion campus site consists of approximately 7.6 acres on six contiguous city blocks in the Western Addition neighborhood of San Francisco. The campus site is generally bounded by Bush Street to the north, Scott Street to the east, Post Street to the south and Broderick Street to the west. The Mount Zion campus site has 776,200 gsf of owned space and 45,300 gsf of leased space within a quarter-mile, for a total of 821,500 gsf. The Medical Center at Mount Zion is located on the main block, with the entrance on Divisadero Street between Post and Sutter Streets. Additional Mount Zion facilities are located on and distributed across five adjoining blocks, within the area bounded by Broderick Street to the west, Scott Street to the east, Bush Street to the north and Geary Boulevard to the south. The Mount Zion campus site has not been designated with functional zones by UCSF prior to the adoption of the 2014 LRDP.

The campus site is located in a mixed-use neighborhood commercial district and is fully integrated with the city street grid. Most buildings along Divisadero Street consist of residential and office uses above ground floor retail. In the vicinity of the campus site there are several private medical office buildings that are not affiliated with UCSF. Kaiser Medical Center is located on Geary Boulevard, one block to the southwest. Residential uses are widespread north and west and directly across Scott Street to the east of the main block.

8.9.2.1 City of San Francisco Zoning

The campus site is zoned as Neighborhood Commercial (NC-3) by the City, with the exception of one parcel at 2375 Post Street that is zoned Residential Mixed Use (RM-1). NC-3 Districts are intended in most cases to offer a wide variety of comparison and specialty goods and services to a population greater than the immediate neighborhood. NC-3 Districts are linear districts located along heavily trafficked thoroughfares that also serve as major transit routes. Height and Bulk Districts within the campus site boundaries include the following: 40-X, 65-A and 105-E. The locations with an "X" designation permit all floors of structures to cover the entire building footprint. The "A" designation limits building floor plans above 40 feet to a maximum plan length of 110 feet and a maximum diagonal plan dimension of 125 feet. The "E" designation limits floor plans above 65 feet to a maximum plan length of 110 feet and a maximum diagonal plan dimension of 140 feet.

8.9.3 Land Use and Planning – Mount Zion Impacts and Mitigation Measures

Impact LU-MZ-1: Implementation of the 2014 LRDP at the Mount Zion campus site would be consistent with applicable land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental effect. (Less than Significant)

Upon adoption by the Regents, the proposed 2014 LRDP will replace the 1996 LRDP, as amended, and become the applicable campus land use plan for UCSF. Pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation. The University is the only agency with land use jurisdiction over activities proposed at UCSF campus sites by the 2014 LRDP. Therefore, all proposed activities that would be in general conformance with the 2014 LRDP would have no significant land use impacts.

However, UCSF considers the land use policies and zoning regulations of the City when analyzing potential land use impacts under CEQA. The 2014 LRDP is not expected to conflict with City plans and policies adopted for the purpose of avoiding or mitigating an environmental effect. Consistency with the City's height and bulk districts is discussed below under Impacts LU-MZ-2 and LU-MZ-3.

The Mount Zion campus site would be newly designated with functional zones under the 2014 LRDP (see Figure 3-13 in Chapter 3, *Project Description*). The majority of the campus site is proposed as Clinical, consistent with the predominance of inpatient and outpatient uses. The cancer research building is designated as Research. Other areas include structured parking controlled by UCSF. The functional zone classifications proposed by UCSF do not present land use conflicts with adjacent existing land uses on the campus site or in the surrounding neighborhood. The renovation of the Main Hospital and construction of the proposed office/research building would be consistent with the existing uses on the campus site. Therefore, implementation of the 2014 LRDP would have a less-than-significant impact regarding consistency with land use plans and policies adopted for the purpose of avoiding or mitigating an environmental effect.

Mitigation: None required.

Impact LU-MZ-2: Renovation of the Main Hospital at the Mount Zion campus site would be compatible with existing land uses, density, and height and bulk restrictions. (Less than Significant)

With the opening of the Medical Center at Mission Bay in 2015, the inpatient uses at the Mount Zion campus site currently located in the Main Hospital will be relocated to the Mission Bay campus site. The Main Hospital would be repurposed as an ambulatory care center with ambulatory surgery. Vacated space would be backfilled with growth of the cancer program, expansion of outpatient services and support space. The decommissioned hospital may also accommodate program space and clinics now located in the Hellman, Harold Brunn Institute and Dialysis Center buildings proposed for demolition, as well as nearby leased space if and when leases are not renewed. Proposed renovations would be limited to the interior and no conflicts would result with local zoning regulations. This would therefore be a less than significant impact.

Mitigation: None required.

Impact LU-MZ-3: The proposed office/research building at the Mount Zion campus site would be compatible with adjacent land uses. (Less than Significant)

UCSF proposes to construct one or more buildings (or a phased building) totaling approximately 257,000 gsf on the east side of the main block where the Hellman, Harold Brunn Institute and Dialysis Center buildings are currently located. UCSF conducted a capacity study to evaluate options and to determine how much space could be developed on this portion of the block, given the program space target, the need for a central open space area, parking and loading requirements and the City's height and bulk limits. The study determined that the full program could be met, but only if the City's bulk limits were exceeded and parking was located underground or off the block. A new building along Scott Street could be built up to 65 feet tall with a 20-foot step back at the 40-foot height level to lower the building scale at the street level. The building could be set back from Post Street to align with the existing hospital building. Building space on Sutter Street could be up to 105 feet in height with a 20-foot setback along Sutter and Scott Streets. The proposed building would comply with the City's height limit, but not the bulk limit.

As noted above, the University is exempt from local zoning. However, UCSF strives to adhere to City zoning codes to the extent practicable in accordance with 2014 LRDP Objective 1: Respond to the City and Community Context. The 2014 LRDP also includes an objective (Objective 3) to ensure that its facilities are seismically safe. To the extent feasible, UCSF would design the new office/research building to avoid or minimize the effects of this conflict with the City's Planning Code. While the proposed new office/research building would exceed the bulk restrictions of the Planning Code, the proposed building would be designed to align with the existing Main Hospital building and is located in a setting already built out with other UCSF facilities. Accordingly, although it would technically exceed the local bulk restrictions, it would be compatible with adjacent land uses and would not therefore create a significant land use impact.

Mitigation: None required.

8.10 Noise

This section considers the setting and noise impacts of implementation of the 2014 LRDP at the Mount Zion campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Noise are contained in Section 4.10 of this EIR. The CEQA Significance Standards presented in Section 4.10.3 are used to evaluate the potential noise impacts of all proposed 2014 LRDP activities.

8.10.1 Noise Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mount Zion campus site, the Initial Study concluded that:

- **Permanent ambient noise.** The demolition of the Hellman, Brunn and Dialysis buildings would not result in a substantial permanent increase in ambient noise levels. Therefore, no additional analysis of this issue is required for these activities.

- **Airport noise.** No activities would be located within the vicinity of a public or private airport. Therefore, no additional analysis of this issue is required.

- **Average daily noise levels.** The demolition of the Hellman, Brunn and Dialysis buildings would not contribute to increases in average daily noise levels. Therefore, no additional analysis of this issue is required for these activities.

8.10.2 Noise – Mount Zion Setting

8.10.2.1 Existing Noise Environment

Long-term environmental noise in urbanized areas is primarily dependent on vehicle traffic volumes and the mix of vehicle types. The existing ambient noise environment within the Mount Zion campus site area is dominated by vehicular traffic on Divisidero Street, Bush Street and Sutter Street.

The San Francisco Department of Public Health (DPH) has mapped transportation noise throughout the City and County of San Francisco, based on modeled baseline traffic volumes derived from the San Francisco County Transportation Authority travel demand model[9]. DPH maps indicate the areas subject to noise levels over 60 dBA (L_{dn}) and the range of L_{dn} noise levels that occur on every street in San Francisco. The portions of these maps that cover the campus site area indicate that areas along Divisidero Street, Bush Street and Sutter Street are generally between 65 and 70 dBA (L_{dn}).

Ambient Noise Measurements

Ambient short-term (10-minute) noise measurement data was collected in March of 2014 to characterize noise conditions in the campus site area. To characterize ambient noise in the

[9] San Francisco Department of Public Health (DPH), San Francisco City-wide Noise Map, August 2006, Available online at http://www.sfdph.org/dph/files/EHSdocs/ehsPublsdocs/Noise/noisemap2.pdf Accessed April 30, 2013.

campus site area, the short-term measurement data were collected at a location where residential land uses exist adjacent to where proposed demolition and construction activities could occur. These data are presented in **Table 8.10-1**.

TABLE 8.10-1
SHORT- TERM AMBIENT NOISE LEVEL DATA IN THE MOUNT ZION CAMPUS AREA

Measurement Location	Time	Noise Levels in dBA	
		Hourly L_{eq}	L_{max}
MZ-ST1: Residences on Scott Street between Sutter Street and Post Street	4:25	66.4	78.1

NOTE: L_{eq} represents the constant sound level; L_{max} is the maximum noise level.

SOURCE: Environmental Science Associates, 2014.

8.10.3 Noise – Mount Zion Impacts and Mitigation Measures

Impact NOI-MZ-1: Demolition activities proposed under the 2014 LRDP at the Mount Zion campus site would result in a temporary increase in ambient noise levels. (Potentially Significant)

As noted in the Regional Setting section, the hours that construction activity noise can occur is described in Section 2908 of the Police Code, known as the San Francisco Noise Ordinance. Although UCSF is not subject to the noise ordinance, it strives to be consistent with it. Section 2908 prohibits any person, between the hours of 8:00 p.m. of any day and 7:00 a.m. of the following day, from erecting, constructing, demolishing, excavating for, altering, or repairing any building or structure if the noise level created is in excess of the ambient noise level by 5 dBA at the nearest property line.

Demolition of the three buildings proposed to be removed would require the use of heavy duty off-road construction equipment as well as haul trucks to remove debris. Construction activity noise levels at and near the demolition sites would fluctuate depending on the particular type, number, and duration of uses of various pieces of construction equipment. **Table 8.10-2** shows typical noise levels produced by various types of construction equipment. Equipment typically involved with large-scale demolition would include excavators, dozers, loaders and trucks for off-hauling demolition debris. Additionally, a hoe-ram (a back-hoe fitted with a ramming bit) may be used to break up large concrete structures.

The demolition of the three buildings would occur within 60 feet of an occupied residential building across Scott Street to the east. The estimated noise level of demolition activities, assuming simultaneous operation of an excavator, a loader and a bulldozer as calculated using the Roadway Construction Noise Model of the FHWA, would be 84.1 dBA, Leq. The nearest sensitive residential receptor currently experiences existing daytime noise levels of 66 dBA. Noise from standard construction equipment could exceed these existing noise levels by as much as 18 dBA.

TABLE 8.10-2
TYPICAL NOISE LEVELS FROM CONSTRUCTION EQUIPMENT

Construction Equipment	Noise Level (dBA, Leq at 50 Feet)	Noise Level (dBA, Leq at 60 Feet)
Dump truck	76	74
Portable air compressor	78	76
Concrete mixer (truck)	79	77
Crane	81	79
Excavator	81	79
Dozer	82	80
Paver	77	75
Generator	81	79
Backhoe	78	76
Pile driver	101	99
Auger Drill Rig	84	92

SOURCE: FHWA, 2006.

Trucks off-hauling demolition debris would also generate noise. The number of daily truck trips would depend on the pace of demolition. The CalEEMod air quality model estimates that based on the square feet of demolition involved at for the removal of the three buildings up to 39 daily truck trips could occur per day (20 truck loads per day). Different truck routes would be use for these two proposals each of which would add about two additional truck trips per hour to local roadways. The Traffic Noise Prediction Model of the FHWA indicates that addition of two trucks per hour along Scott Street would increase the existing hourly noise level by 1.5 dBA which would not be a significant contribution to existing roadside noise levels.

Noise levels from proposed demolition would exceed 10 dBA over existing levels (a perceived doubling of loudness) during peak demolition activities. Receptors near these buildings would also experience noise levels approaching or exceeding a speech-interference threshold of 70 dBA and result in a temporary but significant construction noise impact from demolition activities.

Implementation of **Mitigation Measure NOI-LRDP-1** will reduce noise levels associated with demolition activities by 5 to 10 dBA. However, it is likely that intermittent hoe-ram operations to break up concrete structures could result in noise levels at sensitive receptors in excess of 70 dBA, even after mitigation. Consequently, this impact, although temporary, would be significant and unavoidable.

Mitigation Measure: Implement Mitigation Measure NOI-LRDP-1

Significance after Mitigation: Significant and Unavoidable

Impact NOI-MZ-2: Construction activities proposed under the 2014 LRDP at the Mount Zion campus site would result in increases in ambient noise levels over the term of the exterior construction activities. (Potentially Significant)

Construction of the new office/research building would require the use of heavy duty off-road construction equipment. Construction activity noise levels at and near the office/research building site would fluctuate depending on the particular type, number, and duration of uses of various pieces of construction equipment, which could involve excavation, grading, and earth movement and, potentially, pile driving.

The nearest sensitive residential receptors to the office/research building site currently experience existing daytime noise levels of 66 dBA. Noise from standard construction equipment could exceed these existing noise levels by as much as 14 dBA. An impact pile driver, if required could result in an increase of up to 33 dBA over existing noise levels, resulting in a significant noise increase over existing conditions. Consequently mitigation measures to reduce construction noise are identified.

Renovation of the Main Hospital is expected to be largely conducted within the existing shell of the building and not require the use of heavy-duty construction equipment and therefore, not result in significant construction noise impact.

Mitigation Measure: Implement Mitigation Measures NOI-LRDP-1 and NOI-LRDP-2

Significance after Mitigation: Significant and Unavoidable. Mitigation Measures NOI-LRDP-1 and 2 would reduce the severity of noise generated by construction and pile-driving activities and reduce to the extent feasible the potential annoyance to nearby residents and others who could be disturbed by pile-driving. If piles can be installed though drilling and cast in place measures then these mitigation measures would result in a less than significant impact.

However, if geotechnical conditions exist such that impact or vibratory pile-driving is required, then construction noise would be significant. Although pile-driving noise would be intermittent and would occur over a short duration (up to about six weeks in total), even after mitigation the noise level would likely exceed 20 dBA during pile-driving activities, resulting in a significant and unavoidable impact.

Impact NOI-MZ-3: Demolition and construction activities proposed under the 2014 LRDP at the Mount Zion campus site could generate ground-borne vibration. (Less than Significant)

The types of construction activities associated with propagation of ground-borne vibration include pile driving, use of hoe-rams for demolishing large concrete structures and caisson drilling. It is possible that pile driving and drilling could occur during building construction. Pile driving, if required could take one or more months, and would occur during daytime hours, consistent with the City's Police Code.

Of the construction equipment likely to be used for construction of the office/research building, pile driving has the potential to result in the highest levels of ground-borne vibration. Pile driving

can result in peak particle velocities (PPV) of up to 1.5 inches per second (in/sec) at a distance of 25 feet (FTA, 2006), but typically results in an average of about 0.644 PPV at that distance. The Caltrans measure of the threshold of architectural damage for conventional sensitive structures is 0.5 in/sec PPV for new residential structures and modern commercial buildings and 0.25 in/sec PPV for historic and older buildings.

The nearest existing off-campus structure is approximately 60 feet away from the site of the proposed building, where pile driving may occur. At this distance, vibration from pile driving would be expected to be reduced to 0.17 inches per second. Therefore, vibration from pile driving would not exceed the criterion published by Caltrans of 0.25 in/sec for the protection of fragile older buildings. Vibration levels could be strongly perceptible at the nearest residential receptors but would be below the thresholds considered severe, 0.4 in/sec PPV. Consequently, if restricted to daytime hours, as required by ordinance, the proposals would have a less-than-significant impact with regard to ground-borne vibration. If piles can be installed though drilling and cast in place measures then vibrations levels would not be perceptible at the nearest residences.

Mitigation: None required.

Impact NOI-MZ-4: Operational noise generated by development under the 2014 LRDP at the Mount Zion campus site could cause a long-term increase in ambient noise levels in the campus vicinity. (Less than Significant)

Long-term noise sources associated with operation of the new office/research building and repurposed Main Hospital would primarily consist of marginal increases in roadway traffic resulting from new and repurposed land use. There will likely be some new mechanical equipment (e.g. heating ventilation and air conditioning) associated with operation of the new building. The potential location of such equipment in not known, but such equipment would be operated is such a manner as to conform to the requirements of the City of San Francisco Noise Ordinance. Additionally new mechanical equipment would effectively replace older and potentially noisier HVAC equipment currently existing at the Dialysis Center building that would be demolished.

Increased traffic would primarily be on the local roadway network, including Divisadero Street, Bush Street, Sutter Street and Scott Street. A project would be considered to generate a significant impact if it resulted in a permanent increase in ambient noise levels greater than 3 dBA in the project vicinity above levels existing without the project for areas already impacted by noise.

Noise levels were determined for this analysis using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model and the turning movements in the traffic section for Existing (2014), Existing Plus LRDP, and Cumulative Plus LRDP conditions. Peak hour intersection turning data from the traffic study were analyzed to evaluate increases and resulting traffic-generated noise increases on roadway links most affected by LRDP -related traffic. The roadway segments analyzed and the results of the noise increases resulting from modeling are shown in **Table 8.10-3**, below.

TABLE 8.10-3
PEAK-HOUR TRAFFIC NOISE LEVELS IN THE VICINITY OF THE MOUNT ZION CAMPUS

Roadway Segment[a,b]	(A) Existing	(B) Existing Plus Project	(B-A) Difference between Existing Plus Project and Existing[c]	(D) Cumulative Plus Project (2040)	(D-A) Difference between Cumulative Plus Project and Existing
Divisidero Street between Post Street and Sutter Street	66.6	66.9	0.3	67.2	0.6
Divisidero Street between Sutter Street and Bush Street	66.3	66.7	0.4	67.0	0.7
Scott Street between Post Street and Sutter Street	60.2	60.4	0.2	61.4	1.2
Scott Street between Sutter Street and Bush Street	59.9	60.0	0.1	61.3	1.4
Bush Street between Divisidero Street and Scott Street	69.0	69.1	0.1	69.9	0.9
Sutter Street between Divisidero Street and Scott Street	59.3	59.5	0.2	59.8	0.5

[a] Road center to receptor distance is 15 meters (approximately 50 feet) for all roadway segments. Noise levels were determined using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model.
[b] The analysis considered the vehicle mix based on – cars 91 percent, medium trucks eight percent, and heavy trucks one percent on all streets based on observed city and para-transit bus activity. Traffic speeds for all vehicle classes were set at 25 mph for all vehicle classes, except on Divisidero Street and Bush Street where speeds were assumed to be 30 mph.

SOURCE: ESA, 2014.

As shown in Table 8.10-3, the increase in traffic noise from the Existing Plus LRDP scenario compared to the Existing scenario would increase peak hour noise levels by less than 3 dBA at all roadway segments. Overall, traffic noise impacts associated with implementation of the 2014 LRDP at all analyzed roadway segments in the vicinity of the Mount Zion campus site would be less than significant.

Mitigation: None required.

8.11 Population and Housing

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Population and Housing are contained in Section 4.11 of this EIR. The CEQA Significance Standards presented in Section 4.11.3 are used to evaluate the potential population and housing impacts of all proposed 2014 LRDP activities.

The 2014 LRDP would result in population growth in San Francisco or the wider Bay Area through increased employment and student enrollment. The 2014 LRDP would accommodate an increase in employment and students at all campus sites from the current approximately 30,840 to approximately 42,270 by 2035. This anticipated population increase could result in an increased demand for housing in the Bay Area. This overall increase and its potential effect on housing were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures.*

The 2014 LRDP development proposals would result in changes in daily population at this campus site. The direct and indirect physical environmental effects that result from those changes are fully considered in each of the appropriate topical sections of this chapter.

8.12 Public Services

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Public Services are contained in Section 4.12 of this EIR. The CEQA Significance Standards presented in Section 4.12.3 are used to evaluate the potential public services impacts of all proposed 2014 LRDP activities.

In 2013, the estimated daily UCSF population across all sites, including patients and visitors, was approximately 39,420. At 2014 LRDP horizon in 2035, total population is projected to reach approximately 56,420, an increase of about 17,000, the majority of which would be associated with growth proposed by the 2014 LRDP. The projected increase in population at the Mount Zion campus site would be approximately 1,600 in 2035.

This anticipated population increase could result in an increased demand for public services in San Francisco, including fire protection, law enforcement, and public education. This overall increase and its potential effect on public services were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures*. The anticipated small increase in population at this campus site under the LRDP would not cause substantial increased demand for public services specific to this campus site, and all impacts are found to be less than significant.

8.13 Recreation

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Recreation are contained in Section 4.13 of this EIR. The CEQA Significance Standards presented in Section 4.13.3 are used to evaluate the potential recreation impacts of all proposed 2014 LRDP activities.

In 2013, the estimated daily UCSF population across all sites, including patients and visitors, was approximately 39,420. At 2014 LRDP horizon in 2035, total population is projected to reach approximately 56,420, an increase of about 17,000, the majority of which would be associated with growth proposed by the 2014 LRDP. The projected increase in population at the Mount Zion campus site would be approximately 1,600 in 2035.

After evaluation of the 2014 LRDP activities proposed at the Mount Zion campus site, the Initial Study concluded that the anticipated small increase in population at this campus site under the LRDP would not cause substantial increased demand for recreation facilities specific to this campus site. All activities would result in no impact or less than significant impacts regarding recreation; therefore, no additional analysis is required.

8.14 Transportation and Traffic

This section considers the setting and transportation and traffic impacts of implementation of the 2014 LRDP at the Mount Zion campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Transportation and Traffic are contained in Section 4.14 of this EIR. The CEQA Significance Standards presented in Section 4.14.3 are used to evaluate the potential transportation and traffic impacts of all proposed 2014 LRDP activities.

8.14.1 Transportation and Traffic Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mount Zion campus site, the Initial Study concluded that:

- **Air traffic patterns.** No activities would result in a change in air traffic patterns. Therefore, no additional analysis of this issue is required.

8.14.2 Transportation and Traffic – Mount Zion Setting

A more-detailed description of current transportation and traffic characteristics in the Mount Zion campus site area is provided in Appendix G, Transportation Impact Study (TIS) for the UCSF LRDP.

8.14.2.1 Roadway Facilities

The network of regional roadways that serve the Mount Zion campus site is described in Section 4.14.

The Mount Zion campus site is located at the crossroads of San Francisco between the more modestly-scaled neighborhoods of the Richmond District to the west and more downtown-scaled areas to the east. As such, the roadways serving the campus site are primarily east-west corridors – Geary Boulevard, Pine Street, and Bush Street. Primary north-south access to the campus site is provided via Divisadero Street. The primary vehicular entrances to parking and loading areas for the campus site are located along Sutter Street and Post Street between Broderick Street and Divisadero Street, along Geary Boulevard between Divisadero Street and Scott Street, and along Scott Street between Geary Boulevard and Post Street. Local access to the Mount Zion campus site is provided by an urban street grid network. Key local roadways through the campus site are discussed below.

The local road network serving the Mount Zion campus site consists of several two-lane roadways with on-street parking provided on both sides of the streets in most areas, as follows:

- **Sutter Street** runs from Market Street to Presidio Avenue and is classified by the City as a Transit Conflict street. The 2 Clement bus line travels westbound, except within the campus site where it operates in both directions.

- **Post Street** runs from Market Street to Presidio Avenue and has Class II bicycle lanes in both directions between Presidio Avenue and Steiner Street, west of which turns into a Class III bicycle route.

- **Pierce Street** runs from Clay Street to Post Street.

- **Scott Street** runs from Marina Boulevard to Duboce Avenue and is designated as a Class III bicycle route within the study area from Post Street to Geary Boulevard.

- **Broderick Street** runs between Marina Boulevard and Waller Street and is designated a Class III bicycle route between Clay and Post streets.

Other roadways in the local network are as follows:

- **Geary Boulevard** is a six-lane east-west arterial that extends from Gough Street to 48th Avenue. The City classifies this arterial as a Primary Transit Important roadway. From Steiner Street to Baker Street (within the campus site area) the roadway has a center median with foliage. On-street parking is provided on both sides of the street within the vicinity of the campus site. The 38 Geary, 38L Geary Limited, and Golden Gate Transit bus lines operate in both directions along Geary Boulevard, while the NX Judah Express operates only in the westbound direction during weekday peak hours.

- **Pine Street** is a three-lane, one-way westbound roadway that extends from Market Street to Presidio Avenue. The City classifies this roadway as a Major Arterial. Pine Street is the westbound component of the Pine/Bush Street one-way couplet. On-street parking is provided on both sides of the street. The 1AX California A Express, 31AX Balboa A Express, 31BX Balboa B Express, 38AX Geary A Express, and 38BX Geary B Express bus lines utilize Pine Street to travel from Market Street to northwestern San Francisco neighborhoods.

- **Bush Street** is a three-lane, one-way eastbound roadway that extends from Market Street to Presidio Avenue. The City classifies this roadway as a Major Arterial. Bush Street is the eastbound component of the Pine/Bush Street one-way couplet. On-street parking is provided on both sides of the street. The 1AX California A Express, 31AX Balboa A Express, 31BX Balboa B Express, 38AX Geary A Express, 38BX Geary B Express, and NX Judah Express bus lines utilize Bush Street to travel from northwestern San Francisco neighborhoods to Market Street.

- **Divisadero Street** is a four-lane north-south roadway that extends from Marina Boulevard to 14th Street. The City classifies this roadway as a Secondary Transit arterial. On-street parking is provided on both sides of the street. The 24 Divisadero bus line operates in both directions along Divisadero Street between Jackson and Waller streets, providing transit service between Pacific Heights and Bayview neighborhoods.

8.14.2.2 Intersection Operating Conditions

Intersection operating conditions at 16 intersections were evaluated during the weekday peak hours of the AM (7:00-9:00 AM) and PM (4:00-6:00 PM) peak periods. Intersections usually form the critical capacity constraints on roadways. Therefore, most transportation analyses examine intersection operations as a measure of overall roadway conditions.

The operating characteristics of intersections are evaluated using the concept of Level of Service ("LOS"). LOS is a qualitative description of driver comfort and convenience. Intersection levels of service range from LOS A, which indicates free flow or excellent vehicle flow conditions with short delays, to LOS F, which indicates congested or overloaded vehicle flow conditions with extremely long delays. In San Francisco, LOS A through D is considered acceptable, and LOS E and LOS F are considered unsatisfactory service levels. The intersections were evaluated using the 2000 Highway Capacity Manual (HCM) methodology. Tables summarizing the relationship between average delay per vehicle and LOS for signalized and unsignalized intersections according to the 2000 HCM method can be found in the appendices of the TIS for the UCSF Long Range Development Plan (Appendix G).

For signalized intersections, this methodology determines the capacity for each lane group approaching the intersection. The LOS is based on average delay (in seconds per vehicle) for the various movements within the intersection. A combined weighted average delay and LOS is presented for the intersection. For unsignalized intersections, operations are defined by the average control delay per vehicle (in seconds per vehicle) for each stop-controlled movement or movement that must yield the right-of-way, and the LOS is determined by the worst (highest average delay) approach. Generally, the delay ranges for each LOS are lower than for signalized intersections because drivers expect less delay at unsignalized intersections.

As shown in **Table 8.14-1**, all 16 of the study intersections operate at an acceptable level of service, which is LOS D or better, during the AM and PM peak hour.

8.14.2.3 Transit Network

The Mount Zion campus site is well-served by public transit, both local and regional. Local service is provided by the Muni bus lines. Regional service is provided by BART, AC Transit, Golden Gate Transit, SamTrans, and Caltrain. UCSF supplements Muni transit service with its own shuttle system that provides direct connections to UCSF-operated facilities throughout San Francisco. In many cases, these shuttles provide a direct transit alternative between two campus sites that would otherwise require a transfer between two or more Muni routes. Based on the 2013 UCSF Transportation Commute Survey, approximately 25% of those traveling to and from the campus site use public transit, while another 8% rely on UCSF shuttles to get to and from the campus site.

Local Transit

San Francisco Muni. San Francisco Municipal Railway (Muni) provides transit service within the City and County of San Francisco, including bus (both diesel and electric trolley), light rail (Muni Metro), cable car and electric streetcar lines. Muni operates five bus lines in the vicinity of the Mount Zion campus site (see the TIS in Appendix G for details about these transit lines).

The Transit Effectiveness Project (TEP) serves as both a thorough review of and repositioning of San Francisco's public transit system, initiated by SFMTA in collaboration with the City Controller's Office. The TEP is aimed at improving reliability, reducing travel times, providing

TABLE 8.14-1

SOURCE: Fehr & Peers, 2014.

more frequent service and updating Muni bus routes and rail lines to better match current travel patterns. TEP recommendations include new routes and route realignments, more service on busy routes, and elimination or consolidation of certain routes or route segments with low ridership. The TEP recommendations were unanimously endorsed by the SFMTA Board of Directors in October 2008, for environmental impact review. The initial TEP recommendations were revised based on public feedback on the draft TEP environmental impact report (TEP EIR). The TEP EIR was certified on March 27, 2014, and the SFMTA Board of Directors approved most of the

Service Improvements and portions of the Transit Travel Time Reduction Proposals on March 28, 2014.[10] The TEP project will be implemented based on funding and resource availability. The TEP Implementation Strategy anticipates that many of the improvements will be implemented sometime between Fiscal Year 2014 and Fiscal Year 2019, subject to funding sources and resource availability.[11] The changes proposed by the TEP for routes near the Mount Zion campus site, plus the non-TEP changes proposed to the 38 Geary/38L Geary Limited, are described in the TIS (Appendix G).

UCSF Shuttle System

UCSF Shuttles to and from the Mount Zion campus site (Gold, Blue, Black, Tan, and Purple) stop at a designated shuttle loading zone located midblock on Sutter Street between Divisadero Street and Scott Street. A more-detailed description of the UCSF shuttle system serving the Mount Zion campus site area is provided in Appendix G (TIS for the UCSF LRDP).

8.14.2.4 Pedestrian Circulation

Based on the 2013 UCSF Transportation Commute Survey, approximately 6% of those traveling to and from the campus site walk. About 54% of all trips made by UCSF Mount Zion campus site employees and students to off-campus locations throughout the day are made by foot.

Pedestrian activity is high around the Mount Zion campus site, particularly along Divisadero Street between Geary Boulevard and Bush Street. Beyond the campus site itself, many ground level shops, restaurants, and services in the area attract foot traffic.

Pedestrian facilities include sidewalks, crosswalks, curb ramps, and pedestrian signals. Within the campus site area, sidewalks generally exist on both sides of the street in most locations, and are generally 11 to 15 feet wide. Continental crosswalks are provided at the intersections of Divisadero / Bush and Divisadero / Sutter, while standard crosswalks are provided at other intersections surrounding the campus site. Curb ramps are generally provided at all intersections in the vicinity of the campus site. Pedestrian signals are present at signalized intersections surrounding the campus site with the exception of the signalized intersection of Divisadero Street / Sutter Street.

8.14.2.5 Bicycle Circulation

Based on the 2013 UCSF Transportation Commute Survey, approximately 3% of those traveling to and from the Mount Zion campus site use a bicycle. This is consistent with the bicycling mode share throughout San Francisco. Bicycle counts indicate the most popular bicycling route through

10 San Francisco Planning Department. 2014. TEP Final EIR, March 27, 2014, Available online at http://tepeir.sfplanning.org. Accessed April 3, 2014. Case No. 2011.0558E. The document and supporting information may also be viewed at the Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA in case file 2011.0558E.

11 San Francisco Municipal Transportation Agency. 2014. TEP Implementation Workbook, March 5, 2014, Available online at: http://www.sfmta.com/sites/default/files/projects/TEP%20Implementation%20Plan%20-%20Section%201%20%282%29_1.pdf. Accessed June 27, 2014.

the campus site is Post Street, where between 40 and 70 bicyclists were counted during the AM and PM peak hours. Fewer than 10 bicyclists were counted during the AM and PM peak hours on most other streets in the study area.

The following bicycle facilities are located within or near the Mount Zion campus site:

- **Post Street** is part of San Francisco Bike Route 16, an east-west bike route extending from Van Ness Avenue to Presidio Avenue. Between Van Ness Avenue and Steiner Street, Post Street is designated as a Class III bicycle route with sharrows. From Steiner Street to Presidio Avenue, Post Street has Class II bicycle lanes in both directions.

- **Clay Street** is part of San Francisco Bike Route 10, an east-west bike route that extends from the Embarcadero to Cherry Street via Broadway Street, Pacific Avenue, Webster Street, and Clay Street. Between the Embarcadero and Columbus Avenue, Bike Route 10 is a Class III bicycle route with sharrows, while the rest of the route is Class III, but with no sharrows.

The SF Bike Plan does not include any short- or long-term improvements in the Mount Zion campus site area.

Bicycle counts indicate the most popular bicycling route through the campus site is Post Street, where between 40 and 70 bicyclists were counted during the AM and PM peak hours. Fewer than 10 bicyclists were counted on most other streets during the AM and PM peak hours in the study area.

Short-term bicycle parking is provided in "u-racks" in front of UCSF buildings on Sutter, Divisadero, and Post streets, and within the 2230 Post Street garage. Secure bicycle parking is provided in a bicycle cage in the 2325 Post Street and 2420 Sutter Street garages. Bicycle parking was observed to be less than half full at most short-term and secure bicycle parking locations.

8.14.2.6 Loading Conditions

The Mount Zion campus site has both service vehicle and passenger loading. There are three off-street service vehicle loading facilities serving the existing uses on the campus site. Passenger and service vehicles may also load on-street in marked zones on Sutter Street, Post Street, and Scott Street.

The off-street loading dock at the building on Sutter Street between Divisadero and Scott streets receives approximately 20 deliveries a day, not including additional deliveries made by catering, food services, waste management and other contractors. Passenger loading fronting the Scott Street facility appears to currently be at capacity, as multiple passenger vehicles were seen occupying metered parking spots. Existing vehicle and most passenger loading areas provide sufficient amount of space for existing demand.

8.14.2.7 Parking Conditions

On-Street Parking

The majority of the streets in the vicinity of Mount Zion campus site are subject to Residential Parking Permit (Zone "G") restrictions (two-hour parking, except for residents, Mondays through Friday from 8:00 AM to 6:00 PM). Metered parking with 30-minute and one-hour time limits is provided along Divisadero Street and on portions of Post and Sutter streets on one to two blocks to the east and west of Divisadero Street.

Parking occupancies throughout the mid-morning, midday, and evening periods are very similar, close to 90% (i.e., very close to their effectively capacity). Most of the available parking during the peak parking demand periods is at non-metered spaces subject to residential permit parking restrictions, or at spaces subject to daytime passenger loading/unloading regulations. Overall, on-street metered parking is typically at capacity.

Off-Street Parking

There are three UCSF-managed and six public parking facilities in the vicinity of the Mount Zion campus site that provide a combined total of about 1,160 parking spaces. In addition, there are several private customer-only parking facilities that serve other medical office building in the area. The public parking facilities typically close in the late evening (e.g., at about 9:00 PM) and are not generally available for residential parking. The UCSF-managed parking facilities include:

- 1701 Divisadero Street garage, located at the northwest corner of Divisadero and Sutter streets, provides 156 marked spaces for parking by UCSF permit holders only.
- 2420 Sutter Street garage, located between Divisadero and Broderick streets, provides 172 public parking spaces and 56 UCSF permit-holders only spaces, and also connects underground to the 1701 Divisadero Street garage. If needed, attendant parking can increase the capacity of the garage by approximately 20 vehicles.
- 2325 Post Street garage, located between Divisadero and Broderick streets, provides 20 parking spaces (ground level), accessed off Post Street, and 29 spaces (upper level), accessed off Garden Street.
- Bush Street surface lot, located at the southwest corner of Bush and Scott streets, provides 20 UCSF permit holders only spaces.

The general public parking facilities include:

- 1635 Divisadero Street garage, located between Divisadero and Broderick streets, has approximately 430 marked spaces; attendant parking on the upper levels can increase the total capacity of the garage by approximately 50 vehicles.
- 2355 Post Street surface lot, located on the south side of the street between Divisadero and Broderick streets, has about 30 marked spaces, and can provide 37 additional spaces with attendant parking.

- 2186 Geary Boulevard surface lot, located on the north side of Geary Boulevard between Divisadero and Scott streets, It has 70 marked spaces and can provide 25 additional spaces with attendant parking.

- 2120 Geary Boulevard surface lot, located on the north side of Geary Boulevard between Divisadero and Scott streets, provides 30 marked spaces and can provide 16 additional spaces with attendant parking.

- 1515 Scott Street surface lot, located at the northwest corner of Geary Boulevard and Scott Street, provides 35 marked spaces and can provide 10 additional spaces with attendant parking.

- 2300 Sutter Street garage, located on the west side of the street, between Bush and Sutter streets, provides 23 public parking spaces.

Overall off-street parking occupancy is 88% during the mid-morning period (10:00 AM – 12 Noon) and 83% during the midday period (12 Noon – 2:00 PM), while the overall occupancy in the evening (6:00 PM – 8:00 PM) is 23%. The overall parking occupancy at the UCSF-managed parking facilities is generally lower than at the other facilities. During mid-morning, the peak parking demand period, the UCSF parking facilities near the Mount Zion site operate at about 84% of their capacity, while the other facilities operate at 91%. An occupancy above 90% typically represents that the facility has reached its effective capacity.

8.14.3 Transportation and Traffic – Mount Zion Campus Site Impacts and Mitigation Measures

8.14.3.1 Impact Methodology

Analysis Approach

The transportation analysis in this EIR considers operations-related issues related to vehicular traffic, transit facilities, pedestrians, bicyclists, and parking, as well as construction-related impacts, associated with the 2014 LRDP at the Mount Zion campus site. To determine potential impacts on the transportation system, it was first necessary to establish the background transportation conditions for the horizon years. Future year background conditions for this project are based on the countywide travel demand model developed and maintained by the San Francisco County Transportation Authority (SFCTA).

Vehicle, pedestrian, bicycle, and transit travel demand associated with the 2014 LRDP was estimated based on factors developed from extensive surveys conducted at existing UCSF facilities over the past few years, and through the use of a four-step process: trip generation, mode split, trip distribution, and trip assignment. In the first step, the number of person trips generated by the 2014 LRDP was estimated on a daily, AM and PM peak hour basis. Next, the person trips were assigned to different modes of travel (automobile, transit, UCSF shuttle, bicycles, etc.). Then, the geographic distribution of the trip origins and destinations was predicted, and finally, project trips for each mode were assigned to specific streets, UCSF shuttle routes and transit lines along the transportation network.

Travel Demand Estimates

The 2014 LRDP proposes various levels of growth at each campus site through the plan horizon year of 2035. Some known projects, such as Phase 2 of the Medical Center in Mission Bay, are currently projected to occur between 2035 and 2040, after the 2014 LRDP horizon year, but have been incorporated into the travel demand estimates presented in this document, As such, the transportation analysis represents a conservative approach as it includes development five years past the 2015 LRDP horizon, to the year 2040. Each campus site is expected to increase in population through the 2014 LRDP horizon year, with the highest growth expected at the Mission Bay site.

The Mount Zion campus site is estimated to generate a total of approximately 3,223 new daily person trips by 2040. That number of trips reflects the total number of additional person trips that would be generated by the increased campus site population. As described in Sections 6.14 and 7.14, some trips generated by campus site activity are internal trips that occur within the campus site. However, given its relatively small size, and to provide a conservative estimate of travel demand, no internal person trips were assumed to occur within the Mount Zion campus site.

"Mode choice" is the designation of trips to the various means that people use to travel, such as automobile, transit, walking, bicycling, taxi, or other mode of transportation. The determination of the mode of transportation used in trips to and from the Mount Zion campus site would depend on many characteristics of the trip (e.g., the population group that is, faculty, staff, vendor, patient, visitor), the type of trip (work, visit), and the specific site. Travel mode split and average vehicle occupancy assumptions were based on information collected by UCSF and its consultants, with the estimates of the future modal share based on the current modal splits for each campus site by population type, which take into account the transit accessibility, UCSF shuttle service, parking availability, and TDM measures being provided at each campus site; this approach is consistent with the travel demand methodologies established by the SF Planning Department. The majority of Mount Zion campus site trips arrive/depart the campus site by driving alone, followed by travel by public transit. The above-cited external daily person trips generated by the Mount Zion campus site are expected to use the following travel modes:

1,246	Auto Drive Alone
182	Drop-Off/Taxi
516	Carpool/Vanpool
810	Public Transit
165	UCSF Shuttle
100	Bicycle/Motorcycle
203	Walk

The auto drive alone, drop-off/taxi, carpool/vanpool, and UCSF shuttle person trips would generate about 1,292 daily vehicle trips.[12]

[12] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

Approximately 290 new vehicle trips would occur during the AM peak hour, and about 150 new vehicles would occur during the PM peak hour. There would be approximately 260 and 160 new transit riders in the AM and PM peak hour, respectively. A majority of transit users are expected to arrive/depart by SF Muni.

The new trips associated with the Mount Zion campus site were assigned to San Francisco and regional origins/destinations, including the four San Francisco Superdistricts (northeast, northwest, southeast, and southwest quadrants of the City), the East Bay, the North Bay, and the South Bay, as well as areas outside the Bay Area region. Information collected by UCSF as part of their ongoing surveys of employees, patients, visitors and residents was used in this analysis.

8.14.3.2 Construction Period Impacts

Impact TRAF-MZ-1: Implementation of the 2014 LRDP on the Mount Zion campus site could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during demolition and construction activities. (Potentially Significant)

Impacts associated with demolition and construction activities that would occur as the 2014 LRDP is implemented are addressed in Chapter 5 (**Impact TRAF-LRDP-1**). That 2014 LRDP Plan-Level analysis determined that although construction activities would be temporary, construction impacts would be considered potentially significant given the magnitude of LRDP development over the course of many years and need for on-going coordination and monitoring. The potentially significant determination would apply to the LRDP elements of the Mount Zion campus site. The implementation of LRDP **Mitigation Measure TRAF-LRDP-1: Construction Coordination and Monitoring Measures** would reduce construction-period impacts to less-than-significant levels.

Mitigation Measure: Implement **Mitigation Measure TRAF-LRDP-1**

Significance after Mitigation: Less than Significant

8.14.3.3 Operational Impacts

Impact TRAF-MZ-2: Implementation of the 2014 LRDP on the Mount Zion campus site would increase traffic at intersections on the adjacent roadway network. (Less than Significant)

Table 8.14-2 presents a summary comparison of Existing and Existing plus Plan intersection LOS for the weekday AM and PM peak hours. The addition of 2014 LRDP-generated traffic would result in small changes in the average delay per vehicle at the study intersections, and all study intersections would continue to operate at the same acceptable service levels (LOS D or better) as under Existing conditions. Therefore, the 2014 LRDP's traffic impact would be considered less than significant.

Mitigation: None required.

TABLE 8.14-2
EXISTING AND EXISTING PLUS 2014 LRDP
PEAK-HOUR INTERSECTION LEVEL OF SERVICE (LOS) – MOUNT ZION

Intersection	Traffic Control[a]	Peak Hour	Existing		Existing plus 2014 LRDP	
			Delay (sec.)[b]	LOS[c]	Delay (sec.)[b]	LOS[c]
45. Pine Street / Divisadero Street	Signal	AM PM	14 32	B C	14 32	B C

59. Geary Boulevard / Divisadero Street	Signal	AM PM	34 30	C C	36 31	D C
60. Geary Boulevard / Scott Street	Signal	AM PM	21 20	C B	21 20	C B

[a] AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
[b] Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For SSS intersections, the highest average delay for an approach is reported. For AWS intersections, the combined weighted average delay of the intersection is reported, followed by the highest average delay for an approach (indicated in parentheses).
[c] For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For unsignalized intersections, LOS is based on the worst approach, which for AWS is indicated in parentheses.
[d] **Bold** indicates unacceptable operations per UCSF LOS standards

SOURCE: Fehr & Peers, 2014.

Impact TRAF-MZ-3: Implementation of the 2014 LRDP on the Mount Zion campus site would increase transit ridership demand. (Less than Significant)

As described in 8.14.3.1 above, approximately 260 and 160 new transit trips are expected during the AM and PM peak hour, respectively. About 60% of transit users would use SF Muni and 20% would use BART to commute to and from the campus site, while the remaining 20% of transit users would use the UCSF shuttle, Caltrain, SamTrans or Golden Gate Transit.

San Francisco Muni

Existing Muni transit stops are located within a half-mile of the campus site, and are accessible by walking, and no stop relocations are anticipated at this time. The TEP proposes several changes on routes traversing adjacent to and within the Mount Zion campus site. The 1 California, 2 Clement, and 24 Divisadero will reduce peak period headways, and a supplemental trolley coach service will be added to the 2 Clement. In addition, Muni proposes to convert the 38 Geary/38L Geary Limited to Bus Rapid Transit (BRT), with high service frequencies (proposed to begin service by 2020).

The estimated number of 2014 LRDP-generated Muni trips is about a 35% increase in ridership traveling to and from the Mount Zion campus site, which would not require the expansion of transit service or facilities. The 2014 LRDP-generated transit trips for the 38 Geary corridor were assumed to split evenly between the 38 Geary and the 38L Geary Limited Outbound during the PM peak hour, resulting in the 38 Geary Limited outbound operating above Muni's crowding standard (85% capacity utilization). It should be noted that transit riders could choose to travel on either bus line, thus if one bus line (e.g., 38L Geary Limited) were crowded, then riders have the option of traveling on the less-crowded 38 Geary, which serves the same stops and destinations. The 2014 LRDP's transit impact on SF Muni transit service would be considered less than significant.

Regional Transit

UCSF staff, patrons and students are anticipated to continue to use BART, Caltrain, SamTrans, and Golden Gate Transit for regional transit service through the 2014 LRDP horizon year. Regional service stations are likely to remain at existing locations, accessed by SF Muni and UCSF shuttles, and Golden Gate Transit riders can walk to the nearest stop, located on Geary Boulevard and Divisadero Street. Fewer than 70 new regional transit trips are expected during each AM and PM peak hours, and that increase would not require the expansion of regional transit service or facilities. Therefore, the 2014 LRDP's transit impact on regional transit service would be considered less than significant.

UCSF Shuttle

The 2014 LRDP does not propose specific changes to shuttle service headways, although UCSF Transportation Services may change headways based on shifting shuttle demand as 2014 LRDP projects are constructed and occupied at the campus site.

An additional estimated 30 AM and PM peak hour shuttle person trips, an approximately 40% increase during both peak hours are anticipated through the 2014 LRDP horizon year, and that increase would not require the expansion of UCSF shuttle service or facilities. Therefore, the 2014 LRDP's transit impact on UCSF Shuttle service would be considered less than significant.

Mitigation: None required.

Impact TRAF-MZ-4: Implementation of the 2014 LRDP on the Mount Zion campus site would not cause a substantial conflict with pedestrian facilities, or otherwise decrease the performance or safety of such facilities. (Less than Significant)

The 2014 LRDP does not propose changes to pedestrian amenities or introduce new conflicts to the pedestrian network surrounding the Mount Zion campus site. Overall, the 2014 LRDP would not change pedestrian accessibility to the Mount Zion campus site and on the campus site frontage. Further, the LRDP would not conflict with proposed changes to Geary Boulevard to accommodate BRT service.

The 2014 LRDP would add approximately 250 and 140 pedestrian trips (mostly transit-access trips) to the surrounding streets during the AM and PM peak hours, respectively. Pedestrian trips would primarily use Divisadero Street to access nearby commercial uses and would disperse across the surrounding street grid to access the residential neighborhoods in Pacific Heights and the Western Addition. The 2014 LRDP-generated transit trips begin and end as pedestrian trips, and those pedestrian trips would be along Divisadero Street to transit stops on Divisadero Street, Sutter Street, Geary Boulevard, or California Street. UCSF shuttle riders will walk to the stop located within the center of the campus site on Sutter Street between Divisadero and Scott streets. Existing pedestrian facilities adequately accommodate existing pedestrian volumes and overcrowding is not expected to occur due to the 2014 LRDP.

The immediate area surrounding the Mount Zion campus site includes robust pedestrian facilities that provide access to nearby neighborhoods, commercial uses, and transit stops, and that would accommodate the new pedestrian trips generated by the 2014 LRDP. The 2014 LRDP would not create substantial conflicts between pedestrians and autos, bicyclists, or transit vehicles. Therefore, the 2014 LRDP's impact to pedestrian circulation and facilities at the Mount Zion campus site would be less than significant.

Mitigation: None required.

Impact TRAF-MZ-5: Implementation of the 2014 LRDP on the Mount Zion campus site would not would not cause a substantial conflict with bicycle facilities, or otherwise decrease the performance or safety of such facilities. (Less than Significant)

The area around the Mount Zion campus site has a number of streets with bicycle lanes, and streets designated as bicycle routes, including Post Street and Clay Street. The Mount Zion campus site is within convenient bicycling distance of residential and commercial areas in surrounding neighborhoods. The LRDP does not propose changes to the bicycle circulation network surrounding the Mount Zion campus site. The SF Bike Plan does not include any short- or long-term improvements in the study area.

The 2014 LRDP is expected to increase bicycle demand in the area by approximately 20 and 10 new trips during both the AM and PM peak hours, respectively. These trips would primarily occur on designated bicycle facilities, which connect to surrounding neighborhoods through the San Francisco Bike Route network. The increased bicycle demand would be accommodated at the

campus site through additional bicycle parking provided as a part of UCSF's TDM program. In the near-term, UCSF plans to add eight additional bicycle racks at the Mount Zion campus site, which would increase bicycle parking capacity and generally improve bicycle conditions on the campus site.

The expected increase in bicycle traffic would not represent a level that would adversely affect bicycle facilities on the campus site, nor would the 2014 LRDP create substantial conflicts between bicyclists and pedestrians, autos, or transit vehicles. Therefore, the 2014 LRDP's impact to bicycle circulation and facilities at the Mount Zion campus site would be less than significant.

Mitigation: None required.

Impact TRAF-MZ-6: Implementation of the 2014 LRDP on the Mount Zion campus site would increase loading demand. (Less than Significant)

The San Francisco Planning Code requires that land uses, such as medical offices and hospitals, provide off-street loading spaces according to a prescribed schedule. The required loading supply was estimated based on that Code schedule, and the existing and proposed loading supply exceeds the Code requirement at the Mount Zion campus site.

The demand for loading spaces through the 2014 LRDP horizon year was calculated based on surveys from the Parnassus Heights campus site and methods described in the City's *Transportation Impact Analysis Guidelines for Environmental Review*. The existing peak hourly demand is estimated to be about 13 spaces on the Mount Zion campus site, and the 2014 LRDP horizon year peak hourly demand is estimated to be about 16 spaces.

It is expected that the estimated 2014 LRDP loading supply should be adequate for the estimated demand, but as mentioned above, the campus sites are unique and should be monitored over time. This is considered a less-than-significant impact if UCSF continues to monitor loading operations and provide appropriate supply with guidance from the SF Planning Code and existing operations. As noted in Section 8.14.2.6, the loading area fronting the Scott Street facility appears to currently be at capacity, as multiple passenger vehicles were seen occupying metered parking spots. While this is not considered a significant impact, an Improvement Measure to add a curbside passenger loading zone on Scott Street has been identified. UCSF could work with the SFMTA to add a curbside passenger loading zone on Scott Street. An additional 50-foot-long zone would require the removal of approximately two metered parking spaces on Scott Street. This loading zone will reduce overflow for passenger loading on Scott Street.

In addition to freight loading, there is a demand for passenger loading spaces, and in order to estimate passenger loading demand, the drop-off/taxi service mode split and a portion of the carpool mode split percentages presented in 8.14.3.1 above was applied to the peak AM and PM peak-hour person trips. The peak-hour passenger loading demand is estimated to increase by approximately 35% at the Mount Zion campus site.

The existing passenger loading supply is sufficient for the estimated 2014 LRDP loading needs during both the AM and PM peak hour. Therefore, the 2014 LRDP's impact to passenger loading is considered less than significant.

Mitigation: None required.

Impact TRAF-MZ-7: Implementation of the 2014 LRDP on the Mount Zion campus site would increase parking demand. (Less than Significant)

Under the 2014 LRDP, additional parking would be provided on the Mount Zion campus site, as warranted by the proposed development (i.e., the number of any new parking spaces would be determined as projects are proposed). It is estimated that the number of parking spaces owned by UCSF at the Mount Zion campus site would increase by approximately 185 spaces by year 2040. The following list describes the currently proposed changes in parking supply:

- A 185-space garage would be constructed as part of a new clinical and/or office/research building to be located on Scott Street, on the east side of the main block. The parking could be provided in the building, underground, or off-site.

As described previously, the available on-street parking is well-occupied at the Mount Zion campus site, and has therefore not been considered as a resource for the future parking utilization analysis, which has focused instead on the availability of off-street parking. Assessment of the growth of peak parking demand under the 2014 LRDP shows that the future parking utilization at the Mount Zion campus site would be at its effective capacity. Because there would not be a shortfall in parking supply, the 2014 LRDP's impact to parking is considered less than significant.

Mitigation: None required.

8.15 Utilities and Service Systems

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Utilities and Service Systems are contained in Section 4.15 of this EIR. The CEQA Significance Standards presented in Section 4.15.3 are used to evaluate the potential utilities and service systems impacts of all proposed 2014 LRDP activities.

The overall effects on water supply, wastewater treatment, storm drainage facilities, solid waste disposal and energy demand resulting from implementation of the 2014 LRDP were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures*. No expansion of water, wastewater or storm drainage facilities beyond the standard service connections of future buildings to the City's existing infrastructure is anticipated at the Mount Zion campus site.

CHAPTER 9
Mission Center Campus Site – Setting, Impacts and Mitigation Measures

9.0 Introduction

This chapter considers the existing conditions and describes the potential impacts of 2014 LRDP activities proposed at the Mission Center campus site. Space program, population at LRDP horizon and proposed LRDP development activities that would occur at the Mission Center campus site were described in detail in Section 3.8.4 of Chapter 3, *Project Description*, and are summarized briefly below. The remaining 15 major sections of this chapter present the site settings and impacts for each of the 15 environmental topics.

9.0.1 Functional Zones

The Mission Center campus site has not been designated with functional zones by UCSF.

9.0.2 Space Program

The LRDP proposes an additional 2.39 million gsf in owned and leased buildings across all of UCSF's sites through 2035. The 100,000 gsf allocation of this growth at the Mission Center campus site at LRDP horizon in 2035 is shown below in **Table 9.0-1**.

TABLE 9.0-1
MISSION CENTER EXISTING AND LRDP HORIZON GSF

Type of Space	Existing 2013 Total gsf	LRDP Horizon 2035 Total gsf
Instruction	2,200	2,200
Research	27,800	27,800
Clinical	29,400	29,400
Support		
Academic Support	12,300	27,300
Academic/Campus Admin	192,400	247,400
Campus Community	8,100	23,100
Logistics	18,500	33,500
Support Subtotal	231,300	331,300
Housing	--	--
Vacant/Alteration	--	--
Total	**290,700**	**390,700**

9.0.3 Population

The total projected UCSF population across all campus sites (including population associated with the Phase 2 Medical Center at Mission Bay) would increase by approximately 17,000 at LRDP horizon. As shown in **Table 9.0-2**, below, the projected increase in population at the Mission Center campus site would be approximately 530 in 2035.

TABLE 9.0-2
MISSION CENTER EXISTING AND PROJECTED POPULATION

	Existing (2013)	Projected Population at LRDP Horizon (2035)	Change
Students	16	26	10
Faculty and Staff	784	1,274	490
Patients	--	--	--
Visitors	55	89	34
Total	**855**	**1,389**	**534**

9.0.4 Mission Center – 2014 LRDP Proposals

As described in Chapter 5, the 2014 LRDP proposals at the four campus sites consist of four general activities: 1) demolition, 2) renovation, 3) construction of new facilities, and 4) circulation, open space, and utilities/infrastructure proposals. The 2014 LRDP proposal at the Mission Center campus site only includes construction of new facilities, as listed below.

Construction Proposals

- Office building and parking facility

9.1 Aesthetics

This section considers the setting and Aesthetics impacts at the Mission Center campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential Aesthetics effects are contained in Section 4.1 of this EIR. The CEQA Significance Standards presented in Section 4.1.3 are used to evaluate the potential aesthetics impacts of all proposed 2014 LRDP activities.

9.1.1 Aesthetics Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Center campus site, the Initial Study concluded that:

- **Scenic vista.** The construction of the proposed office building and parking structure would not result in a potential adverse effect on a scenic vista. Therefore, no additional analysis of this issue is required.

- **Scenic resources.** The construction of the proposed office building and parking structure would not result in an adverse impact to scenic resources within a state scenic highway. Therefore, no additional analysis of this issue is required.

9.1.2 Aesthetics – Mission Center Setting

The three-acre Mission Center campus site is in the northeast portion of San Francisco's mixed use Mission District, located on the southern half of the block bounded by Fourteenth, Harrison, Fifteenth and Folsom streets. It has only one building that is six stories tall (approximately 72 feet). The building fronts on Folsom Street, but the main entrance is adjacent to the 220-space parking lot, which can be accessed from Harrison and Fifteenth streets. A San Francisco MUNI Bus Depot occupies the entire block south of the campus site across Fifteenth Street. Other uses in the vicinity include low-rise light industrial and automotive services, a grocery and some residential properties westward down Fifteenth Street.

9.1.3 Aesthetics – Mission Center Impacts and Mitigation Measures

Impact AES-MC-1: The proposed office/research building and parking structure at the Mission Center campus site would not substantially degrade the existing visual character or quality of the campus site and its surroundings. (Less than Significant)

The proposed office/research building has not yet been designed, but for planning purposes the LRDP assumes that it would not exceed the City's height limit of 55 feet, which would allow for a four-story building of up to 100,000 gsf. To help integrate the site into the surrounding fabric of the City, a small amount of retail space or another active use at the ground floor would be considered when this building is programmed. A five-story, approximately 95,000 gsf garage

with up to 294 parking spaces would be built between the existing and new buildings. The proposed garage would be shorter than both the existing and proposed buildings on the campus site. Vehicular access into the garage would be limited to Harrison Street. As discussed further in Section 8.4, *Cultural Resources*, both the proposed building and garage would be constructed toward the secondary façade of the existing Mission Center building, which would not affect views of the primary façade on Folsom Street. Additional open space with a southern exposure would be developed between the existing and proposed office buildings.

Although changes in appearance at the Mission Center campus site would be noticeable, particularly along Fifteenth Street, the new buildings would be built in accordance with UCSF's *Physical Design Framework* and *Facilities Design Guidelines* and would be consistent with the 2014 LRDP's Community Planning Principles regarding Building and Public Realm Design. The design guidelines would ensure that the final design of the buildings responds to the form of adjacent buildings (e.g., in terms of massing and height) and the overall urban context of the Mission Center campus site and surrounding neighborhood. Because the new buildings would be visually similar to existing uses on and adjacent to the campus site, the proposed buildings would not substantially degrade the visual character of the campus site and its surroundings. Therefore, effects to visual quality and character are less than significant.

Mitigation: None required.

Impact AES-MC-2: The proposed office building and parking structure at the Mission Center campus site could create new sources of substantial light or glare which would adversely affect day or nighttime views in the area. (Potentially Significant)

The proposed office/research building and parking structure could increase ambient light levels due to light dispersion resulting from new buildings at this location. Increases in night lighting could affect nighttime views in this area from the surrounding neighborhood. New light sources could include street lights, illuminated signage, exterior safety lighting and light emitted from building windows. Glare could be generated from reflective building materials. Because specific architectural features and building materials of the new buildings have yet to be determined, the proposed improvements have the potential to include reflective surfaces, such as metal and glass. The resultant glare could affect nearby residents, pedestrians and passing motorists. **Mitigation Measure AES-LRDP-1** would be implemented to reduce the impact to a less than significant level. By employing appropriate design standards and minimizing the quantity of reflective material used in new construction, light and glare impacts and impacts to views related to lighting could be reduced to less-than-significant levels.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-1

Significance after Mitigation: Less than Significant

Impact AES-MC-3: Construction of the proposed office building and parking structure at the Mission Center campus site could result in flood lighting sites during nighttime construction activities. (Potentially Significant)

Although construction operations are generally expected to take place during the day, some activities could be conducted at night to reduce noise, vibration or other effects on daytime office or research uses. To enable construction at night, flood lighting would be required. The use of night lighting would have the potential to disturb residents in neighborhoods near the construction site, and potentially also affect nighttime views. Night lighting of the construction site would be temporary and would cease upon completion of construction. **Mitigation Measure AES-LRDP-2** would be implemented to reduce the impact of nighttime work lighting to a less than significant level.

Mitigation Measure: Implement Mitigation Measure AES-LRDP-2

Significance after Mitigation: Less than Significant

Impact AES-MC-4: The proposed office building and parking structure at the Mission Center campus site could cast shadow on City park property protected by City Planning Code Section 295 or create street-level winds that could be hazardous to pedestrians in the area. (Less than Significant)

The proposed office/research building on the Mission Center campus site would have a height of approximately 55 feet above ground and the proposed parking structure would be shorter than both the existing and proposed building on the campus site. The office/research building could cast shadow that would be, at most, approximately 350 feet long during the daylight hours between one hour after sunrise and one hour before sunset, throughout the year, the times covered by Planning Code Section 295. Since there are no City properties under the control of the Recreation and Park Department within that critical distance from the building site, shadow from the office/research building or parking structure would not affect City park property protected by City Planning Code Section 295. (See also Section 7.1 for more information on Section 295.)

In early morning, shadow from the office/research building would reach across the planned USCF central open space fronting Fifteenth Street, moving off it by mid-day, when both the building and parking structure shadows would reach north into mid-block interior open areas now used for parking and for rear access to other buildings. Afternoon shadow from the office/research building would reach Harrison Street sidewalks north of Fifteenth Street all year, reaching as far north as Alameda Street in fall and winter. Shadow from the office/research building would not reach any open space, except the planned central open space on the Mission Center campus site,

The planned central open space would be mostly shadowed by the office/research building in early-morning, would be mostly in sunlight from mid-morning to mid-afternoon, and then, by late-afternoon, would again be shadowed, but by the existing Mission Center building. The impact with regard to shadows would be less than significant.

As previously discussed under Impact AES-PH-5 in Section 6.1, a building that is 50 feet tall, or less, has very little to no effect on the wind, unless the building is very wide, or it is the only structure standing on an open site. Given that this building and parking structure will be located to the east of the existing Mission Center building and therefore shielded from the predominant west winds, there would be little or no change in pedestrian-level winds in the vicinity of the new building sites due to construction of the new building or garage.

The changes in wind conditions due to construction of the Mission Center building and garage would not result in a new pedestrian-level wind hazard or increase an existing wind hazard on adjacent sidewalks.

The impact with regard to winds would be less than significant.

Mitigation: None required.

9.2 Air Quality

This section considers the setting and air quality impacts at the Mission Center campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Air Quality are contained in Section 4.2 of this EIR, while the plan-level Air Quality impacts of the 2014 LRDP are described in Section 5.1.2. The CEQA Significance Standards presented in Section 4.2.3 are used to evaluate the potential Air Quality impacts of all proposed 2014 LRDP activities.

9.2.1 Air Quality Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Center campus site, the Initial Study concluded that:

- **Objectionable odors.** The proposed construction of the office building and parking structure would not result in objectionable odors affecting a substantial number of people. Therefore, no additional analysis of this issue is required.

9.2.2 Air Quality – Mission Center Setting

9.2.2.1 Sensitive Receptors

The closest sensitive receptors to Mission Center consist of residential land uses approximately 300 feet west of the development site on Folsom Street and residential land uses approximately 650 feet south of the development site on Sixteenth Street.

9.2.2.2 Existing Stationary Sources of Air Pollution

The BAAQMD inventory of permitted stationary sources of emissions identifies 12 permitted stationary emission sources present within or near the 1,000-foot zone of influence of the Mission Center campus site. These permitted facilities are primarily made up of stationary diesel engines for back-up power generators, auto body shops and gasoline fueling facilities.

The Mission Center campus site also operates fume hoods which emit TACs and has some laboratories that handle bio hazardous material (up to Biosafety Level 3)[1]. These fume hood emissions do not require a permit from BAAQMD based on the operating throughput and therefore have not been assigned an existing risk value in BAAQMD databases like permitted sources. UCSF maintains an inventory of chemical throughput for each campus site and has implemented a series of correctional measures to reduce exposure to fume hood emissions, which are expected to minimize health risks from fume hood emissions. The primary measure was to

[1] Biosafety levels are levels of safety precautions proscribed for various activities that involve work with biological materials. Four levels exist: Biosafety levels 1 to 4, with Biosafety Level 4 being the most hazardous. UCSF does not conduct Biosafety Level 4 activities

reduce the volume of chemical use within hoods, which are now inventoried. At present there are approximately seven active fume hoods in operation at the Mission Center campus site.

9.2.2.3 Major Roadways Contributing to Air Pollution

Harrison, Folsom and Sixteenth Streets are arterial streets in the existing local roadway system within the 1,000-foot zone of influence that have at least 10,000 vehicles in annual average daily traffic based on the City's SF CHAMP roadway model[2]. This traffic contributes to elevated concentrations of $PM_{2.5}$, DPM, and other contaminants emitted from motor vehicles near the street level. Additionally, U.S. 101 is a freeway located approximately 650 feet north of the Mission Center campus site.

9.2.3 Air Quality – Mission Center Impacts and Mitigation Measures

Impact AIR-MC-1: Implementation of the 2014 LRDP at the Mission Center campus site would result in increased emissions of criteria air pollutants during construction activities. (Potentially Significant)

Construction activities under the 2014 LRDP would result in emissions of criteria pollutants from the use of heavy-duty construction equipment, haul truck trips, and vehicle trips generated from construction workers traveling to and from the campus site. In addition, fugitive dust or PM_{10} emissions would result from excavation, trenching, and other construction activities.

There is a single proposal for the Mission Center campus site under the LRDP: construct a new office building and parking structure.

Construction-related emissions from these proposals were calculated using the California Emissions Estimator Model (CalEEMod), assuming completion by 2025 and phasing lengths based on CalEEMod default estimates which are based on square footage for office and research building and the parking garages. All model inputs and outputs are provided in Appendix E.

Table 9.2-1 presents the average annual daily construction emissions generated by development under the 2014 LRDP at the Mission Center campus site. As can be seen in Table 9.2-1, estimated average daily construction-related exhaust emissions would not exceed the thresholds for NOx, ROG or particulate matter.

The BAAQMD approach to analysis of construction-related particulate impacts (other than exhaust PM) emphasizes implementation of effective and comprehensive dust control measures rather than detailed quantification of emissions. As indicated under Impact AIR-LRDP-4 in Section 5.2 of this EIR, the BAAQMD considers construction-related fugitive dust impacts of projects to be less than significant if a suite of recommended dust-control measures are

[2] San Francisco Metropolitan Transportation Agency, Chained Activity Modeling Process version 4.3.0, Average Daily Traffic Volumes, provided to ESA August 2, 2012.

TABLE 9.2-1
AVERAGE DAILY CONSTRUCTION-RELATED POLLUTANT EMISSIONS WITHOUT MITIGATION - MISSION CENTER

Years	Estimated Emissions (lbs/day)			
	ROG	NO_X	Exhaust PM_{10}[a]	Exhaust $PM_{2.5}$[a]
2020/2021	22.62	28.41	1.73	1.65
BAAQMD Considered Construction Threshold	54	54	82	54
Potential Significant Impact?	No	No	No	No

SOURCE: ESA (Appendix E)

implemented. Therefore, BAAQMD-identified Best Management Practices for control of fugitive dust are adopted Campus-wide in Section 5.2 as **Mitigation Measure AIR-LRDP-1: Best Management Practices for Controlling Particulate Emissions.** With this measure in place the construction-related fugitive dust impacts would be less than significant.

Mitigation Measure: Implement Mitigation Measure AIR-LRDP-1

Although the criteria air pollutant emissions from demolition and construction proposals at the Mission Center campus site would be below BAAQMD significance thresholds, **Impact AIR-LRDP-4** in Section 5.2 identifies a significant and unavoidable LRDP construction-related air quality impact resulting from emissions of criteria air pollutants when the combined construction at all campus sites is considered. In response, **Mitigation Measure AIR-LRDP-2: Architectural Coatings** and **Mitigation Measure AIR-LRDP-3: Off-Road Equipment Control Measures** were adopted Campus-wide and therefore would also apply to construction projects at the Mission Center campus site.

Mitigation Measures: Implement Mitigation Measure AIR-LRDP-2 and AIR-LRDP-3

Significance after Mitigation: Less than Significant

Impact AIR-MC-2: Construction activities at the Mission Center campus site under the 2014 LRDP would increase emissions of toxic air contaminants (TACs) and increase health risks for nearby residents. (Less than Significant)

Construction activities under the 2014 LRDP would produce DPM and $PM_{2.5}$ emissions due to combustion equipment such as loaders, backhoes, and cranes, as well as haul truck trips. These emissions would result in elevated concentrations of DPM and $PM_{2.5}$ at nearby receptors (both new and existing residences and schools). These elevated concentrations could lead to an increase in the risk of cancer or other health impacts. Consequently, a health risk assessment was performed to determine the extent of increased cancer risks and hazard indices at the maximally exposed receptors. The health risk assessment was based on recommended methodology of the state Office of Environmental Health Hazard Assessment and adopted by BAAQMD. Detailed assumptions and methodology for the health risk assessment are included in Appendix E.

Additionally, cancer risk estimates also incorporate age sensitivity factors (ASFs). This approach provides updated calculation procedures that factor in the increased susceptibility of infants and children to carcinogens as compared to adults. For estimating cancer risks for residential receptors over a 70 year lifetime, the incorporation of the ASFs results in a cancer risk adjustment factor of 1.7.

A summary of the health impacts related to construction under the 2014 LRDP at the Mission Center campus site is presented in **Table 9.2-2**.

TABLE 9.2-2
CONSTRUCTION-RELATED HEALTH IMPACTS - MISSION CENTER

Receptor Type	Cancer Risk (per million persons)	Chronic Index	Acute Index	$PM_{2.5}$ Concentration ($\mu g/m^3$)
School Children	0.04	0.01	0.01	0.01
Existing Residence (adult / child)	0.64 / 7.19	0.02	0.21	0.08
BAAQMD Significance Criteria	10	1	1	0.3
Significant Impact?	No	No	No	No

SOURCE: KB Environmental Sciences, Inc., 2014.

As shown in Table 9.2-2, the maximum cancer risk for an existing residence-adult and residence-child (located to the west of the project site) would be 0.6 and 7.2 per million persons, respectively. The maximum cancer risk for a school-child receptor (including Marshall Elementary School) would be 0.04 per million persons. Thus, the cancer risk due to construction activities alone is below the BAAQMD threshold of 10 per million and would be less than significant.

The chronic HI would be 0.02 or less at all receptors. The chronic HI would be below the BAAQMD threshold of 1 and the impact of the construction would be less than significant. The acute HI would be 0.2 or less at all receptors. The acute HI would be below the BAAQMD threshold of 1 and the impact of the construction would be less than significant.

The maximum annual $PM_{2.5}$ concentrations would be less than 0.1 $\mu g/m^3$ for the school-child and the existing residences. The construction-related annual $PM_{2.5}$ concentration is below the BAAQMD threshold of 0.3 $\mu g/m^3$, and hence is considered less than significant.

Mitigation: None required.

Impact AIR-MC-3: Operations at the Mission Center campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants. (Potentially Significant)

2014 LRDP proposals at the Mission Center campus site would result in an increase in criteria air pollutant and precursor emissions, including ROG, NOx, PM_{10} and $PM_{2.5}$ from a variety of emissions sources, including onsite area sources (e.g., natural gas combustion for space and water

heating, landscape maintenance, use of consumer products such as hairsprays, deodorants, cleaning products, etc.) and mobile on-road sources. Operational emissions of criteria pollutants were estimated using the CalEEMod version 2013.2.2 emissions inventory model. All model inputs and outputs are provided in Appendix E.

One of the sources of operational emissions would be increased vehicle emissions from traffic due to additional staff and visitors. Traffic volumes used to estimate vehicle-related emissions were derived from the Transportation Demand Analysis prepared for the LRDP (Adavant, 2014). Development at the campus site would generate an estimated 540 additional daily vehicle trips. In addition to exhaust emissions, vehicles would also generate PM_{10} and $PM_{2.5}$ from entrained road dust and tire and brake wear.

Emissions would also be generated by on-site natural gas combustion, operation of landscape maintenance equipment, and maintenance application of paint and other architectural coatings.

Table 9.2-3 presents estimated operational emissions from development under the 2014 LRDP at the Mission Center campus site. As shown in the table, without mitigation, operational emissions of NOx and ROG, PM_{10} and $PM_{2.5}$ would be below threshold levels.

Although estimated emissions at the Mission Center campus site would be less than the daily thresholds, **Impact AIR-LRDP-5** in Section 5.2 identifies a significant and unavoidable operational air quality impact resulting from emissions of criteria air pollutants when LRDP operations at all campus sites are considered. In response, **Mitigation Measure AIR-LRDP-4: BAAQMD-Suggested Operational Measures** was adopted Campus-wide and therefore would also apply to operation of projects at the Mission Center campus site.

Mitigation Measure: Implement Mitigation Measure AIR-LRDP-4

Significance after Mitigation: Less than Significant

TABLE 9.2-3
UNMITIGATED OPERATIONAL CRITERIA POLLUTANT EMISSIONS- MISSION CENTER

	Estimated Emissions (lbs/day)			
Air Pollutant	**ROG**	**NO_X**	**PM_{10}**	**$PM_{2.5}$**
Mobile Sources[a]	1.28	2.39	2.83	0.80
Area Sources[a]	2.43	<0.001	<0.001	<0.001
Natural gas combustion	0.06	0.55	0.04	0.04
Total	**3.76**	**2.94**	**2.87**	**0.84**
Regional Significance Threshold	54	54	82	54
Significant Impact?	No	No	No	No

[a] Mobile sources are motor vehicles and trucks. Area sources include landscape maintenance (equipment used for these activities such as gasoline-powered lawnmowers and blowers), maintenance application of paints and other interior and exterior surface coatings, and increased use of consumer products that result in emissions of ROG. Natural gas combustion is for space and water heating.

SOURCE: ESA, 2014 (see Appendix E).

Impact AIR-MC-4: Operations at the Mission Center campus site under the 2014 LRDP would increase emissions of TACs and increase health risks for nearby residents. (Less than Significant)

Operations under the 2014 LRDP at the Mission Center campus site would not generate substantial DPM emissions. Development at the campus site would generate an estimated 540 additional daily vehicle trips from staff, students and visitors that would be almost entirely gasoline powered. New operational sources of TACs are not proposed. It is assumed that no additional research uses would occur at the new Mission Center building and therefore no new fume hood emissions would be generated. For planning purposes, the LRDP assumes that a new building would be no greater than the City's height limit of 55 feet, which is less than the 70-foot threshold for requiring a back-up generator. Consequently, generator emissions would not be a concern for this development. Operations resulting from implementation of the 2014 LRDP at the Mission Center campus site would have a less than significant impact with regard to health risks.

Mitigation: None required.

9.3 Biological Resources

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Biological Resources are contained in Section 4.3 of this EIR. The CEQA Significance Standards presented in Section 4.3.3 are used to evaluate the potential impacts to biological resources of all proposed 2014 LRDP activities.

After evaluation of the 2014 LRDP proposals at the Mission Center campus site, the Initial Study concluded that all activities would result in no impact or less-than-significant impacts regarding biological resources issues. Therefore, no additional analysis is required.

9.4 Cultural Resources

This section considers the setting and cultural resources impacts of implementation of the 2014 LRDP at the Mission Center campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Cultural Resources are contained in Section 4.4 of this EIR. The CEQA Significance Standards presented in Section 4.4.3 are used to evaluate the potential impacts to cultural resources of all proposed 2014 LRDP activities.

9.4.1 Cultural Resources Issues Adequately Addressed in the Initial Study

The Initial Study concluded that the construction of the proposed office building and parking structure and its potential effects on cultural resources would be evaluated in the EIR.

9.4.2 Cultural Resources – Mission Center Setting

The three-acre Mission Center campus site is in the northeast portion of San Francisco's mixed use Mission District, on the southern half of the block bounded by Fourteenth, Harrison, Fifteenth and Folsom Streets. It has only one building, 1855 Folsom Street, which is six stories tall and contains 291,000 gsf of office space for UCSF employees. Adjacent to the Mission Center building is a 207-space parking lot, which can be accessed from Harrison and Fifteenth Streets.

The Mission Center building site is located in what was historically the Mission Valley, a formerly rural area bisected by the meandering course of Mission Creek. This area was filled in during the late nineteenth century primarily to accommodate the city's growing commercial and industrial needs. Numerous heavy timber and steel-frame brick warehouses and factories were constructed in the area between 1890 and 1930, with the vast majority constructed after the 1906 Earthquake and Fire. It is within this context that the reinforced concrete and brick former industrial Mission Center Building was constructed in 1927 for the Illinois Pacific Glass Company (CCSF, 2011).

Although the interior of the building was altered for office uses in the 1970s, it was recommended as individually eligible for listing in the CRHR as part of the Showplace Square/Northeast Mission Survey, which was completed by the San Francisco Planning Department in 2011. A campus-wide survey commissioned by UCSF by Carey & Co. in 2011 concluded that the building is not individually eligible for the CRHR or the NRHP, but rather, could be a contributor to a potential historic district, the Showplace Square Heavy Timber and Steel-frame Brick Warehouse and Factory District, described below. Whether the property is considered individually eligible, or a contributor to a potential historic district, it is considered a historic resource for CEQA purposes. A review of this building by ESA in 2014 identified no changes since the original evaluation, and as such, its current historic status would remain.

The City's survey identified the discontiguous Showplace Square Heavy Timber and Steel-frame Brick Warehouse and Factory District as a potential historic district. Neither the Mission Center building or adjacent parking lot was identified by the City as being within or adjacent to any of the

three discontiguous areas that comprise the potential historic district; the closest of which is about two blocks to the east. As described above, however, the Mission Center building is considered a potential contributor to this district according to the Carey & Co. survey, and is being treated as such in this analysis. The parking lot adjacent to the Mission Center building is identified as 'non-historic' in both the City and Carey & Co. surveys.

9.4.3 Cultural Resources – Mission Center Impacts and Mitigation Measures

Impact CUL-MC-1: Construction of the proposed office building and parking structure at the Mission Center campus site would not result in a substantial adverse change in the significance of a historical resource. (Less than Significant)

The existing building on the Mission Center campus site will remain, and no changes in use are planned. UCSF would construct a new office building and parking structure in the location of the existing parking lot. The new building would be no greater than the City's height limit of 55 feet, which would allow for a four-story building up to 100,000 gsf. To support this space, a five-story, 95,600 gsf garage with up to 294 parking spaces would be built between the existing and new buildings.

Although the Mission Center building has been identified as individually eligible for listing in the CRHR, and a possible contributor to the potential Showplace Square Heavy Timber and Steel-frame Brick Warehouse and Factory District, and would be considered a historic resource for CEQA purposes, no changes to this building are planned under the 2014 LRDP. As such, no direct impacts to historic resources would occur. New construction adjacent to the Mission Center building would occur on the adjacent parking lot, which was identified as a non-historic site in the City and Carey & Co. surveys. The proposed parking garage to be constructed directly adjacent to the Mission Center building could indirectly affect the setting of this historic resource if completed in a manner that physically competed with, or overwhelmed, this historic brick building. However, the proposed parking garage would be shorter in height, smaller in size, and set back from Fifteenth Street, allowing the Mission Center building to 'read' as a separate building on the subject block. The proposed parking garage would be subordinate to the Mission Center building, allowing this building to retain its primacy on the subject block. In addition, both the proposed parking garage and office building would be constructed toward the rear or secondary façade of the Mission Center building, allowing the primary, front façade on Folsom Street to remain unaffected. For these reasons, the proposed office building and parking garage at the Mission Center site would have no significant impacts to the Mission Center building as a historic architectural resource. As the proposed office building and parking garage would be constructed about two blocks west from the other, primary grouping of contributors to the potential Showplace Square Heavy Timber and Steel-frame Brick Warehouse and Factory District, there would be sufficient distance between the new structures and the potential district such that no significant indirect impacts to the district would occur.

As this proposal would undergo additional CEQA review at the project-level, and the design of the project would be further refined at that time, there are future opportunities for UCSF to design

a building which meets their programmatic needs while honoring the industrial materials and massing of the adjacent Mission Center building as well as other industrial buildings in the surrounding area.

Mitigation: None required.

Impact CUL-MC-2: Construction of the proposed office building and parking structure at the Mission Center campus site could cause substantial adverse changes to archaeological resources. (Potentially Significant)

Due to its location within or near a former watercourse, the Mission Center campus site suggests a high sensitivity to contain significant archaeological deposits and/or features from both prehistoric and historic-period use and occupation. In order to minimize impacts resulting from construction of the proposed office building and parking structure to archaeological resources, the following mitigation measures are recommended.

Mitigation Measure CUL-MC-1: Archaeological Testing Program.

Based on a reasonable presumption that archeological resources may be present within the Mission Center campus site, the following measures shall be undertaken to avoid any potentially significant adverse effect from the proposed office building and parking structure on buried archaeological resources. UCSF shall retain the services of an archaeological consultant that meets Secretary of Interior standards for archaeology, and has knowledge of California prehistory and historical archaeology. The archeological consultant shall perform sufficient archival and background research to determine if an archeological testing program is appropriate. The archeological consultant shall prepare an archeological testing plan (ATP). The ATP shall identify the property types of the expected archeological resource(s) that potentially could be adversely affected by the proposed office building and parking structure, the testing method to be used, and the locations recommended for testing. The purpose of the archeological testing program will be to determine to the extent possible the presence or absence of archeological resources and to identify and to evaluate whether any archeological resource encountered on the site constitutes an historical resource under CEQA.

If required, an archeological testing program shall be conducted in accordance with the approved ATP. After the completion of the archeological testing program, the archeological consultant shall submit a written report of the findings. If based on the archeological testing program the archeological consultant finds that significant archeological resources may be present, the archeological consultant shall determine if additional measures are warranted. If feasible, the proposed office building and parking structure shall be re-designed so as to avoid any adverse effect on the significant archeological resource. If avoidance is not feasible, additional measures that may be undertaken include additional archeological testing, archeological monitoring, and/or an archeological data recovery program. These measures would be undertaken to reduce to a less than significant level any potential effects on a significant archeological resource as defined in CEQA Guidelines Section 15064.5 (a)(c).

Mitigation Measure CUL-MC-2: Consultation with Descendant Communities.

On discovery of an archeological site associated with a specific Native American or other descendant group, an appropriate representative of the descendant group shall be contacted

to discuss the potential cultural significance of the archaeological site and assist in developing a plan for the area of the find. Topics for discussion may include archeological field investigations, appropriate archeological treatment of resources, and, if applicable, interpretative treatment of the associated archeological site. A copy of the Final Archaeological Resources Report shall be provided to the representative of the descendant group.

Mitigation Measure CUL-MC-3: Archaeological Monitoring.

The ATP (Mitigation Measure CUL-MC-1) will determine the need for archaeological monitoring. Should it be required before or after archaeological testing and/or data recovery, an archaeologist that meets the Secretary of the Interior's Standards and Guidelines for professional archaeologists will monitor ground-disturbing activities in areas proposed for ground disturbing activities associated with construction activities at the building sites. The monitor will be empowered to temporarily halt construction in the immediate vicinity of a discovery while it is evaluated for significance. With the archaeologist's approval, work may continue on other portions of the site. If the discovery proves to be significant, additional measures will be implemented; these may include avoidance, capping beneath a layer of sterile soil, or data recovery through archaeological excavation.

Should an archaeological artifact be discovered at the Mission Center campus site during project construction and excavation, pursuant to CEQA Guidelines 15064.5 (f), "provisions for historical or unique archaeological resources accidentally discovered during construction" shall be instituted. In the event that any prehistoric or historic subsurface cultural resources are discovered during ground disturbing activities, all work within 100 feet of the resources shall be halted and UCSF shall consult with a qualified archaeologist or paleontologist to assess the significance of the find (per Public Resource Code Section 5024.1, Title 14 CCR, Section 4852 and/or Public Resource Code 21083.2 in the event of a unique archaeological find). If any find is determined to be significant and will be adversely affected by the construction of the office building and parking structure, representatives of UCSF and the qualified archaeologist and/or paleontologist shall meet to determine the appropriate avoidance measures or other appropriate mitigation (per CEQA Guidelines 15064.5 (b) and Public Resource Code 21083.2). All significant cultural materials recovered shall be subject to scientific analysis, professional museum curation, and documented by the qualified archaeologist according to current professional standards (Per the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation (48 FR44716)).

Whether or not significant archeological resources are encountered during monitoring, the archeological consultant shall submit a written report of the findings.

Significance after Mitigation: Less than Significant

Impact CUL-MC-3: Construction of the proposed office building and parking structure at the Mission Center campus site could cause substantial adverse changes to paleontological resources. (Potentially Significant)

Paleontology is a multidisciplinary science that combines elements of geology, biology, chemistry, and physics in an effort to understand the history of life on earth. Paleontological resources, or fossils, are the remains, imprints, or traces of once-living organisms preserved in rocks and

sediments. The fossil yielding potential of a particular area is highly dependent on the geologic age and origin of the underlying rocks. In general, older sedimentary rocks (more than 10,000 years old) are considered most likely to yield vertebrate fossils of scientific interest. Review of geological maps and previous analysis suggests that there no unique paleontological resources or unique geologic features at the Mission Center site, which is underlain by dune sands. In the event that paleontological resources are uncovered during the course of construction, **Mitigation Measure CUL-LRDP-4** would reduce impacts to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-LRDP-4

Significance after Mitigation: Less than Significant

Impact CUL-MC-4: Construction of the proposed office building and parking structure at the Mission Center campus site could cause substantial adverse changes to human remains. (Potentially Significant)

As described above, the Mission Center campus site has a heightened sensitivity for the presence of prehistoric and historic period occupation, which also suggests a heightened sensitivity for the presence of human remains. Implementation of **Mitigation Measures CUL-MC-1** and **CUL-MC-2**, in addition to **Mitigation Measure CUL-LRDP-5** would reduce the impact to a less than significant level.

Mitigation Measure: Implement Mitigation Measure CUL-MC-1, CUL-MC-2, and CUL-LRDP-5

Significance after Mitigation: Less than Significant

9.5 Geology, Soils and Seismicity

This section considers the setting and geology, soils and seismicity impacts of implementation of the 2014 LRDP at the Mission Center campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Geology, Soils and Seismicity are contained in Section 4.5 of this EIR. The CEQA Significance Standards presented in Section 4.5.3 are used to evaluate the potential Geology, Soils and Seismicity impacts of all proposed 2014 LRDP activities.

Those impacts that are specific to the implementation of the 2014 LRDP at the Mission Center campus site are discussed below.

9.5.1 Geology, Soils and Seismicity Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Center campus site, the Initial Study concluded that:

- **Landslides.** The proposed office building and parking structure would not result in an adverse effect from landslides. Therefore, no additional analysis of this issue is required.
- **Expansive soils.** The proposed office building and parking structure would not be located on expansive soils. Therefore, no additional analysis of this issue is required.
- **Soils and wastewater disposal.** The proposed office building and parking structure would not result in the installation of septic tanks or alternative wastewater disposal systems. Therefore, no additional analysis of this issue is required.
- **Structural hazards.** The proposed office building would not result in potential effects regarding exposure to structural hazards in an existing building. Therefore, no additional analysis of this issue is required.

9.5.2 Geology, Soils and Seismicity – Mission Center Setting

The Mission Center campus site is located within an area associated with the historic Mission Creek which has since been filled and built over. The relatively flat site lies at an elevation of approximately 22 feet above sea level. According to the California Geologic Survey (CGS), the Mission Center campus site is located within a Seismic Hazard Zone for liquefaction indicating a high potential for the presence of soils that could be susceptible to the effects of liquefaction during an earthquake (ABAG, 2014).

9.5.3 Geology, Soils and Seismicity – Mission Center Impacts and Mitigation Measures

There is only one development proposal for the Mission Center campus site under the 2014 LRDP, namely to construct an office / research building and parking structure.

As discussed in Section 5.5, the general Geology, Soils and Seismicity impacts that could occur as a result of implementing the 2014 LRDP, are:

Impact GEO-LRDP-1: Implementation of the 2014 LRDP could result in adverse effects to people and structures resulting from geologic hazards.

Impact GEO-LRDP-2: Implementation of the 2014 LRDP could result in substantial soil erosion or loss of topsoil.

The proposed office building and parking structure site is located in a seismically active region that could experience at least one major earthquake (Richter magnitude (M) 6.7 or higher) over the next 30 years. Strong ground shaking at the campus site could occur during a moderate to severe earthquake occurring on one of the active Bay Area faults near to the campus site. If not engineered appropriately, new construction could be susceptible to significant damage as a result of strong ground shaking. However, all proposed construction under 2014 LRDP would be required to adhere to the most stringent building code requirements which include measures to minimize potential from anticipated seismic forces. Due to the location of the campus site within the seismic hazard zone for liquefaction, the proposed plans would be required to be in compliance with Special Publication 117A which includes measures on the identification and appropriate mitigation of any identified liquefaction hazards. Adherence to these existing regulatory requirements as well as UC's *Seismic Safety Policy* would ensure that seismic hazards are reduced to less than significant levels.

Construction activities would also include disturbance to underlying soils. If not managed appropriately, these soils could be susceptible to the effects of wind and water erosion. However, all construction activities would be required to adhere to best management practices that include erosion control measures. As a result, the potential impacts related to erosion would be reduced to less than significant.

Mitigation: None required.

9.6 Greenhouse Gas Emissions

This section considers the setting and greenhouse gas emissions impacts of implementing the 2014 LRDP at the Mission Center campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of greenhouse gas emissions are contained in Section 4.6 of this EIR. The CEQA Significance Standards presented in Section 4.6.3 are used to evaluate the potential greenhouse gas emissions impacts of all proposed 2014 LRDP activities.

9.6.1 Greenhouse Gas Emissions Issues Adequately Addressed in the Initial Study

The Initial Study concluded that construction of the proposed office building and parking structure at the Mission Center campus site and its potential effect on greenhouse gas emissions would be evaluated in the EIR.

9.6.2 Greenhouse Gas Emissions – Mission Center Setting

Greenhouse gas (GHG) emissions are generated at the Mission Center campus site from a variety of sources. These include motor vehicle trips generated by uses on site, electrical and natural gas usage including, water and wastewater transport (the energy used to pump water and wastewater to and from the campus site), and solid waste generation.

9.6.3 Greenhouse Gas Emissions – Mission Center Impacts and Mitigation Measures

Impact GHG-MC-1: Development at the Mission Center campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions. (Potentially Significant)

Construction emissions from development were estimated using the CalEEMod emissions model assuming the construction of a 100,000 square foot office building and 95,000 square foot parking garage. Construction-related emissions from development under the 2014 LRDP were calculated assuming completion by 2025 and phasing lengths based on CalEEMod default estimates which are based on square footage and number of parking spaces. All model inputs and outputs are provided in Appendix E. Construction-related GHG emissions for the one year anticipated construction period are presented in **Table 9.6-1**. Estimated emissions are 406 metric tons of carbon dioxide equivalent greenhouse gases[3] (CO_2e). As discussed earlier, BAAQMD has not established a quantitative threshold relative to construction-related emissions. In lieu of any proposed or adopted thresholds relative to construction-related emissions, these emissions are considered significant unless best management practices are implemented to reduce GHG emissions during construction, as feasible. Consequently, **Mitigation Measure GHG-LRDP-1** is identified to ensure implementation of best management practices during construction.

[3] CO_2e in all calculations of project impact include CO2, CH4 and N2O.

TABLE 9.6-1
ANNUAL CONSTRUCTION-RELATED GHG EMISSIONS
WITHOUT MITIGATION - MISSION CENTER

Emission Source	Emissions (metric tons/year)			
	CO_2	CH_4	N_2O	Total CO_2e
2015	405	<1	<1	406

NOTE: Project CO_2 emissions estimates were made using CalEEMod v.2013.2.

Mitigation Measure: Implement Mitigation Measure GHG-LRDP-1

Significance after Mitigation: Less than Significant. Implementation of Mitigation Measure GHG-LRDP-1 would ensure that the applicant employs feasible, effective measures to reduce GHG emissions during construction. This mitigation measure would therefore reduce this potential impact to a less than significant level.

Impact GHG-MC-2: Development at the Mission Center campus site under the 2014 LRDP would result in an increase in operational GHG emissions. (Less than Significant)

Operational Emissions

Area, Energy, and Indirect Sources

GHG emissions from electrical usage, natural gas combustion, mobile transportation, water and wastewater conveyance, and solid waste were estimated using the CalEEMod model, and are presented in **Table 9.6-2**. Default GHG emissions factor for PG&E was adjusted to reflect future reductions envisioned by PG&E (PG&E, 2013). Electrical and natural gas emissions also assume compliance with UCSF policy to achieve a 20% energy reduction beyond Title 24 requirements. Energy use (electrical and natural gas) represents approximately 38% of estimated operational GHG emissions.

TABLE 9.6-2
ANNUAL OPERATIONAL GHG EMISSIONS
WITHOUT MITIGATION - MISSION CENTER

Emission Source	Emissions (metric tons/year)			
	CO_2	CH_4	N_2O	Total CO_2e
Area Sources	<1	<1	<1	<1
Energy Sources	345	<1	<1	334
Mobile Sources	345	<1	<1	345
Solid Waste	19	1	<1	42
Water and Wastewater	23	1	<1	40
Total	**719**	**2**	**<1**	**762**

NOTE: Columns may not total precisely due to rounding. Rows may not total precisely due to differences in global warming potential.

Mobile Emission Sources

One of the sources of operational emissions would be increased vehicle emissions from additional staff, patients, visitors and residents. Traffic volumes used to estimate vehicle-related emissions were derived from the Transportation Demand Analysis prepared for the LRDP (Adavant, 2014). Development under the 2014 LRDP at the Mission Center campus site would generate an estimated 540 additional daily vehicle trips. GHG emissions from motor vehicle sources were calculated using CalEEMod. Table 9.6-2 presents the incremental mobile source GHG emissions associated with development under the 2014 LRDP at the Mission Center campus site, which represent approximately 50% of the total operational GHG emissions.

As shown in Table 9.6-2, the sum of both direct and indirect GHG emissions resulting from operations under the 2014 LRDP at the Mission Center campus site would result in an estimated 762 metric tons per year of CO_2e. Applying a service population of 500 persons associated with development at the Mission Center campus site (490 new faculty and staff and 10 students) results in operational emissions of approximately 1.5 metric tons CO_2e/SP/yr. This is below the service population threshold of 4.6 metric tons CO_2e/SP/yr and operational GHG emissions associated with development under the 2014 LRDP at the Mission Center campus site would therefore be a less than significant impact.

Mitigation: None required.

9.7 Hazards and Hazardous Materials

This section considers the setting and hazards and hazardous materials impacts at the Mission Center campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Hazards and Hazardous Materials are contained in Section 4.7 of this EIR. The CEQA Significance Standards presented in Section 4.7.3 are used to evaluate the potential hazards and hazardous materials impacts of all proposed 2014 LRDP activities.

9.7.1 Hazards and Hazardous Materials Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Center campus site, the Initial Study concluded that:

- **Safety hazards from airport operations.** The construction of the proposed office building and parking structure would not result in safety hazards resulting from proximity to public or private airports. Therefore, no additional analysis of this issue is required.

- **Wildland fires.** The construction of the proposed office building and parking structure would not result in exposure to wildland fires. Therefore, no additional analysis of this issue is required.

9.7.2 Hazards and Hazardous Materials – Mission Center Setting

The Mission Center campus site is in a mixed use area of the City and currently consists of only one six-story building. The building is currently used for a variety of support services including campus police, documents, media and mail, information technology services, the finance services center and the controller's office. The building contains a small amount of research and other administrative functions.

9.7.3 Hazards and Hazardous Materials – Mission Center Impacts and Mitigation Measures

Impact HAZ-MC-1: Implementation of the 2014 LRDP at the Mission Center campus site could result in hazardous emissions or the handling of hazardous or acutely hazardous materials, substances or waste within one-quarter mile of existing or proposed schools. (Less than Significant)

The Marshall Elementary School is located approximately 0.2 miles southwest of the Mission Center campus. As discussed above, the new office building would be associated with handling, storage, and disposal of hazardous materials and wastes which would be managed consistent with current regulatory requirements and UCSF policies and plans. In general, existing hazardous materials use for administrative support services or even research laboratory purposes at UCSF

does not involve large enough quantities of hazardous materials or result in emissions that would represent potential health hazards to the Marshall Elementary School. Adherence to current regulatory requirements and UCSF policies and plans would provide sufficient control to reduce impacts from potential exposure to hazardous materials to a less than significant level.

Mitigation: None required.

Impact HAZ-MC-2: 2014 LRDP proposals located at Mission Center campus sites are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public. (Potentially Significant)

The Mission Center campus site is not found on the EnviroStor database maintained by the Department of Toxic Substances Control but does contain three cases (i.e., listed as Alioto's Garage, Commercial Building, and International Disposal) found on the Geotracker database maintained by the State Water Resources Control Board (DTSC, 2014 and SWRCB, 2014). The three case listings are listed as closed indicating that either the identified contamination was minimal or remediated to point such that no further action was warranted (SWRCB, 2014).

However, earthwork activities have the potential to encounter previously unidentified contamination or materials that contain naturally occurring asbestos fibers. As such, there is a potential for encountering that could present exposure hazards to workers or the public. However, with implementation of **Mitigation Measure HAZ-LRDP-1**, potential impacts from exposure to residual contamination or naturally occurring asbestos would be less than significant.

Mitigation Measure: Implement Mitigation Measure HAZ-LRDP-1

Significance after Mitigation: Less than Significant

9.8 Hydrology and Water Quality

This section considers the setting and hydrology and water quality impacts of implementation of the 2014 LRDP at the Mission Center campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Hydrology and Water Quality are contained in Section 4.8 of this EIR. The CEQA Significance Standards presented in Section 4.8.3 are used to evaluate the potential Hydrology and Water Quality impacts of all proposed 2014 LRDP activities.

Those impacts that are specific to the implementation of the 2014 LRDP at the Mission Center campus site are discussed below.

9.8.1 Hydrology and Water Quality Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Center campus site, the Initial Study concluded that:

- **Groundwater supplies.** The construction of the proposed office building and parking structure would not result in substantial depletion of groundwater supplies or interfere substantially with groundwater recharge. Therefore, no additional analysis of this issue is required.

- **Housing or other structures within flood hazard areas.** The construction of the proposed office building and parking structure would not place housing or other structures within a flood hazard area. Therefore, no additional analysis of this issue is required.

- **Exposure to flooding.** The construction of the proposed office building and parking structure would not result in exposure to flooding. Therefore, no additional analysis of this issue is required.

- **Inundation by seiche, tsunami or mudflow.** The construction of the proposed office building and parking structure would not result in inundation by seiche, tsunami or mudflow. Therefore, no additional analysis of this issue is required.

9.8.2 Hydrology and Water Quality – Mission Center Setting

The three-acre Mission Center campus site is in the northeast portion of San Francisco's mixed use Mission District, located on the southern half of the block bounded by Fourteenth, Harrison, Fifteenth and Folsom streets. The campus site drains to the City's Combined Sewer System; flows are treated at the Southeast Treatment Plant before being discharged to San Francisco Bay.

9.8.3 Hydrology and Water Quality – Mission Center Impacts and Mitigation Measures

Under the 2014 LRDP, a new office/research building and parking garage is proposed at the Mission Center campus site.

Proposed LRDP development at the Mission Center campus site (including on-site staging) would include excavation, grading, and construction activities that would require temporary disturbance of surface soils and removal of existing pavement and sub-surface structures (if present). These activities would expose soil to water runoff as well as entrainment of sediment in the runoff. If dewatering would be necessary during construction, the water would likely contain suspended sediments and would require settling before being discharged to the Combined Sewer System. Sediment in runoff and deposits of soil and related debris from haul truck tires on local streets could increase the amount of sediment entering the storm drains, which could potentially clog drain inlets and reduce the flow capacity of the storm drains. The accumulation of this material could potentially result in increased localized ponding or flooding, particularly after large storm events.

The use of construction equipment as well as the delivery, handling, and storage of construction materials and waste could contaminate stormwater that could negatively impact water quality. Potential contaminants include, but are not limited to (CSW/Stuber-Stroeh, 2011):

- Petroleum hydrocarbons and metals from stockpiled soils excavated from the site
- Fuel from storage drums
- Diesel from refueling trucks
- Oils and grease from miscellaneous heavy equipment
- Sewage from portable sanitary facilities
- Sediment from construction generated waste–piles of concrete, rock and debris
- Sediment from rock crushing activities
- Hazardous materials storage-hydraulic oil, motor oil, and lubricating fluid
- Spills and releases of hydrocarbons and related pollutants from routine light maintenance activities such as fluid topping off, and welding and repairing belts and gears of heavy equipment

Polluted stormwater runoff could violate water quality standards and/or waste discharge requirements established in the NPDES General Permit for Construction and the NPDES discharge permits for the Southeast Treatment Plant.

In accordance with the Construction General Stormwater Permit, UCSF would be required to prepare and implement a SWPPP to minimize water quality impacts during construction activities on the campus site.

The SWPPP will identify pollutant sources within the construction area and recommend site-specific BMPs regarding control of sediments in runoff and storage and use of hazardous materials to prevent discharge of pollutants into stormwater. Likely BMPs are listed in Section 5.1.8.

In addition, construction of the proposed buildings will need to obtain a water quality certification from the RWQCB for the construction activity, which would also require implementation of BMPs and specific measures for the protection of water quality during construction.

Proposed development at the Mission Center campus site would not significantly change the volumes of site stormwater runoff, nor how this runoff is directed or routed through the campus site to the CSS. The proportion of impermeable surfaces at the campus site will not significantly change as a result of 2014 LRDP activities. Measures to prevent and minimize erosion and its potential effects on storm drain siltation and water quality would be included in the SWPPP.

Implementation of SWPPPs and associated BMPs would reduce erosion and water quality impacts during construction activities. These measures, part of the regulatory requirements discussed in Sections 4.8 and 5.8, limit the potential adverse effects of these impacts to less than significant.

Mitigation: None required.

9.8.4 References

CSW/Stuber-Stroeh Engineering Group, Inc., *Storm Water Pollution Prevention Plan*, UCSF Medical Center at Mission Bay, San Francisco, California, August, 2011.

9.9 Land Use and Planning

This section considers the setting and land use and planning impacts of implementation of the 2014 LRDP at the Mission Center campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Land Use are contained in Section 4.9 of this EIR. The CEQA Significance Standards presented in Section 4.9.3 are used to evaluate the potential land use impacts of all proposed 2014 LRDP activities.

9.9.1 Land Use and Planning Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Center campus site, the Initial Study concluded that:

- **Physically divide an established community.** The proposed office building and parking structure would not physically divide an established community. Therefore, no additional analysis of this issue is required.

- **Habitat conservation plan.** The proposed office building and parking structure would not result in a conflict with any applicable habitat conservation plan. Therefore, no additional analysis of this issue is required.

9.9.2 Land Use and Planning – Mission Center Setting

The three-acre Mission Center campus site is in the northeast portion of San Francisco's mixed use Mission District, located on the southern half of the block bounded by Fourteenth, Harrison, Fifteenth and Folsom Streets. It has only one building that is six stories tall and contains 291,000 gsf. The building fronts on Folsom Street, but the main entrance is adjacent to the 220-space parking lot, which can be accessed from Harrison and Fifteenth streets.

9.9.2.1 UCSF Functional Zones

The Mission Center campus site has not been designated with functional zones by UCSF.

9.9.2.2 City of San Francisco Zoning

The Mission Center campus site is primarily located in a P (Public) Zoning District. P Districts refer to land owned by a governmental agency that is in public use, including open space. The entire campus site is located within the 55-X Height and Bulk District. The "X" designation permits all floors of structures to cover the entire building footprint.

9.9.3 Land Use and Planning – Mission Center Impacts and Mitigation Measures

Impact LU-MC-1: Implementation of the 2014 LRDP at the Mission Center campus site would be consistent with applicable land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental effect. (Less than Significant)

Upon adoption by the Regents, the proposed 2014 LRDP will replace the 1996 LRDP, as amended, and become the applicable campus land use plan for UCSF. Pursuant to the University of California's constitutional autonomy, development and uses on property owned or leased by the University that are in furtherance of the University's educational purposes are not subject to local land use regulation. The University is the only agency with land use jurisdiction over programs and projects proposed at UCSF campus sites by the 2014 LRDP. Therefore, all proposed activities that would be in general conformance with the 2014 LRDP would have no significant land use impacts.

UCSF has not designated the Mission Center campus site with any functional zones. Its existing use, which consists of office and administrative units, would remain unchanged under the 2014 LRDP. The proposed LRDP activities at the Mission Center campus site would not conflict with City plans and policies adopted for the purpose of avoiding or mitigating an environmental effect and the impact would be less than significant.

Mitigation: None required.

Impact LU-MC-2: The proposed new office building at the Mission Center campus site would be compatible with adjacent land uses. (Less than Significant)

UCSF proposes to construct a new office/research building and parking garage on the Mission Center campus site. The proposed building would include up to 100,000 gsf and would not exceed 55 feet in height. A five-story, approximately 95,000 gsf parking garage with up to 294 parking spaces would be built between the existing and new buildings. Additional open space would be developed between the buildings.

The proposed use of the Mission Center campus site for office and administrative functions would remain consistent with the City's Public District designation. Although the proposed office building has not yet been designed, the proposed height would not exceed the City's height limit of 55 feet for this site. Land uses adjacent to the proposed development include a MUNI Bus Depot that occupies the entire block south of the campus site across Fifteenth Street and low-rise light industrial/commercial uses along Harrison Street. Development proposed for the Mission Bay campus site under the 2014 LRDP would be compatible with adjacent land uses and the impact would be less than significant.

Mitigation: None required.

9.10 Noise

This section considers the setting and noise impacts of implementation of the 2014 LRDP at the Mission Center campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Noise are contained in Section 4.10 of this EIR. The CEQA Significance Standards presented in Section 4.10.3 are used to evaluate the potential noise impacts of all proposed 2014 LRDP activities.

9.10.1 Noise Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Center campus site, the Initial Study concluded that:

- **Airport noise.** The proposed office building and parking structure would not be located within the vicinity of a public or private airport. Therefore, no additional analysis of this issue is required.

9.10.2 Noise – Mission Center Setting

9.10.2.1 Existing Noise Environment

Long-term environmental noise in urbanized areas is primarily dependent on vehicle traffic volumes and the mix of vehicle types. The existing ambient noise environment within the Mission center campus site area is dominated by vehicular traffic on Fourteenth Street, Fifteenth Street, Harrison Street and Folsom Street as from the elevated section of U.S. 101 to the north of campus site.

The San Francisco Department of Public Health (DPH) has mapped transportation noise throughout the City and County of San Francisco, based on modeled baseline traffic volumes derived from the San Francisco County Transportation Authority travel demand model[4]. DPH maps indicate the areas subject to noise levels over 60 dBA (L_{dn}) and the range of L_{dn} noise levels that occur on every street in San Francisco. The maps with the Mission Center campus site area indicate that areas along Folsom Street are generally between 65 and 70 dBA (L_{dn}) while Harrison Street and Fourteenth and Fifteenth Streets are generally between 60 and 65 dBA (L_{dn}).

Ambient Noise Measurements

Ambient short-term (10-minute) noise measurement data were collected in March 2014 to characterize noise conditions in the Mission Center campus site area. To characterize ambient noise in the campus site area, the short-term measurement data were collected at a location where residential land uses exist adjacent to where proposed construction activities could occur. These data are presented in **Table 9.10-1**.

[4] San Francisco Department of Public Health (DPH), San Francisco City-wide Noise Map, August 2006, Available online at http://www.sfdph.org/dph/files/EHSdocs/ehsPublsdocs/Noise/noisemap2.pdf Accessed April 30, 2013.

TABLE 9.10-1
SHORT- TERM AMBIENT NOISE LEVEL DATA IN THE MISSION CENTER CAMPUS AREA

Measurement Location	Time	Noise Levels in dBA	
		Hourly L_{eq}	L_{max}
MC-ST1: Residences on Folsom Street between 14th Street and 15th Street	5:19 pm	69.8	85.9

NOTE: L_{eq} represents the constant sound level; L_{max} is the maximum noise level.

SOURCE: Environmental Science Associates, 2014.

9.10.3 Noise – Mission Center Impacts and Mitigation Measures

Impact NOI-MC-1: Construction activities proposed under the 2014 LRDP at the Mission Center campus site would result in increases in ambient noise levels over the term of the exterior construction activities. (Potentially Significant)

As noted in the Regional Setting section, the hours that construction activity noise can occur is restricted by Section 2908 of the Police Code. Although UCSF is not subject to the noise ordinance, it strives to be consistent with it. Section 2908 prohibits any person, between the hours of 8:00 p.m. of any day and 7:00 a.m. of the following day, from erecting, constructing, demolishing, excavating for, altering, or repairing any building or structure if the noise level created is in excess of the ambient noise level by 5 dBA at the nearest property line.

Construction of the proposed office building and parking structure would require the use of heavy duty off-road construction equipment. Construction activity noise levels at and near the building site would fluctuate depending on the particular type, number, and duration of uses of various pieces of construction equipment. Construction activities would involve excavation, grading, and earth movement and, potentially, pile driving. **Table 9.10-2** shows typical noise levels produced by various types of construction equipment typically involved with large-scale construction projects at a reference level of 50 feet and a distance of 300 feet which is the approximate distance from the new building site to the nearest residences on Folsom Street.

The nearest sensitive residential receptors to the campus site currently experience existing daytime noise levels of 70 dBA. Noise from standard construction equipment would be shielded by an existing building between these receptors and the office building and parking structure sites, resulting is a combined equipment noise level of 61 dBA, Leq, which would not exceed existing noise levels. Nevertheless, **Mitigation Measure NOI-LRDP-1** would be implemented to further reduce noise generated during standard construction activities.

Mitigation Measure: Implement Mitigation Measure NOI-LRDP-1

Significance after Mitigation: Less than Significant

TABLE 9.10-2
TYPICAL NOISE LEVELS FROM CONSTRUCTION EQUIPMENT

Construction Equipment	Noise Level (dBA, Leq at 50 Feet)	Noise Level (dBA, Leq at 300 Feet)
Dump truck	76	60
Portable air compressor	78	62
Concrete mixer (truck)	79	63
Crane	81	65
Excavator	81	65
Dozer	82	66
Paver	77	61
Generator	81	65
Backhoe	78	62
Pile driver	101	85
Auger Drill Rig	84	68

SOURCE: FHWA, 2006.

Impact NOI-MC-2: Construction activities proposed under the 2014 LRDP at the Mission Center campus site would result in increases in ambient noise levels during pile-driving activities. (Potentially Significant)

An impact pile driver, if required could result in an increase of up to 15 dBA over existing noise levels, resulting in a significant noise increase over existing conditions. Consequently, mitigation measures to reduce construction noise are identified in **Mitigation Measure NOI-LRDP-2**.

Mitigation Measure: Implement Mitigation Measure NOI-LRDP-2

Significance after Mitigation: Significant and Unavoidable. Mitigation Measure NOI-LRDP-2 would reduce the severity of noise generated by pile-driving activities and reduce to the extent feasible the potential annoyance to nearby residents and others who could be disturbed by pile-driving. If piles can be installed though drilling and cast in place measures then these mitigation measures would result in a less than significant impact.

However, if geotechnical conditions exist such that impact or vibratory pile driving is required, then construction noise would be significant. Although pile-driving noise would be intermittent and would occur over a short duration, even after mitigation the increase in ambient noise level would likely exceed 10 dBA during pile-driving activities, resulting in a significant and unavoidable impact.

Impact NOI-MC-3: Construction activities proposed under the 2014 LRDP at the Mission Center campus site could generate ground-borne vibration. (Less than Significant)

The types of construction activities associated with propagation of ground-borne vibration include pile driving, use of hoe-rams for demolishing large concrete structures and caisson drilling. It is possible that pile driving and drilling could occur during building construction. Pile driving, if required could take one or more months, and would occur during daytime hours, consistent with the City's Police Code.

Of the construction equipment likely to be used for construction of the office building and parking structure, pile driving has the potential to result in the highest levels of groundborne vibration. Pile driving can result in peak particle velocities (PPV) of up to 1.5 inches per second (in/sec) at a distance of 25 feet (FTA, 2006), but typically results in an average of about 0.644 PPV at that distance. The Caltrans measure of the threshold of architectural damage for conventional sensitive structures is 0.5 in/sec PPV for new residential structures and modern commercial buildings and 0.25 in/sec PPV for historic and older buildings.

The nearest existing structure is approximately 60 feet away from the site of the proposed office building and parking structure, where pile driving may occur. At this distance, vibration from pile driving would be expected to be reduced to 0.17 inches per second. Therefore, vibration from pile driving would not exceed the criterion published by Caltrans of 0.25 in/sec for the protection of fragile older buildings. The nearest sensitive receptor are Folsom Street residents approximately 300 feet to the west. Vibration levels from pile driving at this distance would be 0.02 in/sec PPV which would be below the thresholds considered strongly perceptible. Consequently, if restricted to daytime hours, as required by ordinance, the 2014 LRDP proposals at the Mission Center campus site would have a less-than-significant impact with regard to groundborne vibration.

Mitigation: None required.

Impact NOI-MC-4: Operational noise generated by development under the 2014 LRDP at the Mission Center campus site could cause a long-term increase in ambient noise levels in the campus vicinity. (Less than Significant)

Long-term noise sources associated with operation of the new office building and parking structure would primarily consist of marginal increases in roadway traffic resulting from new and repurposed land use. There will likely be some new mechanical equipment (e.g. heating ventilation and air conditioning) associated with operation of the new office building. The potential location of such equipment is not at this time but such equipment would be operated is such a manner as to conform to the requirements of the City of San Francisco Noise Ordinance.

Increased traffic would primarily be on the local roadway network, including Fourteenth and Fifteenth Streets, Harrison Street and Folsom Street. A project would be considered to have a significant impact if it resulted in a permanent increase in ambient noise levels greater than 3 dBA above levels existing without the project for areas already impacted by noise.

Noise levels were determined for this analysis using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model and the turning movements in the traffic section for Existing (2014), Existing Plus LRDP, and Cumulative Plus LRDP conditions. Peak hour intersection turning data from the traffic study were analyzed to evaluate increases and resulting traffic-generated noise increases on roadway links most affected by LRDP -related traffic. The roadway segments analyzed and the results of the noise increases resulting from modeling are shown in **Table 9.10-3**, below.

TABLE 9.10-3
PEAK-HOUR TRAFFIC NOISE LEVELS IN THE VICINITY OF THE MISSION CENTER CAMPUS

Roadway Segment[a,b]	(A) Existing	(B) Existing Plus Project	(B-A) Difference between Existing Plus Project and Existing[c]	(D) Cumulative Plus Project (2035)	(D-A) Difference between Cumulative Plus Project and Existing
14th Street between Folsom Street and Harrison Street	61.7	61.9	0.2	62.4	0.7
15th Street between Folsom Street and Harrison Street	59.7	59.8	0.1	60.1	0.4
Harrison Street between 14th Street and 15th Street	66.0	66.1	0.1	66.4	0.4
Folsom Street between 14th Street and 15th Street	65.0	65.3	0.3	65.9	0.9

[a] Road center to receptor distance is 15 meters (approximately 50 feet) for all roadway segments. Noise levels were determined using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model.
[b] The analysis considered the vehicle mix based on – cars 95 percent, medium trucks three percent, and heavy trucks two percent on all streets. Traffic speeds for all vehicle classes were set at 30 mph for all vehicle classes.

SOURCE: ESA, 2014.

As shown in Table 9.10-3, the increase in traffic noise from the Existing Plus LRDP scenario compared to the Existing scenario would increase peak hour noise levels by less than 3 dBA at all roadway segments. Overall, traffic noise impacts associated with the LRDP at all analyzed roadway segments in the vicinity of the Mission Center campus site would be less than significant.

Mitigation: None required.

9.11 Population and Housing

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Population and Housing are contained in Section 4.11 of this EIR. The CEQA Significance Standards presented in Section 4.11.3 are used to evaluate the potential population and housing impacts of all proposed 2014 LRDP activities.

The 2014 LRDP would result in population growth in San Francisco or the wider Bay Area through increased employment and student enrollment. The 2014 LRDP would accommodate an increase in employment and students at all campus sites from the current approximately 30,840 to approximately 42,270 by 2035. This anticipated population increase could result in an increased demand for housing in the Bay Area. This overall increase and its potential effect on housing were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures.*

The 2014 LRDP development proposals would result in an increase in daily population at this campus site of 530 people. The direct and indirect physical environmental effects that result from those changes are fully considered in each of the appropriate topical sections of this Chapter.

9.12 Public Services

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Public Services are contained in Section 4.12 of this EIR. The CEQA Significance Standards presented in Section 4.12.3 are used to evaluate the potential public services impacts of all proposed 2014 LRDP activities.

In 2013, the estimated daily UCSF population across all sites, including patients and visitors, was approximately 39,420. At LRDP horizon in 2035, total population is projected to reach approximately 56,420, an increase of about 17,000, the majority of which would be associated with growth proposed by the 2014 LRDP. The projected increase in population at the Mission Center campus site would be approximately 530 people by 2035.

This anticipated population increase could result in an increased demand for public services in San Francisco, including fire protection, law enforcement, and public education. This overall increase and its potential effect on public services were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures*. The anticipated small increase in population at this campus site under the LRDP would not cause substantial increased demand for public services specific to this campus site, and all impacts are found to be less than significant.

9.13 Recreation

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Recreation are contained in Section 4.13 of this EIR. The CEQA Significance Standards presented in Section 4.13.3 are used to evaluate the potential recreation impacts of all proposed 2014 LRDP activities.

In 2013, the estimated daily UCSF population across all sites, including patients and visitors, was approximately 39,420. At 2014 LRDP horizon in 2035, total population is projected to reach approximately 56,420, an increase of about 17,000, the majority of which would be associated with growth proposed by the 2014 LRDP. The projected increase in population at the Mission Center campus site would be approximately 530 people by 2035.

After evaluation of the 2014 LRDP activities proposed at the Mission Center campus site, the Initial Study concluded that the anticipated small increase in population at this campus site under the LRDP would not cause substantial increased demand for recreation facilities specific to this campus site. All activities would result in no impact or less than significant impacts regarding recreation; therefore, no additional analysis is required.

9.14 Transportation and Traffic

This section considers the setting and transportation and traffic impacts of implementation of the 2014 LRDP at the Mission Center campus site. The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Transportation and Traffic are contained in Section 4.14 of this EIR. The CEQA Significance Standards presented in Section 4.14.3 are used to evaluate the potential transportation and traffic impacts of all proposed 2014 LRDP activities.

9.14.1 Transportation and Traffic Issues Adequately Addressed in the Initial Study

After evaluation of the 2014 LRDP activities proposed at the Mission Center campus site, the Initial Study concluded that:

- **Air traffic patterns.** No activities would result in a change in air traffic patterns. Therefore, no additional analysis of this issue is required.

9.14.2 Transportation and Traffic – Mission Center Setting

A more-detailed description of current transportation and traffic characteristics in the Mission Center campus site area is provided in Appendix G, Transportation Impact Study (TIS) for the UCSF LRDP.

9.14.2.1 Roadway Facilities

The network of regional roadways that serve the Mission Center campus site is described in Section 4.14.

The Mission Center campus site is located in the Mission neighborhood. The primary north-south corridors are Mission Street, Howard Street/South Van Ness Avenue, Folsom Street, Harrison Street, and Bryant Street. Primary east-west routes to the campus are Tenth Street, Thirteenth/Division Street, and Sixteenth Street. The primary vehicular entrances to parking and loading areas for the campus site are located along Harrison Street between Fourteenth and Fifteenth streets and along Fifteenth Street between Harrison and Folsom streets.

The local road network serving the Mission Center campus site consists of several two-lane roadways with on-street parking provided on both sides of the streets in most areas, as follows:

- **11th Street** runs from Bryant Street to Market Street and is classified as a Secondary Transit street. The 9 San Bruno and 9L San Bruno Limited bus lines operate along the entirety of 11th Street, while the 47 Van Ness bus line operates on 11th Street between Mission and Bryant streets. 11th Street has Class II bicycle lanes along its entire length.

- **14th Street** runs from Harrison Street to Buena Vista Terrace and operates one-way eastbound between Market and Folsom streets. 14th Street is designated as a Class III

bicycle route with shared-lane markings ("sharrows") between Harrison and Folsom streets.

- **15th Street** runs from Harrison Street to Roosevelt Way and operates one-way westbound between South Van Ness Avenue and Guerrero Street.

- **17th Street** runs from Pennsylvania Street to Stanyan Street. Near the campus site, 17th Street has Class II bicycle lanes in both directions.

- **Florida Street** runs from Division Street to 16th Street.

- **Alabama/Treat/Division Streets** runs from Bryant Street to 16th Street.

- **Shotwell Street** runs between 14th and 16th streets.

Major roadways in the local network are as follows:

- **Mission Street** is a four-lane roadway that extends from The Embarcadero to A Street in Daly City. The City classifies this roadway as a Primary Transit Oriented street. On-street parking is provided on both sides of the street. The 14 Mission and 14L Mission Limited Muni bus lines operate on Mission Street between The Embarcadero and San Jose Avenue; the 49 Mission/Van Ness bus line operates on Mission Street between South Van Ness Avenue and Ocean Avenue; and the 33 Stanyan operates on Mission Street between 16th and 18th streets. SamTrans Routes KX, 292 and 397 also operate along Mission Street between the Temporary Transbay Terminal and 10th Street. Several Golden Gate Transit basic and commute bus routes operate on Mission Street between the Temporary Transbay Terminal and Eighth Street.

- **Howard Street/South Van Ness Avenue** is a two to four-lane roadway that extends from The Embarcadero (as Howard Street) to Cesar Chavez Street (as South Van Ness Avenue), with Howard Street merging into South Van Ness Avenue just north of 13th Street. In addition, Howard Street operates as a southbound one-way street between Fremont Street and 11th Street. The City classifies this roadway as a Major Arterial. On-street parking is provided on both sides of the street. SamTrans Route 397 operates on Howard Street/South Van Ness Avenue between 10th Street and Cesar Chavez Street. Several Golden Gate Transit basic and commute bus routes operate on Howard Street between First and Eighth streets.

- **Folsom Street** is a three to four-lane roadway that extends from The Embarcadero to Ripley Street. In addition, Folsom Street operates as a northbound one-way street north of 11th Street. The City classifies this roadway as a Major Arterial east of 13th Street and a Local Street west of 13th Street. On-street parking is provided on both sides of the street. The 12 Folsom/Pacific bus line operates on Folsom Street between Second and Cesar Chavez streets. Several Golden Gate Transit basic and commute bus routes operate on Folsom Street between Fremont and Seventh streets. Folsom Street is designated as a Class II bike facility between 11th and 19th streets, but only has a northbound bicycle lane between 11th and 14th streets.

- **Harrison Street** is a three to four-lane roadway that extends from The Embarcadero to Cesar Chavez Street. The City classifies this roadway as a Secondary Transit street north of 11th Street(which transitions into a Primary Transit Important street until Fourth Street), a Major Arterial street between 11th and 13th streets, and a Local Street south of 13th Street.

In addition, Harrison Street operates as a southbound one-way street between Third Street and 10th Street. On-street parking is provided on both sides of the street. The 12 Folsom/ Pacific, 27 Bryant, and 47 Van Ness bus lines operate on Harrison Street between Fifth and 11th streets. Harrison has Class II bicycle lanes between 11th and 23rd streets, after which the street transitions into a Class III bicycle route.

- **Bryant Street** is a two to four-lane roadway that extends from The Embarcadero to Cesar Chavez Street. In addition, Bryant Street operates as a northbound one-way street between Second and 13th streets. The City classifies this roadway as a Secondary Transit street north of 11th Street (which transitions into a Primary Transit Important street until Third Street), a Major Arterial street between 11th and 13th streets, and a Local Street south of 13th Street. On-street parking is provided on both sides of the street. The 27 Bryant bus line operates on Bryant Street between Fifth and Cesar Chavez streets, while the 47 Van Ness bus line operates between 13th and Fourth streets.

- **10th Street** is a four-lane, one-way eastbound roadway that extends from Division Street to Market Street. The City classifies this roadway as a Major Arterial. On-street parking is provided on both sides of the street. San Mateo transit (SamTrans) operates on 10th Street between Mission and Division streets.

- **13th/Division Street** is a six-lane roadway that extends from Bryant Street to Mission Street underneath the US101 Central Freeway. The City classifies this roadway as a Major Arterial. On-street parking is provided on both sides of the street.

- **16th Street** is a four-lane roadway that extends from Third Street to Castro Street. The City classifies this roadway as a Primary Transit-Oriented street. On-street parking is provided on both sides of the street. The 22 Fillmore bus line operates on 16th Street between Kansas and Church streets, while the 33 Stanyan bus line operates between Potrero Avenue and Mission Street.

9.14.2.2 Intersection Operating Conditions

Intersection operating conditions at 15 intersections were evaluated during the weekday peak hours of the AM (7:00-9:00 AM) and PM (4:00-6:00 PM) peak periods. Intersections usually form the critical capacity constraints on roadways. Therefore, most transportation analyses examine intersection operations as a measure of overall roadway conditions.

The operating characteristics of intersections are evaluated using the concept of Level of Service ("LOS"). LOS is a qualitative description of driver comfort and convenience. Intersection levels of service range from LOS A, which indicates free flow or excellent vehicle flow conditions with short delays, to LOS F, which indicates congested or overloaded vehicle flow conditions with extremely long delays. In San Francisco, LOS A through D is considered acceptable, and LOS E and LOS F are considered unsatisfactory service levels. The intersections were evaluated using the 2000 Highway Capacity Manual (HCM) methodology. Tables summarizing the relationship between average delay per vehicle and LOS for signalized and unsignalized intersections according to the 2000 HCM method can be found in the appendices of the TIS for the UCSF Long Range Development Plan (Appendix G).

For signalized intersections, this methodology determines the capacity for each lane group approaching the intersection. The LOS is based on average delay (in seconds per vehicle) for the various movements within the intersection. A combined weighted average delay and LOS is presented for the intersection. For unsignalized intersections, operations are defined by the average control delay per vehicle (in seconds per vehicle) for each stop-controlled movement or movement that must yield the right-of-way, and the LOS is determined by the worst (highest average delay) approach. Generally, the delay ranges for each LOS are lower than for signalized intersections because drivers expect less delay at unsignalized intersections.

As shown in **Table 9.14-1**, 14 of the 15 study intersections operate at an acceptable level of service, which is LOS D or better during the AM peak hour, and all 15 operate at an acceptable LOS during the PM peak hour. The following intersection operates unacceptably during the AM peak hour:

- 13th Street and South Van Ness Avenue (#65) operates at LOS F during the AM peak hour due to the high volume of southbound traffic on South Van Ness Avenue.

9.14.2.3 Transit Network

The Mission Center campus site is well-served by public transit, both local and regional. Local service is provided by the Muni bus lines. Regional service is provided by BART, AC Transit, Golden Gate Transit, SamTrans, and Caltrain. UCSF supplements Muni transit service with its own shuttle system that provides direct connections to UCSF-operated facilities throughout San Francisco. In many cases, these shuttles provide a direct transit alternative between two campus sites that would otherwise require a transfer between two or more Muni routes. Based on the 2013 UCSF Transportation Commute Survey, approximately 25% of those traveling to and from the campus site use public transit, while another 13% rely on UCSF shuttles to get to and from the campus site.

Local Transit

San Francisco Muni. San Francisco Municipal Railway (Muni) provides transit service within the City and County of San Francisco, including bus (both diesel and electric trolley), light rail (Muni Metro), cable car and electric streetcar lines. Muni operates ten bus lines in the vicinity of the Mission Center campus site (see TIS in Appendix G for details about these transit lines).

The Transit Effectiveness Project (TEP) serves as both a thorough review of and repositioning of San Francisco's public transit system, initiated by SFMTA in collaboration with the City Controller's Office. The TEP is aimed at improving reliability, reducing travel times, providing more frequent service and updating Muni bus routes and rail lines to better match current travel patterns. TEP recommendations include new routes and route realignments, more service on busy routes, and elimination or consolidation of certain routes or route segments with low ridership. The TEP recommendations were unanimously endorsed by the SFMTA Board of Directors in October 2008, for environmental impact review. The initial TEP recommendations were revised based on public feedback on the draft TEP environmental impact report (TEP EIR). The TEP EIR was certified on March 27, 2014, and the SFMTA Board of Directors approved most of the

TABLE 9.14-1
EXISTING PEAK-HOUR INTERSECTION LEVEL OF SERVICE (LOS) – MISSION CENTER

Intersection	Traffic Control[a]	Peak Hour	Delay (seconds)[b]	LOS[c]
61. 13th Street / South Van Ness Avenue	Signal	AM PM	**71** 30	**F** C
62. 13th Street / Folsom Street	Signal	AM PM	26 29	C C
63. 13th Street / Harrison Street	Signal	AM PM	16 19	B B
64. Tenth Street / Bryant Street	Signal	AM PM	14 16	B B
65. 14th Street / South Van Ness Avenue	Signal	AM PM	15 16	B B
66. 14th Street / Folsom Street	Signal	AM PM	16 15	B B
67. 14th Street / Harrison Street	AWS	AM PM	11 (12) 20 (24)	B (B) C (C)
68. 15th Street / South Van Ness Avenue	Signal	AM PM	15 18	B B
69. 15th Street / Folsom Street	Signal	AM PM	12 29	B C
70. 15th Street / Harrison Street	AWS	AM PM	10 (12) 14 (15)	B (B) B (C)
71. 16th Street / Mission Street	Signal	AM PM	26 16	C B
72. 16th Street / South Van Ness Avenue	Signal	AM PM	37 20	D B
73. 16th Street / Folsom Street	Signal	AM PM	38 28	D C
74. 16th Street / Harrison Street	Signal	AM PM	21 30	C C
75. 16th Street / Bryant Street	Signal	AM PM	20 35	C D

[a] AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
[b] Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For unsignalized intersection, the highest average delay for an approach is reported.
[c] For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
[d] **Bold** indicates unacceptable operations per UCSF LOS standards

SOURCE: Fehr & Peers, 2014.

Service Improvements and portions of the Transit Travel Time Reduction Proposals on March 28, 2014.[5] The TEP project will be implemented based on funding and resource availability. The TEP Implementation Strategy anticipates that many of the improvements will be implemented sometime between Fiscal Year 2014 and Fiscal Year 2019, subject to funding sources and

[5] San Francisco Planning Department. 2014. TEP Final EIR, March 27, 2014, Available online at http://tepeir.sfplanning.org. Accessed April 3, 2014. Case No. 2011.0558E. The document and supporting information may also be viewed at the Planning Department, 1650 Mission Street, Suite 400, San Francisco, CA in case file 2011.0558E.

resource availability.[6] The changes proposed by the TEP for routes near the Mission Center campus site are described in the TIS (Appendix G).

UCSF Shuttle System

UCSF Shuttles to and from the Mission Center campus site (Lime, Red, and Yellow) stop in the parking lot located adjacent to the Mission Center building on the corner of Harrison and 15th streets. A more-detailed description of the UCSF shuttle system serving the Mission Center campus site area is provided in Appendix G (TIS for the UCSF LRDP).

9.14.2.4 Pedestrian Circulation

Walking to and from the campus site is a relatively small travel mode for many UCSF Mission Center employees and students. Based on the 2013 UCSF Transportation Commute Survey, approximately 3% of those traveling to and from the campus site walk, although those using Muni or BART arrive to the campus site via foot as well. Approximately 50% of all trips made by UCSF Mission Center campus site employees and students to off-campus locations throughout the day are made by foot.

Pedestrian facilities include sidewalks, crosswalks, curb ramps, and pedestrian signals. Within the Mission Center area, sidewalks exist on both sides of the street in most locations, and are generally 11 to 15 feet wide. Standard crosswalks are provided at most intersections surrounding the campus site, however no crosswalks are striped across 14th Street at the t-intersection with Trainor Street, nor across Harrison Street at the t-intersection with Alameda Street. Curb ramps are generally provided at most intersections and pedestrian signals are present at signalized intersections in the campus site vicinity.

9.14.2.5 Bicycle Circulation

The topography at and around the Mission Center campus site is relatively flat, which facilitates easy bicycle travel. Based on the 2013 UCSF Transportation Commute Survey, approximately 6% of UCSF Mission Center employees and students bike to the campus site, which is approximately double the bicycling mode share throughout San Francisco. In addition, approximately 3% of trips made by UCSF Mission Center employees and students to off-site, non-UCSF locations throughout the day are made by bike. The following bicycle facilities are located near the Mission Center campus site:

- 11th Street is part of San Francisco Bike Routes 25 and 30, an east-west bike route that extends from Market Street to 13th Street with Class II bicycle lanes.

- 13th Street/Division is part of Bike Route 36, an east-west bike route that extends from Townsend Street to Bryant Street with Class II physically-separated bicycle lanes between Brannan and Townsend streets.

6 San Francisco Municipal Transportation Agency. 2014. TEP Implementation Workbook, March 5, 2014, Available online at: http://www.sfmta.com/sites/default/files/projects/TEP%20Implementation%20Plan%20-%20Section%201%20%282%29_1.pdf. Accessed June 27, 2014.

- 14th Street is part of Bike Routes 30 and 36, an east-west bike route that extends from Harrison Street to Market Street with a Class II bicycle lane and Class III sharrows.

- 17th Street is part of Bike Routes 25 and 40, an east-west bike route that extends from Kansas Street to Market Street with Class II bicycle lanes between Kansas and Church streets. Between Church and Market streets, 17th Street is designated as a Class III bicycle route, but does not have shared-lane markings.

- Harrison Street is part of Bike Routes 25, 33, and 36, a north-south bike route that extends from 11th Street to Cesar Chavez Street. From 11th Street to 23rd Street, the route has Class II bicycle lanes. South of 23rd Street to Cesar Chavez, the route is designated as a Class III bicycle facility with no shared-lane markings.

- Folsom Street is part of Bike Route 30, a north-south bike route that extends from 11th Street to 19th Street as a Class II route. However, only the segment of Folsom between 11th Street and 14th Street has a single, northbound bicycle lane.

The SF Bike Plan includes planned short-term improvements to Bicycle Route 25 on Howard Street and Route 40 on 17th Street. Improvements to Howard Street include bicycle lanes from Ninth Street to 11th Street. Improvements to 17th Street include bicycle lanes between Market Street and Corbett Avenue.

The streets surrounding the Mission Center campus site serve as popular bicycle routes, connecting the Mission neighborhood with Downtown San Francisco. Bicycle routes connecting to downtown such as Harrison, Folsom, and 14th streets all see over 200 bicyclists during the AM peak hours. These routes are slightly less traveled in the PM peak hour, but still generally exceed 50 to 100 bicyclists. Other popular streets for bicycling include Division Street and Sixteenth Street, which is not a signed bicycle route, but sees between 20 and 40 bicyclists during the AM and PM peak hours.

Bicycle racks are provided adjacent to the main entrance to the Mission Center Building. In an effort to increase bike parking and respond to feedback received from bicyclists, UCSF has recently redesigned and expanded the bike parking with new user-friendly racks.

9.14.2.6 Loading Conditions

The Mission Center campus site has both service vehicle and passenger loading. There is one off-street service vehicle loading facility serving the existing uses on the campus site. Marked zones for passenger and service vehicles are unavailable on adjacent streets, with most passenger loading occurring within the parking lot, adjacent to the existing building. The Mission Center campus site receives approximately 12 deliveries per day in the designated off-street loading area. Additional parcel deliveries are made at the front of the building on Folsom Street, sometimes blocking the bicycle lane. Existing vehicle loading areas are sufficient for existing demand.

9.14.2.7 Parking Conditions

On-Street Parking

The majority of the on-street parking spaces in the vicinity of the Mission Center campus site are generally unrestricted. On-street parking on South Van Ness Avenue is limited to a one-hour period between the hours of 8:00 AM and 6:00 PM.

Parking occupancies throughout the mid-morning (10:00 AM to 12:00 Noon) and midday (12:00 Noon to 2:00 PM), periods are very similar, at 95% (i.e., at their effective capacity); parking utilization in the evening (6:30 PM to 8:00 PM) period is about 80%. An occupancy above 90% typically represents that the facility has reached its effective capacity.

Off-Street Parking

The Mission Center campus site provides 224 marked parking spaces at an adjacent surface lot on the east side of the building. The vast majority of the spaces are reserved for UCSF permit-holders, with 17 spaces available for general paid parking.

Additional non-UCSF owned public parking is available at nearby facilities, including a surface lot at 3111 17th Street at the northwest corner of 17th and Folsom streets (220 spaces), a surface lot at 24 Florida Street near Treat Street (139 spaces), and a surface lot at 1550 Bryant Street near 15th Street (41 spaces).

Overall off-street parking occupancy is 86% during the mid-morning period and 87% during the midday period, while the overall occupancy in the evening is 38%. The overall peak parking occupancy at the UCSF surface parking lot is lower than at the other facilities. During mid-morning, the peak parking demand period, the parking lot at the Mission Center campus site operates at 86% of its capacity, while the other facilities have a combined utilization of 88%. An occupancy above 90% typically represents that the facility has reached its effective capacity.

9.14.3 Transportation and Traffic – Mission Center Campus Site Impacts and Mitigation Measures

9.14.3.1 Impact Methodology

Analysis Approach

The transportation analysis in this EIR considers operations-related issues related to vehicular traffic, transit facilities, pedestrians, bicyclists, and parking, as well as construction-related impacts, associated with the 2014 LRDP at the Mission Center campus site. To determine potential impacts on the transportation system, it was first necessary to establish the background transportation conditions for the horizon years. Future year background conditions for this project are based on the countywide travel demand model developed and maintained by the San Francisco County Transportation Authority (SFCTA).

Vehicle, pedestrian, bicycle, and transit travel demand associated with the 2014 LRDP was estimated based on factors developed from extensive surveys conducted at existing UCSF facilities over the past few years, and through the use of a four-step process: trip generation, mode split, trip distribution, and trip assignment. In the first step, the number of person trips generated by the 2014 LRDP was estimated on a daily, AM and PM peak hour basis. Next, the person trips were assigned to different modes of travel (automobile, public transit, UCSF shuttle, bicycles, etc.). Then, the geographic distribution of the trip origins and destinations was predicted, and finally, project trips for each mode were assigned to specific streets, UCSF shuttle routes and transit lines along the transportation network.

Travel Demand Estimates

The 2014 LRDP proposes various levels of growth at each campus site through the plan horizon year of 2035. Some known projects, such as Phase 2 of the Medical Center in Mission Bay, are currently projected to occur between 2035 and 2040, after the 2014 LRDP horizon year, but have been incorporated into the travel demand estimates presented in this document, As such, the transportation analysis represents a conservative approach as it includes development five years past the 2015 LRDP horizon, to the year 2040. Each campus site is expected to increase in population through the 2014 LRDP horizon year, with the highest growth expected at the Mission Bay site.

The Mission Center campus site is estimated to generate a total of approximately 1,064 new daily person trips by 2040. That number of trips reflects the total number of additional person trips that would be generated by the increased campus site population. As described in Sections 6.14 and 7.14, some trips generated by campus site activity are internal trips that occur within the campus site. However, given its relatively small size, and to provide a conservative estimate of travel demand, no internal person trips were assumed to occur within the Mission Center campus site.

"Mode choice" is the designation of trips to the various means that people use to travel, such as automobile, transit, walking, bicycling, taxi, or other mode of transportation. The determination of the mode of transportation used in trips to and from the Mission Center campus site would depend on many characteristics of the trip (e.g., the population group that is, faculty, staff, vendor, patient, visitor), the type of trip (work, visit), and the specific site. Travel mode split and average vehicle occupancy assumptions were based on information collected by UCSF and its consultants, with the estimates of the future modal share based on the current modal splits for each campus site by population type, which take into account the transit accessibility, UCSF shuttle service, parking availability, and TDM measures being provided at each campus site; this approach is consistent with the travel demand methodologies established by the SF Planning Department. The majority of Mission Center campus site trips arrive/depart the campus site by driving alone, followed by travel by public transit. The above-cited external daily person trips generated by the Mission Center campus site are expected to use the following travel modes:

490 Auto Drive Alone
10 Drop-Off/Taxi
49 Carpool/Vanpool
275 Public Transit

135 UCSF Shuttle
68 Bicycle/Motorcycle
37 Walk

The auto drive alone, drop-off/taxi, carpool/vanpool, and UCSF shuttle person trips would generate about 539 daily vehicle trips.[7]

Approximately 120 new vehicle trips would occur during the AM peak hour, and about 110 new vehicles would occur during the PM peak hour. There would be approximately 105 and 100 new transit riders in the AM and PM peak hour, respectively. A majority of transit users are expected to arrive/depart by SF Muni, BART, or the UCSF bus shuttle service.

The new trips associated with the Mission Center campus site were assigned to San Francisco and regional origins/destinations, including the four San Francisco Superdistricts (northeast, northwest, southeast, and southwest quadrants of the City), the East Bay, the North Bay, and the South Bay, as well as areas outside the Bay Area region. Information collected by UCSF as part of their ongoing surveys of employees, patients, visitors and residents were used in this analysis.

9.14.3.2 Construction Period Impacts

Impact TRAF-MC-1: Implementation of the 2014 LRDP on the Mission Center campus site could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during construction activities. (Potentially Significant)

Impacts associated with demolition and construction activities that would occur as the 2014 LRDP is implemented are addressed in Chapter 5 (Impact TRAF-LRDP-1). That 2014 LRDP Plan-Level analysis determined that although construction activities would be temporary, construction impacts would be considered potentially significant given the magnitude of LRDP development over the course of many years and need for on-going coordination and monitoring. The potentially significant determination would apply to the LRDP elements of the Mission Center campus site. The implementation of LRDP **Mitigation Measure TRAF-LRDP-1: Construction Coordination and Monitoring Measures** would reduce construction-period impacts to less-than-significant levels.

Mitigation Measure: Implement **Mitigation Measure TRAF-LRDP-1**

Significance after Mitigation: Less than Significant

9.14.3.3 Operational Impacts

Impact TRAF-MC-2: Implementation of the 2014 LRDP on the Mission Center campus site would increase traffic at intersections on the adjacent roadway network. (Less than Significant)

[7] Vehicle trips are calculated based on the following formula: Drive Alone trips + (Drop-off trips x 2) + (Carpool trips / 2) + (Vanpool trips / 10) + (UCSF Shuttle / 15).

Table 9.14-2 presents a summary comparison of Existing and Existing plus Plan intersection LOS for the weekday AM and PM peak hours. In general, the addition of 2014 LRDP-generated traffic would result in small changes in the average delay per vehicle at the study intersections, and most study intersections would continue to operate at the same service levels as under Existing conditions. The great majority of the study intersections operate at acceptable levels of service (LOS D or better) under both AM and PM peak hour conditions under Existing conditions, and would continue to operate acceptably under Existing Plus 2014 LRDP conditions.

The following study intersection currently operates at an unacceptable LOS F, and would continue to operate at the same LOS under Existing Plus 2014 LRDP conditions:

61. 13th Street / South Van Ness Avenue (AM peak hour)

The 2014 LRDP would add 14 vehicle trips to the critical southbound through movement (LOS F) during at the 13th Street/South Van Ness Avenue (Intersection #61) signalized intersection, which represents a 1% increase from Existing conditions. That 1% increase would be less than the threshold of significance, and the 2014 LRDP's contribution (and impact) would be considered less-than-significant.

Mitigation: None required.

Impact TRAF-MC-3: Implementation of the 2014 LRDP on the Mission Center campus site would increase transit ridership demand. (Less than Significant)

As described in 9.14.3.1 above, approximately 105 and 100 new transit riders in the AM and PM peak hour, respectively. A majority of transit users are expected to arrive/depart by SF Muni, BART, or the UCSF bus shuttle service.

San Francisco Muni

Existing Muni transit stops are located within a half-mile of the campus site, and are accessible by walking. Major stop relocations adjacent to campus are not anticipated at this time. The TEP proposes to reduce headways for the 9L San Bruno Limited, 14/14L Mission Limited, and 22 Fillmore. In addition to increasing peak period headways, the 22 Fillmore will be rerouted to continue along 16th Street, connecting to Mission Bay. The 12 Folsom/Pacific will be discontinued, though a majority of the route will be served by rerouting the 27 Bryant and the new 11 Downtown Connector.

The estimated number of 2014 LRDP-generated Muni trips is a relatively small increase (about 1% to 3%) in ridership traveling to and from the Mission Center campus site, which

TABLE 9.14-2

[a] AWS = All-way stop controlled; SSS = Side Street stop controlled; Signal = Signal controlled
[b] Delay reported as seconds per vehicle. For signalized intersections, a combined weighted average delay for the various movements within the intersection is reported. For unsignalized intersection, the highest average delay for an approach is reported.
[c] For signalized intersections, LOS based on average intersection delay, based on the methodology in the Highway Capacity Manual, 2000. For unsignalized intersection, LOS is based on the worst approach which is indicated in parentheses.
[d] **Bold** indicates unacceptable operations per UCSF LOS standards

SOURCE: Fehr & Peers, 2014.

would not require the expansion of transit service or facilities. Additionally, none of the specific proposals of the 2014 LRDP would reconfigure, or reduce access to, transit stops in a way that would degrade transit service to the campus site. Therefore, the 2014 LRDP's transit impact on Muni service would be considered less than significant.

Regional Transit

UCSF staff, patrons and students are anticipated to continue to use BART, AC Transit, Caltrain, SamTrans, and Golden Gate Transit for regional transit service through the 2014 LRDP horizon year. Regional service stations are likely to remain at existing locations, over a half-mile away,

and can be accessed by other transit modes such as SF Muni and the UCSF shuttle, and by walking in the case of the 16th Street BART. Fewer than 40 new regional transit trips are expected during each AM and PM peak hours, and that increase would not require the expansion of regional transit service or facilities. Therefore, the 2014 LRDP's transit impact on regional transit service would be considered less than significant.

UCSF Shuttle

Current UCSF shuttle service operations would continue to serve the Mission Center campus site under the 2014 LRDP, with the shuttle stop and loading area shifted to 15th Street, just east of the vehicle access point. The proposed shuttle loading areas should accommodate two shuttles loading at one time. The new shuttle stop would displace three on-street spaces with parking meters. The LRDP does not propose specific changes to shuttle service headways, although UCSF Transportation Services may change headways based on shifting shuttle demand as LRDP projects are constructed and occupied at the campus site.

An approximately 60% increase in UCSF Shuttle ridership during both peak hours is anticipated through the 2014 LRDP horizon year, and that increase would not require the expansion of UCSF shuttle service or facilities. Therefore, the 2014 LRDP's transit impact on UCSF Shuttle service would be considered less than significant.

Mitigation: None required.

Impact TRAF-MC-4: Implementation of the 2014 LRDP on the Mission Center campus site would not cause a substantial conflict with pedestrian facilities, or otherwise decrease the performance or safety of such facilities. (Less than Significant)

The 2014 LRDP does not propose changes to pedestrian amenities or introduce new conflicts to the pedestrian network surrounding the Mission Center campus site. Overall, the 2014 LRDP would not change pedestrian accessibility to the Mission Center campus site and on the campus site frontage.

The 2014 LRDP would add approximately 100 and 90 pedestrian trips (mostly transit-access trips) to the surrounding streets during the AM and PM peak hours, respectively. Pedestrian trips would primarily use 15th Street to access the surrounding street grid network and connect to residential and commercial neighborhoods in Mission and SoMa. The 2014 LRDP-generated transit trips will begin as pedestrian trips traveling along 15th, 16th, Folsom, and Harrison streets to the nearest BART Station at 16th and Mission streets, and Muni bus routes on Mission Street, Folsom Street, 16th Street, or 11th Street.

The 2014 LRDP proposes to relocate the current UCSF shuttle stop from the parking lot to the north side of 15th Street midblock. This relocated shuttle stop, and the UCSF shuttle riders, would not hinder pedestrian mobility on 15th Street because the 15-foot-wide sidewalks would handle the expected pedestrian traffic. Existing pedestrian facilities surrounding the Mission Center campus site adequately accommodate existing pedestrian volumes and overcrowding is not expected to occur due to the 2014 LRDP.

The immediate area surrounding the Mission Center campus site includes robust pedestrian facilities that provide access to nearby neighborhoods, commercial uses, and transit stops, and that would accommodate the new pedestrian trips generated by the 2014 LRDP. The 2014 LRDP would not create substantial conflicts between pedestrians and autos, bicyclists, or transit vehicles. Therefore, the 2014 LRDP's impact to pedestrian circulation and facilities at the Mission Center campus site would be less than significant.

Mitigation: None required.

Impact TRAF-MC-5: Implementation of the 2014 LRDP on the Mission Center campus site would not would not cause a substantial conflict with bicycle facilities, or otherwise decrease the performance or safety of such facilities. (Less than Significant)

The area around the Mission Center campus site has a number of streets with bicycle lanes, and streets designated as bicycle routes, including Folsom Street, Harrison Street, 17th Street, 14th Street, and 11th Street. The Mission Center campus site is within convenient bicycling distance of residential and commercial areas in surrounding neighborhoods. The 2014 LRDP does not propose changes to the bicycle circulation network surrounding the Mission Center campus site. The SF Bike Plan includes planned short-term improvements to add bicycle lanes from Ninth Street to 11th Street for Bicycle Route 25 on Howard Street.

Parcel delivery vehicles occasionally block the bicycle lane on Folsom Street in front of the Mission Center campus site due to the lack of a curbside loading zone. Folsom Street is a popular bicycle route to Downtown San Francisco, and bicyclists currently must pass the loading vehicles in the vehicle travel lane. While this is not considered a significant impact, an Improvement Measure to add a curbside loading zone on Folsom Street has been identified. UCSF would work with the SFMTA to add a 50-foot-long loading zone adjacent to the existing Mission Center building. Such a loading zone would require removing of two parking spaces on Folsom Street, but would improve conditions for bicyclists who currently have their travel path blocked by vehicles loading in the bicycle lane.

The 2014 LRDP is expected to increase bicycle demand in the area by approximately 15 new trips during both the AM and PM peak hours. These trips would primarily occur on designated bicycle facilities, which connect to surrounding neighborhoods through the San Francisco Bike Route network. The increased bicycle demand would be accommodated at the campus site through additional bicycle parking provided as a part of UCSF's TDM program. In the near-term, UCSF plans to add four new bicycle racks at the Mission Center Campus Site, which would increase bicycle parking capacity and generally improve bicycle conditions on the campus site.

The expected increase in bicycle traffic would not represent a level that would adversely affect bicycle facilities on the campus site, nor would the 2014 LRDP create substantial conflicts between bicyclists and pedestrians, autos, or transit vehicles. Therefore, the 2014 LRDP's impact to bicycle circulation and facilities at the Mission Center campus site would be less than significant.

Mitigation: None required.

Impact TRAF-MC-6: Implementation of the 2014 LRDP on the Mission Center campus site would increase loading demand. (Less than Significant)

The San Francisco Planning Code requires that land uses, such as medical offices and hospitals, provide off-street loading spaces according to a prescribed schedule. The required loading supply was estimated based on that Code schedule, and the existing and proposed loading supply exceeds the Code requirement at the Mission Center campus site.

The demand for loading spaces through the 2014 LRDP horizon year was calculated based on surveys from the Parnassus Heights campus site and methods described in the City's *Transportation Impact Analysis Guidelines for Environmental Review*. The existing peak hourly demand is estimated to be about 4 spaces on the Mission Center campus site, and the 2014 LRDP horizon year peak hourly demand is estimated to be about 6 spaces.

It is expected that the estimated 2014 LRDP loading supply should be adequate for the estimated demand, but as mentioned above, the campus sites are unique and should be monitored over time. This is considered a less-than-significant impact if UCSF continues to monitor loading operations and provide appropriate supply with guidance from the SF Planning Code and existing operations.

In addition to freight loading, there is a demand for passenger loading spaces, and in order to estimate passenger loading demand, the drop-off/taxi service mode split and a portion of the carpool mode split percentages presented in 9.14.3.1 above was applied to the peak AM and PM peak-hour person trips. The peak-hour passenger loading demand is estimated to increase by three or four spaces at the Mission Center campus site.

The existing passenger loading supply is sufficient for the estimated 2014 LRDP loading needs during both the AM and PM peak hour. Therefore, the 2014 LRDP's impact to passenger loading is considered less than significant.

Mitigation: None required.

Impact TRAF-MC-7: Implementation of the 2014 LRDP on the Mission Center campus site would increase parking demand. (Less than Significant)

Under the 2014 LRDP, additional parking would be provided on the Mission Center campus site, as warranted by the proposed development (i.e., the number of any new parking spaces would be determined as projects are proposed). It is estimated that the number of parking spaces owned by UCSF at the Mission Center campus site would increase by approximately 70 spaces by year 2040. The following list describes the currently proposed changes in parking supply:

- A new UCSF building would be constructed at the existing surface parking lot to the east of the existing Mission Center building, with approximately 294 parking spaces.

As described previously, the available on-street parking is well-occupied at the Mission Center campus site, and has therefore not been considered as a resource for the future parking utilization analysis, which has focused instead on the availability of off-street parking. Assessment of the

growth of peak parking demand under the 2014 LRDP shows that the future parking utilization at the Mission Center campus site would be approximately 100 spaces above the future planned supply. However, as part of the implementation of the 2014 LRDP, UCSF would monitor parking demand at each phase of development and adjust parking supply as demand warrants. Should the demand for parking exceed on-site supply, priority for on-site parking would be given to patients and visitors, and if necessary, UCSF would look to secure off-site parking to satisfy staff demand. That additional parking supply could be on the site, if available, or elsewhere in the vicinity. As the sites develop, UCSF (through its Campus Transportation Services Offices) will make efforts to educate faculty, staff and students about transit options in order to reduce auto usage and parking demand. Thus, the parking impacts under the 2014 LRDP would be less than significant.

Mitigation: None required.

9.15 Utilities and Service Systems

The Regional Setting, Regulatory Considerations, Significance Standards and Analysis Methodology for analysis of potential effects of Utilities and Service Systems are contained in Section 4.15 of this EIR. The CEQA Significance Standards presented in Section 4.15.3 are used to evaluate the potential utilities and service systems impacts of all proposed 2014 LRDP activities.

The overall effects on water supply, wastewater treatment, storm drainage facilities, solid waste disposal and energy demand resulting from implementation of the 2014 LRDP were evaluated in Chapter 5, *2014 LRDP – Impacts and Mitigation Measures*. No expansion of water, wastewater or storm drainage facilities beyond the standard service connections of future buildings to the City's existing infrastructure is anticipated at the Mission Center campus site.

This page intentionally left blank

CHAPTER 10
CEQA Statutory Sections

This chapter summarizes the following categories of impacts resulting from implementation of the 2014 LRDP; significant and unavoidable environmental impacts; cumulative impacts; growth-inducing impacts; and significant irreversible environmental effects.

10.1 Significant and Unavoidable Impacts

Section 15126.2(b) of the CEQA Guidelines requires an EIR to identify significant environmental effects that cannot be avoided if the project is implemented, including those that can be mitigated, but not to a less-than-significant level. This section identifies significant impacts that could not be eliminated or reduced to a less-than-significant level by mitigation measures imposed by UCSF. The final determination of significance of impacts and of the feasibility of mitigation measures will be made by the Regents as part of their certification action for the EIR. The following significant and unavoidable impacts would result from implementation of the 2014 LRDP:

2014 LRDP

- **Impact AIR-LRDP-4:** Implementation of the 2014 LRDP would result in increased emissions of criteria air pollutants during demolition and construction activities.

- **Impact AIR-LRDP-5:** Implementation of the 2014 LRDP would result in increased emissions of criteria air pollutants during operation.

- **Impact CUL-LRDP-2:** Implementation of the 2014 LRDP could result in demolition of historical resources as defined in CEQA Guidelines Section 15064.5.

- **Impact NOI-LRDP-2:** Implementation of the 2014 LRDP would result in increased ambient noise levels during pile-driving activities.

2014 LRDP Proposals at the Parnassus Heights Campus Site

- **Impact CUL-PH-2:** Demolition of the Surge building at the Parnassus Heights campus site would result in a substantial adverse change in the significance of an historical resource.

- **Impact NOI-PH-1:** Demolition activities proposed under the 2014 LRDP at the Parnassus Heights campus site would result in a temporary increase in ambient noise levels.

- **Impact NOI-PH-2:** Construction activities proposed under the 2014 LRDP at the Parnassus Heights campus site would result in increases in ambient noise levels over the term of the exterior construction activities.

2014 LRDP Proposals at the Mission Bay Campus Site

- **Impact AIR-MB-3:** Operations at the Mission Bay campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants.

- **Impact NOI-MB-2:** Construction activities proposed under the 2014 LRDP at the Mission Bay campus site would result in increases in ambient noise levels during pile-driving activities.

- **Impact UTIL-MB-2:** There may be impacts related to wastewater infrastructure as a result of 2014 LRDP development at the Mission Bay campus site.

2014 LRDP Proposals at the Mount Zion Campus Site

- **Impact CUL-MZ-1:** Demolition of the Hellman building at the Mount Zion campus site would result in a substantial adverse change in the significance of an historical resource.

- **Impact NOI-MZ-1:** Demolition activities proposed under the 2014 LRDP at the Mount Zion campus site would result in a temporary increase in ambient noise levels.

- **Impact NOI-MZ-2:** Construction activities proposed under the 2014 LRDP at the Mount Zion campus site would result in increases in ambient noise levels over the term of the exterior construction activities.

2014 LRDP Proposals at the Mount Zion Campus Site

- **Impact NOI-MC-2:** Construction activities proposed under the 2014 LRDP at the Mission Center campus site would result in increases in ambient noise levels during pile-driving activities.

10.2 Cumulative Impacts

10.2.1 Introduction

The CEQA Guidelines define cumulative impacts as two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts. The Cumulative impact analysis required under CEQA is intended to describe the "incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects" which can result from "individually minor but collectively significant projects taking place over a period of time" (CEQA Guidelines Section 15355).

Cumulative impacts must be discussed when they could be significant, but the discussion may be more general than that for individual project impacts. The discussion should also reflect the potential extent, severity, and probability of the impact. The cumulative impact analysis must be based on either a list of reasonably foreseeable projects, or projections from a General Plan or a contribution to significant cumulative impacts must also be proposed.

This chapter contains the cumulative impact analysis for the environmental topics addressed in Sections 5.1 through 5.15 of this EIR. The cumulative impact analyses consider the impacts from implementation of the 2014 LRDP (either significant or less than significant), plus:

- Impacts from other projects similar to the project, including those from other on-going UCSF projects or activities;
- Impacts such as traffic generation or demand for public services, that are similar to project impacts, but which result from other projects independent of the proposed project;
- The interaction of these impacts to create a cumulative impact affecting the same geographic area as the impact of the proposed project; and
- Whether the project's contribution to a significant cumulative impact is cumulatively considerable.

10.2.2 General and Regional Plans Considered in the Cumulative Analysis

Consistent with CEQA Guidelines Section 1530(b)(1)(B), the cumulative impact analysis in this EIR considers the 2014 LRDP's effects in combination with the projections contained within previously approved local and regional planning documents and forecasting models, including, but not limited to the *San Francisco General Plan*, the *Mission Bay Redevelopment Plan*, the San Francisco County Transportation Authority (SFCTA) Forecast Model, Port of San Francisco plans and regional planning documents from the Association of Bay Area Governments (ABAG), Bay Area Air Quality Management District (BAAQMD) and California Department of Transportation (Caltrans), as well as all associated environmental review documents.

10.2.3 Specific Projects Considered in the Cumulative Analysis

Consistent with CEQA Guidelines Section 15130(b)(1)(A), this cumulative impact analysis also considers other known or reasonably foreseeable projects that could combine with potential impacts from implementation of the 2014 LRDP within the same geographic area. These include the following:

- UCSF projects underway at the Parnassus Heights and Mission Bay campus sites
- *Mission Bay Redevelopment Plan* (North and South) projects
- Proposed Golden State Warriors Event Center Project – an arena and other development on a 12-acre site bounded by Third, 16th and South streets and Terry Francois Boulevard. Blocks 29-32 in the Mission Bay South Redevelopment Area. The Warriors project, now in environmental review by the City, proposes to construct an arena and other development on its site, rather than the general office / research and development uses in the *Mission Bay Redevelopment Plan.*

10.2.4 Areas of Potential Cumulative Impacts

10.2.4.1 Aesthetics

The Parnassus Heights, Mount Zion and Mission Center campus sites are located in urban settings surrounded by a mix of institutional, residential, neighborhood commercial and open space uses. These areas are built-out and opportunity for new development is limited, requiring reuse or redevelopment of existing buildings rather than new construction on undeveloped tracts of adjacent land. As such, potential growth in the vicinity of the these three campus site would be limited to the intensification or rebuilding of existing uses, which could result in changes in the size or architectural character of several individual buildings. However, development proposed under the 2014 LRDP at the Parnassus Heights, Mount Zion or Mission Center campus sites would not be visually incompatible or result in adverse effects to the future aesthetic character of these neighborhoods, thus the 2014 LRDP does not contribute to cumulative aesthetic impacts at these campus sites.

The *Mission Bay South Redevelopment Plan* and the Port of San Francisco's *Waterfront Land Use Plan* call for a future mix of land uses and increased density in the Mission Bay area. Development proposed under the 2014 LRDP at the Mission Bay campus site would be designed in accordance with UCSF's design guidelines to generally be visually consistent with the development patterns and urban environment planned for in the *Mission Bay South Redevelopment Plan*. The 2014 LRDP would generally be consistent with the *Mission Bay South Redevelopment Plan* in terms of scale and architectural design, so implementation of the 2014 LRDP would not substantially degrade the existing visual character of the surrounding area, and the visual effects would not be cumulatively considerable.

10.2.4.2 Air Quality

As detailed in Section 5.2 and Sections 7.2 and 8.2, site-specific construction and demolition activities at the Mission Bay and Mount Zion campus sites would have local, significant cumulative impact on air quality. Project construction would be a temporary significant impact at these sites, but could be mitigated through identified measures, including avoiding overlapping construction schedules at the Mission Bay campus site. The impacts would be cumulatively considerable when considered in combination with other construction proposed in the immediate area of each campus site.

Operations under the 2014 LRDP would increase emissions within the San Francisco Bay Area Air Basin which is designated as a non-attainment region for state and federal ozone and particulate matter standards. As stated in Impact AIR-LRDP-5, the increase in non-attainment criteria air pollutant and precursor emissions resulting from operations under the 2014 LRDP would be considered a significant and unavoidable impact because emissions would exceed BAAQMD's proposed thresholds of significance. In developing its proposed thresholds of significance for air pollutants, BAAQMD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant

adverse air quality impacts to the region's existing air quality conditions. Therefore, additional analysis to assess cumulative impacts is unnecessary (BAAQMD, 2011) and implementation of the 2014 LRDP would be considered to have a significant and unavoidable cumulative impact with respect to air quality.

Proposed Golden State Warriors Event Center on Blocks 29-32 at Mission Bay. Given the proximity of the Warriors project site to the UCSF Mission Bay campus site, if construction of large elements of both projects were to occur during the same time frames, the construction emissions of the two projects could have local, significant cumulative impact on air quality. Further, the operations emissions of that Warriors Event Center project would add to the already cumulatively considerable operations emissions from the 2014 LRDP. Because the Warriors EIR analysis has yet to be done, the magnitude of this potential impact is not yet known. Therefore, it is conservatively assumed that this impact may be significant and unavoidable.

10.2.4.3 Biological Resources

Implementation of 2014 LRDP proposals would occur at already developed campus sites within an urban setting. Small areas of special or sensitive habitat are present within the City, but not at or in the vicinity of the campus sites for which proposals are included under the 2014 LRDP.

For the most part, the LRDP proposals at the Parnassus Heights campus site are the only ones with potential to adversely affect biological resources. Construction and demolition proposals, as well as open space and utilities activities within and near the Reserve at the Parnassus Heights campus site, could have potentially adverse impacts on special-status wildlife and plant species in the Reserve. However, these impacts are limited to small portions of the campus site, and would be considered less than significant with mitigation.

2014 LRDP proposals at the Mission Bay, Mount Zion or Mission Center campus sites would not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS.

Given that all 2014 LRDP actions would take place within the developed urban area of San Francisco, cumulative biological impacts within the City would be less than significant and the contribution from implementation of 2014 LRDP proposals would not result in a significant cumulative impact.

10.2.4.4 Cultural Resources

Implementation of the 2014 LRDP could result in the demolition or substantial alteration of historic resources at the Parnassus Height and Mount Zion campus sites. There are no known or reasonably foreseeable projects in the Parnassus Heights or Mount Zion areas that could combine with the loss of the potentially historically significant structures (Surge on the Parnassus Heights campus site and the Hellman building on the Mount Zion campus site) to result in cumulatively significant impacts. The areas surrounding the Mission Bay campus site do not contain significant

cultural resources. Proposed development on the Mission Center campus site is not proximate to the primary grouping of contributors to the potential Showplace Square Heavy Timber and Steel-frame Brick Warehouse and Factory District. Therefore, cumulative impacts to cultural resources are considered less than significant.

10.2.4.5 Geology, Soils and Seismicity

Development under the 2014 LRDP, when combined with other foreseeable development in the vicinity of UCSF campus sites, could result in cumulative impacts with respect to exposure of more people to geologic and seismic hazards. As development projects under the 2014 LRDP are constructed throughout the LRDP horizon, additional people will come onto the campus sites and will be subjected to seismic risks and hazards. While the number of people visiting, living and working on UCSF campus sites will increase, incrementally exposing additional people to seismic and geological hazards over a short term, the construction of new facilities will substantially decrease the individual risks to people and property by upgrading or demolishing older buildings which are seismically unsafe. Older buildings will be seismically retrofitted and newer buildings will be constructed to stricter building codes. Therefore, the 2014 LRDP would not result in significant cumulative impacts on geology, soils and seismicity.

10.2.4.6 Greenhouse Gas Emissions

UCSF has developed a Climate Action Plan, a long-term strategy for voluntarily meeting the State of California's goal for reducing greenhouse gas (GHG) emissions to 1990 levels by 2020, pursuant to the *California Global Warming Solutions Act of 2006* (AB 32). In addition, as part of the 2014 LRDP, UCSF proposes a GHG Reduction Strategy (GHGRS) to provide streamlined analysis under CEQA for future development projects.

Consistent with Appendix G of the CEQA Guidelines, construction and operational GHG emissions related to development at the four affected campus sites under the 2014 LRDP were quantified and assessed relative to thresholds considered by the BAAQMD for impact assessment. Also, the consistency of the 2014 LRDP was qualitatively assessed with respect to applicable state and local plans, policies and regulations adopted for the purpose of reducing GHG emissions. The assessment of potential GHG impact acknowledges the existing CAP and proposed GHGRS as well as the policies and plans of the UC Regents and University of California Office of the President.

BAAQMD considers GHG impacts to be exclusively cumulative impacts; as such, assessment of significance is based on a determination of whether GHG emissions represent a cumulatively considerable contribution to the global atmosphere. The specific impacts found with respect to construction-related greenhouse gas emissions were less than significant with mitigation, while operational emissions were less than significant. Further, implementation of the 2014 LRDP would not conflict with the AB32 Scoping Plan, the UCSF Climate Action Plan, or the UCSF GHGRS, and would therefore be less than significant. Therefore, cumulative impacts of the 2014 LRDP on global climate change and GHG emissions would be less than significant.

10.2.4.7 Hazards and Hazardous Materials

The cumulative hazards and hazardous materials impacts from implementation of the 2014 LRDP, when combined with other foreseeable development in the vicinity of the campus sites would not be cumulatively considerable. Development under the 2014 LRDP would continue the handling, storage, use and transport of hazardous materials and hazardous waste as part of normal operations, which may expand with proposed growth. Hazardous substances would continue to be subject to oversight and regulation by federal, state, and local rules, regulations, and policies. Cumulative development could generate similar types of impacts from the use, storage, transport, and disposal of hazardous materials, as well as construction-related hazardous material impacts, all of which would be highly regulated by federal, state, and local laws. Compliance with all applicable federal, state, and local laws that regulate, control, or respond to hazardous waste, transport, disposal or cleanup would ensure that cumulative impacts from implementation of the 2014 LRDP would be less than significant. On the Mission Bay campus site, continued implementation of the *Risk Management Plan* would result in additional excavation and disposal of contaminated soil and groundwater in accordance with mitigation measures identified in the *Mission Bay Subsequent EIR*, but these impacts would be site-specific and therefore would not result in a significant cumulative impact.

10.2.4.8 Hydrology and Water Quality

Implementation of the 2014 LRDP, when combined with other foreseeable development in the vicinity of the campus sites, would not result in cumulatively considerable impacts on water quality or hydrologic resources.

The Parnassus Heights, Mount Zion and Mission Center campus sites are located in a highly urbanized environment that is almost entirely covered with impervious surfaces. Construction activities occurring under the 2014 LRDP coupled with other reasonably foreseeable projects in neighborhoods surrounding these campus sites would therefore not cumulatively increase impervious surface area or increase non-point source urban pollutants resulting in adverse water quality impacts

Development activities are on-going in Mission Bay and would continue to intensify gradually until buildout is complete in the Mission Bay Redevelopment Area, which surrounds the Mission Bay campus site. Compliance with regulatory requirements and applicable water quality laws, e.g., National Pollution Discharge Elimination System and the City's Wastewater Master Plan, would ensure that potential cumulative impacts to water quality and hydrology would be less than significant.

10.2.4.9 Land Use and Planning

The Parnassus Heights, Mount Zion and Mission Center campus sites are situated in built-out urban areas surrounded by a mix of land uses. Generally, opportunities for new development are limited, and would require building replacement rather than new construction on undeveloped tracts of land. Potential growth in the vicinity of these three campus site would be limited to the intensification of existing uses rather than a substantial change from established land uses. The

San Francisco General Plan does not propose land use changes that would affect the neighborhoods adjacent to these areas. Existing uses can therefore be assumed during the LRDP horizon. Therefore, the implementation of the 2014 LRDP combined with cumulative growth would not physically divide an established community. No cumulative land use impact is anticipated.

The Mission Bay campus site is surrounded by the Mission Bay Redevelopment South project area, which guides redevelopment of the former industrial area as a mixed-use neighborhood including research and development, biomedical, academic, commercial industrial, office, residential and open space uses. Development under the 2014 LRDP would intensify institutional uses and would also expand residential and open space areas. These uses would be compatible with existing adjacent land uses and with the redevelopment plans for the Mission Bay area; therefore, the cumulative impact would be less than significant.

10.2.4.10 Noise

As detailed in Section 5.10, site-specific construction and demolition activities at each campus site would have a local, significant impact on the noise environment. Project construction would be a temporary significant impact at all proposed project sites. The impacts would be cumulatively considerable in combining with other construction proposed in the immediate area of each proposed demolition or construction proposal.

At the Parnassus Heights campus site, planned activities include the potential simultaneous demolition of the Radiobiology Laboratory, Medical Research 4 building, Surge, and Woods buildings, as well as the construction of new housing at Fifth and Parnassus Avenues. These construction and demolition projects, which could occur concurrently, would lead to a significant cumulative impact on the noise environment in the site vicinity.

At the Mission Bay campus site, proposed construction activities between 2015 and 2019 include new construction at Block 15 housing, Block 33 research building, Block 33/34 parking garage, and the cancer outpatient building. These construction projects, which could occur concurrently, would lead to a significant cumulative impact on the noise environment in the site vicinity.

Project operations would increase noise levels in the area of each campus site. Based on the low levels of noise increases seen in Tables 6.10-5, 7.10-5, 8.10-3, and 9.10-3 for the cumulative traffic plus the project surface traffic, the operations at all four main campus sites would not be cumulatively considerable.

Proposed Golden State Warriors Event Center on Blocks 29-32 at Mission Bay. Given the proximity of the Warriors project site to the Mission Bay campus site, if construction of the Warriors project occurred concurrent with construction of buildings at the campus site, the construction of the Warriors project could add to the potential cumulatively considerable construction noise impact of the 2014 LRDP. Because the Warriors EIR analysis has yet to be done, the magnitude of this potential impact is not yet known. Therefore, it is conservatively assumed that this impact may be significant and unavoidable. Noise from operation of the Golden

State Warriors project would come from building operations and daily activities, as well as daytime and nighttime noise associated with identifiable events. Event noise would include noise from people, the traffic supplying the facility, and traffic carrying people to and from events. Event noise likely could be identifiable even amidst other normal operational noise under the 2014 LRDP. Although noise from specific events may be identifiable as being caused by the event, the associated long-term noise levels may not differ from to noise levels anticipated with office/R&D development under the *Mission Bay South Redevelopment Plan*, but Warriors project operational noise would increase the cumulative noise levels in the UCSF Mission Bay campus site vicinity. Because the Warriors EIR analysis has yet to be done, the magnitude of this potential impact is not yet known. Therefore, it is conservatively assumed that this impact may be significant and unavoidable.

10.2.4.11 Population and Housing

As discussed in Section 5.11, the 2014 LRDP would accommodate an increase in employment and students at all campus sites from the current approximately 30,840 to approximately 42,270 by 2035, or an increase of about 11,430. Population and housing volumes identified in Section 5.11 were based on *Plan Bay Area* forecasts through the year 2040, which includes all planned and approved cumulative development and associated population and housing information. The UCSF share of employment growth in San Francisco at the 2014 LRDP horizon in 2035 is approximately 7%; the share of total population associated with UCSF growth under the 2014 LRDP would be less than 2%. Some of the additional population associated with the LRDP would be housed in the approximately 852 new units proposed by UCSF on the Parnassus Heights and Mission Bay campus sites, thereby reducing demand for off-campus housing in San Francisco and the Bay Area. Although implementation of the 2014 LRDP would induce population growth in the Bay Area, the cumulative contribution of UCSF would not be considerable and the impact would be less than significant.

10.2.4.12 Public Services

Development under the 2014 LRDP, when combined with foreseeable growth in the vicinity of the campus sites, could increase the demand for public services. However, this increased demand would not result in the need for new or physically altered facilities, the construction of which could cause significant environmental impacts. The Parnassus Heights, Mount Zion and Mission Center campus sites are located within built-out urban areas. Land use intensification in the vicinity of these campus sites would result in incremental changes to population and the associated demand for public services. As discussed further in Section 5.12, implementation of the 2014 LRDP would result in increased population on UCSF campus sites that could result in corresponding increases in the need for police and fire protection services, as well as public schools. Regarding the Mission Bay campus site, the City is currently constructing a new Public Safety Building at Third Street and Mission Rock Street that will house a new fire station and become the new San Francisco Police Department headquarters, as well as the new Southern District Station. The new station will serve all new development in the Mission Bay area, including the Mission Bay campus site, and is planned to be operational in fall 2014. The 2014 LRDP would not result in demand for public services that would result in the construction of new

or physically altered facilities. Although implementation of the 2014 LRDP would result in increased demand for public services, the cumulative contribution of UCSF would not be considerable and the impact would be less than significant.

10.2.4.13 Recreation

Development under the 2014 LRDP, when combined with cumulative growth in the vicinity of the campus sites, could increase the demand for recreation facilities. However, this increased demand would not cumulatively result in the substantial physical deterioration of such facilities. Population growth at the Parnassus Heights, Mount Zion, and Mission Center campus sites would not be substantial; therefore, demand on existing recreation facilities in combination with cumulative growth in the vicinity of these campus sites would not be significant. Residential growth at the Mission Bay campus site would be served primarily by existing facilities on the campus site in addition to new facilities proposed under the 2014 LRDP, such as the proposed sports field on Block 18C. Therefore, development under the 2014 LRDP, when combined with cumulative growth in the vicinities of the main campus sites, would not result in a significant cumulative impact to recreation.

10.2.4.14 Transportation and Traffic

In addition to foreseeable increases in traffic volumes and transit ridership by 2040 (estimated based on cumulative development and growth identified by the SFCTA SF-CHAMP travel demand model), there are foreseeable changes to the transportation network (roads, intersections, transit service, and bicycle facilities) that will affect potential cumulative impacts. Regarding changes to the transportation network, of note is the transit enhancement treatment visions for Sixteenth Street (two alternatives) under study by the SFMTA, one of which will be selected by the SFMTA Board prior to implementation. The treatments are referred to as the Moderate and Expanded Alternatives in the TEP EIR. The Mission Bay Year 2040 traffic analysis includes both alternatives, referred to (in the TEP EIR) as the Moderate Alternative and Expanded Alternative.

Traffic Conditions

Impact TRAF-MB-C-1: Implementation of the 2014 LRDP on the Mission Bay campus site in combination with foreseeable 2040 traffic volumes would increase traffic at intersections on the adjacent roadway network. (Potentially Significant)

The 2014 LRDP's contributions to the 2040 traffic conditions would be less than significant for the Parnassus Heights, Mount Zion, and Mission Center campus sites. The 2014 LRDP's cumulative contributions to the 2040 traffic conditions for the Mission Bay campus site would be potentially significant at the following five intersections (numbered to match intersection numbers in Table 7.14-2):

26. Brannan Street / Seventh Street (PM peak hour)
35. 16th Street / Fourth Street (AM peak hour)
36. 16th Street / Owens Street (AM and PM peak hours)
37. 16th Street / Seventh Street (AM and PM peak hours)

40. 16th Street / Potrero Avenue (AM and PM peak hours)

The 2014 LRDP's potentially-significant cumulative impacts at the above-cited intersections would be mitigated by the following mitigation measure:

Mitigation Measure TRAF-MB-C-1: Implement the Moderate Alternative of the TEP Sixteenth Street Proposal.

The City of San Francisco would implement the TEP Moderate Alternative, which would provide two mixed-flow travel lanes in each direction on Sixteenth Street, thereby maintaining the requisite traffic carrying capacity (and acceptable traffic level of service) on Sixteenth Street for the forecasted traffic demand with the 2014 LRDP in place.

However, implementation of this mitigation measure will require further study and coordination with other agencies for approval and is outside the jurisdiction of UCSF. Therefore, the impacts are considered significant and unavoidable.

Significance after Mitigation: Significant and Unavoidable

The following mitigation measures, implemented by UCSF, would lessen the significant and unavoidable impacts, but would not mitigate the impacts to less-than-significant levels:

Mitigation Measure TRAF-MB-C-2: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips.

UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20-year horizon of the LRDP.

Mitigation Measure TRAF-MB-C-3: Manage Parking Supply.

UCSF shall continue to monitor the parking supply at the Mission Bay campus site so as not to oversupply parking at this campus site. Currently there is a downward trend in parking supply at the Mission Bay campus site, as it is expected to grow at a lower rate than total population. Monitoring and reducing the future parking supply per person at the Mission Bay campus site would improve traffic operations along Sixteenth Street by reducing SOV trips to and from the Mission Bay campus site.

However, implementation of these mitigation measures would not be reasonably expected to achieve the required reduction in vehicle trips on Sixteenth Street to lessen the impact to less-than-significant levels. Therefore, the potential impacts are considered significant and unavoidable.

LRDP Variant. Traffic conditions associated with the LRDP Variant would be similar to those described for the 2014 LRDP. The LRDP Variant's contributions to volumes at the critical intersection movements operating poorly (i.e., at LOS E or LOS F) for the intersections operating at LOS E or LOS F under Year 2040 conditions would be approximately 2% higher than those calculated for the 2014 LRDP. All but two of the Mission Bay campus site study intersections would continue to operate at the same levels of service, and have the same impacts (significant or

not) as under 2040 Plus 2014 LRDP conditions. The exceptions (Sixteenth Street / Seventh Street and Mariposa Street / Third Street) are discussed here.

Impact TRAF-MB-C-2: Implementation of the 2014 LRDP with the LRDP Variant on the Mission Bay campus site in combination with foreseeable 2040 traffic volumes would increase traffic at the Sixteenth Street / Seventh Street and the Mariposa Street / Third Street intersections on the adjacent roadway network. (Potentially Significant)

Sixteenth Street / Seventh Street. The LRDP Variant would contribute considerably to the AM peak-hour operations at this intersection under the TEP Moderate Alternative, a significant impact. By comparison, the 2014 LRDP impact would be less than significant under the TEP Moderate Alternative, but significant under the TEP Expanded Alternative.

Capacity-enhancing measures were investigated, but were found to be infeasible because of physical constraints (I-280 freeway support structures) that prohibit further widening of the Sixteenth Street right-of-way, and policy constraints (the City's Transit First Policy regarding transit and pedestrian environments) that would prohibit the narrowing of sidewalks and/or removal of the Class II bicycle lanes on Sixteenth Street.

Mariposa Street / Third Street. The LRDP Variant would contribute considerably to the AM peak-hour operations at this intersection under both the TEP Moderate and Expanded Alternatives, a significant impact. By comparison, the 2014 LRDP impact would be less than significant at this intersection under both the TEP Moderate and Expanded Alternatives.

Capacity-enhancing measures were investigated, but were found to be infeasible because of policy constraints (the City's Transit First Policy) that would prohibit the narrowing of sidewalks on Mariposa Street. The following mitigation measure, unique to the LRDP Variant, would be implemented by UCSF:

Mitigation Measure TRAF-MB-C-4: Implement Additional TDM Strategies to Reduce Single Occupancy Vehicle Trips (LRDP Variant)

- UCSF shall continue to investigate TDM measures targeted at reducing SOV trips. Although UCSF has already identified those TDM measures it can feasibly implement and has included those measures as part of the proposed 2014 LRDP, more measures may be developed or become evident over the 20-year horizon of the LRDP.

- UCSF will monitor traffic conditions within and immediately surrounding the Mission Bay campus site. Should traffic conditions approach unacceptable levels, (LOS E or F), and should UCSF's contribution to this cumulative impact be significant, UCSF shall implement additional TDM strategies that it investigates (beyond those identified in its existing TDM program and beyond those proposed in the 2014 LRDP, as described in Section 5.14) and finds could reasonably result in a reduction in SOV trips. The additional TDM strategies shall target a reduction in SOV trips by encouraging persons to select other modes of transportation, including: walking, bicycling, transit, car-share, carpooling, and/or to travel during non-peak periods.

Significance after Mitigation: Less than Significant at Sixteenth Street / Seventh Street and at Mariposa Street/Third Street. The implementation of this mitigation measure would improve traffic operations surrounding and within the Mission Bay campus site by reducing SOV trips by approximately 5 to 10%, which would represent a 4 to 8% reduction in the overall vehicle trips generated by the campus site. The implementation of this measure by UCSF and the associated 4% reduction in vehicle trips to the Mission Bay campus site would improve traffic operations at Sixteenth Street / Seventh Street from LOS E to LOS D in the AM peak hour and reduce the impacts to less-than-significant levels.

To summarize and compare the traffic impacts of the 2014 LRDP versus the LRDP Variant at the Sixteenth Street study intersections: 1) under the TEP Expanded Alternative, all five study intersections on Sixteenth Street would have significant and unavoidable impacts under either the 2014 LRDP or the LRDP Variant; and, 2) under the TEP Moderate Alternative, all five study intersections on Sixteenth Street would have less than significant impacts under the 2014 LRDP, and four would have less than significant impacts under the LRDP Variant, while the fifth (Sixteenth Street / Seventh Street) would have a significant impact that would be reduced to less than significant by **Mitigation Measure TRAF-MB-C-4**.

Other 2040 Impacts. The LRDP Variant, similar to the 2014 LRDP, in combination with past, present and reasonably foreseeable development, would have less than significant impacts to transit conditions (Muni, regional, and UCSF and MBTMA shuttle buses), pedestrian conditions, bicycle conditions, loading (commercial and passenger) conditions, and parking conditions.

Proposed Golden State Warriors Event Center on Blocks 29-32 at Mission Bay. In April 2014, the Golden State Warriors (GS Warriors) announced the purchase of 12 acres of land in the Mission Bay South Redevelopment Project Area where the team intends to build a new sports and entertainment center. The GS Warriors have just started the planning and design, and environmental studies, for the new site, so the division of square footage of development allowed for the site among the arena, office, and retail uses has not yet been established. The transportation effects of the GS Warriors development are not yet known, but there is a potential for cumulative transportation impacts associated with the GS Warriors event center. In addition the GS Warriors are in the process of developing as part of the project a Transportation Management Program to address potential transportation impacts of the event center. A qualitative discussion of the potential effects of the development of a Golden State Warriors event center at Mission Bay Blocks 29-32 is presented for general information.

The SF-CHAMP travel demand forecasting model developed in 2013 by the SFCTA and the SF Planning Department and used in this study to estimate future cumulative transportation conditions assumes approximately one million square feet of office/R&D with ground floor retail to occur by the year 2040 within Blocks 29 through 32. As such, the traffic and transit data used in the analysis of cumulative transportation impacts of the 2014 LRDP can be deemed as valid representative of a typical day when no events take place at the proposed arena.

Based on data taken from surveys of SF Giants game attendees, spectators at a sellout game at the new arena could be expected to generate about 3,200 vehicle trips and 8,300 transit trips. Based

on previous data for Piers 30 and 32, the event vehicle and transit demand would be inbound during the evening (starting around 6:00 PM) and outbound late at night (after 10:00 or 10:30 PM) because most games and concerts would start around 7:30 PM and last for 2½ to 3 hours. The exact contribution of the new arena to the PM peak-hour cumulative traffic and transit conditions is not known at this time, as the arena project analysis have just started. In addition, the GS Warriors are in the process of developing as part of the project a Transportation Management Program to address potential transportation project impacts.

Several key intersections in the Mission Bay South Area, such as Sixteenth Street/Third Street, Sixteenth/Seventh/Mississippi streets, Mariposa Street/ Third Street, and Seventh Street/Mission Bay Drive, would be expected to operate at a high LOS D by year 2040 during the PM peak hour. Thus, it is possible that an increase in inbound traffic due to an arena event would cause those intersections to degrade to LOS E or F instead of LOS D. If inbound arena event traffic causes significant traffic impacts at these intersections, the contribution of 2014 LRDP traffic, with or without the LRDP Variant, to the cumulative conditions at these intersections would be substantial, and the 2014 LRDP's impact to cumulative traffic impacts would be considered significant. Because the significant impact may not be able to be mitigated to a less than significant level, the cumulative impacts potentially would be significant and unavoidable.

Transit Conditions. While there would be a general increase in ridership, the 2014 LRDP would not create excess demand for public transit that would require the development or expansion of mass transit facilities, the development of which would cause significant environmental impacts.

The SFMTA conducted a facilities needs assessment study[1] in 2013. This study determined that many of Muni's storage, maintenance, and operations facilities are at maximum capacity and not seismically safe and therefore Muni will need to upgrade existing facilities and build new facilities to accommodate transit demand associated with City-wide development.

While the 2014 LRDP would increase ridership on the SF Muni routes serving the four campus sites, this increase in ridership would not exceed the existing or planned capacity of routes serving UCSF. UCSF Transportation Services performs monthly auditing. Should they find that public transit to and from UCSF campus sites does not meet demand, they will adjust shuttle operations (which may include providing additional shuttle service) where necessary to meet demand. Therefore, the 2014 LRDP would not require the expansion or replacement of public transit facilities. If UCSF demand for public transit service requires the construction of facilities that would cause physical impacts, UCSF would contribute its fair share towards the cost.

For the above reasons, the 2014 LRDP, in combination with past, present and reasonably foreseeable development in San Francisco, would have less-than-significant cumulative impacts on SF Muni, regional transit, or UCSF shuttle services.

[1] *The SFMTA's Real Estate and Facilities Vision for the 21st Century* (SFMTA and Parsons Brinckerhoff), January 2013).

The 2014 LRDP would have less-than-significant cumulative impacts to pedestrian flow and safety, bicycle flow and safety, loading access, and parking.

10.2.4.15 Utilities and Service Systems

Development under the 2014 LRDP, when combined with cumulative growth in the vicinity of the campus sites, could increase the demand for utilities and service systems. The 2014 LRDP would accommodate an increase in employment and students of about 11,400 at LRDP horizon in 2035, which would represent approximately 5% of the growth anticipated in the City by 2040. As discussed in Section 5.15, development at the Parnassus Heights, Mount Zion, and Mission Center campus sites would occur as replacement or in-fill on otherwise built-out sites. The necessary City utilities have sufficient capacities to serve those sites and the proposed 2014 LRDP development. To the extent that cumulative demands on wastewater or stormwater conveyance systems from reasonably foreseeable growth in the City would require the construction of new facilities, such construction may have the potential to cause environmental impacts. In general, impacts would be limited to temporary construction effects.

At the Mission Bay campus site, a significant and unavoidable impact was found because there is a question whether the capacity of the pump station on Block P15 or the Mariposa Pump Station and associated sanitary collection system are adequate to handle flows resulting from 2014 LRDP development at the Mission Bay campus site. UCSF has conservatively concluded that potential improvements to the pump stations may be required that may also result in physical environmental effects. It is not yet known whether other cumulative development, including the Warriors project, would encounter this or other utilities impacts. Therefore, it is conservatively assumed that this impact may be significant and unavoidable.

10.3 Significant Irreversible Environmental Effects

Section 15126.2(c) of the CEQA Guidelines requires a discussion of any significant irreversible environmental changes that would be caused by a proposed project. Generally, a project would result in significant irreversible environmental changes if

- The primary and secondary impacts would generally commit future generations to similar uses;
- The project would involve a large commitment of nonrenewable resources;
- The project involves uses in which irreversible damage could result from any potential environmental accidents associated with the project (e.g., highway improvements that provide access to a previously inaccessible area); or
- The proposed consumption of resources is not justified (e.g., the project involves the wasteful use of energy)

Development under the 2014 LRDP would intensify uses on UCSF campus sites consistent with development in San Francisco's urban environment and, for the Mission Bay campus site,

consistent with the *Mission Bay Redevelopment Plan*. The 2014 LRDP would commit future generations to the same land uses for at least the LRDP horizon. Implementing the 2014 LRDP would result in an irreversible commitment of energy resources, primarily in the form of fossil fuels, including fuel oil, natural gas and gasoline or diesel fuel for construction equipment and automobiles during demolition, construction and on-going use of the campus sites.

Development under the 2014 LRDP would comply with the UC *Presidents Policy on Sustainable Resources,* which requires 20% or better energy performance than California Code of Regulations Title 24 for new construction and renovations, and strives to achieve 30%; requires new laboratory buildings to meet Labs21 Environmental Performance Criteria; and requires all new construction and major renovations to meet a minimum standard of LEED-NC Silver and strive for LEED-NC Gold when possible. Therefore, development under the 2014 LRDP would not use energy in a wasteful, inefficient or unnecessary manner. The consumption or destruction of other non-renewable or slowly renewable resources would also result during construction activities and operations under the 2014 LRDP. These resources include, but are not limited to, lumber, concrete, sand, gravel, asphalt, masonry, metals and water. The 2014 LRDP would also irreversibly use water resources. However, the plan would not involve a large commitment of those resources relative to supply, nor would it consume any of those resources wastefully, inefficiently or unnecessarily.

10.4 Growth Inducement

As required by the CEQA Guidelines, an EIR must include a discussion of the ways in which the proposed project could directly or indirectly foster economic or population growth, or the construction of additional housing and how that growth would, in turn, affect the surrounding environment (CEQA Guidelines Section 15126.2(d)). Growth can be induced in a number of ways, including the elimination of obstacles to growth, or through the stimulation of economic activity within the region. The discussion of removal of obstacles to growth relates directly to the removal of infrastructure limitations or regulatory constraints that could result in growth unforeseen at the time of project approval. Under CEQA, induced growth is not necessarily considered beneficial, detrimental, or of little significance to the environment.

The 2014 LRDP would not extend utilities or transportation infrastructure to previously undeveloped areas. As discussed in Section 7.15, UCSF is proposing to modify the pump station on Mission Bay Redevelopment Area Block P15. The pump station would be modified without structural or piping modifications by replacing existing pumps with more powerful pumps. These more powerful pumps are physically the same size as the existing pumps and can be connected to the existing discharge piping. Replacement of existing pumps with the proposed more powerful pumps would increase the pump station capacity to 7.34 million gallons per day, which is approximately 0.7 million gallons per day greater than the capacity needed for development under the 2014 LRDP (Freyer & Laureta, Inc, 2013).

The increases in population and intensification of activity at the UCSF campus sites would reinforce existing urban development patterns in San Francisco, concentrating economic activity

in the already-built environment of one of the Bay Area's central cities. As described in Section 5.11, *Population and Housing*, UCSF's share of additional employment in San Francisco (including students) in 2035 would be approximately 6%, and its share of population growth would be approximately 5%. The increase in employment associated with the 2014 LRDP would not result in significant increases in regional population or housing demand that could not be accommodated by planned and potential housing supply within the regional market area.

The *Mission Bay Redevelopment Plan* predicates its future buildout on the assumption that UCSF's development of the Mission Bay campus site would strongly stimulate more biotechnical and related research and development, as well as related retail and commercial business activity within and adjacent to the greater Mission Bay Redevelopment Area, in San Francisco and in the Bay Area region. San Francisco's land use planning for the Mission Bay area and for adjacent areas has considered and is intended to focus and accommodate the projected development. The *Mission Bay Subsequent EIR* identifies the fact that the *Mission Bay Redevelopment Plan* is not growth-inducing, so it follows that UCSF campus development in general accord with the Plan is also not growth-inducing.

CHAPTER 11
Alternatives

11.1 Introduction

CEQA requires that an EIR describe and evaluate the comparative effects of "a reasonable range of potentially feasible alternatives" to the project. A primary criterion for selecting alternatives to be considered is that such alternatives "would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project" (CEQA Guidelines Section 15126.6(a): CEQA Section 21002).

The EIR need only discuss alternatives that could feasibly attain most of the project's basic objectives. CEQA and the CEQA Guidelines generally define a "feasible" alternative as one that is capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, technological, and legal factors, including regulatory constraints and jurisdictional boundaries.

The range of alternatives is governed by the "rule of reason" which requires the EIR to set forth only those alternatives necessary to permit a reasoned choice (CEQA Guidelines Section 15126.6(f)). Evaluation of a No Project Alternative and identification of an environmentally superior alternative are required. The significant effects of the alternatives shall be discussed, but in less detail than the significant effects of the proposed project (CEQA Guidelines Section 15126.6(d)).

11.2 Significant and Unavoidable Impacts of the 2014 LRDP

The following significant and unavoidable impacts would result from implementation of the 2014 LRDP:

2014 LRDP

- **Impact AIR-LRDP-4:** Implementation of the 2014 LRDP would result in increased emissions of criteria air pollutants during demolition and construction activities.

- **Impact AIR-LRDP-5:** Implementation of the 2014 LRDP would result in increased emissions of criteria air pollutants during operation.

- **Impact CUL-LRDP-2:** Implementation of the 2014 LRDP could result in demolition of historical resources as defined in CEQA Guidelines Section 15064.5.

- **Impact NOI-LRDP-2:** Implementation of the 2014 LRDP would result in increased ambient noise levels during pile-driving activities.

2014 LRDP Proposals at the Parnassus Heights Campus Site

- **Impact CUL-PH-2:** Demolition of the Surge building at the Parnassus Heights campus site would result in a substantial adverse change in the significance of an historical resource.

- **Impact NOI-PH-1:** Demolition activities proposed under the 2014 LRDP at the Parnassus Heights campus site would result in a temporary increase in ambient noise levels.

- **Impact NOI-PH-2:** Construction activities proposed under the 2014 LRDP at the Parnassus Heights campus site would result in increases in ambient noise levels over the term of the exterior construction activities.

2014 LRDP Proposals at the Mission Bay Campus Site

- **Impact AIR-MB-3:** Operations at the Mission Bay campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants.

- **Impact NOI-MB-2:** Construction activities proposed under the 2014 LRDP at the Mission Bay campus site would result in increases in ambient noise levels during pile-driving activities.

- **Impact UTIL-MB-2:** There may be impacts related to wastewater infrastructure as a result of 2014 LRDP development at the Mission Bay campus site.

2014 LRDP Proposals at the Mount Zion Campus Site

- **Impact CUL-MZ-1:** Demolition of the Hellman building at the Mount Zion campus site would result in a substantial adverse change in the significance of an historical resource.

- **Impact NOI-MZ-1:** Demolition activities proposed under the 2014 LRDP at the Mount Zion campus site would result in a temporary increase in ambient noise levels.

- **Impact NOI-MZ-2:** Construction activities proposed under the 2014 LRDP at the Mount Zion campus site would result in increases in ambient noise levels over the term of the exterior construction activities.

2014 LRDP Proposals at the Mount Zion Campus Site

- **Impact NOI-MC-2:** Construction activities proposed under the 2014 LRDP at the Mission Center campus site would result in increases in ambient noise levels during pile-driving activities.

11.3 Alternatives Analyzed in the EIR

The project alternatives selected for evaluation would have the potential to lessen or avoid one or more of the identified significant and unavoidable impacts of the 2014 LRDP. The alternatives addressed in this EIR were selected in consideration of one or more of the following factors:

- The extent to which the alternative would accomplish most of the basic objectives of the proposed 2014 LRDP (identified in Chapter 3, *Project Description*)
- The extent to which the alternative would avoid or lessen any of the identified significant environmental effects of the proposed 2014 LRDP
- The feasibility of the alternative, taking into account site suitability, economic viability, availability of infrastructure, and consistency with applicable plans regulatory limitations, and jurisdictional boundaries;
- The appropriateness of the alternative in contributing to a range of reasonable alternatives necessary to permit a reasoned choice; and
- The requirement of the CEQA Guidelines to consider a "no project" alternative and to identify an "environmentally superior" alternative that differs from the no project alternative.

This chapter describes four alternatives to the proposed 2014 LRDP: (1) No Project—No Development (2) No Project—Development Under the Existing LRDP; (3) Reduced Program; and (4) No Demolition of Historical Resources. These alternatives are described below, followed by a discussion of their impacts and how the impacts would differ from those of the proposed 2014 LRDP.

11.3.1 Alternative 1: No Project—No Development

CEQA requires an evaluation of the "no project" alternative so that decision makers can compare the impacts of approving the project with the impacts of not approving the project. According to CEQA Guidelines Section 15126.6(e)(3), when the no project alternative is the revision of an existing land use plan, such as the 2014 LRDP, the no project alternative will be the continuation of the existing plan into the future.

This "No Project—No Development" alternative, by contrast considers the impacts of a no project alternative where development currently approved under the existing 1996 LRDP would not be undertaken and, buildings proposed for demolition under the 1996 LRDP would not be demolished. While buildings currently under construction at the Mission Bay campus site would be completed (Mission Hall and the Phase 1 Medical Center), the remaining existing entitlement for the campus site would not be developed under Alternative 1. This alternative was selected for evaluation because it would avoid the significant and unavoidable air quality impacts during operation at the Mission Bay campus site; avoid the significant and unavoidable noise impacts during construction at all four main campus sites; and avoid the significant and unavoidable cultural resources impacts to resulting from demolition of Surge at the Parnassus Heights campus

site and the demolition of Hellman at the Mount Zion campus site. Because building demolitions proposed at the Parnassus Heights campus site would not occur under Alternative 1, the space ceiling would continue to be exceeded.

The No Project – No Development alternative would consist of:

- No demolition of existing buildings at Parnassus Heights or Mount Zion campus sites.
- No new development proposed under the 2014 LRDP.
- No further development of currently approved projects under the existing 1996 LRDP.
- Complete and operate Mission Bay campus site buildings now under construction: Mission Hall and Phase 1 of the Medical Center at Mission Bay.
- Decommission and reuse Moffitt Hospital for uses other than inpatient care.
- No development of Blocks 33 or 34 at Mission Bay; leave land vacant.

11.3.1.1 Comparison to Impacts of the 2014 LRDP

No further development under the 1996 LRDP or the 2014 LRDP, with the exception of Mission Hall and Phase 1 of the Medical Center at Mission Bay, would greatly reduce most construction and operational significant impacts, including air quality and noise impacts, as well as generally reducing the effects of a number of other less than significant impacts of the 2014 LRDP.

Not demolishing existing buildings at the Parnassus Heights or Mount Zion campus sites would eliminate the significant adverse impact to historic resources, and would reduce related air quality, noise, and traffic effects at those campus sites.

The environmental effects of the alternatives are classified by the level of significance for each environmental topic.[1] A comparison to the effects of the 2014 LRDP is also listed.

Impacts that are Significant and Unavoidable under the 2014 LRDP

Air Quality **(LTSM, much less than 2014 LRDP)**

The potential air quality impacts under Alternative 1 would be much less than the significant and unavoidable impacts of the 2014 LRDP because no buildings would be demolished and no new buildings would be constructed. As a result, the related air quality effects of construction and operation would be greatly reduced. Traffic-related air quality effects would also be greatly reduced.

Cultural Resources **(LTSM, much less than 2014 LRDP)**

The potential cultural resources impacts under Alternative 1 would be much less than the significant and unavoidable impacts of the 2014 LRDP because the demolition of the Surge and

[1] LTS=Less than Significant
LTSM=Less than Significant with Mitigation
SU=Significant and Unavoidable

Hellman buildings on the Parnassus Heights and Mount Zion campus sites, respectively, would not occur. Thus, these significant and unavoidable impacts of the 2014 LRDP would not occur.

Noise **(LTSM, much less than 2014 LRDP)**

The potential construction or demolition noise impacts under Alternative 1 would be much less than the significant and unavoidable impacts of the 2014 LRDP because no demolition or development other than completion of under-construction projects would occur. Traffic-related noise effects would also be greatly reduced.

Transportation and Traffic **(LTS, less than 2014 LRDP)**

The potential cumulative transportation and traffic impacts under Alternative 1 would be less than the significant and unavoidable impacts of the 2014 LRDP because no new development would occur on the Mission Bay campus site that could result in transportation and traffic effects.

Utilities and Service Systems **(SU, similar to 2014 LRDP)**

The potential wastewater infrastructure impact at the Mission Bay campus site under Alternative 1 would be similar to the significant and unavoidable impact of the 2014 LRDP because Mission Hall and Phase 1 of the Medical Center at Mission Bay have been constructed and will be opening, and may require wastewater infrastructure improvements.

Impacts that are Less Than Significant or Mitigated under the 2014 LRDP

Aesthetics **(LTS, less than 2014 LRDP)**

The potential aesthetic impacts under Alternative 1 would be less than the 2014 LRDP as no new development would occur that could result in aesthetic effects.

Biological Resources **(LTS, less than 2014 LRDP)**

The potential biological impacts under Alternative 1 would be less than the 2014 LRDP as no buildings would be demolished and no new buildings, utilities, infrastructure, or open space proposals would be constructed on the Parnassus Heights campus site that could result in adverse effects.

Geology, Soils and Seismicity **(LTS, greater than 2014 LRDP)**

The potential geology and soils impacts under Alternative 1 would be similar to the 2014 LRDP although no new development would occur that could result in geology and soils effects. A potential exists for a greater adverse effect at the Parnassus Heights campus site than under the 2014 LRDP if the hillside instability is not corrected.

Greenhouse Gas Emissions **(LTSM, less than 2014 LRDP)**

The potential greenhouse gas (GHG) emissions impacts under Alternative 1 would be less than the mitigated impacts of the 2014 LRDP as no new development would occur that could result in increased GHG emissions. However, the potential reductions in GHG emissions that could occur with implementation of the GHG Reduction Strategy would also not occur under this alternative, and therefore impacts would actually be greater over time.

Hazards and Hazardous Materials **(LTS, less than 2014 LRDP)**

The potential hazards and hazardous materials impacts under Alternative 1 would be less than the mitigated impacts of the 2014 LRDP because no new construction would occur and there would be no increase in storage, handling, and use of hazardous materials. An Excavation Management Plan and Soil Management Plan would not be required to reduce effects from naturally occurring asbestos and on-site contamination (Mission Center campus site), respectively.

Hydrology and Water Quality **(LTS, less than 2014 LRDP)**

The less than significant potential hydrology and water quality impacts under Alternative 1 would be less than the mitigated impacts of the 2014 LRDP because no new development would occur that could result in hydrology and water quality effects.

Land Use and Planning **(LTS, greater than 2014 LRDP)**

The less than significant potential land use impacts under Alternative 1 would be greater than the less than significant impacts of the 2014 LRDP because proposed building demolitions on the Parnassus Heights campus site would not occur under this alternative and, the space ceiling overage would not be reduced.

Population and Housing **(LTS, less than 2014 LRDP)**

The potential population and housing impacts under Alternative 1 would be less than the less than significant impacts of the 2014 LRDP because no new development would occur that could result in population and housing effects.

Public Services **(LTS, less than 2014 LRDP)**

The potential public services impacts under Alternative 1 would be less than the less than significant impacts of the 2014 LRDP because no new development would occur that could result in public services effects.

Recreation **(LTS, less than 2014 LRDP)**

The potential recreation impacts under Alternative 1 would be less than the less than significant impacts of the 2014 LRDP because no new development would occur that could result in recreation effects.

Transportation and Traffic **(LTS, less than 2014 LRDP)**

The potential construction or demolition traffic impacts under Alternative 1 would be much less than the mitigated impacts of the 2014 LRDP because no demolition or development other than completion of under-construction projects would occur.

11.3.1.2 Relationship to Project Objectives

This section examines how Alternative 1 would compare with the 2014 LRDP in terms of achieving the five campus-wide objectives.

- *Respond to the City and Community Context:* Demolitions proposed under the 1996 LRDP for the Parnassus Heights campus site would not occur; therefore, the University would not

be responding to the 1976 Regents' Resolution by reducing the space ceiling exceedance. In addition, UCSF would not replace the decommissioned Moffitt Hospital, which would eliminate an important medical resource at a location in San Francisco that serves the Sunset District and other neighborhoods in the southwestern portion of the City. As a result, Alternative 1 would not meet this objective of the 2014 LRDP.

- *Accommodate UCSF's Growth Through 2035:* This alternative would only develop buildings already under construction at the Mission Bay campus site; therefore, growth proposed through 2035 under the 2014 LRDP at this and the other three main campus sites would not occur. As a result, Alternative 1 would not meet this objective of the 2014 LRDP.

- *Ensure UCSF's Facilities are Seismically Safe:* While Moffitt Hospital would not be seismically retrofitted under this alternative, by moving inpatient care to other facilities the facility could be reused for other purposes. The Faculty Alumni House, Hellman, the Harold Brunn Institute, and 2255 Post Street are seismically compromised and they would not be retrofitted under this alternative. As a result, Alternative 1 would not meet this objective of the 2014 LRDP.

- *Promote Environmental Sustainability:* This alternative would not reduce commute travel as new on-site housing would not be provided. The GHG Reduction Strategy would not be implemented; therefore, reductions in GHG emissions proposed by this plan would not occur. This objective would only be partially met under this alternative.

- *Minimize Facility Costs:* Because no new development would occur under this alternative, facility costs would be far less than compared to the 2014 LRDP. However, this alternative may preclude the consolidation of leased facilities at UCSF-owned facilities and may require the continued operation or possible expansion of remote campus sites, which would not meet this objective of the 2014 LRDP.

11.3.2 Alternative 2: No Project—Development Under Existing LRDP

As mentioned above under Alternative 1, when the no project alternative is the revision of an existing land use plan, the no project alternative represents the continuation of the existing plan, which in this case is the University's 1996 LRDP. Alternative 2 would either renovate Moffitt Hospital for inpatient use or decommission this facility for acute care and accelerate construction of the Phase 2 Medical Center at Mission Bay. Under either scenario the New Hospital Addition would not be constructed at the Parnassus Heights campus site. Development on the North and South Campuses of the Mission Bay campus site would continue under existing entitlement and Blocks 33 and 34 would be developed according to existing City entitlement. Buildings proposed for demolition under the 2014 LRDP at the Mount Zion campus site would be demolished under this alternative, but no new replacement buildings would be constructed. Likewise, no development would occur at the Mission Center campus site.

This alternative was selected for evaluation because it would avoid the significant and unavoidable air quality impacts during operation at the Mission Bay campus site and avoid the significant and unavoidable noise impacts during construction at the Parnassus Heights, Mount Zion, and Mission Center campus sites. Alternative 2 would result in significant and unavoidable

cultural resources impacts resulting from demolition of the Surge building at the Parnassus Heights campus site and the demolition of the Hellman building at the Mount Zion campus site. The GHG Reduction Strategy would not be adopted under this alternative.

The No Project – Development Under the Existing LRDP alternative would consist of:

- No new development under proposed 2014 LRDP.

Parnassus Heights Campus Site

- No New Hospital Addition at the Parnassus Heights campus site.
- Renovate Moffitt Hospital for inpatient use or decommission Moffitt for other uses and accelerate construction of Phase 2 of the Medical Center at Mission Bay.
- Demolish the following buildings at the Parnassus Heights campus site to get closer to space ceiling: Aldea, UC Hall, Surge, Woods, Environmental Health and Safety, Proctor, Medical Research 4, and the Laboratory of Radiobiology.

Mission Bay Campus Site

- Continue buildout of North Campus of the Mission Bay campus site to 2.65 million gsf.
- Develop remainder of the entitlement on South Campus of the Mission Bay campus site: Outpatient Cancer building and Phase 2 Medical Center.
- Develop Blocks 33 and 34 according to existing City entitlement.

Mount Zion Campus Site

- Demolish the Hellman, Harold Brunn Institute, and the Dialysis Center buildings. Renovate existing buildings at Mount Zion for outpatient use.

Mission Center Campus Site

- No new development.

11.3.2.2 Comparison to Effects of the 2014 LRDP

Significant and Unavoidable Impacts of the 2014 LRDP

Air Quality **(LTSM, less than 2014 LRDP)**

The potential air quality impacts under Alternative 2 would be less than the significant and unavoidable impacts of the 2014 LRDP because less development would occur at the Parnassus Heights, Mission Bay, and Mount Zion campus sites and no development would occur at the Mission Center campus site. As a result, the related air quality effects of construction and operation would be greatly reduced. Traffic-related air quality effects would also be greatly reduced.

Cultural Resources **(SU, similar to the 2014 LRDP)**

The potential cultural resources impacts under Alternative 2 would be similar to the significant and unavoidable impacts of the 2014 LRDP because the demolition of the Surge and Hellman buildings on the Parnassus Heights and Mount Zion campus sites, respectively, would still occur.

Noise **(SU, less than 2014 LRDP)**

The potential construction and demolition noise impacts under Alternative 2 would be generally less than the significant and unavoidable impacts of the 2014 LRDP because less development would occur at the Parnassus Heights, Mission Bay, and Mount Zion campus sites and no development would occur at the Mission Center campus site. Traffic-related noise effects would also be reduced. However, if pile driving is required during construction at the Mission Bay campus site noise impacts from construction would remain significant and unavoidable under Alternative 2.

Transportation and Traffic **(SU, less than 2014 LRDP)**

The potential cumulative transportation and traffic impacts under Alternative 2 would be less than the significant and unavoidable impacts of the 2014 LRDP because less development would occur on the Mission Bay campus site that could result in transportation and traffic effects. It is not known with certainty whether the reduction in development proposed under this alternative would be sufficient to reduce the significant and unavoidable cumulative impact identified under the 2014 LRDP to a less-than-significant level.

Utilities and Service Systems **(SU, similar 2014 LRDP)**

The potential wastewater infrastructure impact at the Mission Bay campus site under Alternative 2 would be similar to the significant and unavoidable impact of the 2014 LRDP because Mission Hall and the Phase 1 Medical Center will open soon, in addition to other proposed development under this Alternative, and may require wastewater infrastructure improvements.

Less than Significant or Mitigated Impacts of the 2014 LRDP

Aesthetics **(LTSM, less than 2014 LRDP)**

The potential aesthetic impacts under Alternative 2 would be less than the 2014 LRDP because less development would occur at the Parnassus Heights, Mission Bay, and Mount Zion campus sites and no development would occur at the Mission Center campus site.

Biological Resources **(LTSM, less than 2014 LRDP)**

The potential biological impacts under Alternative 2 would be less than the 2014 LRDP because the proposed New Hospital Addition would not be constructed on the Parnassus Heights campus site thereby reducing potential adverse effects to birds.

Geology, Soils and Seismicity **(LTS, similar to 2014 LRDP)**

The potential geology and soils impacts under Alternative 2 would be similar to the 2014 LRDP because new development would occur that could result in geology and soils effects. A potential

exists for a larger adverse effect at the Parnassus Heights campus site if the hillside instability is not corrected.

Greenhouse Gas Emissions **(LTSM, less than 2014 LRDP)**

The potential greenhouse gas (GHG) emissions impacts under Alternative 2 would be less than the mitigated impacts of the 2014 LRDP as less development would occur that could result in GHG effects. However, the potential reductions in GHG emissions that could occur with implementation of the GHG Reduction Strategy might not occur under this alternative.

Hazards and Hazardous Materials **(LTSM, less than 2014 LRDP)**

The potential hazards and hazardous materials impacts under Alternative 2 would be less than the mitigated impacts of the 2014 LRDP because less construction would occur and there would be less increase in storage, handling, and use of hazardous materials.

Hydrology and Water Quality **(LTS, similar to 2014 LRDP)**

The potential hydrology and water quality impacts under Alternative 2 would be similar to the less than significant impacts of the 2014 LRDP because new development would occur that could result in hydrology and water quality effects.

Land Use and Planning **(LTS, similar to 2014 LRDP)**

The potential land use impacts under Alternative 2 would be similar to the less than significant impacts of the 2014 LRDP because proposed building demolitions on the Parnassus Heights campus site would still occur under this alternative; therefore, the University would be responding to the 1976 Regents' Resolution by reducing the space ceiling overage.

Population and Housing **(LTS, less than 2014 LRDP)**

The potential population and housing impacts under Alternative 2 would be less than the less than significant impacts of the 2014 LRDP because less development would occur that could result in population and housing effects.

Public Services **(LTS, less than 2014 LRDP)**

The potential public services impacts under Alternative 2 would be less than the less than significant impacts of the 2014 LRDP because no less development would occur that could result in public services effects.

Recreation **(LTS, less than 2014 LRDP)**

The potential recreation impacts under Alternative 2 would be less than the less than significant impacts of the 2014 LRDP because less development would occur that could result in recreation effects.

Transportation and Traffic **(LTS, less than 2014 LRDP)**

The potential construction or demolition traffic impacts under Alternative 2 would be less than the mitigated impacts of the 2014 LRDP, because less development would occur that could result in construction and demolition traffic effects.

11.3.2.3 Relationship to Project Objectives

This section examines how Alternative 2 would compare with the 2014 LRDP in terms of achieving the five campus-wide objectives.

- *Respond to the City and Community Context:* Demolitions proposed under the 1996 LRDP for the Parnassus Heights campus site would occur under this alternative; therefore, the University would be responding to the 1976 Regents' Resolution by reducing building space. If UCSF decommissioned Moffitt Hospital or retrofitted it for inpatient use without constructing the New Hospital Addition, then this alternative would eliminate an important medical resource at a location in San Francisco that serves the Sunset District and other neighborhoods in the southwestern portion of the City. Therefore, Alternative 2 would only partially meet this objective of the 2014 LRDP.
- *Accommodate UCSF's Growth Through 2035:* This alternative would result in much less development at the Parnassus Heights, Mount Zion, and Mission Bay campus sites and no development at the Mission Center campus site; therefore, growth proposed by UCSF through 2035 under the 2014 LRDP at the four main campus sites would not be accommodated. Therefore, Alternative 2 would only partially meet this objective of the 2014 LRDP.
- *Ensure UCSF's Facilities are Seismically Safe:* Moffitt Hospital could be seismically retrofitted under this alternative, but the Faculty Alumni House would not. Hellman and the Harold Brunn Institute are seismically compromised and they would be demolished under this alternative. Therefore, Alternative 2 would only partially meet this objective of the 2014 LRDP.
- *Promote Environmental Sustainability:* This alternative would not reduce commute travel as new on-site housing would not be provided. The GHG Reduction Strategy would not be implemented; therefore, reductions in GHG emissions proposed by this plan would not occur. Therefore, Alternative 2 would only partially meet this objective of the 2014 LRDP.
- *Minimize Facility Costs:* Because less new development would occur under this alternative, facility costs would be less than compared to the 2014 LRDP. However, this alternative may preclude the consolidation of leased facilities at UCSF-owned facilities and may require the continued operation or possible expansion of remote campus sites, which would not meet this objective of the 2014 LRDP.

11.3.3 Alternative 3: Reduced Program

The Reduced Program Alternative would either renovate Moffitt Hospital for inpatient use or decommission this facility for acute care and accelerate construction of the Phase 2 Medical Center at Mission Bay. Under either scenario the New Hospital Addition would not be constructed at the Parnassus Heights campus site. The Mission Bay campus site would be developed under the existing entitlement and Blocks 33 and 34 would be developed as proposed under the 2014 LRDP. The Mount Zion and Mission Center campus sites would be developed as proposed under the 2014 LRDP. This alternative was selected to avoid the significant and unavoidable air quality impacts during operation at the Mission Bay campus site and avoid the significant and unavoidable noise impacts during construction at the Parnassus Heights and Mission Bay campus sites. Alternative 3 would result in significant and unavoidable cultural

resources impacts resulting from demolition of the Surge building at the Parnassus Heights campus site and the demolition of the Hellman building at the Mount Zion campus site.

The Reduced Program alternative would consist of:

- Implement the GHG Reduction Strategy.

Parnassus Heights Campus Site

- No New Hospital Addition at the Parnassus Heights campus site.
- Renovate Moffitt Hospital for inpatient use; or decommission Moffitt and accelerate construction of the Phase 2 Medical Center at Mission Bay.
- Renovate and reuse UC Hall and Millberry Union towers.
- Demolish the following buildings at the Parnassus Heights campus site to get closer to space ceiling: Surge, Woods, Environmental Health and Safety, Proctor, Medical Research 4, Laboratory of Radiobiology, and Koret.

Mission Bay Campus Site

- Continue buildout of Mission Bay North Campus to 2.65 million gsf.
- Develop remainder of entitlement on South Campus: Phase 2 Medical Center.
- Develop Blocks 33 and 34 as proposed under the 2014 LRDP.

Mount Zion Campus Site

- Demolish Hellman, Harold Brunn Institute, the Dialysis Center and possibly 2255 Post Street. Renovate existing Mount Zion hospital for outpatient use.
- Develop Mount Zion as proposed under the 2014 LRDP.

Mission Center Campus Site

- Develop Mission Center building as proposed under the 2014 LRDP.

11.3.3.2 Comparison to Effects of the 2014 LRDP

Significant and Unavoidable Impacts of the 2014 LRDP

Air Quality **(SU, less than 2014 LRDP)**

The potential air quality impacts under Alternative 3 would be less than the significant and unavoidable impacts of the 2014 LRDP because less development would occur at the Parnassus Heights and Mission Bay campus sites. As a result, the related air quality effects of construction and operation would be reduced. Traffic-related air quality effects would also be reduced. It is not known with certainty whether the reduction in development proposed under this alternative would be sufficient to reduce the significant and unavoidable impact identified under the 2014 LRDP to a less-than-significant level.

Cultural Resources **(SU, similar to the 2014 LRDP)**

The potential cultural resources impacts under Alternative 3 would be similar to the significant and unavoidable impacts of the 2014 LRDP because the demolition of the Surge and Hellman buildings on the Parnassus Heights and Mount Zion campus sites, respectively, would still occur.

Noise **(SU, less than 2014 LRDP)**

The potential construction or demolition noise impacts under Alternative 3 would be less than the significant and unavoidable impacts of the 2014 LRDP because less development would occur at the Parnassus Heights and Mission Bay campus sites. Traffic-related noise effects would also be reduced. However, if pile driving is required during construction the impact would remain significant and unavoidable under Alternative 3.

Transportation and Traffic **(SU, less than 2014 LRDP)**

The potential cumulative transportation and traffic impacts under Alternative 3 would be less than the significant and unavoidable impacts of the 2014 LRDP because less development would occur on the Mission Bay campus site that could result in transportation and traffic effects. It is not known with certainty whether the reduction in development proposed under this alternative would be sufficient to reduce the significant and unavoidable cumulative impact identified under the 2014 LRDP to a less-than-significant level.

Utilities and Service Systems **(SU, similar 2014 LRDP)**

The potential wastewater infrastructure impact at the Mission Bay campus site under Alternative 3 would be similar to the significant and unavoidable impact of the 2014 LRDP because Mission Hall and the Phase 1 Medical Center will open soon, in addition to other proposed development under this Alternative, and may require wastewater infrastructure improvements.

Less than Significant or Mitigated Impacts of the 2014 LRDP

Aesthetics **(LTSM, less than 2014 LRDP)**

The potential aesthetic impacts under Alternative 3 would be less than the 2014 LRDP because less development would occur at the Parnassus Heights and Mission Bay campus sites.

Biological Resources **(LTSM, less than 2014 LRDP)**

The potential biological impacts under Alternative 3 would be less than the 2014 LRDP because the proposed New Hospital Addition would not be constructed on the Parnassus Heights campus site thereby reducing potential adverse effects to birds.

Geology, Soils and Seismicity **(LTS, similar to 2014 LRDP)**

The potential geology and soils impacts under Alternative 3 would be similar to the 2014 LRDP because new development would occur that could result in geology and soils effects.

Greenhouse Gas Emissions **(LTSM, less than 2014 LRDP)**

The potential greenhouse gas (GHG) emissions impacts under Alternative 3 would be less than the mitigated impacts of the 2014 LRDP as less development would occur that could result in GHG effects.

Hazards and Hazardous Materials **(LTSM, similar to 2014 LRDP)**

The potential hazards and hazardous materials impacts under Alternative 3 would be similar to the mitigated impacts of the 2014 LRDP because new development would occur that could result in hazards and hazardous materials effects.

Hydrology and Water Quality **(LTS, similar to 2014 LRDP)**

The potential hydrology and water quality impacts under Alternative 3 would be similar to the less than significant impacts of the 2014 LRDP because new development would occur that could result in hydrology and water quality effects.

Land Use and Planning **(LTS, similar to 2014 LRDP)**

The potential land use impacts under Alternative 3 would be similar to the less than significant impacts of the 2014 LRDP because proposed building demolitions on the Parnassus Heights campus site would still occur under this alternative; therefore, the University would be responding to the 1976 Regents' Resolution.

Population and Housing **(LTS, less than 2014 LRDP)**

The potential population and housing impacts under Alternative 3 would be less than the less than significant impacts of the 2014 LRDP because less development would occur that could result in population and housing effects.

Public Services **(LTS, less than 2014 LRDP)**

The potential public services impacts under Alternative 3 would be less than the less than significant impacts of the 2014 LRDP because no less development would occur that could result in public services effects.

Recreation **(LTS, less than 2014 LRDP)**

The potential recreation impacts under Alternative 3 would be less than the less than significant impacts of the 2014 LRDP because less development would occur that could result in recreation effects.

Transportation and Traffic **(LTS, less than 2014 LRDP)**

The potential construction or demolition traffic impacts under Alternative 3 would be less than the mitigated impacts of the 2014 LRDP, because less development would occur that could result in construction and demolition traffic effects.

11.3.3.3 Relationship to Project Objectives

This section examines how Alternative 3 would compare with the 2014 LRDP in terms of achieving the five campus-wide objectives.

- *Respond to the City and Community Context:* Demolitions proposed under the 1996 LRDP for the Parnassus Heights campus site would occur under this alternative; therefore, the University would be responding to the 1976 Regents' Resolution by reducing building space. If UCSF decommissioned Moffitt Hospital or retrofitted it for inpatient use without the New Hospital Addition, then this alternative would eliminate an important medical resource at a location in San Francisco that serves the Sunset District and other neighborhoods in the southwestern portion of the City. Therefore, this objective would only be partially met under this alternative.

- *Accommodate UCSF's Growth Through 2035:* This alternative would result in less development at the Parnassus Heights and Mission Bay campus sites; therefore, growth proposed by UCSF through 2035 at the four main campus sites would not be accommodated and the objective would only be partially met under this alternative.

- *Ensure UCSF's Facilities are Seismically Safe:* Moffitt Hospital could be seismically retrofitted under this alternative. Hellman and the Harold Brunn Institute are seismically compromised and they would be demolished under this alternative. Therefore, Alternative 3 would only partially meet this objective of the 2014 LRDP.

- *Promote Environmental Sustainability:* This alternative would reduce commute travel as new on-site housing would be provided at the Parnassus Heights campus site and possibly at the Mission Bay campus site. The Greenhouse Gas Reduction Strategy would be implemented; therefore, reductions in GHG emissions proposed by this plan would occur.

- *Minimize Facility Costs:* Because less new development would occur under this alternative, facility costs would be less than compared to the 2014 LRDP. However, this alternative may preclude the consolidation of leased facilities at UCSF-owned facilities and may require the continued operation or possible expansion of remote campus sites. Therefore, this object would only be partially met under this alternative.

11.3.4 Alternative 4: No Demolition of Historical Resources

The No Project – No Demolition of Historical Resources alternative would include all elements of the 2014 LRDP, with the exceptions that the Surge building at the Parnassus Heights campus site and the Hellman building at the Mount Zion campus site would not be demolished. Rather, these two buildings would be preserved and rehabilitated per the Secretary of the Interior's Standards, and then reused in order to avoid the 2014 LRDP's significant and unavoidable impacts on historical resources. The proposed new office/research building at the Mount Zion campus site would still be constructed, but it would have a smaller footprint as it would only be built in the area currently occupied by the Harold Brunn Institute and the Dialysis Center buildings.

11.3.4.1 Comparison to Effects of the 2014 LRDP

Significant and Unavoidable Impacts of the 2014 LRDP

Air Quality **(SU, similar to the 2014 LRDP)**

The potential air quality impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Cultural Resources **(LTSM, less than the 2014 LRDP)**

The potential cultural resources impacts under Alternative 4 would be less than the 2014 LRDP as the demolition of Surge and Hellman buildings on the Parnassus Heights and Mount Zion campus sites, respectively, would not occur.

Noise **(SU, similar to the 2014 LRDP)**

The potential noise impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Transportation and Traffic **(SU, similar to the 2014 LRDP)**

The potential transportation and traffic impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Utilities and Service Systems **(SU, similar 2014 LRDP)**

The potential wastewater infrastructure impact at the Mission Bay campus site under Alternative 3 would be similar to the significant and unavoidable impact of the 2014 LRDP because Mission Hall and the Phase 1 Medical Center will open soon and all development proposed at the Mission Bay campus site under the 2014 LRDP would be constructed under this alternative.

Less than Significant or Mitigated Impacts of the 2014 LRDP

Aesthetics **(LTSM, similar to the 2014 LRDP)**

The potential aesthetic impacts under Alternative 4 would generally be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative. Depending on the final building design for the proposed office/research building on the Mount Zion campus site, shadow effects on the Hamilton Recreation Center may be reduced because the building would not be constructed in the space currently occupied by the Hellman building.

Biological Resources **(LTSM, similar to the 2014 LRDP)**

The potential biological resources impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP at the Parnassus Heights campus site would be constructed under this alternative.

Geology, Soils and Seismicity **(LTS, similar to the 2014 LRDP)**

The potential geology and soils impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Greenhouse Gas Emissions **(LTSM, similar to the 2014 LRDP)**

The potential greenhouse gas impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Hazards and Hazardous Materials **(LTSM, similar to the 2014 LRDP)**

The potential hazards and hazardous materials impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Hydrology and Water Quality **(LTS, similar to the 2014 LRDP)**

The potential hydrology and water quality impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Land Use and Planning **(LTS, similar to the 2014 LRDP)**

The potential land use impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative. Not demolishing Surge would have an effect on the space ceiling.

Population and Housing **(LTS, similar to the 2014 LRDP)**

The potential population and housing impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Public Services **(LTS, similar to the 2014 LRDP)**

The potential public services impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Recreation **(LTS, similar to the 2014 LRDP)**

The potential recreation impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Transportation and Traffic **(LTS, less than 2014 LRDP)**

The potential construction or demolition traffic impacts under Alternative 4 would be the same as the 2014 LRDP as all development proposed under the 2014 LRDP would be constructed under this alternative.

Utilities and Service Systems **(LTS, similar to the 2014 LRDP)**

The potential utilities and service systems impacts under Alternative 4 would be the same as the 2014 LRDP as Mission Hall and the Phase 1 Medical Center will open soon and all development proposed under the 2014 LRDP would be constructed under this alternative.

11.3.4.2 Relationship to Project Objectives

The relationship of Alternative 4 to the project objectives would generally be the same as the 2014 LRDP; however, the seismically compromised Hellman building on the Mount Zion campus site would not be retrofitted or replaced under this alternative and therefore this alternative would only partially meet the objective to endure seismic safety. In addition, because the proposed office/research building would not be constructed at least partially on the space currently occupied by the Hellman building, the new building may by necessity be smaller than proposed under the 2014 LRDP, thereby reducing the space needed to accommodate UCSF growth through 2035.

11.4 Summary Comparison of the 2014 LRDP Alternatives[2]

Significant Impacts (before mitigation)	Alternative 1: No Project-No Development	Alternative 2: No Project-Development Under Existing LRDP	Alternative 3: Reduced Program	Alternative 4: No Demolition of Historical Resources
Aesthetics				
Impact AES-LRDP-3: Implementation of the 2014 LRDP could result in flood lighting during nighttime construction activities that would adversely affect nighttime views in the area. (LSM)	L+	L	L	E
Impact AES-LRDP-4: Implementation of the 2014 LRDP could create new sources of substantial light or glare that would adversely affect day or nighttime views in the area. (LSM)	L+	L	L	E
Impact AES-LRDP-5: Implementation of the 2014 LRDP could create street-level winds that could be hazardous to pedestrians in the area. (LSM)	L+	L	L	E
Impact AES-LRDP-6: Implementation of the 2014 LRDP could substantially reduce sunlight or significantly increase shadows in public open space areas. (LSM)	L+	L	L	E
Impact AES-PH-3: Construction of the New Hospital Addition and faculty housing buildings at the Parnassus Heights campus site could result in flood lighting on the sites during nighttime construction activities. (LSM)	L+	L+	L+	E
Impact AES-PH-4: The New Hospital Addition and new faculty housing at the Parnassus Heights campus site could create new sources of substantial light or glare that would adversely affect day or nighttime views in the area. (LSM)	L+	L+	L+	E

[2] E = Impacts are similar or the same as the 2014 LRDP
L = Impacts are less
L+ = Impacts are much less
G = Impacts are greater
G+ = Impacts are much greater

Significant Impacts (before mitigation)	Alternative 1: No Project-No Development	Alternative 2: No Project-Development Under Existing LRDP	Alternative 3: Reduced Program	Alternative 4: No Demolition of Historical Resources
Impact AES-PH-5: The demolition of 8 existing buildings, including LPPI, and construction of the New Hospital Addition at the Parnassus Heights campus site would create street-level winds that could be hazardous to pedestrians in the area. (LSM)	E	E	E	E
Impact AES-MB-5: Implementation of the 2014 LRDP at the Mission Bay campus site could create street-level winds that could be hazardous to pedestrians in the area. (LSM)	L+	E	E	E
Impact AES-MZ-2: The proposed office/research building at the Mount Zion campus site could create new sources of substantial light or glare which would adversely affect day or nighttime views in the area. (LSM)	L+	L+	E	E
Aesthetics (cont.)				
Impact AES-MZ-3: Construction of the proposed office/research building at the Mount Zion campus site could result in flood lighting sites during nighttime construction activities. (LSM)	L+	L+	E	E
Impact AES-MZ-4: The proposed office/research building at the Mount Zion campus site would cast shadow on the Hamilton Recreation Center. (LSM)	L+	L+	E	E
Impact AES-MZ-5: The demolition of the three existing buildings and construction of the Office / Research building at the Mount Zion campus site would create street-level winds that could be hazardous to pedestrians in the area. (LSM)	E	E	E	E
Impact AES-MC-2: The proposed office building and parking structure at the Mission Center campus site could create new sources of substantial light or glare which would adversely affect day or nighttime views in the area. (LSM)	L+	L+	E	E
Impact AES-MC-3: Construction of the proposed office building and parking structure at the Mission Center campus site could result in flood lighting sites during nighttime construction activities. (LSM)	L+	L+	E	E
Air Quality				
Impact AIR-LRDP-4: Implementation of the 2014 LRDP would result in increased emissions of criteria air pollutants during demolition and construction activities. (SU)	L+	L	L	E
Impact AIR-LRDP-5: Implementation of the 2014 LRDP would result in increased emissions of criteria air pollutants during operation. (SU)	L+	L	L	E
Impact AIR-PH-1: Implementation of the 2014 LRDP at the Parnassus Heights campus site would result in increased emissions of criteria air pollutants during demolition and construction activities. (LSM)	L+	L	L	E

Significant Impacts (before mitigation)	Alternative 1: No Project-No Development	Alternative 2: No Project-Development Under Existing LRDP	Alternative 3: Reduced Program	Alternative 4: No Demolition of Historical Resources
Impact AIR-PH-3: Operations at the Parnassus Heights campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants. (LSM)	L+	L+	L+	E
Impact AIR-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site would result in increased emissions of criteria air pollutants during construction activities. (LSM)	L+	L	L	E
Impact AIR-MB-2: Construction activities at the Mission Bay campus site under the 2014 LRDP would increase emissions of toxic air contaminants (TACs) and increase health risks for nearby residents. (LSM)	L+	L+	E	E
Air Quality (cont.)				
Impact AIR-MB-3: Operations at the Mission Bay campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants. (SU)	L+	L	L	E
Impact AIR-MB-4: Operations at the Mission Bay campus site under the 2014 LRDP would expose persons (new receptors) to substantial levels of TACs, which may lead to adverse health effects. (LSM)	L+	L	E	E
Impact AIR-MZ-1: Implementation of the 2014 LRDP at the Mount Zion campus site would result in increased emissions of criteria air pollutants during demolition and construction activities. (LSM)	L+	L+	E	E
Impact AIR-MZ-3: Operations at the Mount Zion campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants. (LSM)	L+	L	E	E
Impact AIR-MC-1: Implementation of the 2014 LRDP at the Mission Center campus site would result in increased emissions of criteria air pollutants. (LSM)	L+	L+	E	E
Impact AIR-MC-3: Operations at the Mission Center campus site under the 2014 LRDP would result in increased emissions of criteria air pollutants. (LSM)	L	L	E	E
Biological Resources				
Impact BIO-LRDP-4: Implementation of the 2014 LRDP would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. (LSM)	L+	L	L	E
Impact BIO-PH-1: Demolition and construction activities at the Parnassus Heights campus site could have a substantial adverse effect, either directly or through habitat modifications, on species identified as candidate, sensitive, or	L+	L	L	E

Significant Impacts (before mitigation)	Alternative 1: No Project-No Development	Alternative 2: No Project-Development Under Existing LRDP	Alternative 3: Reduced Program	Alternative 4: No Demolition of Historical Resources
special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. (LSM)				
Impact BIO-PH-2: Demolition and construction activities at the Parnassus Heights campus site could interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. (LSM)	L+	L	L	E
Cultural Resources				
Impact CUL-LRDP-1: Implementation of the 2014 LDP would result in a substantial adverse change in the significance of historical resources as defined in CEQA Guidelines Section 15064.5. (PS)	L+	L	L	E
Impact CUL-LRDP-2: Implementation of the 2014 LRDP could result in demolition of historical resources as defined in CEQA Guidelines Section 15064.5.	L+	E	E	L+
Cultural Resources (cont.)				
Impact CUL-LRDP-3: Implementation of the 2014 LRDP could result in a substantial adverse change to archaeological resources. (LSM)	L+	L	L	E
Impact CUL-LRDP-4: Implementation of the 2014 LRDP could result in a substantial adverse change to paleontological resources. (LSM)	L+	L	L	E
Impact CUL-LRDP-5: Implementation of the 2014 LRDP could result in a substantial adverse change to human remains. (LSM)	L+	L	L	E
Impact CUL-PH-2: Demolition of the Surge building at the Parnassus Heights campus site would result in a substantial adverse change in the significance of an historical resource. (SU)	L+	E	E	L+
Impact CUL-PH-4: Seismic rehabilitation of the historic Faculty Alumni House could result in significant impact to this historic structure if not completed in accordance with the Secretary of the Interior's Standards. (LSM)	L+	E	E	E
Impact CUL-PH-5: Renovation of Saunders Court at the Parnassus Heights campus site could alter the features and spaces which convey its historic significance as a cultural landscape, which could result in a substantial adverse change in the significance of historical resources. (LSM)	L+	E	E	E
Impact CUL-PH-6: Construction of the New Hospital Addition at the Parnassus Heights campus site could cause substantial adverse changes to archaeological resources. (LSM)	L+	L+	L+	E
Impact CUL-PH-7: Construction of the New Hospital Addition at the Parnassus Heights campus site could cause substantial adverse	L+	L+	L+	E

Significant Impacts (before mitigation)	Alternative 1: No Project-No Development	Alternative 2: No Project-Development Under Existing LRDP	Alternative 3: Reduced Program	Alternative 4: No Demolition of Historical Resources
changes to paleontological resources. (LSM)				
Impact CUL-PH-8: Construction of the New Hospital Addition at the Parnassus Heights campus site could cause substantial adverse changes to human remains. (LSM)	L+	L+	L+	E
Impact CUL-PH-9: Infrastructure and utilities improvements proposed at the Parnassus Heights campus site, including the Parnassus Avenue Streetscape Plan, would not result in a substantial adverse change in the significance of historical resources. (LSM)	L+	E	E	E
Impact CUL-MB-1: Construction of 2014 LRDP proposals at the Mission Bay campus site could cause substantial adverse changes to archaeological resources. (LSM)	L+	L	L	E
Impact CUL-MB-2: Construction of 2014 LRDP proposals at the Mission Bay campus site could cause substantial adverse changes to paleontological resources. (LSM)	L+	L	L	E
Cultural Resources (cont.)				
Impact CUL-MB-3: Construction of 2014 LRDP proposals at the Mission Bay campus site could cause substantial adverse changes to human remains. (LSM)	L+	L	L	E
Impact CUL-MZ-1: Demolition of the Hellman building at the Mount Zion campus site would result in a substantial adverse change in the significance of an historical resource. (SU)	L+	E	E	L+
Impact CUL-MZ-4: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to archaeological resources. (LSM)	L+	L+	E	E
Impact CUL-MZ-5: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to paleontological resources. (LSM)	L+	L+	E	E
Impact CUL-MZ-6: Construction of the proposed office/research building at the Mount Zion campus site could cause substantial adverse changes to human remains. (LSM)	L+	L+	E	E
Impact CUL-MC-2: Construction of the proposed office building and parking structure at the Mission Center campus site could cause substantial adverse changes to archaeological resources. (LSM)	L+	L+	E	E
Impact CUL-MC-3: Construction of the proposed office building and parking structure at the Mission Center campus site could cause substantial adverse changes to paleontological resources. (LSM)	L+	L+	E	E
Impact CUL-MC-4: Construction of the proposed office building and parking structure at the Mission Center campus site could cause substantial adverse changes to human	L+	L+	E	E

Significant Impacts (before mitigation)	Alternative 1: No Project-No Development	Alternative 2: No Project-Development Under Existing LRDP	Alternative 3: Reduced Program	Alternative 4: No Demolition of Historical Resources
remains. (LSM)				
Greenhouse Gas Emissions				
Impact GHG-LRDP-1: Implementation of the 2014 LRDP would result in an increase in construction-related greenhouse gas emissions. (LSM)	L+	L	L	E
Impact GHG-PH-1: Development at the Parnassus Heights campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions. (LSM)	L+	L+	L	E
Impact GHG-MB-1: Development at the Mission Bay campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions. (LSM)	L+	L	L	E
Impact GHG-MZ-1: Development at the Mount Zion campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions. (LSM)	L+	L+	E	E
Greenhouse Gas Emissions (cont.)				
Impact GHG-MC-1: Development at the Mission Center campus site under the 2014 LRDP would result in an increase in construction-related GHG emissions. (LSM)	L+	L+	E	E
Hazards and Hazardous Materials				
Impact HAZ-LRDP-1: Implementation of the 2014 LRDP could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions. (LSM)	L+	L	E	E
Impact HAZ-LRDP-3: 2014 LRDP proposals are located on campus sites that are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public. (LSM)	L+	L	E	E
Impact HAZ-PH-1: Implementation of the 2014 LRDP at the Parnassus Heights campus site could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions. (LSM)	L+	L+	L	E
Impact HAZ-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions. (LSM)	L+	L	L	E
Impact HAZ-MB-3: 2014 LRDP proposals located at the Mission Bay campus sites that are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create	L+	L	L	E

Significant Impacts (before mitigation)	Alternative 1: No Project-No Development	Alternative 2: No Project-Development Under Existing LRDP	Alternative 3: Reduced Program	Alternative 4: No Demolition of Historical Resources
a significant hazard to the public. (LSM)				
Impact HAZ-MZ-1: Implementation of the 2014 LRDP could create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions. (LSM)	L+	L	E	E
Impact HAZ-MC-2: 2014 LRDP proposals located at Mission Center campus sites are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, could create a significant hazard to the public. (LSM)	L+	L+	E	E
Hydrology				
Impact HYD-MB-1: Implementation of the 2014 LRDP at the Mission Bay campus site could violate water quality standards or waste discharge requirements or otherwise substantially degrade water quality. (LSM)	L	E	E	E
Noise				
Impact NOI-LRDP-1: Implementation of the 2014 LRDP would result in increased ambient noise levels during demolition and construction activities. (LSM)	L+	L	L	E
Impact NOI-LRDP-2: Implementation of the 2014 LRDP would result in increased ambient noise levels during pile-driving activities. (SU)	L+	L	L	E
Impact NOI-PH-1: Demolition activities proposed under the 2014 LRDP at the Parnassus Heights campus site would result in a temporary increase in ambient noise levels. (SU)	L+	L+	L+	E
Impact NOI-PH-2: Construction activities proposed under the 2014 LRDP at the Parnassus Heights campus site would result in increases in ambient noise levels over the term of the exterior construction activities. (SU)	L+	L	L	E
Impact NOI-MB-1: Construction activities proposed under the 2014 LRDP at the Mission Bay campus site would result in increases in ambient noise levels over the term of the exterior construction activities. (SU)	L+	L	L	E
Impact NOI-MB-2: Construction activities proposed under the 2014 LRDP at the Mission Bay campus site would result in increases in ambient noise levels during pile-driving activities. (SU)	L+	L+	E	E
Impact NOI-MZ-1: Demolition activities proposed under the 2014 LRDP at the Mount Zion campus site would result in a temporary increase in ambient noise levels. (SU)	L+	L+	E	E
Impact NOI-MZ-2: Construction activities proposed under the 2014 LRDP at the Mount Zion campus site would result in increases in ambient noise levels over the term of the exterior construction activities. (SU)	L+	L+	L	L

Significant Impacts (before mitigation)	Alternative 1: No Project-No Development	Alternative 2: No Project-Development Under Existing LRDP	Alternative 3: Reduced Program	Alternative 4: No Demolition of Historical Resources
Impact NOI-MC-1: Construction activities proposed under the 2014 LRDP at the Mission Center campus site would result in increases in ambient noise levels over the term of the exterior construction activities. (LSM)	L+	L+	E	E
Impact NOI-MC-2: Construction activities proposed under the 2014 LRDP at the Mission Center campus site would result in increases in ambient noise levels during pile-driving activities. (SU)	L+	L+	E	E
Transportation and Traffic				
Impact TRAF-LRDP-2: Implementation of the 2014 LRDP could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during demolition and construction activities. (LSM)	L+	L	L	E
Transportation and Traffic (cont.)				
Impact TRAF-LRDP-3: Implementation of the 2014 LRDP would result in temporary increases in traffic volumes on roadways in the vicinity of each of the four campus sites during demolition and construction activities. (LSM)	L+	L	L	E
Impact TRAF-PH-1: Implementation of the 2014 LRDP on the Parnassus Heights campus site could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during demolition and construction activities. (LSM)	L+	L+	L+	E
Impact TRAF-MB-1: Implementation of the 2014 LRDP on the Mission Bay campus site could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during construction activities. (LSM)	L+	L	L	E
Impact TRAF-MZ-1: Implementation of the 2014 LRDP on the Mount Zion campus site could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during demolition and construction activities. (LSM)	L+	L+	E	E
Impact TRAF-MC-1: Implementation of the 2014 LRDP on the Mission Center campus site could cause substantial adverse impacts to traffic flow, circulation and access as well as to transit, pedestrian, and parking conditions during construction activities. (LSM)	L+	L+	E	E
Impact TRAF-MB-C-1: Implementation of the 2014 LRDP on the Mission Bay campus site in combination with foreseeable 2040 traffic volumes would increase traffic at intersections on the adjacent roadway network. (SU)	L+	L	L	E

Significant Impacts (before mitigation)	Alternative 1: No Project-No Development	Alternative 2: No Project-Development Under Existing LRDP	Alternative 3: Reduced Program	Alternative 4: No Demolition of Historical Resources
Impact TRAF-MB-C-2: Implementation of the 2014 LRDP with the LRDP Variant on the Mission Bay campus site in combination with foreseeable 2040 traffic volumes would increase traffic at the Sixteenth/Seventh Street and the Mariposa Street/Third Street intersections on the adjacent roadway network. (LSM)	L+	L	L	E
Utilities and Service Systems				
Impact UTIL-MB-2: There may be impacts related to wastewater infrastructure as a result of 2014 LRDP development at the Mission Bay campus site. (SU)	E	E	E	E

11.5 Alternatives Withdrawn from Consideration

No other alternatives were proposed for consideration during the scoping process.

In the early stages of the LRDP planning process, UCSF considered additional research and office space at the Mission Bay campus site to meet considerable needs for space in these areas, but no additional housing was contemplated beyond the existing Block 20 campus housing complex. As the plan evolved, additional housing was proposed to advance UCSF's housing goals, to reduce travel to and from the campus site, and to further the jobs-housing balance in San Francisco. In recognition of the importance of on-campus housing, UCSF is no longer considering the prior iteration of the plan that included only additional research and office space on the Mission Bay campus site, which would have resulted in greater traffic and parking impacts compared to the current mix of uses proposed under the LRDP.

11.6 Environmentally Superior Alternative

Of the alternatives assessed in this EIR, the environmentally superior alternative, that is the alternative with the least environmental impact, is the No Project–No Development Alternative. Section 15126.6(e)(2) of the CEQA Guidelines directs that if the environmentally superior alternative is the no project alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.

Other than the No Project Alternative, the No Project—Development Under Existing LRDP is the environmentally superior alternative, because it would reduce the significant and unavoidable impacts associated with the 2014 LRDP more than would the other alternatives. Significant and unavoidable Air Quality, Noise, and Traffic impacts related to construction and operation would be reduced in magnitude, even if not necessarily reduced to less than significant levels.

INITIAL STUDY FOR UCSF LONG RANGE DEVELOPMENT PLAN ENVIRONMENTAL IMPACT REPORT

This is the Initial Study for the University of California, San Francisco (UC San Francisco or UCSF) Long Range Development Plan (LRDP) Environmental Impact Report (EIR). In compliance with the State and University of California guidelines for implementation of the California Environmental Quality Act (CEQA), The Regents of the University of California will be the Lead Agency and UCSF will prepare an EIR for the project identified above.

UCSF is preparing a new LRDP to guide future growth and development over a 20+ year planning horizon through the year 2035. The LRDP plans for projected campus growth of approximately 2.76 million gross square feet on existing campus sites (including Parnassus Heights, Mission Bay, and Mount Zion) to accommodate roughly 500 more students and 10,000 more employees. So far, six community workshops have been held at UCSF's campus sites. The complete project description, location, and the potential environmental effects are discussed in the Initial Study.

The purpose of the Initial Study is to: (1) inform responsible agencies and the public of the nature of the proposed project and its location, (2) identify impacts that will clearly not result or will clearly be less than significant and therefore will not be discussed in the EIR, and (3) provide a general description of the environmental topics, scope and content of the issues intended to be addressed in the EIR.

The Notice of Preparation/Initial Study is available at www.ucsf.edu/LRDP. It will be circulated for public review and comment for at least 30 days from September 24, 2013 through October 29, 2013 **[Note: the review period has been extended and will end November 12, 2013 at 5 p.m.]** Public comments must be received no later than **November 12, 2013** and should be sent to the attention of Ms. Diane Wong at the address noted below. Public comments can also be submitted via email to the following address: **EIR@planning.ucsf.edu**. Email responses must be received no later than **November 12, 2013**.

UCSF will hold a public EIR scoping meeting on October 28, 2013. The meeting will be held at the UCSF Parnassus Heights campus site, Millberry Union, 500 Parnassus Avenue, beginning at 7:00 PM.

The EIR scoping meeting provides an opportunity for the community to provide verbal feedback on the Initial Study. This allows UCSF to learn about potential concerns early, as well as further define the issues, feasible alternatives, and potential mitigation measures that may warrant in-depth analysis in the environmental review process.

UCSF Long Range Development Plan

UC San Francisco is preparing a new Long Range Development Plan (LRDP) to guide future growth and development over a 20+ year planning horizon through the year 2035. The LRDP plans for projected campus growth of approximately 2.76 million gross square feet on existing campus sites (including Mission Bay, Mount Zion, and Parnassus) to accommodate roughly 500 more students and 10,000 more employees. So far, six community workshops have been held at UCSF's campus sites.

Some important features of the LRDP include proposals to:

- accommodate growth in clinical care, research programs and student enrollment,
- address seismically compromised buildings,
- optimize the use of existing campus sites, and
- continue to work with neighbors to address potential community concerns that may arise as a result of UCSF's physical development

EIR Scoping Meeting

You are invited to an Environmental Impact Report (EIR) scoping meeting for the UCSF LRDP. This meeting provides an opportunity for the community to discuss the scope and content of the environmental information they expect to see included in the Draft EIR. This allows UCSF to learn about potential concerns early, as well as further define the issues, feasible alternatives and potential mitigation measures that may warrant in-depth analysis in the environmental review process. This public meeting is not required by law.

When: Monday, October 28, 2013
7:00 PM

Where: UCSF Parnassus Campus
Millberry Union
500 Parnassus Avenue

UCSF Parnassus Campus is on MUNI lines 6, 43, 66, N-Judah. If you must drive, please park in the UCSF public parking garage for $1.75 (with validation).

Initial Study

An Initial Study that includes a project description will be available online starting September 24, 2013 at http://campusplanning.ucsf.edu. It also identifies the scope and content of the environmental information that will be included in the Draft EIR. You can obtain a paper or CD copy of the Initial Study by calling 415.476.2911. To give written feedback on the Initial Study, please write to Diane Wong, UCSF Campus Planning, Box 0286, San Francisco, CA 94143 or email her at EIR@planning.UCSF.edu by October 29, 2013.

The Draft EIR is expected to be published in April 2014. If you would like to be notified about the publication of the Draft EIR, or if you would like to attend the public hearing, please contact us at community@cgr.ucsf.edu or at 415.476.3206.

UCSF fully ascribes to the Americans with Disabilities Act. If at any time you feel you have a need for accommodation, please contact UCSF Community & Government Relations at 415.476.3206 or community@cgr.ucsf.edu with your suggested accommodation.

INITIAL STUDY FOR UCSF LONG RANGE DEVELOPMENT PLAN ENVIRONMENTAL IMPACT REPORT

This is the Initial Study for the University of California, San Francisco (UC San Francisco or UCSF) Long Range Development Plan (LRDP) Environmental Impact Report (EIR). In compliance with the State and University of California guidelines for implementation of the California Environmental Quality Act (CEQA), The Regents of the University of California will be the Lead Agency and UCSF will prepare an EIR for the project identified above.

UCSF is preparing a new LRDP to guide future growth and development over a 20+ year planning horizon through the year 2035. The LRDP plans for projected campus growth of approximately 2.76 million gross square feet on existing campus sites (including Parnassus Heights, Mission Bay, and Mount Zion) to accommodate roughly 500 more students and 10,000 more employees. So far, six community workshops have been held at UCSF's campus sites. The complete project description, location, and the potential environmental effects are discussed in the Initial Study.

The purpose of the Initial Study is to: (1) inform responsible agencies and the public of the nature of the proposed project and its location, (2) identify impacts that will clearly not result or will clearly be less than significant and therefore will not be discussed in the EIR, and (3) provide a general description of the environmental topics, scope and content of the issues intended to be addressed in the EIR.

The Notice of Preparation/Initial Study is available at www.ucsf.edu/LRDP. It will be circulated for public review and comment for at least 30 days from September 24, 2013 through October 29, 2013 **[Note: the review period has been extended and will end November 12, 2013 at 5 p.m.]** Public comments must be received no later than **November 12, 2013** and should be sent to the attention of Ms. Diane Wong at the address noted below. Public comments can also be submitted via email to the following address: **EIR@planning.ucsf.edu**. Email responses must be received no later than **November 12, 2013**.

UCSF will hold a public EIR scoping meeting on October 28, 2013. The meeting will be held at the UCSF Parnassus Heights campus site, Millberry Union, 500 Parnassus Avenue, beginning at 7:00 PM.

The EIR scoping meeting provides an opportunity for the community to provide verbal feedback on the Initial Study. This allows UCSF to learn about potential concerns early, as well as further define the issues, feasible alternatives, and potential mitigation measures that may warrant in-depth analysis in the environmental review process.

2. Project Description

2.1 Introduction

The University of California, San Francisco (UC San Francisco or UCSF) is one of ten campuses in the University of California (UC) system, and is the only UC campus devoted solely to the health sciences. UCSF's mission is to advance health worldwide through innovative health sciences education, research and patient care.

In support of its mission, UCSF is preparing a new Long Range Development Plan (LRDP) to guide future campus growth and development over a 20+ year planning horizon through the year 2035. UCSF currently occupies 8.25 million gross square feet (gsf) in owned and leased space in San Francisco, and another 1.13 million gsf is under construction. The LRDP plans for projected campus growth of approximately 2.76 million gross square feet (gsf) by 2035, accommodating approximately an additional 500 students and 10,000 employees in a total population increase of about 14,200 on any given day, including patients and visitors. The LRDP will develop land use maps, or "functional zone" maps for each major campus site, that will guide capital construction and infrastructure development to accommodate a building program for campus growth. Some important features of the LRDP include plans to:

- accommodate growth in clinical care, research programs and student enrollment,
- address seismically compromised buildings,
- optimize the use of existing campus sites and existing space,
- increase on-campus housing,
- consolidate leased sites,
- continue to expand alternative transportation options,
- continue to work with neighbors to address potential community concerns that may arise as a result of UCSF's physical development,
- improve usable open space on campus, as well as enhance the public realm (i.e. public streets/sidewalks) adjacent to campus, and
- limit greenhouse gas emissions through a comprehensive greenhouse gas reduction strategy.

Program Level and Project Level Analysis

Pursuant to the California Environmental Quality Act (CEQA), a program environmental impact report (EIR) is prepared on a series of actions that can be characterized as one large project, such as for an LRDP. A program EIR generally establishes a framework for tiered or project-level environmental documents that are prepared in accordance with the overall program (see CEQA Guidelines Section 15168(a)). An LRDP is defined by statute (Public Resources Code Section 21080.09) as a "physical development and land use plan to meet the academic and institutional objectives for a particular campus or medical center of public higher education." UCSF will

prepare an EIR as required by Public Resources Code Section 21080.09 that will evaluate the environmental effects of growth under the proposed LRDP. The LRDP EIR will be a program EIR that will be used by the Board of Regents of the University of California (The Regents) to evaluate the environmental implications of adopting the proposed LRDP. Once certified, the EIR will also be used to tier subsequent environmental analyses for future UCSF development projects (CEQA Guidelines Section 15152). Proposed UCSF development projects would then be reviewed in light of the LRDP EIR to determine the appropriate level of additional environmental review before implementation.

In addition to analyzing at a program level proposed campus growth under the new LRDP, the LRPD EIR will analyze at a project level a number of specific and foreseeable development proposals. These proposals are to be analyzed in the EIR in sufficient detail to permit project approval and implementation following certification of the EIR. The University anticipates seeking project approval for some projects in the near-term, within several years of EIR certification, while others will occur at a later date but are included because there is sufficient information about the proposals for project-level analyses in the EIR. Project approvals for these will be sought when funding becomes available and project implementation is logistically feasible. Proposed projects are discussed in detail in Section 2.7, Campus Site Locations and Proposed Physical Development Plans.

Purpose of the Initial Study

Pursuant to Section 15063 of the CEQA Guidelines, an Initial Study is a preliminary environmental analysis that may be used by the lead agency to focus the EIR on environmental effects resulting from the proposed project that may be significant. Accordingly, the purpose of this initial study is to analyze the LRDP and individually proposed projects to identify environmental impacts that are potentially significant and therefore require detailed study in the EIR. Potential environmental impacts determined to be less than significant require no further study in the EIR.

The CEQA Guidelines require that an Initial Study contain a project description, a description of environmental setting, an identification of environmental effects by checklist or other similar form, an explanation of environmental effects, a discussion of mitigation for significant environmental effects, an evaluation of the project's consistency with existing, applicable land use controls, and the names of the persons who prepared the study.

2.2 LRDP Background

Each UC campus is required to periodically prepare a LRDP. This LRDP is a comprehensive policy document that articulates a long-term physical development strategy for achieving UCSF's academic, research and clinical missions through the year 2035. It provides objectives and planning guidelines for making decisions regarding future facilities to accommodate new program initiatives and other needs over the next 20 years. While the LRDP does not commit UCSF to implement all elements of the LRDP, future development projects will need to be in general conformity with the vision set forth in the LRDP.

The LRDP also serves as an opportunity for UCSF to assess its current status and establish goals for the future; as a forum for the discussion of issues of mutual concern between UCSF, the City and County of San Francisco and the communities surrounding UCSF's major campus sites; and as a report to The Regents on how UCSF proposes to physically change over time in terms of the amount and type of building space, campus-wide facilities and operations and improvements to campus open space and the public realm during the LRDP planning horizon.

When adopted by The Regents, this LRDP will replace UCSF's 1996 LRDP, as amended.

2.3 Campus and Context

UCSF is a multi-site campus with locations throughout the City and County of San Francisco, encompassing approximately 8.25 million gross square feet (gsf[1]). Its major academic and clinical sites are at Parnassus Heights, Mission Bay and Mount Zion, with a major presence at the City's San Francisco General Hospital (SFGH) site. **Figure 1** shows the main locations of UCSF owned and leased sites in San Francisco. UCSF has major hospital affiliation agreements at both SFGH and the San Francisco Veterans Affairs Medical Center (SFVAMC) where UCSF faculty practice and conduct research. While UCSF leases or otherwise occupies space in exchange for services at SFGH, UCSF does not lease or otherwise control any of the space at the SFVAMC. The remaining UCSF locations outside its major campus sites provide a variety of program space in buildings that are owned or leased by UCSF.

Unlike any other UC campus, UCSF has no large undergraduate student body, but only a small population of graduate and professional students exclusively in health science related fields. The four professional schools include Dentistry, Medicine, Nursing and Pharmacy. UCSF also offers 28 interdisciplinary graduate degree and certification programs through the Graduate Division. Research programs include biological, clinical, social/behavioral and population sciences.

UCSF's clinical enterprise consists of the Medical Center with inpatient facilities at Parnassus Heights and Mount Zion and by 2015, at Mission Bay. There are outpatient clinics at all three of these campus sites but the outpatient hub would be located at Mount Zion by 2015 when existing Mount Zion inpatient uses will be relocated to Mission Bay. Support facilities are designed for staff, students and visitors, and include campus housing, retail, child care, recreation and fitness facilities and parking.

As an urban institution with multiple campus sites, UCSF is located in neighborhoods of highly varied building use, density and design. UCSF facilities and property adjoin residential, neighborhood commercial, research and development, industrial and mixed use districts. All the campus sites lie within the urban framework of the city and are served by the city's street network in well-established neighborhoods. The surrounding urban character deeply influences how UCSF buildings and open spaces respond to their context and contribute to the public realm.

[1] Gross square footage is a UC facilities term denoting the sum of all floor areas, finished and unfinished, on all floors of an enclosed structure. It excludes spaces such as attics without flooring, mezzanines, exterior courts, and balconies.

SOURCE: UCSF

UCSF Long Range Development Plan Initial Study

Figure 1
UCSF Main Locations

In addition, UCSF influences and is influenced by the city in a number of other ways. For example, UCSF maintains a network of shuttles that use city streets to transport faculty, staff, students, patients and patient family members and formal guests among the campus sites. The amount of parking and housing provided on campus sites affects off-site traffic and off-site housing demand. Many of UCSF's facilities, such as recreation and fitness, child care and conference centers, as well as all of its outdoor areas, are available for public use. Consequently, UCSF works closely with both neighbors and city staff when planning development.

2.4 LRDP Objectives and Principles

A primary focus of this LRDP is to address Senate Bill 1953 (SB 1953), which mandates that all inpatient facilities in the State of California meet more stringent seismic regulations by 2030. In 2015, the new Medical Center at Mission Bay will be operational. This facility will provide 289 inpatient beds for women, children and cancer patients, along with outpatient and support space. The opening of the new medical center will provide opportunities at the Parnassus Heights and Mount Zion campus sites to re-occupy vacated space (or "backfill") after programs and occupants are relocated to the Mission Bay campus site. Many of the highly complex adult clinical programs will remain at Parnassus Heights. Mount Zion will be developed into an ambulatory care center and outpatient hub. Both the Parnassus Heights and Mission Bay campus sites will provide inpatient, outpatient, research and administrative functions, as well as campus housing. All four professional schools will remain at Parnassus Heights. To meet the SB 1953 mandate at Parnassus Heights, UCSF proposes to decommission inpatient care in Moffitt Hospital by the 2030 deadline, build a new hospital addition to Long Hospital and reconfigure its inpatient and outpatient programs across the three major sites.

In the 1976 Regents' Resolution, a policy that was adopted to address environmental effects associated with development of the Parnassus Heights campus site, The Regents' designated the Mount Sutro Open Space Reserve as a permanent open space[2]; defined campus boundaries to prohibit further property acquisition (by purchase, condemnation or gift) and leasing of private residential properties outside this area by UCSF; directed that the houses acquired and occupied by UCSF on Third Avenue, Fifth Avenue, Parnassus Avenue, Irving Street and Kirkham Street be returned to residential use, and that some be sold; and adopted a limit on the amount of built space of 3.55 million gsf, commonly referred to as the "space ceiling", within the newly designated campus site boundaries. The space ceiling applies to all building space, including parking structures, but excludes residential uses in UCSF buildings on Third, Fourth, Fifth, and Parnassus Avenues and Kirkham and Irving Streets. The space ceiling was intended to limit environmental impacts such as traffic and parking impacts on the neighborhoods surrounding the Parnassus Heights campus site by limiting UCSF's square footage. Currently, Parnassus Heights contains approximately 3.84 million gsf of space, approximately 0.29 million gsf or 8.2% above the space ceiling limit. The 1976 LRDP incorporated the 1976 Regents' Resolution.

[2] The reserve on Mount Sutro was designated as open space for a 25-year period by The Regents in 1975. In the 1976 Regents' Resolution, The Regents increased the Mount Sutro Open Space Reserve from 52 acres to 58 acres and made the open space designation permanent. The 1996 LRDP updated the boundaries of the Reserve to reflect the results of a survey which found that area contained an additional three acres, for a total of 61 acres.
